# 4-Bit 4-Digit Diagnostic Card PC Analyzer Version 3.2 Advanced

# User's Guide

# Model: postcard\_32

For use only in a desktop model computer with PCI or ISA slot

## **INTRODUCTION**

Diagnostic Card is a powerful diagnostic tool for technicians and administrators to troubleshoot various problems of IBM compatible PCs. It is easy to install, yet extremely powerful to use. With Diagnostic Card in hand, you no longer have to go through tedious and time consuming process of trying to figure out what is wrong with your PC hardware. Diagnostic Card will tell you exactly what is wrong with your PC in just seconds. It saves you time and money.

Our new and improved design of diagnostic card can work with almost all popular types of CPUs, Motherboards, and BIOS.

All though we try, it is not possible to update this manual every time a new motherboard is made by the manufactures. It is always advised to visit the bios manufacture website, and download the latest codes per bios revision. Or visit bioscentral.com for an online reference.

## **System Requirements**

The Diagnostic Card itself only requires an empty PCI or ISA expansion slot. It is not necessary to install memory chips to perform analysis. "POST Codes" can be displayed through the hexadecimal display panel on the Diagnostic Card itself.

#### **Tech Support**

**Tech Support** 

1-888-359-0747 tech@elstonsystems.com

#### **Diagnostic Card INDICATORS**

Two 'Indicators' are any light emitting diodes (LED) or hexadecimal display panel that may be mounted on an Diagnostic Card. This section discusses the following indicators that appear on the Diagnostic Card:

- POST Code Display
- PCI BUS SIGNALS LEDs

#### **POST Code Display**

The POST Code Display is made up of a dual, dot matrix hexadecimal read-out that displays Power On Self Test (POST) status codes.

# The Feature of 4-Bit 4-Digit PC Analyzer

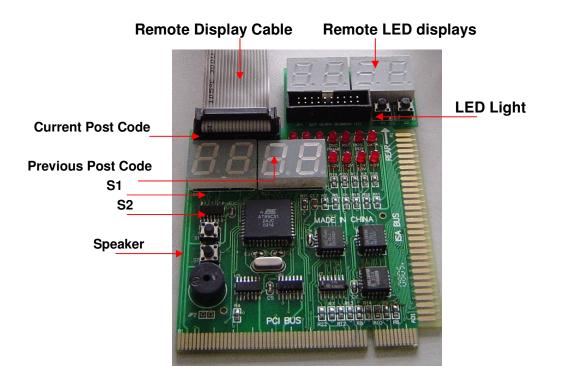

- This Card can work on either PCI or ISA Slot
- Manually to keep on track for the post code in sequence
- Forward and backward button (S1,S2) Design, it can be easy to check the post code step by step.
- Remote LED display and button, it is suitable for mounting outside the casing
- Self-Checking Remote Display Function

# **User Guide**

1. Insert the post code card in PCI or ISA slot. Power on the machine. The post code will show on display. The left Post code display monitor the real time and right post code is for previous one. After the machine booting up complete, press S1 button about 2 seconds, then it can be checked the previous post code by pressing S1 or S2 button.

2. If S1 button is pressed 2 more seconds, it shows the testing speed rate which represents the PCI clock frequency. For example, if the display show F-33, which represent PCI clock 33 MHz.

3. If S1 button is pressed 2 more seconds for next stage, it has self-checking function from 0000 to 9999. To return original status is just by pressing S1 button again.

## Power On Self-Test (POST) Codes

Most AT and 386 computers (and a few XT computers) output status codes during POST. The Diagnostic Card displays these codes during and after POST. Refer to Appendix A for a comprehensive listing of POST codes provided by BIOS manufacturers.

#### **PCI Signal Definition:**

CLK	<b>Motherboard Clock Signal.</b> Should be on when power is supplied to the motherboard even without CPU.
BIOS	BIOS Read Signal. Flashes when CPU reads BIOS code.
IRDY	<b>Device Ready.</b> Flashes when an IRDY signal is detected.
OSC	<b>ISA Oscillation Indicator.</b> Indicate ISA Oscillation Signal is available.
FRAME	PCI Bus Frame. Should be on under normal circumstances and flashes
FKAWL	when a PCI Frame Signal is detected.
DCT	-
RST	<b>Reset.</b> After power on or reset, this indicator should be on for an half
GNG	second and then turned off.
SYS	Bus pulse. If the LED blinks, the main board bus is running. If the bus is
	not running, the LED is off.
DATA	Data Transfer. This signal shows that a device has been selected for data
	transfer. If no blink, the bus controller could be faulty.
IOW	I/O Write. Lights when the BIOS writes to device and provides the same
	troubleshooting clues as the I/O READ.
12V	Power Supply, 12-Volt Positive. Should be on all the time otherwise there
	is a short circuit.
-12V	Power Supply, 12-Volt Negative. Should be on all the time otherwise there
	is a short circuit.
5V	Power Supply, 5-Volt Positive. Should be on all the time otherwise there is
	a short circuit.
-5V	Power Supply, 5-Volt Negative. Should be on all the time otherwise there
	is a short circuit.
3V3	<b>Power Supply, 3.3-Volt.</b> Some motherboards have 3.3V power supply to
	PCI slots. This indicator should be on if the motherboard supplies 3.3V
	power.

### **INSTALLING the Diagnostic Card**

#### **Installation Procedure**

TO INSTALL A Diagnostic Card:

- 1) Install the Diagnostic Card in any available PCI or ISA expansion slot.
- 2) Power on the machine.
- 3) Install JP2 External Speaker Connection if required, see note below.
- 4) Observe POST CODE.

### **POST Codes**

When the machine is turned on, the hexadecimal display should show the various POST codes as the system executes (unless it has a rare BIOS that does not display POST codes).

If the machine does not boot, system POST has detected a fatal fault and stopped. The number showing in the hexadecimal display on the Diagnostic Card is the number of the test in which POST failed. Refer to Appendix A for a listing of POST codes.

#### **Troubleshooting During POST**

After initial power up, Power-On Self-Test (POST) codes begin displaying on the Diagnostic Card's hexadecimal displays (for most machines).

NOTE: A few machines use the parallel port to display POST codes instead of the Diagnostic Card.

#### THE POST PROCESS

The ROM built onto the motherboard of the computer rums its built-in POST (Power-On Self-Test) when you switch power on to the computer, press the reset button on the computer, or press Ctrl-Alt-Del (warm boot). POST performs a tightly interwoven initialization and testing process for each of these methods, but it typically does not test or initialize memory above 64K for warm boot. You can get an even better idea of the detailed process by studying the POST code listings in Appendix A.

#### JP2 EXTERNAL SPEAKER CONNECTION

On some older motherboards you may encounter no onboard speaker or non functional motherboard speakers. Use the 2-pin gray jumper wire included to jump the connection from the speaker terminals on the motherboard header to the JP2 jumper on the PC POST Card. This will connect the onboard speaker of the PC POST card so you can hear BEEP CODES as well as see POST CODES.

	Error Code-00
AMI	(00)Going to give control to INT 19H boot loader.
	Error Code-01
AMI	(01)Processor register test about to start, and NMI to be disabled,286 reg. test about to start.
Award	(01)Processor test 1;Processor status(1FLAGS) verification; Tests the following processor status flags carry, zero, sign, overflow. The BIOS will set each of these flags, verify they are set then turn each flag off and verify it is off.
Phoenix	(01)[Beep]=none 80286 register test in -progress.
	Error Code - 02
AMI	(02)NMI is disabled. Power on delay starting. Power on de- lay starting.286reg.
AST	(02)Test CPU register. (02)Processor test 2;Read/write/verify all CPU registers except SS,SP and BP with
Award	data pattern FF&00.Determine status of manufacturing jumper.
Chips&Tech Dell	(02)Test CPU register.
Phoenix	(02)[Beep]=1-1-3 CMOS write/read test . (02)Varify real mode operation(Peep)=1.1.1.2 CPU Flags test
	(02)Verify real-mode operation(Beep)=1-1-1-3.CPU Flags test.
Phoenix	(02)[Beep]=1-1-3 CMOS write/read test in-progress or failure.
	<b>Error Code – 03</b> (03)Power on delay complete. To check soft reset/power-on. Any initialization
AMI	before keyboard BAT is in progress. ROM BIOS checksum(32K at F800:0) passed.
AST	(03)Test 8042 keyboard controller reset.
	(03)Initialize Chips; Disable NMI,PIE,AIE,UEI,SQWV, disable video, parity checking, DMA; Reset math Coprocessor; Clear all page registers, CMOS shutdown byte; Initialize timer 0,1 and 2 including set EISA timer to a known
Award	state; Initialize DMA controllers 0 and 1; Initialize interrupt controller 0 and 1;Initialize EISA extended registers. Calculate BIOS EPROM and sign-on message checksum; fail if not 0.Initialize EISA registers(EISA)BIOS only).Clear 8042 keyboard controller.
Chips & Tech	(03)ROM did not checksum.
Phoenix&Dell	(03)Disable Non-Maskable Interrupt(NMI).[Beep]=1-1-4 BIOS ROM checksum in-progress or failure.
	Error Code – 04
AMI	(04)Any initialization before keyboard BAT is complete. Reading keyboard SYS bit, to check soft reset/power-on. Reading keyboard SYS bit, to check soft reset/power On. Keyboard controller test with and without mouse passed. 8259
	initialization OK.
AST	<ul><li>(04)Low level keyboard communication, keyboard ID verification.</li><li>(04)Test memory refresh toggle; RAM must be periodically refreshed in order to keep the memory from decaying. This function assures that the memory refresh</li></ul>
Award	function is working properly. Test CMOS RAM I/O port interface and verify battery power is available(bat. status=1).Reset 8042.
Chips & Tech	(04)DMA Controller failed.
Phoenix&Dell	(04)Get the CPU type (Beep)=1-1-2-1.CPU register test. Programmable Interval Timer test failure.
	Error Code – 05
	(05)Soft reset/power-on determined. Going to enable ROM. i.e. disable shadow
AMI	RAM/Cache if any. Going to enable ROM.i.e. disable shadow RAM/cache if any.Chipset initialization over,DMA and interrupt controller disabled. CMOS pending interrupt disabled.
AST	(05)Read keyboard input port.
Chips & Tech	
Award	(05)Keyboard controller self-test enable keyboard interface. Blank video, Initialize keyboard; Keyboard controller initialization. Initialize Chips; Disable NMI,PIE,AIE,UEI, SQ- WV, disable video, parity checking, DMA; Reset math Co- processor; Clear all page registers,CMOS shutdown byte; Initialize timer 0,1 and 2 including set EISA timer to a known state; Initialize DMA controllers 0 and 1;Initialize interrupt controller 0 and 1; Initialize EISA extended Regis- ters.Get manufacturing status, reset if set(loop 1-5).
Phoenix&Dell	(05)[Beep]=1-2-2 DMA initialization in-progress or failure.

#### Error Code – 06

	Error Code – 06
AMI	(06)ROM is enabled. Calculating ROM BIOS checksum, and waiting for Keyboard controller input buffer to be free. Calculating ROM BIOS checksum.Video disabled and system timer test begin. Video disabled and system timer counting OK.
AST	(06)Support chipset initialize.
Award	(06)Test memory refresh toggle;RAM must be periodically refreshed in-order to keep the memory from decaying.This function assures that the memory refresh function is working properly.Initialize chips.
Chips & Tech Phoenix&Dell	(06)64K RAM Failed. (06)Initialize system hardware (Beep)=1-1-2-3.DMA page register write/read test in-progress or fail.
	Error Code – 07
AMI	(07)ROM BIOS checksum passed. CMOS shutdown regi- ster test to be done next.ROM BIOS checksum passed, Keyboard controller I/B free. Going to issue the BAT command to keyboard controller. Going to issue the BAT com- mand to keyboard controller.CH-2 of 8254 initialization half way.CH-2 of 8253 test OK
Award	(07)Verifies CMOS's basis R/W functionality. Test CMOS interface and battery status; Verifies CMOS is working correctly, detects bad battery. Setup low memory; Early chip set initialization; Memory presence test; OEM chip set routines; Clear low 64K of memory; Test first 64K memory; clear lower 256K of memory, enable parity checking and test parity in lower 256K; test lower 25 If the BIOS detects error 2C,2E,or 30(base 512K RAM error), it displays 6K memory. Set up stack, beep.Read/write/verify CPU registers.
Chips & Tech	(07)64K RAM failed data test (Base Memory)
	Error Code – 08
ACER AMI	(08)Shutdown 0. (08)CMOS shutdown register test done. CMOS checksum calculation to be done next. BAT command to keyboard controller is issued. Going to verify the BAT
Award	command. Going to verify the BAT command. CH-2 of timer initiali- zation over. CH-2 delta count test OK (08)Setup low memory; Early chip set initialization; Memory presence test; OEM
	chip set routines; Clear low 64K of memory; Test first 64K memory; clear lower 256K of memory, enable parity checking and test parity in lower 256K; test lower 256K memory. Set up stack, beep. Setup interrupt vector table in lower 1K RAM area; Initialize first 120 interrupt vectors with SPURIOUS_INT_HDLR and initialize INT 00h-1Fh according to INT_TBL. Initialize CMOS timer.
Chips & Tech Phoenix&Dell	(08)Interrupt Controller bad. (08)Initialize chipset registers with POST values. [Beep]= 1-3-1 RAM refresh verification in-progress or failure.
AMI	<b>Error Code – 09</b> (09)CMOS checksum calculation is done, CMOS diag byte written. CMOS initialize to begin. Keyboard controller BAT result verified. Keyboard command byte to be written next.(09)Keyboard command byte to be written next. CH-1 of
AST	timer initialization over. CH-1 delta count test OK. (09)Verify BIOS ROM checksum, flush external cache.
Award	(09)Program the configuration register of Cyrix CPU. OEM specific cache
	initialization., Early Čache initialization; Cyrix CPU initialization; cache initialization. Test CMOS RAM checksum; beep; also test extended storage of para-
	meters in the motherboard chipset; if not warm-booting; display the Test CMOS
	RAM checksum message, if bad, or insert key pressed, load defaults if bad. Check BIOS Checksum.
Chips & Tech Phoenix&Dell	<ul> <li>(09)Unexpected interrupt is occurring.</li> <li>(09)Set POST flay.(Beep)=1-1-3-2. 1st 64K RAM test in-progress.</li> <li>Error Code – 0A</li> </ul>
AMI	(0A)CMOS initialization done(if any). Keyboard command byte code is issued.
	Going to write command byte data. Go- ing to write command byte data. CH-0 of timer initializa- tion over. CH-0 delta count test OK
Award	(0A)Initialize the first 32 interrupt vectors. Initialize INTs 33 to 120.Early Power Management initialization. Setup interrupt vector table in lower 1K RAM area; Initialize first 120 interrupt vectors with SPURIOUS_INT_HDLR and initialize INT 00h-1Fh according to INT_TBL. Initialize key- board; Detect type of keyboard controller(optional 8242 or 8248, with Nedadon XOR gate control); Set NUM_LOCK status. Reset keyboard test keyboard controller interface to verify it returned AAH and responded to enable/disable commands,set keyboard buffer,
	enable keyboard and keyboard interrupts for normal use, beep, halt .Initialize Video
Chips & Tech Phoenix&Dell	controller. (0A)Timer cannot interrupt. (0A)Initialize CPU registers. (Beep)=1-1-3-3. Perform BIOS checksum test. 1st

	64K RAM chip or data line failure multi-bit.
AMI	<b>Error Code – 0B</b> CMOS status register initialize done. Keyboard controller command byte is written. Going to issue Pin-23,24 block- ing/ unblocking command. Going to issue
Award	pin-23,24 block- ing/nubolcking command. Refresh started. Parity status cleared (0B)Verify the RTC time is valid or not. Detect bad battery. Read CMOS data into BIOS stack area. Perform PnP initializations. Assign I/O & Memory for PCI devices (PCI BIOS Only). Test CMOS RAM checksum; beep; also test extended storage of parameters in the motherboard chipset; if not warm-booting,display the Test CMOS RAM check- sum message, if bad, or insert key pressed,load defaults if bad. Initialize video interface; Detect CPU clock; Read CMOS location 14b to find out type of video in use; Detect and initialize video adapter. 8254 timer,channel 0 test.
Chips & Tech Phoenix&Dell	(0B)CPU protected mode. (0B)Enable CPU Cable-Check CPU Jumpers. [Beep]=1-3-4 1st 64K RAM odd/even logic failure.
AMI	<b>Error Code – 0C</b> (0C)KB controller I/B free. Going to issue the BAT command to keyboard controller. Pin-3,24 of keyboard controller is blocked/unblocked. NOP command of key- board controller to be issued next. NOP command of key- board controller to
Award	be issued next. System timer started. Refresh & system timer ÓK (0C)Initialization of the BIOS data area(40:00-40:FF). Initialize keyboard; Detect type of keyboard controller (optional 8242 or 8248, with Nedadon XOR gate control); Set NUM_LOCK status. Reset keyboard test keyboard controller interface to verify it returned AAH and responded to enable/disable commands, set keyboard buffer, enable keyboard and keyboard interrupts for normal use,beep,halt.8254 timer,channel 1 test.
Chips & Tech Phoenix&Dell	(0C)DMA register failure.
1.2.0	Error Code – 0D
AMI AST	(0D)BAT command to keyboard controller is issued. Going to verify the BAT command. NOP command processing is done.CMOS shutdown register test to be done next. CMOS shutdown register test to be done next. Refresh link toggling passed. Refresh link toggling passed.
Chips & Tech Award	<ul> <li>(0D)(Beeps)=13 short,8254 timer register.</li> <li>(0D) (Beeps)=14 short, Refresh failure.</li> <li>(0D)Program some of the chipset's value. Measure CPU speed for display. Video initialization including MDA, CGA,EGA/VGA. Initialize video interface; Detect CPU clock; Read CMOS location 14b to find out type of video in use; Detect and initialize video adapter. OEM specific-Initialize motherboard special chipset as required by OEM; initialize cache controller early, when cache is separate from chipset.8254 timer, channel 2 test.</li> <li>(0D)[Beep]=1-4-2 1st 64K RAM parity test in progress or failure.</li> </ul>

A	memory wrap around at 0:0.
Award Compaq	(44) Going to initialize data to check memory re-map at 0:0. (44)Start verify cycle if 128K RAM test.
Phoenix	(44)Initialize BIOS interrupts.(Beep)=2-1-2-1. Verify video configuration. Error Code – 45
ACER AMI	(45)Set up BIOS RAM . (45)Data initialized. Going to check for memory wrap around at 0:0 and the total
Award	system memory size. (45)Detect & Initialize math CoProcessor; Initialize math CoProcessor.
Compaq	(45)Check for parity errors.
Phoenix	(45)POST device initialization. Error Code – 46
ACER	(46)Test controller and cache memory.
AMI	(46) Memory wrap around test done. Memory size calculation over, writing patterns
Award	to test memory. (46)display the setup message(to press Ctrl-Alt-Esc to enter setup), and enable
	setup.
Compaq Phoenix	(46)No RAM errors. (46)Check ROM copying notice.(Beep)=2-1-2-3. Initialize video system.
AMI	<b>Error Code – 47</b> (47)Pattern to be tested written in extended memory,640K memory.
Award	(47)Set system speed for boot.
Compaq	(47)Got a RAM error.
Phoenix	(47)Initialize manager for PCI Options ROMs.(Beep)=2-1- 2-4. Error Code – 48
ACER	(48)Memory test.
AMI	(48)Patterns written in base memory. Going to find out amount of memory below 1M memory.
Phoenix	(48)Check Video configuration against CMOS.(Beep)=2- 1-3-1. Test for
	unexpected interrupts. Error Code – 49
AMI	(49)Memory below 1M found and verified. Going to find out amount of memory
Dh e en in	above 1M memory.
Phoenix	(49)Initialize PCI bus and devices.(Beep)=2-1-3-2. Error Code – 4A
AMI	(4A)Amount of memory above 1M found and verified. Going for BIOS ROM data
Phoenix	area check. (4A)Initialize all video adapters in system.(Beep)=2-1-3-3. Start 2nd protected
	mode test.
AMI	<b>Error Code – 4B</b> (4B) Amount of memory above 1M found and verified. Check for soft reset and
	going to clear memory below 1M for reset. (If power on, go to check
	point#4Eh).BIOS ROM data area check over. Going to check <esc> and to clear memory below 1M for soft reset.</esc>
Phoenix	(4B)Quiet-Boot start(optional).
ACED	(4C) #2 shutdarm
ACER AMI	(4C)#3 shutdown. (4C)Memory below 1M cleared.(SOFT RESET)Going to clear memory above 1M.
Phoenix	(4C)Shadow video BIOS ROM.(Beep)=2-1-4-1.Perform LDT instructions test.
AMI	<b>Error Code – 4D</b> (4D)Memory above 1M cleared. (SOFT RESET)Going to save the memory
	size.(GOTO check point#52h)
AMI	Error Code – 4E (4E)Memory test started.(NO SOFT RESET)About to display the first 64K memory
	test.
Award	(4E)If there is any error, show all the error messages on the screen & wait for user to press <f1>.Manufacturing POST loop or display messages; Reboot if</f1>
	manufacturing POST loop pin is set. Otherwise display any messages and enter
Phoenix	setup. (4E)Display convine notice (Deen)-2.1.4.2. Perform TD instruction test
Phoenix	(4E)Display copying notice.(Beep)=2-1-4-3. Perform TR instruction test. Error Code – 4F
AMI	(4F)Memory size display started. This will be updated during memory test. Going
Award	for sequential and random memory test. Processor in real mode after shutdown. (4F)If password is needed, ask for password. Clear the Energy Star logo(Green
	BIOS only).Security check; Ask password security.
ACER	(50)#2 shutdown.
ACER AMI	(50)Memory testing/initialization below 1M complete. Going to adjust displayed
	memory size for relocation /shadow. DMA page register test complete.

AST Award	(50)Protected mode. (50)Write all the CMOS values currently in the BIOS stack areas back into the CMOS. Write CMOS; Write all CMOS values back to RAM and clear screen.
Compaq	(50)Check for dual freq in CMOS.
Chips & Tech Phoenix	(50)Display CPU type and speed.(Beep)=2-2-1-1.(50)Per- form LSL instruction test.[Beep]=none Custom chip set or custom platform.
AMI	Error Code – 51 (51)Memory size display adjusted due to relocation/shadow. Memory test above 1M
AST	to follow. DMA unit-1 base register test about to start. (51)Protected mode.
Award Compaq Chips & Tech	(51)Pre-boot enable; Enable parity checker; Enable NMI, Enable cache before boot. (51)Check CMOS VDU configuration.
Phoenix	(51)Initialize EISA board. Error Code – 52
AMI	(52)Memory testing/initialization below 1M complete. Going to save memory size information. Going to prepare to go back to real mode. DMA unit-1 channel OK,
Award	about to begin CH-2. (52)Initialize all ISA ROMs. Later PCI initializations(PCI BIOS only).PnP initializations(PnP BIOS only).Program shadow RAM according to setup settings. Program parity according to setup setting. Power Management initialization. Initialize option ROMs; initialize any option ROMs present from C8000h to EFFFFh.
Compaq Chips & Tech	(52)Start VDU search. (52)DMA controller initialize.
Phoenix	(52)Test keyboard.(Beep)=2-2-1-3.(52)Perform LAR instruction test.
AMI	(53)Memory size information is saved. CPU registers are saved. Going to enter in
Award	real mode. DMA CH-2 base register test OK. (53)If it is not a PnP BIOS, initialize serial & parallel ports. Initialize time value in
Compaq Chips & Tech	BIOS data area. Initialize time value; Initialize time value in 40h BIOS data area. (53)Vector to VDU option ROMs. (53)Initialize interrupt controller.
	Error Code – 54
ACED	
ACER AMI	(54)#7 shutdown. (54)Shutdown successful, CPU in real mode. Going to re- store registers saved during preparation for shutdown. About to check F/F latch for unit-1 and unit-2.
