## Plenary Speakers

### Illuminating a Bright Future for Medicine

Monday, February 15, 2016  
2:00 – 3:00 PM  
Continental Ballroom 5

**Audrey (Ellerbe) Bowden** (Stanford University)

Cancer. Infertility. Hearing loss. Each of these phrases can bring a ray of darkness into an otherwise happy life. The Stanford Biomedical Optics group, led by Professor Audrey Bowden, aims to develop and deploy novel optical technologies to solve interdisciplinary challenges in the clinical and basic sciences. In short, we use light to image life—and in so doing, illuminate new paths to better disease diagnosis, management and treatment. In this talk, I will discuss our recent efforts to design, fabricate and/or construct new hardware, software and systems-level biomedical optics tools to attack problems in skin cancer, bladder cancer, hearing loss and infertility. Our efforts span development of new fabrication techniques for 3D tissue-mimicking phantoms, new strategies for creating large mosaics and 3D models of biomedical data, machine-learning classifiers for automated detection of disease, novel system advances for multiplexed optical coherence tomography and low-cost technologies for point-of-care diagnostics.

*Audrey K (Ellerbe) Bowden, PhD is an Assistant Professor of Electrical Engineering at Stanford University. She received her BSE in Electrical Engineering from Princeton University, her PhD in Biomedical Engineering from Duke University and completed her postdoctoral training in Chemistry and Chemical Biology at Harvard University. During her career, Dr. Bowden spent a short time as an International Fellow at Ngee Ann Polytechnic in Singapore and as a Legislative Assistant in the United States Senate through the AAAS Science and Technology Policy Fellows Program sponsored by the OSA and SPIE. She is a member of the OSA and SPIE and is the recipient of numerous awards, including the Air Force Young Investigator Award, the NSF Career Award and the Hellman Faculty Scholars Award. Dr. Bowden currently serves on the OSA Public Policy Committee.*

*Dr. Bowden directs the Stanford Biomedical Optics group, whose mission is to develop and deploy novel tools for optical imaging at the microscale and nanoscale. Their applications of interest span clinical and basic science domains. The group also has a particular interest in the development of low-cost, portable technologies suited for use in poorly resourced environments. Building on their expertise and experience with interferometry, they aim to create innovative technologies that serve as integral complements to the toolkits of biologists and clinicians, as well as use their own technologies to study various cellular phenomena relevant to disease.*

### Pushing Computational Photography Deeper into Imaging System Design

Tuesday, February 16, 2016  
2:00 – 3:00 PM  
Continental Ballroom 5

**Ren Ng** (University of California, Berkeley)

Computational photography is pushing sophisticated computational thinking deeper into the imaging pipeline. For example, light field cameras record higher-dimensional data than conventional cameras, and enable new functionality, like depth inference, refocusing and correcting lens aberrations in post-processing. In addition to new capabilities, the

architecture of computational imaging systems motivate deep changes in the design of the core subsystems: optics, sensors and processors.

*Ren Ng is a faculty member in EECS at the University of California, Berkeley. His research interests are in imaging, graphics and applied mathematics, focusing on the theory and engineering of computational imaging systems. Dr. Ng was previously Founder and CEO of Lytro, Inc, and led the company to commercialize his Ph.D. research and bring consumer light field cameras to market. Ren completed his Ph.D. in computer science at Stanford University, which received the ACM Doctoral Dissertation Award and Stanford's Arthur Samuel Award. Ren has received the HIPA Photographic Research Award, PMDA Technical Achievement Award, R.I.T.'s Imaging Hall of Fame, the Selwyn Award from the Royal Photographic Society, MIT Tech Review's TR35 and Entrepreneur of the Year, Fast Company's 100 Most Creative People in Business, and Silicon Valley Journal's 40 under 40.*

*Achin Bhowmik is vice president and general manager of the Perceptual Computing Group at Intel Corporation. He leads the development and deployment of interactive technologies and products based on natural sensing, intuitive interfaces, immersive applications and experiences, branded as Intel® RealSense™ Technology. Previously, he served as chief of staff for the Personal Computing Group, Intel's largest business unit. Earlier, he led the development of advanced video and display processing technologies for Intel's computing products. His prior work includes microdisplay technologies and electro-optical devices.*

*As an adjunct and guest professor, Dr. Bhowmik has advised graduate research and taught advanced sensing and human-computer interactions, computer vision and display technologies at the University of California, Berkeley, Stanford University, Liquid Crystal Institute of the Kent State University, Kyung Hee University, Seoul, and the Indian Institute of Technology, Gandhinagar. He has over 150 publications, including two books titled “Interactive Displays: Natural Human-Interface Technologies” and “Mobile Displays: Technology & Applications”, and 28 granted patents.*

*Dr. Bhowmik is on the executive committee of the Society for Information Display (SID), and serves as the vice president of SID Americas. He is a senior member of the IEEE. He is on the board of directors for OpenCV, the organization behind the open source computer vision library.*

## Human Vision and Electronic Imaging (HVEI) 2016

### Conference grouping: Human Perception and Cognition for Emerging Technologies

Conferences in this grouping discuss human visual, auditory and tactile perception, and cognition related to electronic imaging algorithms, methods, and applications; texture and material perception; image understanding; task-based visualization; other topics. Special topics this year include: high-level adaptation, psychophysiological measures of image quality, cross-sensory perception, and visual aesthetics, art and emotion in electronic media.

### Conference overview

The conference on Human Vision and Electronic Imaging explores the role of human perception and cognition in the design, analysis, and use of electronic media systems. Over the years, it has brought together researchers, technologists and artists, from all over the world, for a rich and lively exchange of ideas. We believe that understanding the human observer is fundamental to the advancement of electronic media systems, and that advances in these systems and applications drive new research into the perception and cognition of the human observer. Every year, we introduce new topics through our Special Sessions, centered on areas driving innovation at the intersection of perception and emerging media technologies. The HVEI website (<http://hvei.eecs.northwestern.edu>) includes additional information and updates.

## Digital Photography and Mobile Imaging XII

### Conference grouping: Image Capture Systems

Conferences in this grouping discuss advances in traditional and non-traditional digital cameras and their image processing pipelines; plenoptic devices; sensors for low-light imaging; very high dynamic range sensors and cameras; hyperspectral sensors and cameras; wearable multimedia systems; mobile games; multimedia data mining; and HCI design and techniques, among other topics.

### Conference overview

Digital photography has revolutionized the world we live in. Both the number of still images and videos taken each year and the capabilities of current imaging devices are unprecedented. The number of cell phones produced each year exceeds one billion and the quality of images produced by them is so high that many people are happy with a cell phone as their only camera. At the same time, other types of cameras also keep improving. Advances in hardware and processing of captured images help to push boundaries of what was previously possible in consumer and fine art photography and in the huge range of applications of digital imaging in industry, science, health care, defense, and other areas. Despite the tremendous progress that have been already made, the future promises even more.

This conference serves to bring together researchers, scientists, and engineers working in the fields of traditional, mobile, and computational camera imaging to discuss recent progress in the development of digital cameras and camera modules, with all related areas like optics, sensors, in-camera still image and video processing (including traditional pipeline steps like demosaicing, color correction, and image compression, as well as high dynamic range processing, blur removal, and various other computational imaging techniques), applications of image and video processing, still image and video management and sharing applications, and methods and standards for evaluating the quality of produced images and video and of cameras used for their capture.

The conference includes panel discussions and joint sessions with other Electronic Imaging conferences with overlapping interests.

## Image Sensors and Imaging Systems 2016

### Conference grouping: Image Capture Systems

Conferences in this grouping discuss advances in traditional and non-traditional digital cameras and their image processing pipelines; plenoptic devices; sensors for low-light imaging; very high dynamic range sensors and cameras; hyperspectral sensors and cameras; wearable multimedia systems; mobile games; multimedia data mining; and HCI design and techniques, among other topics.

### Conference overview

Solid state optical sensors and solid state cameras have established themselves as the imaging systems of choice for many demanding professional applications such as scientific and industrial applications. The advantages of low-power, low-noise, high-resolution, high-geometric fidelity, broad spectral sensitivity, and extremely high quantum efficiency have led to a number of revolutionary uses.

This conference aims at being a place of exchanges and at giving the opportunity to a quick publication of new works in the areas of solid state detectors, solid state cameras, new optical concepts and novel applications. To encourage the discussion a set of high level invited talks is followed by a panel discussion. To encourage young talent, a best student paper contest is organized.

## Color Imaging XXI: Displaying, Processing, Hardcopy, and Applications

### Conference grouping: Image Reproduction and Material Appearance

*Conferences in this grouping discuss the effects of extra-spectral attributes; applications of color hard and soft copy; medical imaging, cartography, fine arts, new communications media, knowledge delivery; measurement of Bidirectional Reflectance Distribution Functions (BRDF), Bidirectional Texture Functions (BTF), and Bidirectional Surface Scattering Reflectance Distribution Function (BSSRDF); and quality evaluation of 2.5D and 3D soft- and hard-copy reproductions, among other topics.*

### Conference overview

Color imaging has historically been treated as a constant phenomenon well described by three independent parameters. Recent advances in computational resources and in the understanding of the human aspects are leading to new approaches that extend the purely metrological view towards a perceptual view of color in documents and displays. Part of this perceptual view is the incorporation of spatial aspects, adaptive color processing based on image content, and the automation of color tasks, to name a few.

This dynamic nature applies to hardcopy devices, but to an even larger extent to soft-copy displays. Adaptive gamut and tone mapping, dynamic contrast, adaptive power usage, and color management continue to support the unprecedented development of the display hardware spreading from mobile displays to large size screens.

This conference provides an opportunity to learn about the most recent developments in color imaging technologies and applications. Focus of the conference is on color image input, dynamic color image output and rendering, color image automation, emphasizing color in context and color in images, and reproduction of images across local and remote devices. The conference covers software, media, and systems. Special attention is given to applications and requirements created by new disciplines.

The Special Session entitled "The Dark Side of Color" groups challenging questions, open issues, alternative views, paradigm shifts, bottom up experimentation, re-addressing the current state of the color science, technology, and applications.

**Joint Sessions:** Retinex at 50 with the Human Vision and Electronic Imaging (HVEI) Conference

## Measuring, Modeling, and Reproducing Material Appearance 2016

### Conference grouping: Image Reproduction and Material Appearance

Conferences in this grouping discuss the effects of extra-spectral attributes; applications of color hard and soft copy; medical imaging, cartography, fine arts, new communications media, knowledge delivery; measurement of Bidirectional Reflectance Distribution Functions (BRDF), Bidirectional Texture Functions (BTF), and Bidirectional Surface Scattering Reflectance Distribution Function (BSSRDF); and quality evaluation of 2.5D and 3D soft- and hard-copy reproductions, among other topics.

### Conference overview

The rapid and continuous development of rendering devices such as displays and printers offers interesting challenges related to how materials are understood. Over the years, researchers from different disciplines have studied the interaction of incident light with the texture and surface geometry of a given object, as well as the optical properties of distinct materials. Thanks to those efforts, we have been able to render with high accuracy 2.5D and 3D objects and scenes.

Given the day-to-day technological improvements of materials and devices along with the advances in the areas of visual and tactile perception, modeling how light interacts with materials and techniques for measuring material properties, the field of material appearance is in constant evolution.

This conference offers the possibility to share research results and establish new collaborations among academic and industrial researchers from these related fields.

## Media Watermarking, Security, and Forensics 2016

### Conference grouping: Document Processing and Media Security

Conferences in this grouping discuss document clustering and classification, query languages and modalities, pattern discovery, trend mining, topic modeling and analysis, clustering, media forensics and authentication, biometrics and user identification, and physical object identification and interaction, among other topics.

### Conference overview

The ease of capturing, manipulating, distributing, and consuming digital media (e.g. images, audio, video, graphics, and text) has raised a number of important security challenges to the forefront. These issues have prompted significant research and development activities in the areas of digital watermarking, steganography, data hiding, forensics, media identification, and encryption to protect the authenticity, security, and ownership of media objects. Research results in these areas have translated into new paradigms and applications to monetize media objects without violating their ownership rights.

The Media Watermarking, Security, and Forensics conference is a premier destination for disseminating high-quality, cutting-edge research in these areas. The conference provides an excellent venue for researchers and practitioners to present their innovative work as well as to keep abreast with the latest developments in watermarking, security, and forensics. A unique feature of the conference is that the submission process only requires a structured abstract describing the work in progress, with the full paper to be submitted only a few weeks before the event. This allows researchers to present early results and fresh ideas from the laboratory to motivate new research directions in a timely manner.

A strong focus on how research results are applied in practice by the industry gives the conference its unique flavor.

## Image Quality and System Performance XIII

### Conference grouping: Image and Video Processing, Quality, and Systems

Conferences in this grouping discuss electrical resistance and impedance imaging; diffusion optical imaging; imagery-based surveillance and tracking; the readability of electronic paper and mobile displays; image preference measurement and modeling; medical and forensic imaging; genetic and evolutionary computing; steganography and data hiding, microarray imaging; electronic cinema; multimedia content retrieval; and image and video compression, communications, segmentation and recognition, restoration and enhancement, among other topics.

### Conference overview

We live in a visual world. The perceived quality of images is of crucial importance in industrial, medical, and entertaining application environments. Developments in camera sensors, image processing, 3D imaging, display technology, and digital printing are enabling new or enhanced possibilities for creating and conveying visual content that informs or entertains. Wireless networks and mobile devices expand the ways to share imagery. The power of imaging rests directly on the visual quality of the images and the systems that produce them. As the images are generally intended to be viewed by humans, consideration of the role of human visual perception is intrinsic to the effective assessment of image quality.

This conference brings together engineers and scientists from industry and academia who strive to understand what makes a high-quality image and how to assess the requirements and performance of modern imaging systems. It focuses on both objective and subjective methods for evaluating the perceptual quality of images, and includes applications throughout the imaging chain from image capture, through processing, to output, printed or displayed, video or still, 2D or 3D, LDR or HDR.

**Awards:** Best Student Paper

## 3D Image Processing, Measurement (3DIPM), and Applications 2016

### Conference grouping: Virtual Reality, 3D, and Stereoscopic Systems

Conferences in this grouping discuss virtual reality UI and UX; virtual and augmented reality in education, learning, gaming, art; 3D shape indexing and retrieval; scene analysis: from 2D views to 3D reconstruction and interpretation; stereoscopic image synthesis: 2D to 3D conversion, depth map generation, multi-viewpoint generation; the geometry of 3D perceptual space; and 3D measurement, data processing and recognition among other topics.

### Conference overview

Scientific and technological advances during the last decade in the fields of image acquisition, processing, telecommunications, and computer graphics have contributed to the emergence of new multimedia, especially 3D digital data. Nowadays, the acquisition, processing, transmission, and visualization of 3D objects are a part of possible and realistic functionalities over the internet. Confirmed 3D processing techniques exist and a large scientific community works hard on open problems and new challenges, including 3D data processing, transmission, fast access to huge 3D databases, or content security management.

The emergence of 3D media is directly related to the emergence of 3D acquisition technologies. Indeed, recent advances in 3D scanner acquisition and 3D graphics rendering technologies boost the creation of 3D model archives for several application domains. These include archaeology, cultural heritage, computer assisted design (CAD), medicine, face recognition, video games, and bioinformatics. New devices such as time-of-flight cameras open challenging new perspectives on 3D scene analysis and reconstruction.

Three-dimensional objects are more complex to handle than other multimedia data, such as audio signals, images, or videos. Indeed, only a unique and simple 2D grid representation is associated to a 2D image. All the 2D acquisition devices generate this same representation (digital cameras, scanners, 2D medical systems). Unfortunately (for the users), but fortunately (for scientists), there exist different 3D representations for a 3D object. For example, an object can be represented on a 3D grid (digital image) or in 3D Euclidian space. In the latter, the object can be expressed by a single equation (like algebraic implicit surfaces), by a set of facets representing its boundary surface, or by a set of mathematical surfaces. One can easily imagine the numerous open problems related to these different representations and their processing, a new challenge for the image processing community.

**Awards:** Best Paper Award given to the author(s) of a full paper presented at the conference, selected by the Organizing Committee.

#### Workshop: Introduction to Unity for Use in Virtual Reality Development

Instructors: Margaret Dolinsky, Indiana University and Chauncey Eugene Frennd, Indiana University (USA)

**8:50 – 11:30 am**

Continental Ballroom 3

As the popularity of virtual reality grows in studios, institutes, and industry the Unity game engine has emerged as a trusted tool. VR developers find that Unity along with 3rd party plugins can easily target all types of VR systems. Artists and coders may utilize the Unity editor in productive ways that make them comfortable due to the dynamic interface. This workshop will be presented in two parts. The first part of this workshop will be a

fundamental introduction to the Unity Editor and how to best understand how the tool works. The second part of the workshop will focus on how Unity projects can be configured for CAVE systems as well as the Oculus Rift system. If you would like to follow along during these workshops please bring a laptop with Unity 5 installed. The free personal edition of Unity can be downloaded from this page <https://unity3d.com/get-unity>.

### Conference overview

#### The World's Premier Conference for 3D Innovation

The Stereoscopic Displays and Applications conference (SD&A) focuses on developments covering the entire stereoscopic 3D imaging pipeline from capture, processing, and display to perception. The conference brings together practitioners and researchers from industry and academia to facilitate an exchange of current information on stereoscopic imaging topics. A highly-popular conference demonstration session provides authors with a perfect additional opportunity to showcase their work. Large-screen stereoscopic projection is available, and presenters are encouraged to make full use of these facilities during their presentations. Publishing your work at SD&A offers excellent exposure—across all publication outlets, SD&A has the highest proportion of papers in the top 100 cited papers in the stereoscopic imaging field (Google Scholar, May 2013).

**Awards:** 3D Theater awards are given for best CG film and best live action film. A 3D presentation award is given for best presentation using stereoscopic 3D.

## Image Processing: Machine Vision Applications IX

### Conference grouping: Real-time Image and Video

*Conferences in this grouping discuss machine vision applications for industrial research and development; tracking and scene analysis for intelligent vehicles; 3D vision: modeling, representation, perception, processing, and recognition; and predictive 3D vision, among other topics.*

### Conference overview

This conference brings together real-world practitioners and laboratory researchers in machine vision to share recent applications and developments. Topics of interest include the integration of imaging sensors supporting hardware, computers, and algorithms for manufacturing inspection, characterization, and/or control.

The decreased cost of computational power and vision sensors has motivated the rapid proliferation of machine vision technology in a variety of industries, including aluminum, automotive, forest products, textiles, glass, steel, metal casting, and chemicals. Other industries, such as semiconductor and electronics manufacturing, have been employing machine vision technology for several years. Machine vision supporting handling robots is another main topic for industrial applications.

There is need of accurate, fast and robust detection of objects and their position in space. Their surface, the background and illumination is uncontrolled, in most cases the objects of interest are within a bulk of many others. For both new and existing industrial users of machine vision, there are numerous innovative methods to improve productivity, quality, and compliance with product standards. There are several broad problem areas that have received significant attention in recent years. For example, some industries are collecting enormous amounts of image data from product monitoring systems. New and efficient methods are required to extract insight and to perform process diagnostics based on this historical record. Regarding the physical scale of the measurements, microscopy techniques are nearing resolution limits in fields such as semiconductors, biology, and other nano-scale technologies. Techniques such as resolution enhancement, model-based methods, and statistical imaging may provide the means to extend these systems beyond current capabilities. Furthermore, obtaining real-time and robust measurements in-line or at-line in harsh industrial environments is a challenge for machine vision researchers, especially when the manufacturer cannot make significant changes to their facility or process.

### Conference grouping: Real-time Image and Video

*Conferences in this grouping discuss machine vision applications for industrial research and development; tracking and scene analysis for intelligent vehicles; 3D vision: modeling, representation, perception, processing, and recognition; and predictive 3D vision, among other topics.*

### Conference overview

This meeting focuses on new algorithms and techniques for intelligent robots and computer vision with emphasis on algorithms and techniques.

With computer vision, the conference looks at the development of the science of computer imaging, theory, algorithms, paradigms, and applications. It emphasizes intelligent robotics, new computer vision, and pattern recognition algorithms and applications in robotics and product inspection, modeling of human visual processing, learning for swarms of robots, etc.

In 2016, we plan several major sessions on new advances in intelligent mobile robots (systems, navigation, obstacle avoidance, route planning) with emphasis on results obtained in diverse government and other programs. We are interested especially in the diversity of vehicles including airborne, micro UAVs, and UAVs. Sessions are also planned on detection and tracking of people and vehicles in complex environments, product inspection, cognitive learning strategies and systems, autonomous multivehicle collaboration and vehicle automation and enhanced safety through driver assisted aids for manned and unmanned vehicles for the military and automotive applications. In 2016 we launch two new themes: computational attention (machine attention in robots, joint attention in human-robot cooperation and human factor analyses) and Mobile Mapping (visual infrastructure recognition and localization).

## Video Surveillance and Transportation Imaging Applications 2016

### Conference grouping: Web and Mobile Imaging and Visualization

Conferences in this grouping discuss image, video, and multimedia analytics: object tracking, face recognition, human detection and tracking; social networks: use of images and videos in social networks; video segmentation and tracking algorithms; Bayesian models for tracking and activity monitoring; social media; and multivariate time series visualization, among other topics.

### Conference overview

With the advent of low-cost/high-performance video sensors, imaging platforms, and computational equipment, it has become increasingly possible to process video streams in real-time on affordable cloud computational servers, desktop systems, and various hand held mobile devices. Major applications of these technologies span the spectrum from surveillance, transportation, remote sensing, social media, sports, retail, and biomedical to name a few. Only recently has the potential for these technologies begun to be realized in various commercial, government, and consumer based applications. For instance, automated video understanding can enhance surveillance/monitoring systems beyond what is possible for human operators alone. These systems are being developed to maintain long-term surveillance on large numbers of video streams for various applications with minimal or no manual intervention. In addition, automated systems can coordinate multiple cameras and provide "synopsis" views of activities that can be used to predict/analyze potential events pre or post mortem. On the other hand, transportation systems, the life blood of our economic and social lives, are far from their ideal state. Vehicle accidents are the number one cause of death in the US for ages 4 to 34, and expected to surpass disease as a cause of death for all ages worldwide by 2020. By some estimates, half the fuel consumed in San Francisco is consumed while searching for a parking space. Vehicular congestion is a leading cause of lost productivity and the fuel efficiency considerations have traditionally received very limited attention in the design of present day systems.

Over the past two decades, various video analytics algorithms have been proposed for autonomous understanding of events for a variety of surveillance and transportation type applications. While most of the earlier solutions started from raw data and followed with the interpretation at increasing levels of semantic complexity, more recent techniques attempt to bridge the gap between signal-level and semantic level processing. Technological solutions to problems in these areas have the potential for very significant societal impacts on many fronts from airport/stadium/ building/city security to patient/elderly care. There is an emerging global effort to develop effective surveillance systems to monitor various facilities and smarter transportation networks to improve fuel efficiency, safety, and reduce emissions and congestions in various metropolitan areas throughout the world. The conference brings together world class researchers and practitioners that develop and deploy imaging and video technologies to enable novel solutions for problems in the surveillance, security, and transportation arenas

**8:00 – 10:00 am**

**Course Level:** Introductory

This new course introduces imaging performance evaluation for image capture and provides a foundation for more advanced topics, e.g., system characterization and performance benchmarking. We adopt a scenario-based approach by describing several situations where imaging performance needs evaluation. Each of these, from design to quality assurance for manufacturing, is addressed in terms of suggested methods, color test charts, and standard reporting. For several important attributes, we describe international standards, guidelines, and current best practice. We demonstrate how testing standards can be adapted to evaluate capture devices ranging from cameras to scientific detectors. Examples are drawn from various applications, including consumer, museum, mobile, and clinical imaging.

**Instructors:** Uwe Artmann, Image Engineering GmbH & Co KG (Germany) and Kevin Matherson, Microsoft Corporation (United States)

**8:00 – 10:00 am**

**Course Level:** Introductory/Intermediate

When an image is captured using a digital imaging device it needs to be rendered. For consumer cameras this processing is done within the camera and covers various steps like dark current subtraction, flare compensation, shading, color compensation, demosaicing, white balancing, tonal and color correction, sharpening, and compression. Each of these steps have a significant influence on image quality. In order to design and tune cameras, it is important to understand how color camera hardware varies as well as and the methods that can be used to calibrate such variations. This course provides the basic methods describing the capture and processing of a color camera image. Participants will get to examine the basic color image capture and how calibration can improve images using a typical color imaging pipeline. In the course, participants will be shown how raw image data influences color transforms and white balance. The knowledge acquired in understanding the image capture and calibration process will be used to understand tradeoffs in improving overall image quality.

**Course Level:** Intermediate. Basic machine learning exposure and prior experience programming using a scripting language helpful.

Deep learning has been revolutionizing the machine learning community winning numerous competitions in computer vision and pattern recognition. Success in this space spans many domains including object detection, classification, speech recognition, natural language processing, action recognition and scene understanding. In some cases, results are on par with and even surpassing the abilities of humans. Activity in this space is pervasive, ranging from academic institutions to small startups to large corporations. This short course encompasses the two hottest deep learning fields: convolutional neural networks (CNNs) and recurrent neural networks (RNNs). It gives attendees hands-on training on how to build custom models using popular open source deep learning frameworks. CNNs are end-to-end, learning low level visual features and classifying simultaneously in a supervised fashion, giving substantial advantage over methods using independently solved features and classifiers. RNNs inject temporal feedback into neural networks. The best performing RNN framework, Long Short Term Memory modules, are able to both remember long term sequences and forget more recent events. This course describes what deep networks are, how they evolved over the years, and how they differ from competing technologies. Examples will be given demonstrating their widespread usage in imaging, and as this technology is described, indicating their effectiveness in many applications. There are an abundance of approaches to getting started with deep learning, ranging from writing C++ code to editing text with the use of popular frameworks. After understanding how these networks are able to learn complex systems, the hands-on portion of the talk demonstrates usage with popular open source utilities to build state-of-the-art models. An overview of popular network configurations and how to use them with frameworks will be discussed. The session concludes with tips and techniques for creating and training deep neural networks to perform classification on imagery, assessing performance of a trained network, and modifications for improved performance.

**E112: 3D Imaging**

**Instructor:** Gady Agam, Illinois Institute of Technology (United States)

**1:30 – 5:30 pm**

**Course Level:** Introductory

The purpose of this course is to introduce algorithms for 3D structure inference from 2D images. In many applications, inferring 3D structure from 2D images can provide crucial sensing information. The course begins by reviewing geometric image formation and mathematical concepts that are used to describe it, and then moves to discuss algorithms for 3D model reconstruction. The problem of 3D model reconstruction is an inverse problem in which we need to infer 3D information based on incomplete (2D) observations. We discuss reconstruction algorithms which utilize information from multiple views. Reconstruction requires the knowledge of some intrinsic and extrinsic camera parameters, and the establishment of correspondence between views. Also discussed are algorithms for determining camera parameters (camera calibration) and for obtaining correspondence using epipolar constraints between views. The course also introduces relevant 3D imaging software components available through the industry standard OpenCV library.

**Benefits**

- Describe fundamental concepts in 3D imaging.
- Develop algorithms for 3D model reconstruction from 2D images.
- Incorporate camera calibration into your reconstructions.
- Classify the limitations of reconstruction techniques.

**Intended Audience:** Engineers, researchers, and software developers who develop imaging applications and/or use camera sensors for inspection, control, and analysis. The course assumes basic working knowledge concerning matrices and vectors.

Gady Agam is an associate professor of computer science at the Illinois Institute of Technology. He is the director of the visual computing lab at IIT which focuses on imaging, geometric modeling, and graphics applications. He received his PhD from Ben-Gurion University in 1999.

### E115: Joint Design of Optics and Image Processing for Imaging Systems

**Instructor:** David Stork, Rambus (United States)

**8:30 am – 12:30 pm**

**Course Level:** Introductory to intermediate

For centuries, optical imaging system design centered on exploiting the laws of the physics of light and materials (glass, plastic, reflective metal) to form high-quality (sharp, high-contrast, undistorted) images that "looked good." In the past several decades, the optical images produced by such systems have been ever more commonly sensed by digital detectors and the image imperfections corrected in software. The new era of electro-optical imaging offers a more fundamental revision to this paradigm, however: now the optics and image processing can be designed jointly to optimize an end-to-end digital merit function without regard to the traditional quality of the intermediate optical image. Many principles and guidelines from the optics-only era are counterproductive in the new era of electro-optical imaging and must be replaced by principles grounded on both the physics of photons and the information of bits. This short course will describe the theoretical and algorithmic foundations of new methods of jointly designing the optics and image processing of electro-optical imaging systems. The course will focus on the new concepts and approaches rather than commercial tools.

#### Benefits

- Describe the basics of information theory.
- Characterize electro-optical systems using linear systems theory.
- Compute a predicted mean-squared error merit function.
- Characterize the spatial statistics of sources.
- Implement a Wiener filter.
- Implement spatial convolution and digital filtering.
- Make the distinction between traditional optics-only merit functions and end-to-end digital merit functions.
- Perform point-spread function engineering.
- Become aware of the image processing implications of various optical aberrations.
- Describe wavefront coding and cubic phase plates.
- Utilize the power of spherical coding.
- Compare super-resolution algorithms and multi-aperture image synthesizing systems.
- Simulate the manufacturability of jointly designed imaging systems.
- Evaluate new methods of electro-optical compensation.

**Intended Audience:** Optical designers familiar with system characterization (f#, depth of field, numerical aperture, point spread functions, modulation transfer functions, ...) and image processing experts familiar with basic operations (convolution, digital sharpening, information theory, ...).

David Stork is Distinguished Research Scientist and Research Director at Rambus Labs and a Fellow of the International Association for Pattern Recognition. He holds 40 US patents and has written nearly 200 technical publications including eight books or proceedings volumes such as *Seeing the Light*, *Pattern Classification (2nd ed.)* and *HAL's Legacy*. ### E116: Perceptual Metrics for Image and Video Quality in a Broader Context: From Perceptual Transparency to Structural Equivalence

**Instructors:** Sheila Hemami, Northeastern University (United States) and Thrasylvoulos Pappas, Northwestern University (United States)

**8:30 am – 12:30 pm**

**Course Level:** Intermediate (Prerequisites: Basic understanding of image compression algorithms; background in digital signal processing and basic statistics: frequency-based representations, filtering, distributions.)

The course examines objective criteria for the evaluation of image quality that are based on models of visual perception. The primary emphasis will be on image fidelity, i.e., how close an image is to a given original or reference image, but we will broaden the scope of image fidelity to include structural equivalence. Also discussed is no-reference and limited-reference metrics. An examination of a variety of applications with special emphasis on image and video compression is included. We examine near-threshold perceptual metrics, which explicitly account for human visual system (HVS) sensitivity to noise by estimating thresholds above which the distortion is just noticeable, and supra-threshold metrics, which attempt to quantify visible distortions encountered in high compression applications or when there are losses due to channel conditions. The course also considers metrics for structural equivalence, whereby the original and the distorted image have visible differences but both look natural and are of equally high visual quality. This short course also takes a close look at procedures for evaluating the performance of quality metrics, including database design, models for generating realistic distortions for various applications, and subjective procedures for metric development and testing. Throughout the course we discuss both the state of the art and directions for future research.

#### Benefits

- Gain a basic understanding of the properties of the human visual system and how current applications (image and video compression, restoration, retrieval, etc.) attempt to exploit these properties.
- Gain an operational understanding of existing perceptually-based and structural similarity metrics, the types of images/artifacts on which they work, and their failure modes.
- Understand current distortion models for different applications and how they can be used to modify or develop new metrics for specific contexts.
- Understand the differences between sub-threshold and supra-threshold artifacts, the HVS responses to these two paradigms, and the differences in measuring that response.
- Understand criteria by which to select and interpret a particular metric for a particular application.
- Understand the capabilities and limitations of full-reference, limited-reference, and no-reference metrics, and why each might be used in a particular application.

**Intended Audience:** Image and video compression specialists who wish to gain an understanding of how performance can be quantified. Engineers and Scientists who wish to learn about objective image and video quality

evaluation. Managers who wish to gain a solid overview of image and video quality evaluation. Students who wish to pursue a career in digital image processing. Intellectual Property and Patent Attorneys who wish to gain a more fundamental understanding of quality metrics and the underlying technologies. Government laboratory personnel who work in imaging.

---

**Instructor:** Majid Rabbani, Eastman Kodak Company (United States)

**8:30 am – 12:30 pm**

**Course Level:** to Intermediate

A key problem in computer vision is image and video understanding, which can be defined as the task of recognizing objects in the scene and
