

Møhl & Drivsholm Glass, Ebeltoft Denmark

## THE ART OF FIRE

Design for the modern home is simple and purposeful. Distinctive, high-quality, details from parts to whole. This classical language of form is a Danish tradition that is meant to be experienced, like the warmth of a soft cashmere blanket or the remarkable performance of a luxury car.

We call it the Art of Fire – an uncompromising aesthetic concept based on 35 years of compelling curiosity and the inclination and will to develop that which is inspiring. When it comes to function, form and quality, we never compromise, and our principal approach is that only the very best is good enough for the modern home.

For this reason RAIS collaborates with the Danish Technology Institute and Aalborg University, constantly working to combine materials, knowledge and trends in new ways to meet contemporary demands for highly efficient and environmentally-friendly wood-burning stoves, in which intelligent technology and elegant style meld together in original, designer stoves.

## DESIGN CLASSIC

Our design has always been our trademark. A wood-burning stove has to last many years and for us it is extremely important that it is always a joy to look at.

Design is more than meets the eye and we constantly work to improve our products so that they can live up to ever-increasing expectations for better combustion and better use of the heat source.

## QUALITY

Design, choice of materials, manufacturing processes, customer guidance. All these elements are an essential part of creating a quality product, and at RAIS we are always conscious of the need to continually develop and improve individual elements. To maintain the strength of the entire chain RAIS collaborates with the following organizations:

# RAIS R60

The original RAIS inset stove

The frame can be specially made to fit almost any open fireplace.

The flat appearance makes for a fine, streamlined look.

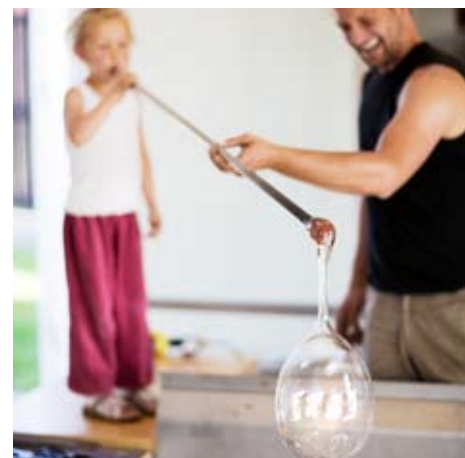

RAIS OPUS won the  
2008 Vesta Award

## RAIS OPUS

Exceptionally efficient, with an extra large firebox.  
Designed with straight lines and angles.  
Unique glass door.  
A rotating base is available as an add-on extra.

Available with an optional heat-accumulating stone  
which builds up and radiates heat long after the  
flames have died out.

# RAIS TOPAS

Incredible combustion performance, with an extra large firebox.

A rotating base is available as an optional extra.

Designed with a clean-cut cubist appearance. Unique glass door. RAIS Topas is available with or without a covered firewood storage space.

# VISUAL IMPRESSIONS..

Visual impressions are extremely important to me when it comes to layout. But functionality must never suffer for the sake of good looks. I don't mind spending a lot of time looking for just the right form of expression that encompasses both aspects. And for this very reason, my wood-burning stove from RAIS is the perfect solution. The design is timeless yet, modern and at the same time, it heats the room extremely well and very quickly, while living up to current and future demands for less pollution.

Jens Veggerby, Galleri Veggerby in Copenhagen

# TRENDS IN INTERIOR DESIGN..

If you take a look at interior design over a period of time, say the last five to 10 years, the mega-trend is: Quality, Simplicity and Function. Whereas you used to see masses of decoration, loops and flourishes, now you see pure style and simple lines. Design classics have made a tremendous comeback, in Denmark as well as abroad. RAIS is part of that trend, a design icon that shapes part of the core rooms of a home, where we enjoy ourselves and socialize.

Design  huset  
Scandinavia

## RAIS X-BASIC

The RAIS X-Basic fireplace has a striking linear design. Nothing detracts from its radiant center. Very cool design features include sophisticated eco-wise burning technology, innovative sliding door, and a safe-touch handle.

# ENVIRONMENT

When used correctly, a wood-burning stove is one of the most environment-friendly forms of energy available. If fired properly, burning dry wood is completely CO<sub>2</sub>-neutral. What we continue to work on is better use of heating value and the improvement of smoke cleansing. We constantly strive to make advancements, and as a result several of our stoves carry the Scandinavian Swan Eco-Label.

# INDOOR CLIMATE

Because many homes have been built to air-tight standards, RAIS developed the Air-System that permits fresh air to be drawn in from outside. However to ensure that Air-System operates properly the installation must be designed to make sure that under pressure does not occur in the dwelling.

RAIS PINA won the 2004 Vesta Award

## RAIS PINA

Award-winning design. Simple and round - perfect as a room divider.

Can be mounted on pivoting base for 90 and 360 degree rotation.

# RAIS RONDO

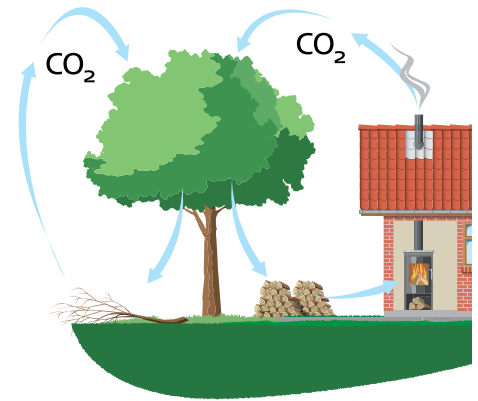

Curvilinear design with firewood storage space and baking bay. A rotating base is available as an optional extra.

# CO<sub>2</sub> NEUTRAL

The environmental issue of reducing CO<sub>2</sub> emissions is something we feel very strongly about at RAIS. We therefore take an active part in the development of new cleaner technologies. When used correctly, CO<sub>2</sub> emissions from a RAIS wood-burning stove compare with the amount of CO<sub>2</sub> the tree would have given off if the wood was left to decompose in its natural surroundings.

## PARTICLE EMISSIONS (PAH)

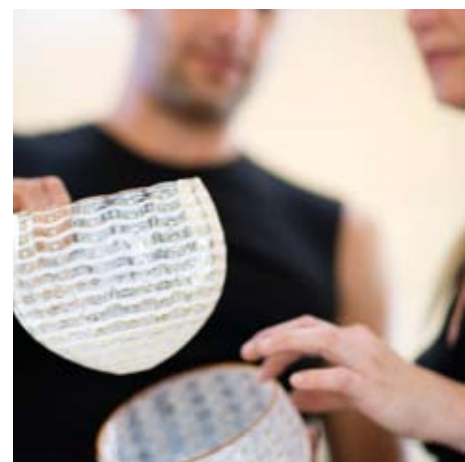

RAIS has reduced the emission of particles from all its stoves due to many years of experience and ongoing development of unique fire boxes. In fact, our stoves have documented United States EPA and Norwegian approval, and several even carry the Scandinavian Swan Eco-Label to illustrate that our product is a good environmental choice.

## RAIS RONDO 92/120

Destined to be a classic, this stylish Rondo stands tall and proud in two heights without the firewood storage space and baking compartment.

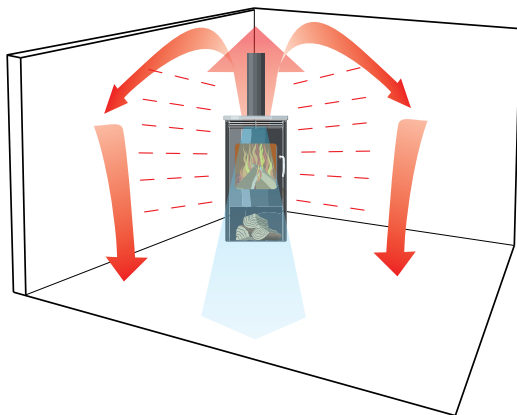

Available in grey or black the RAIS Rondo, 92 or 120, fits perfectly in any modern home - large or small.

# EASY TO USE

Lighting a RAIS wood-burning stove is easy. It is a question of making the best possible use of the firewood.

You do this by using dry firewood of a suitable size, not putting too much of it in the stove and above all, regulating the flow of air, starting with a lot and then using less once the flames have taken hold. The one-handle air regulation system on RAIS wood-burning stoves has been improved and simplified.

# CONVECTION STOVES

RAIS's stoves are convection stoves. Convection means that the air is circulated and is thus distributed more evenly throughout the home. Cold air is drawn in at the base of the stove and up through the convection channel running alongside the firebox of the stove. The heated air flows out of the top of the stove thus ensuring circulation of hot air in the home.

One advantage of convection stoves is that the surface does not get as hot as that of a traditional stove.

# RAIS MINO II

Equipped with unique RAIS details, this petite-sized Mino II, with rounded front and straight sides, is a great choice for bedroom, kitchen or home office. It can be used practically anywhere.

With firewood storage and baking bay.

## RAIS GABO

The Rais Gabo is an all-purpose stove. Improved design features enhance the efficiency of this stove. No ash pan and no shaker grate, but a totally sealed firebox ensures optimal combustion control. This model is also available with a turntable and a heat-retaining soapstone.

## RAIS GABO GAS II

This easy-to-use distinctive gas unit has beautifully crafted ceramic logs and embers with a large curved glass front. Designed with meticulous care, this stove features all the fine qualities of our wood-burning stoves.

# RAIS MALTA

Elegant and slim – The Malta stove embodies the essence of Rais design.

With the wide rounded door and all the other Rais quality features, it can be placed everywhere.

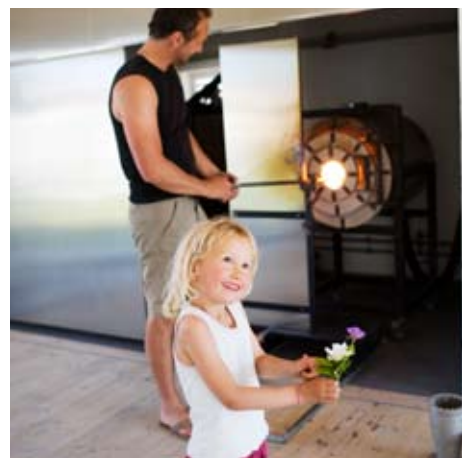

The Rais Malta stove is also available with a turnable solution and a soapstone top plate.

## RAIS BANDO

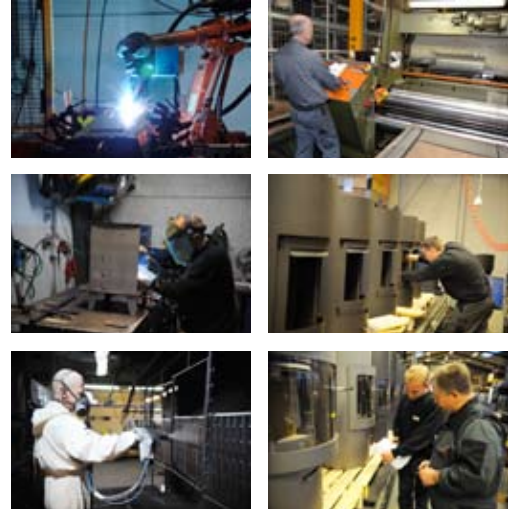

The soapstone exterior of the Bando stove makes it unbeatable when it comes to efficiency. Apart from being very decorative, the soapstone retains the heat, thus prolonging the warmth.

# RAIS

Pioneering new combustion technology that respects the environment, while fulfilling modern-day requirements for quality, high-performance, function, and décor-enhancing style is a long-held RAIS tradition. The ORIGINAL RAIS wood stove was created in 1970 as part of a Danish “green houses” project that required effective fireplaces. Today, RAIS stoves continue to be manufactured in Denmark and are internationally recognized.
