48-749 Special Topics
Parametric Modeling with BIM

Fall Semester 2010 • 6-12 units • 1.30-4.20 • CFA 213

Carnegie Mellon University
School of Architecture

Instructor: Ramesh Krishnamurti
ramesh@cmu.edu

Co-Instructor: Tsung-Hsien Wang
tsunghsw@andrew.cmu.edu

Co-Instructor: Tajin Biswas
tbiswas@andrew.cmu.edu

Lecture 1

- Course introduction
- What is BIM ?
- How we use it in this course
- Overview of Revit 2011

Course Introduction

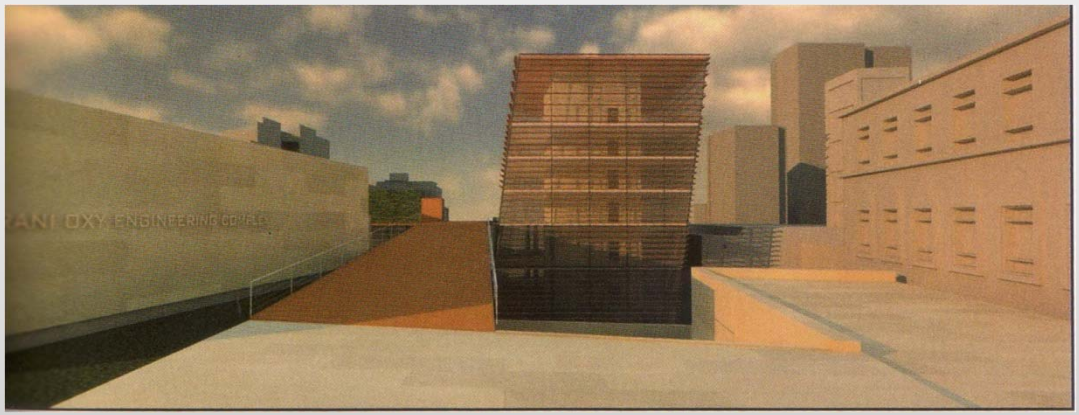
- This course is to prepare students for modeling architectural geometry through development of parametric schemes for architecture applications.
- For students with no programming background, this course is a half-semester course, which supplies the basis of understanding parametric geometric construction mechanisms.
- For all students, the full semester course is regarded as the venue for pursuing individual projects relating to advanced geometric constructions with parametric computation.
- The course will use Revit Architecture 2011, Revit API and .NET framework.

Course credit (6-12)

- All students are initially evaluated for 6 units (half-semester course). Students who score *at least* B- at mid-semester may proceed to the full semester course for credit.
- The project and any accompanying preparatory assignments will be worth an additional 3 units.
- Students may add to their skill and degree of difficulty by completing a Revit-based advanced parametric modeling assignment for an additional 3 units.
  This is required of all Computational Design students.

Course Motivation

- BIM tools, such as Revit, offer a parametric 3D model which can generate information early in the design process (quantity take–offs, solar studies, day-lighting simulation, fabrication possibilities)
- With more parametric control over designed components designers can explore variations, analyze design artifacts, customize components for evaluation and be more efficient.



Course schedule

Date	Class	Assignment
Week 1	Introduction to building information modeling	
	Introduction to Revit Architecture 2011	
Week 2	BIM capabilities	MA 1
	Construction of a simple project	
Week 3	BIM as used in the AECM domain	
	Revit (Lighting Studies, material Takeoff)	MA 1 due/MA 2
Week 4	Type of families	
	Revit Modeling 3d Families I	
Week 5	Categories and Parameters	
	Revit Modeling 3d Families II	MA 2 due/MA 3
Week 6	Encoding Design Rules	
	Revit Modeling 3d Families III	
Week 7	Prototyping	
	Revit Modeling 3d Families IV	MA 3 due

Course schedule

Date	Class	Assignment
Week 8	Introduction to .NET C# I	Project
Week 9	Introduction to .NET C# II	Prog. Assignment1
	Windows Form applications	
Week 10	Introduction to REVIT 2011 API I	Project proposal
Week 11	Introduction to REVIT 2011 API II	Prog. Assignment 1Due Prog. Assignment II
Week 12	Database and SQL,	
	LEED credit evaluations I	
Week 13	Thanksgiving Holiday (No Class)	
Week 14	Review/Working session	
Week 15	Final Presentation	Project Due Prog. Assignment II due

What is BIM ?

From Information Science Definition

- As a noun – Building Information Model

  "An *instance* of a *populated* data model of buildings that contains multi-disciplinary data specific to a particular building which they describe *unambiguously*"

- As a verb – Building Information Modeling

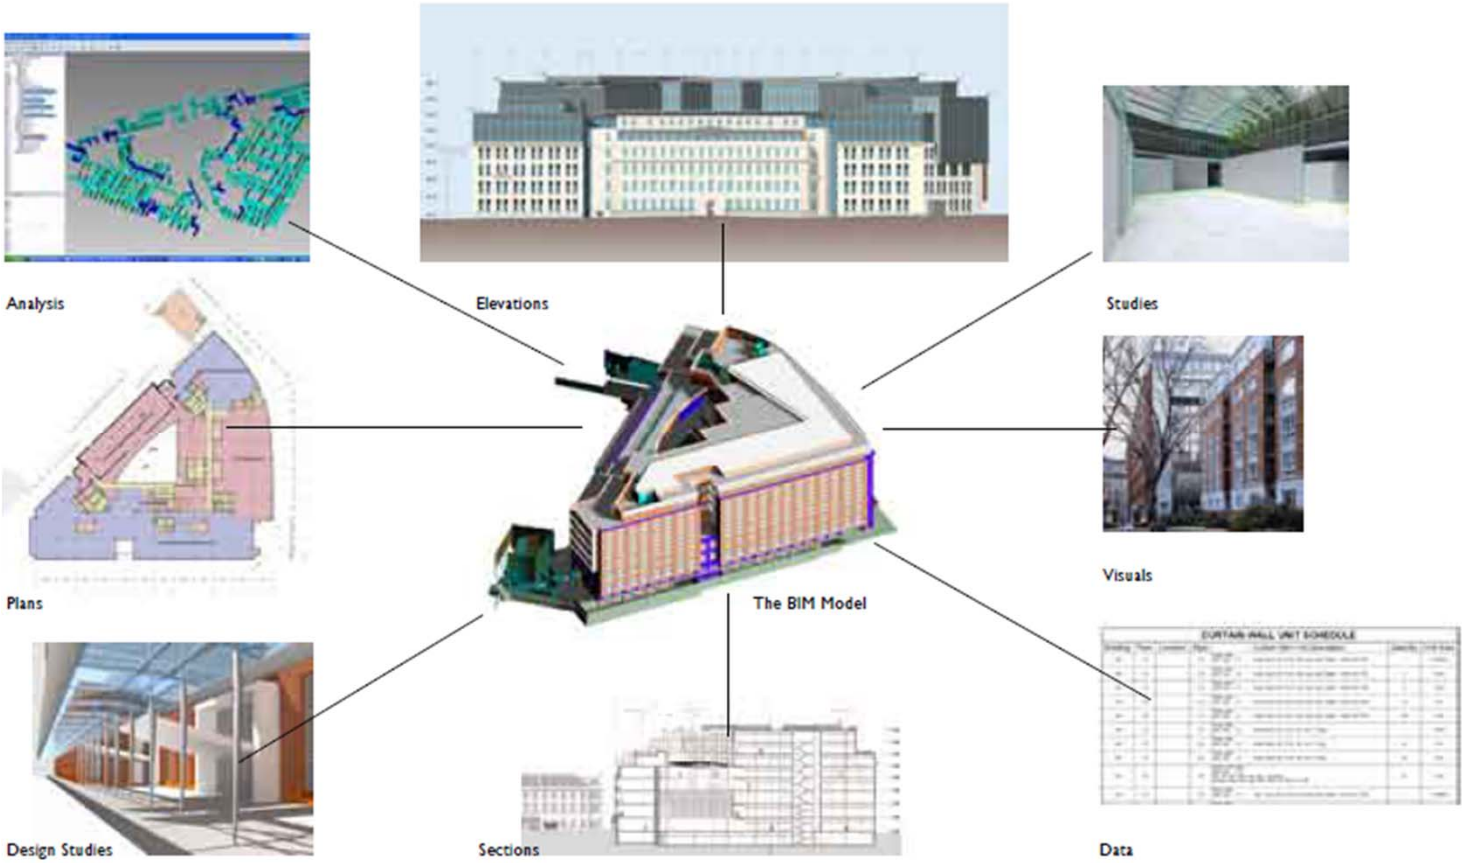
  "The act or process of creating a Building Information model"

What is BIM ?

- The acronym BIM (Building Information Model(ing)) was coined in the early 2002 (attributed to Phil Bernstein and Jerry Laserin though the concept predates this by at least 15 years)

- BIM relies on the creation and collection of interrelated computable information about a building project

What is BIM ?



BIM processes revolve around virtual models that make it possible to share information through out the building industry

- http://bim.arch.gatech.edu/data/reference/hok.pdf

What is BIM?

- These models are embedded with data, which, when shared among design team members, can reduce errors and facilitate an integrated process.

- The federal government has predicted savings of $15.8 billion annually from an integrated process by using BIM.
  (BIG BIM little bim-Finith Jernigan)

What is BIM?

- BIM is an information based system that builds long term value and advances innovation
  - It can improve how projects are designed and built
  - It improves the environment and builds economic value
- BIM can be looked at in this course as "Beyond Information Models" to understand the nature of the concept
- For clarity we will use bim to represent applications– Archicad, Microstation/GC and Revit bim tools

What BIM is not

- BIM is neither a single building model nor a single database

  (series of interconnected models and databases)

- BIM is neither pertect nor a panacea

What BIM is not

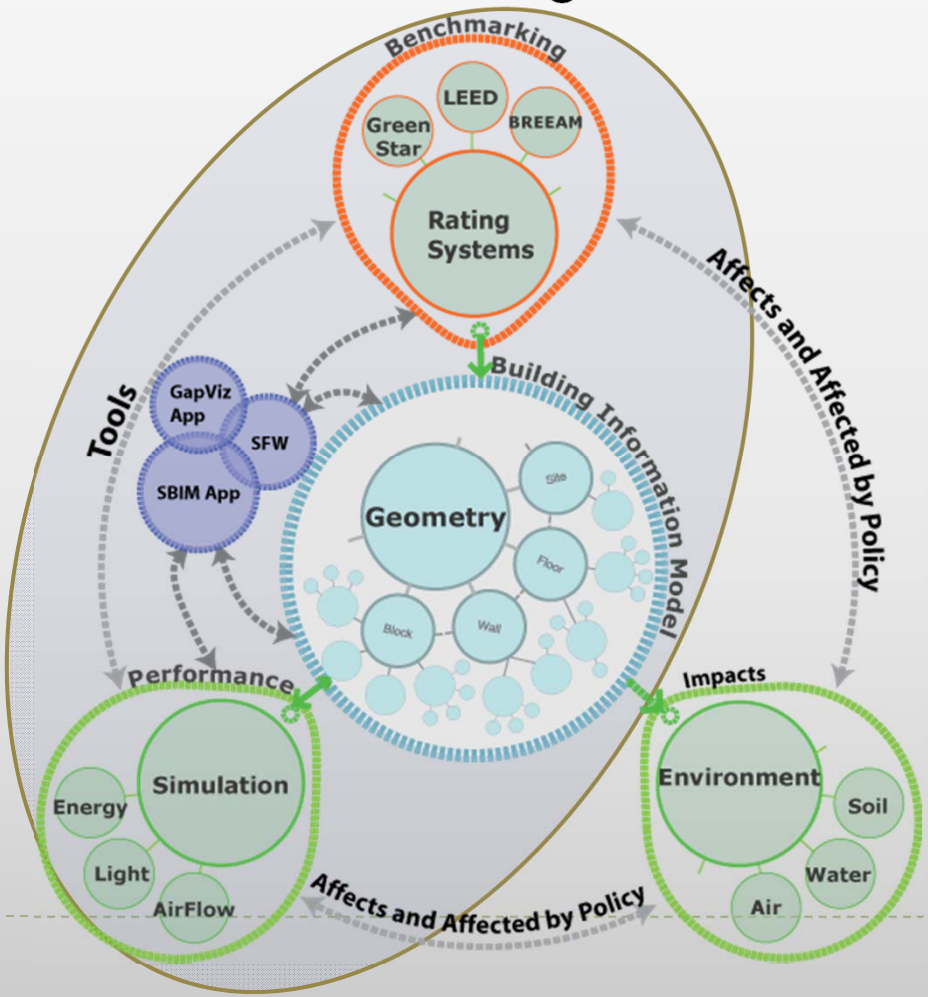
- BIM does not have to be only 3D.
- Example : A spread sheet can be a BIM

- BIM is not complete

- BIM is not a software application–
  (eg, Revit, ArchiCAD or Microstation/GC etc)

How BIM is used pragmatically

- As a distributed relational parametric database
- *So **where** does the knowledge manifest it**self**?*



How BIM is used in this course

- Focus is on the power of bim tools primarily but not limited to evaluate facets of sustainable building design
- Using information from a BIM we are able to count, sort and calculate different requirements set by sustainable building rating systems
  - Material resources
    - Recycled material content
  - Water resources
    - Water usage and savings
  - Energy use
    - Energy use reduction by optimizing façade/envelope of building

How we have used BIM

- Sustainable building rating systems are defined as tools which examine the performance or expected performance of a 'whole building' and translate that examination into an overall assessment that allows for comparison against other buildings
  - LEED (Leadership in Energy and Environmental Design) – USGBC
  - BREEAM (Building Research Establishment's Environmental Assessment Method) – UK
  - CASEBEE (Comprehensive Assessment System for Building Environmental Efficiency) – Japan

Overview of rating systems

General Assessment Area	LEED 3.0	Green Star	BREEAM
Management		Management	Management
Energy & Atmosphere	Energy	Energy	Energy
Emissions		Emissions	Pollution
Sustainable Sites	Sustainable sites	Land Use and Ecology	Land Use and Ecology
		Transportation	Transportation
Water Efficiency	Water Efficiency	Water	Water
Indoor Air Quality	Indoor Air Quality	Indoor Environmental Quality	Health and Well Being
Quality of Service			
Materials and Resources	Materials and Resources	Materials	Materials
Innovations	Innovations	Innovation	
Culture and Heritage

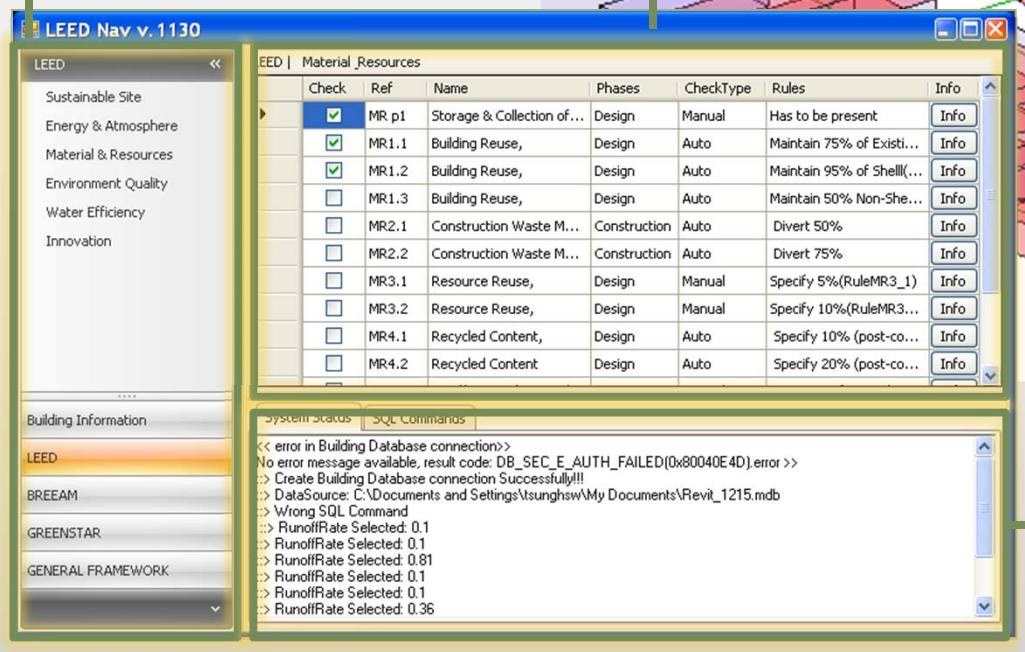
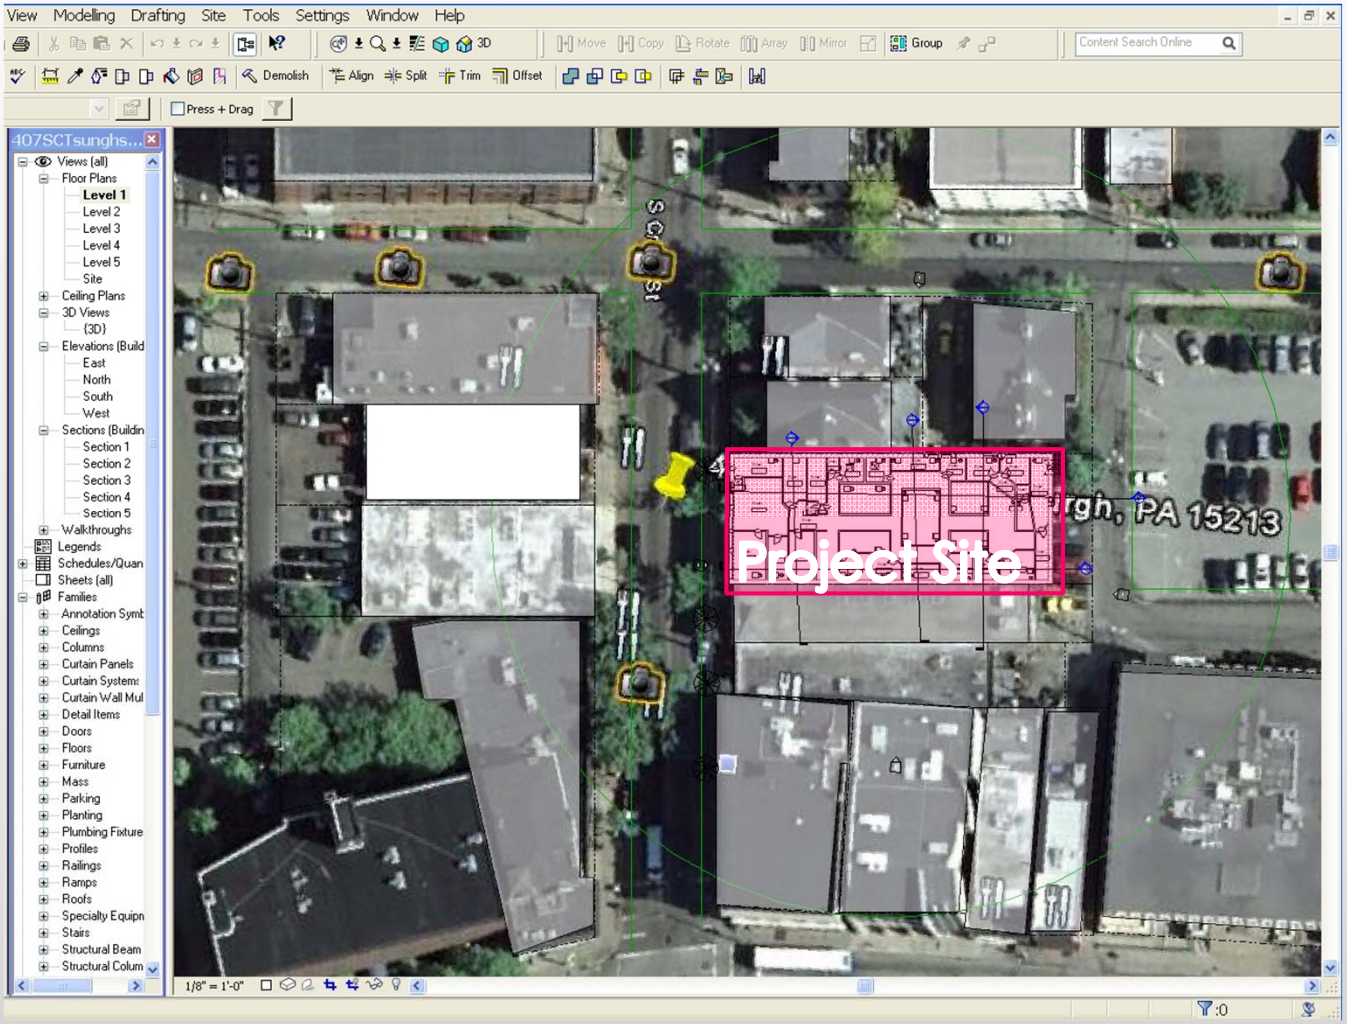
Navigation Column



Status Window

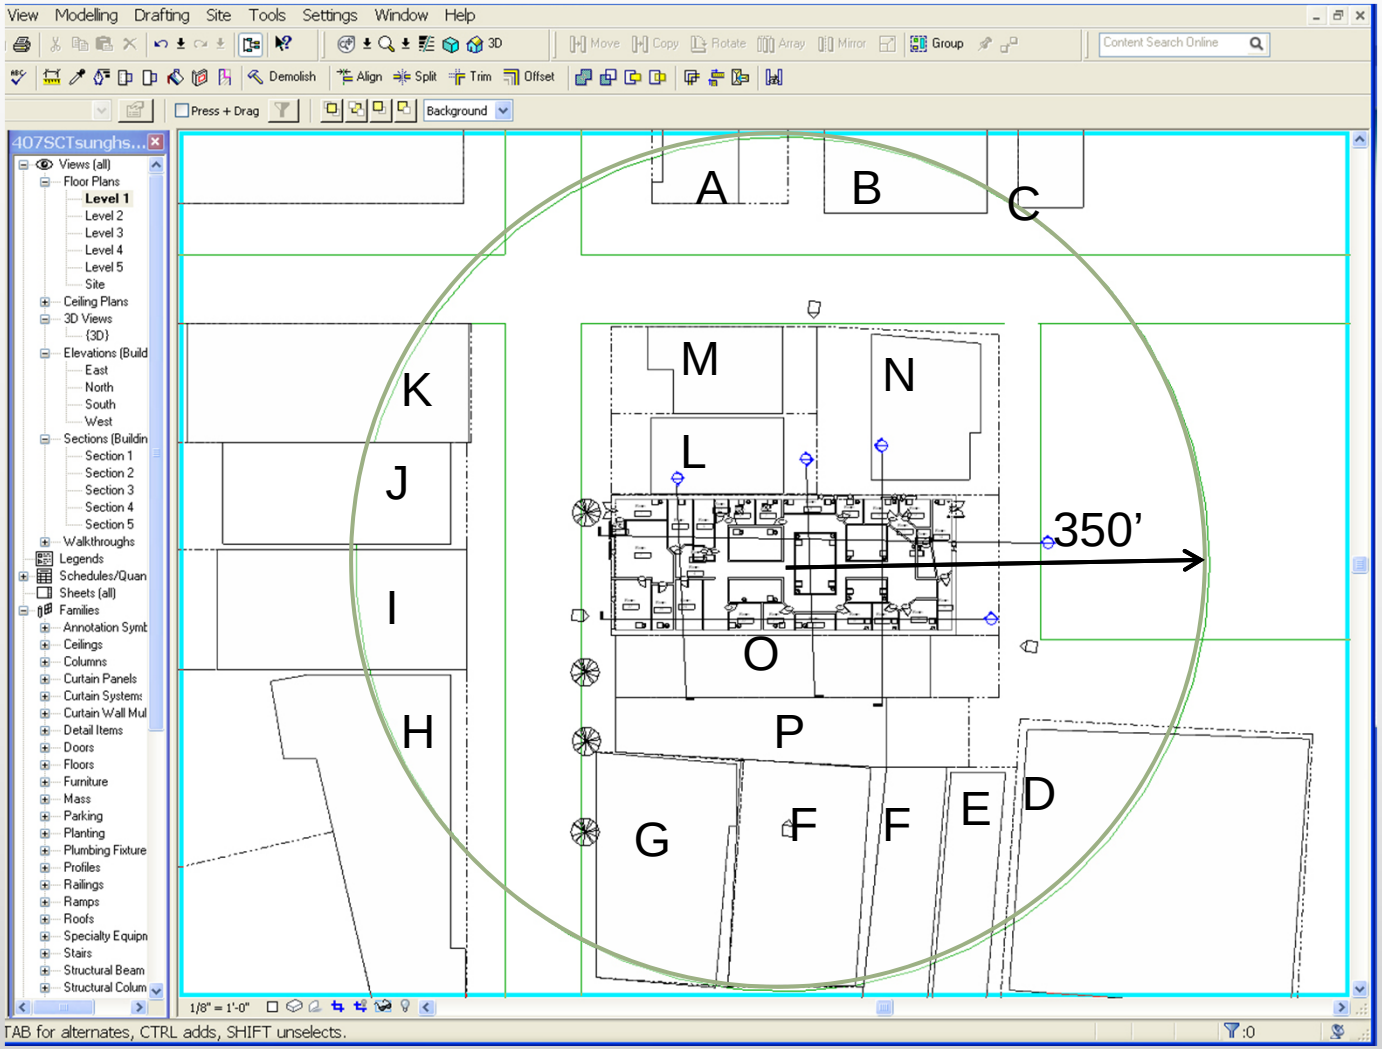
Evaluation example- calculating LEED SS 2

(site density)

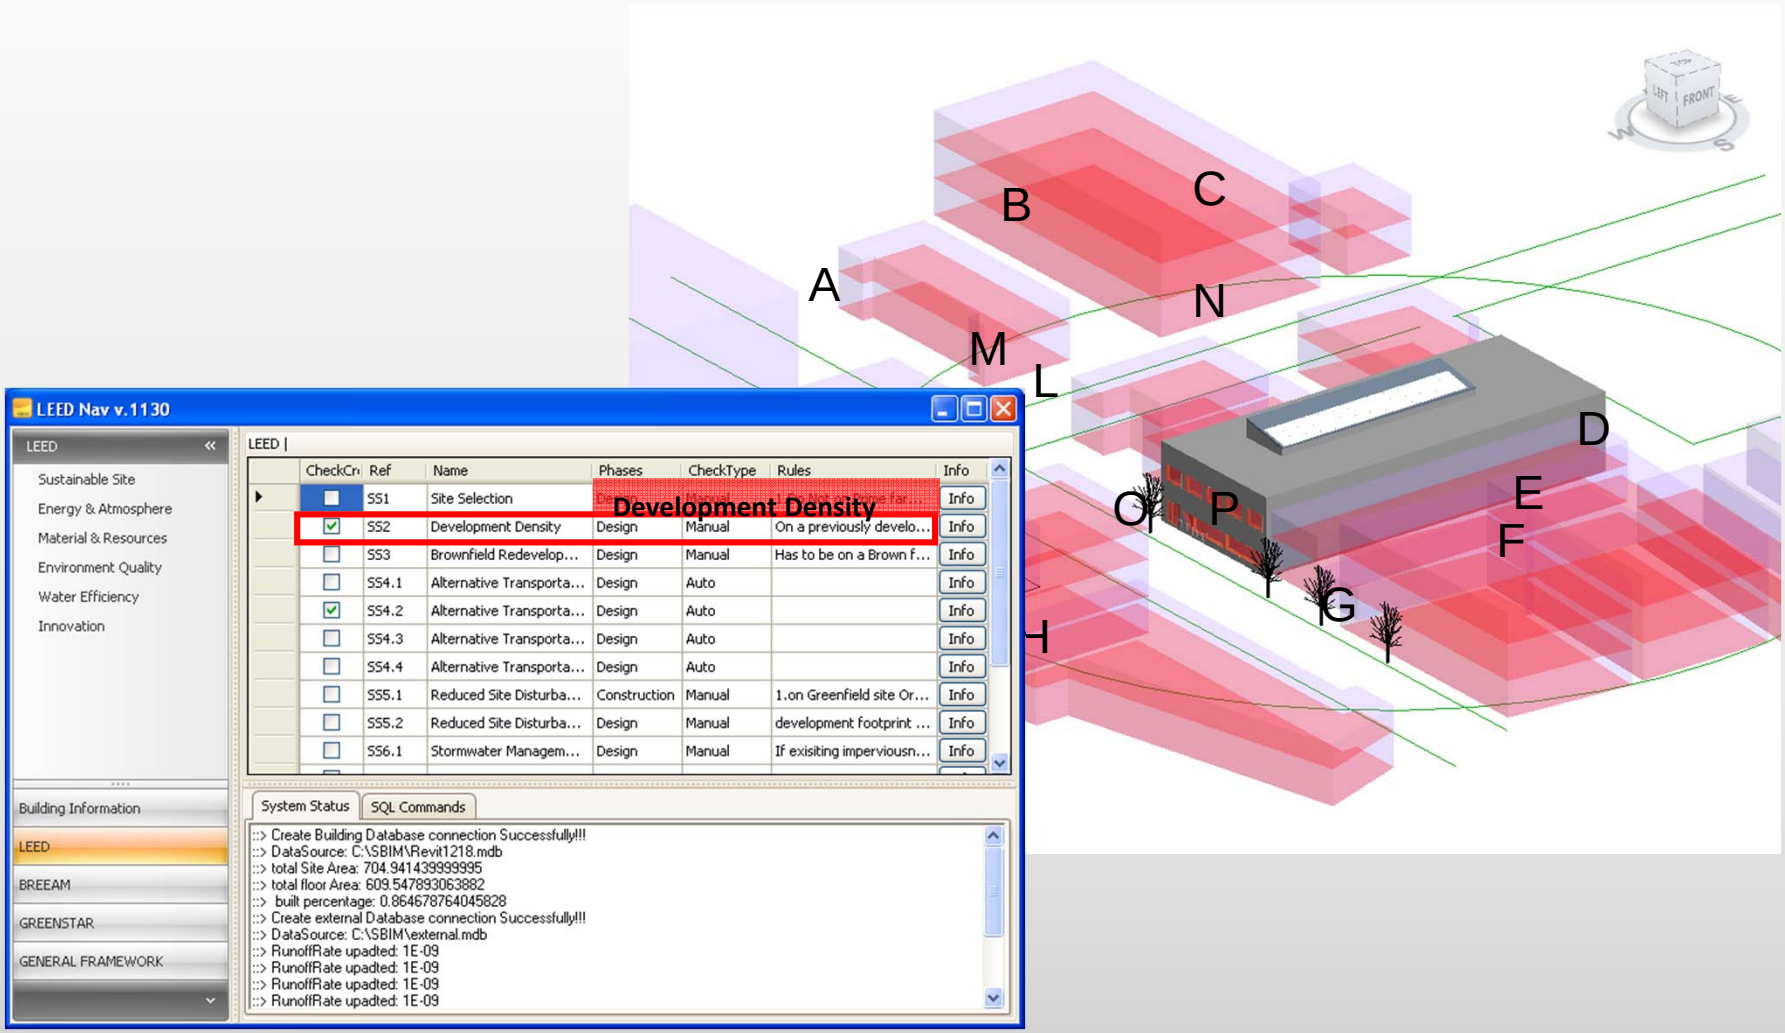


Evaluation example- calculating LEED SS 2

(site density)



Ongoing Evaluations- calculating LEED SS 2 (creating mass model for site density)



Revit as a bim software

- Creates a 3D 'parametric' model which produces an abstraction of plans, elevations, sections and schedules using databases.
- Propagates and manages changes throughout these databases so that a change to any part of the database is reflected in all other associated parts of the database
- Captures and preserves information for collaboration and reuse by additional industry-specific applications

Revit as a bim software

- Bidirectional Associatively
- All views (eg, plan, section, schedule) use the same database
- No updates needed (automatic)
- Parametric Relationships
  - Software manages and coordinates changes

    Example:
    You have equally spaced windows across an elevation. Length of elevation changes. The spacing between the windows changes but the relationship of equal spacing is maintained

Revit vs. AutoCAD

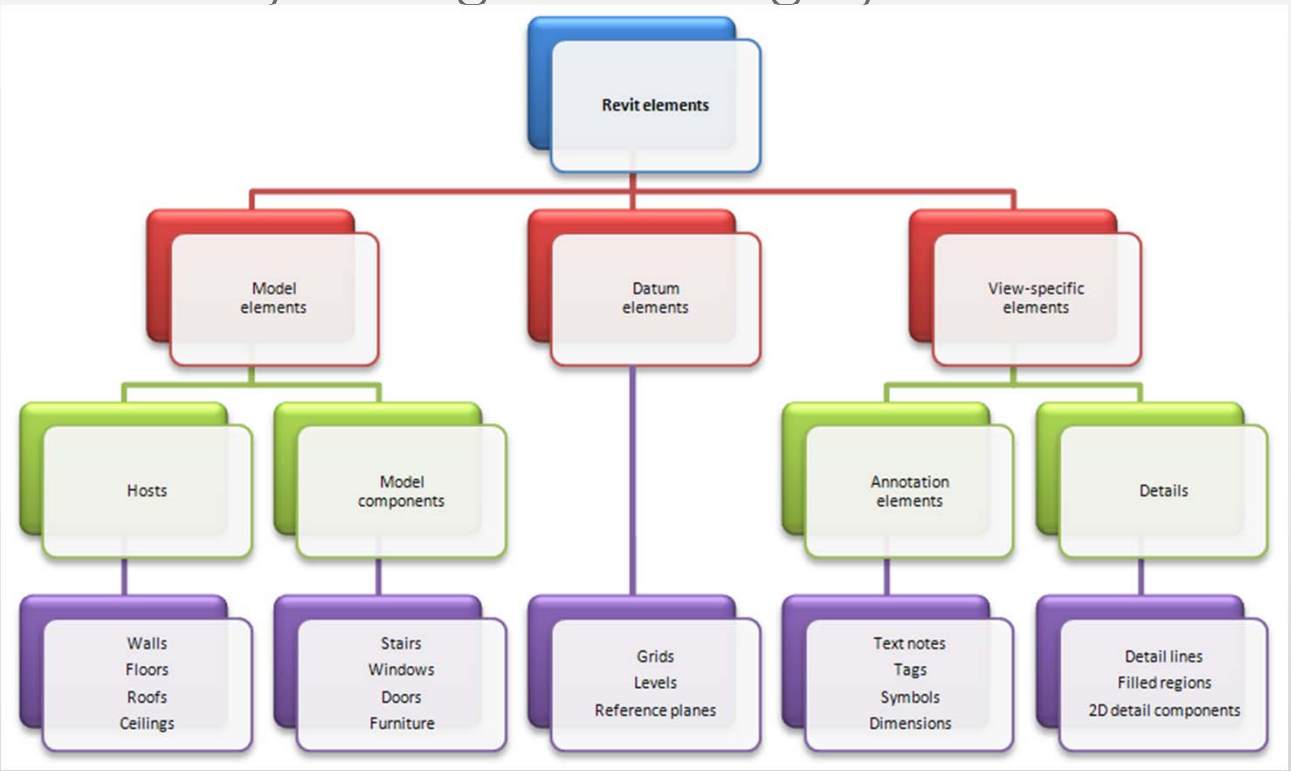
- Revit is a true architectural model (not just geometry)
- Revit is parametric
- Revit uses “families” not blocks
  (eg, doors, windows)
- Revit uses alignment instead of osnaps
- Revit has multiple design views
  (plan, elevation, perspective, section)

Revit vs. AutoCAD

- No command line or layers in Revit
  - Visibility controlled by categories
- Revit uses single file, multiple users projects
- Revit imports/exports AutoCAD file type (.DXF and .DWG)

Revit Fundamentals

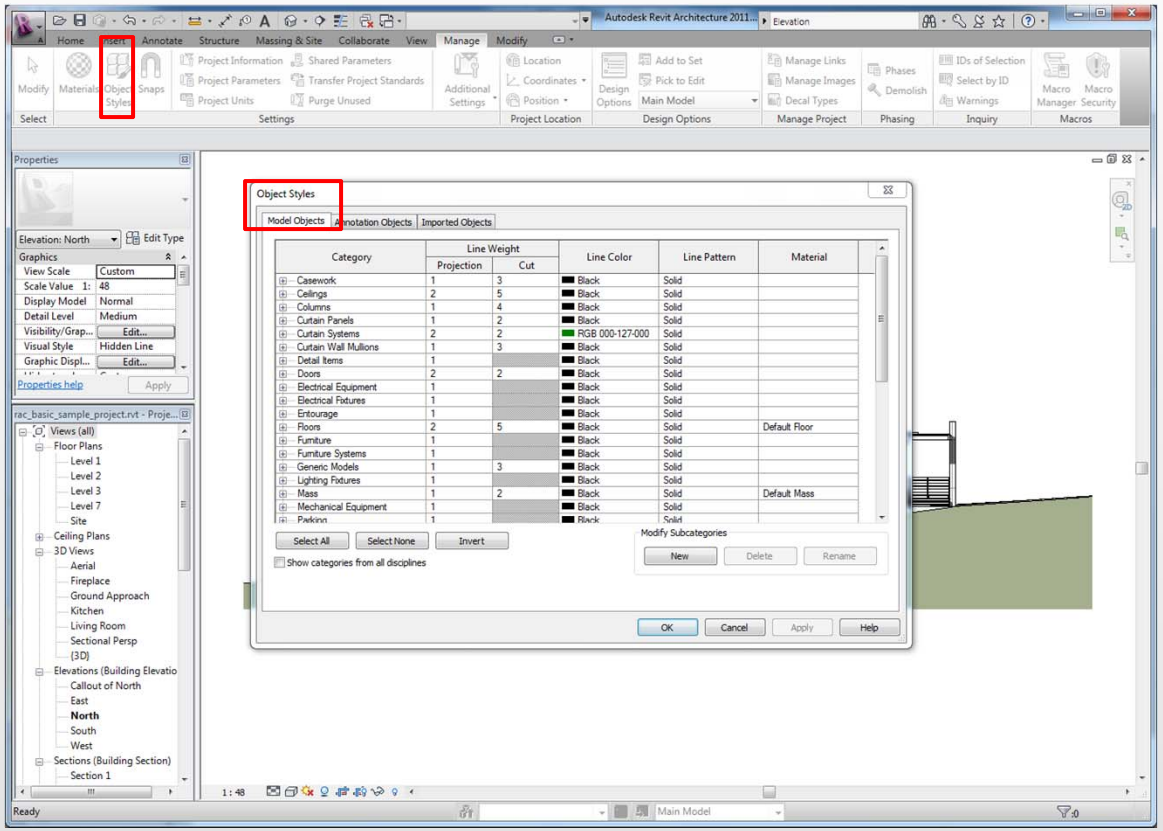
- Revit 'Parametric' Elements
  - Every Element in Revit is considered a family
  - Each family belongs to a category



(2D/3D)

(2D/3D)

Revit Fundamentals- Model



Manage> Object Styles

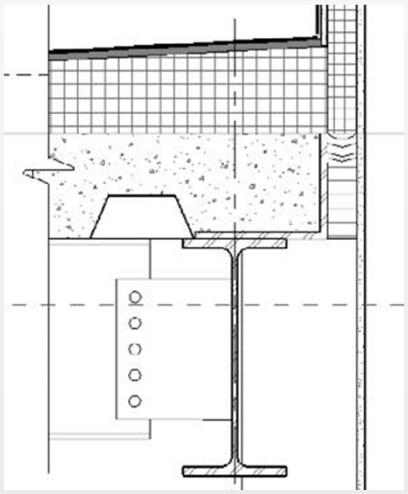
Model categories include elements like walls, floors, roofs etc.

Model elements appear by default in all view- plan, elevations, section and 3D views

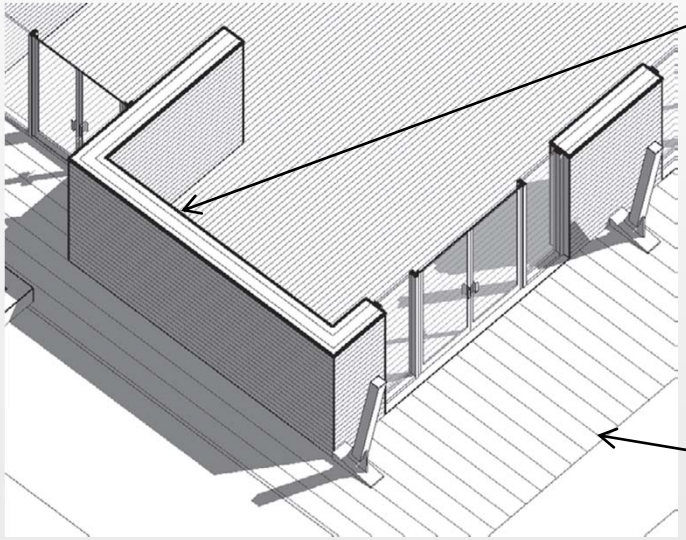
Detailed components only appear in views that they are placed.

Projection view shows elements where they have not been cut

Revit Fundamentals- Model

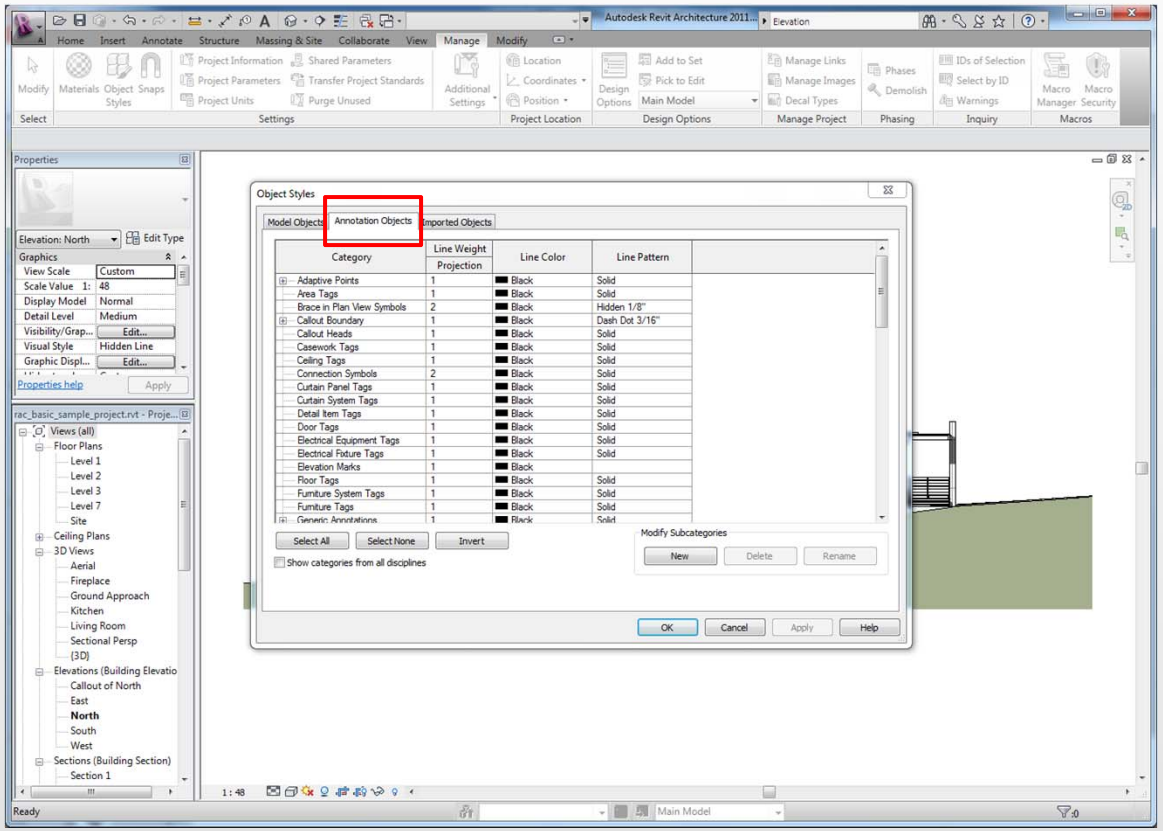


Detailed components only appear in views that they are placed.



Projection view shows elements where they have not been cut

Revit Fundamentals- Annotation



Annotation categories include annotations, symbols and descriptive data

Examples- dimensions, tags, callouts

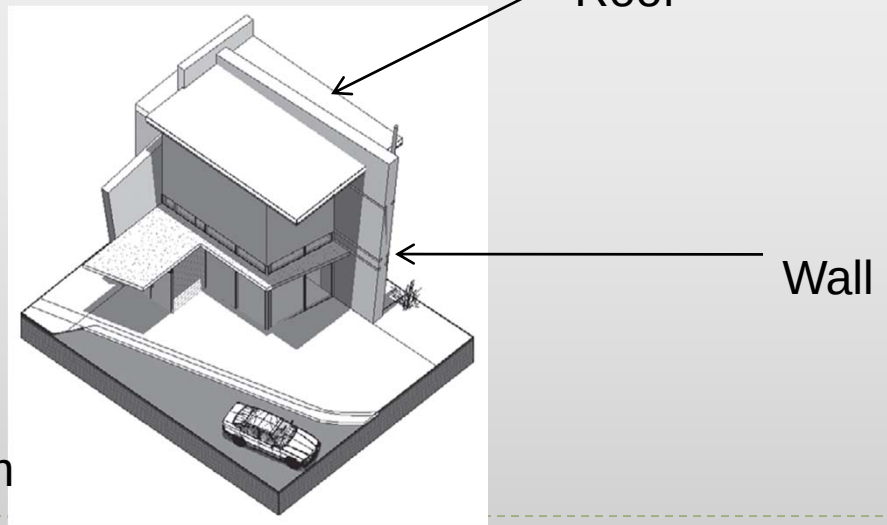
Annotations such as grids, sections, levels are 2D graphics but have 3D characteristics as they appear in other views

Revit Fundamentals- Parametric element

- A **parametric element** is something which can change size, material and graphic look but is still the same fundamental element.
- Most elements in Revit allow for the creation of variations of a base type.
  - Example each type of door typically represents a variation in size, material, color, but is derived from the same **family**
- **Type** parameters affect all instances in the same family
- **Instant** parameters affect only the selected instance

Revit Families

- System Families
- Component Families
- In-Place Families
- Difference lies in their creation methods, in what context they are created and the types of parameters available

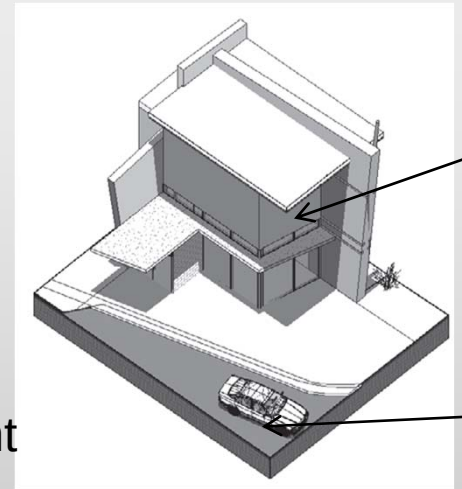


Revit Families- System Families

- They are made of limited categories–
  walls, roofs, floors, ceilings, stairs, railings, mechanical equipments and topo surfaces
- They have different creation methods:
  - Walls – draw/place a wall
  - Floor/Roof – has to be in *Sketch Mode* then it generates a 3D model
  - Floors and railings more detail in *Sketch Mode* that has additional features that floors do not have

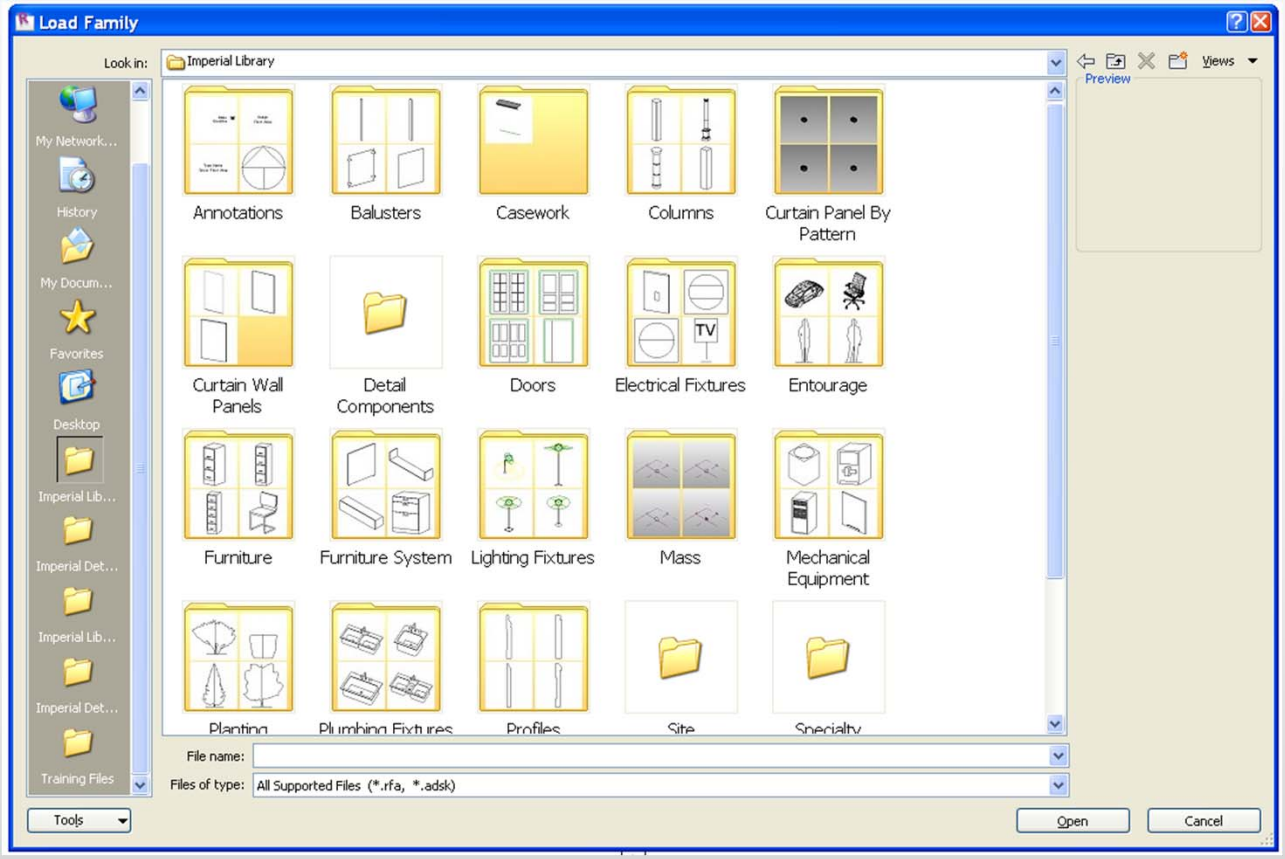
Revit Families- Component Families

- Components or standard families are created outside the project environment using the family editor.
  These are stored in an external library which can be loaded into the project.
- Each component belongs to a specific Revit category.
- They have their own extension .rfa



Revit Families- Component Families

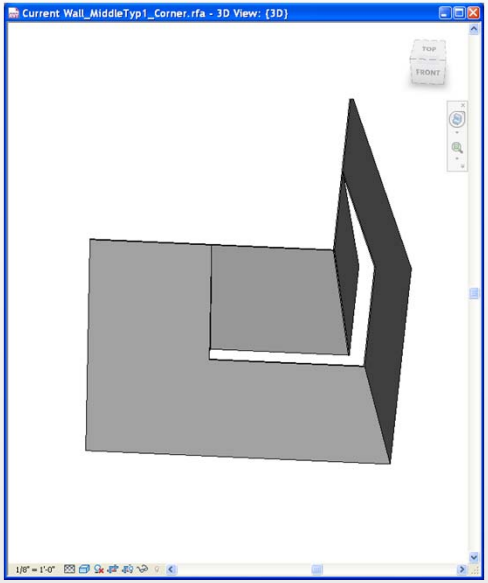
- Go to insert tab > Choose Load Family



Revit Families- In Place Families

- In place families are custom elements that are specific to a project and the conditions of the project.
- The model grays out and becomes in-selectable when such families are made.
  - Example, a non vertical wall shape or skewed mullion
- These can be copied from project to project
- These do not interface well with energy modeling, day lighting tools or direct-to-fabrication .

Family Creations & Manipulations- component



Wall Family _ Corner

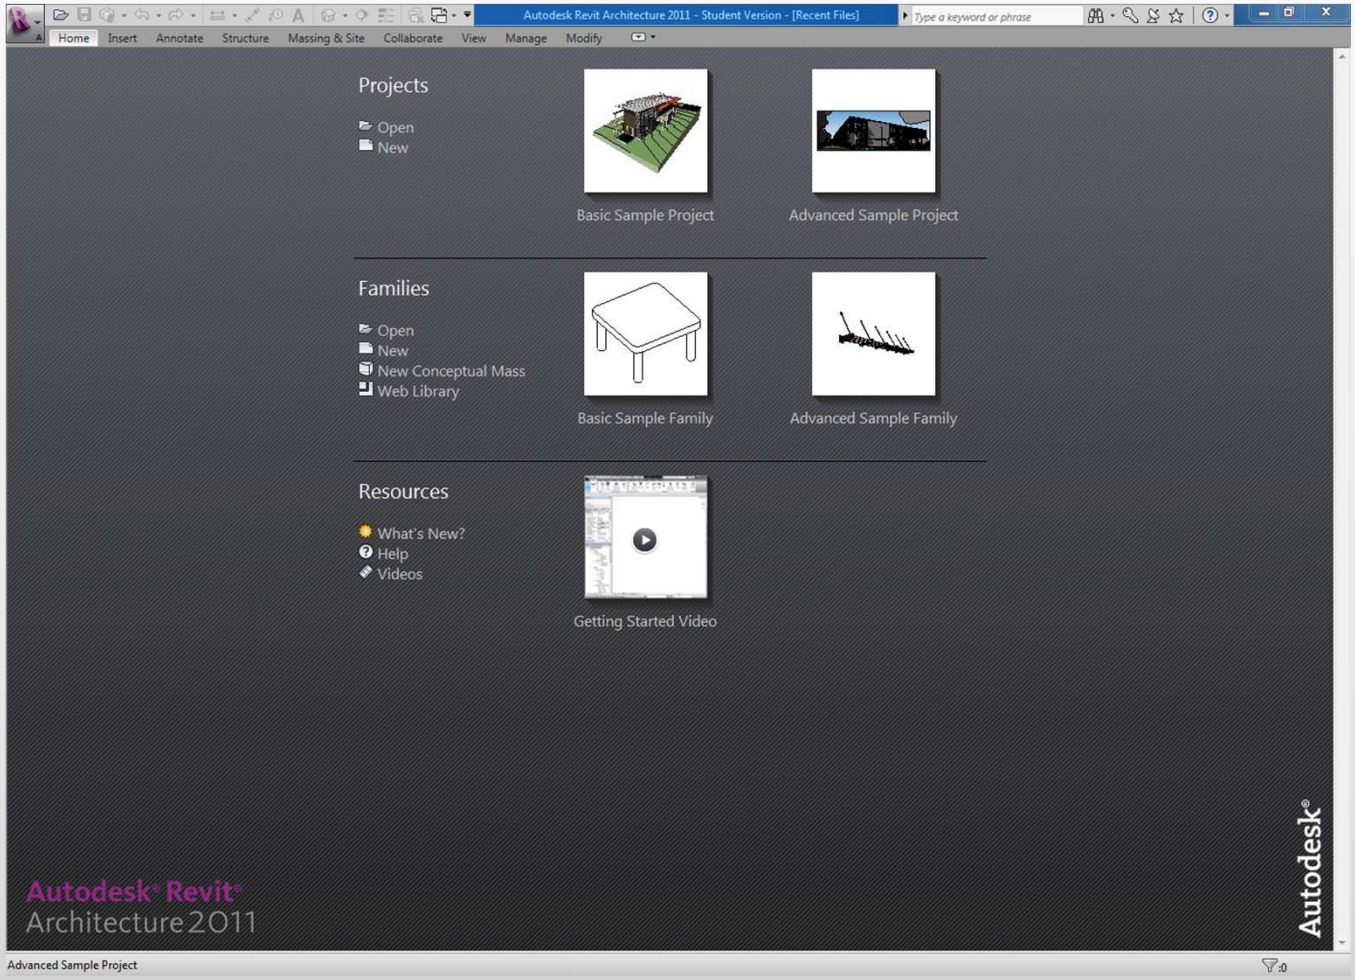
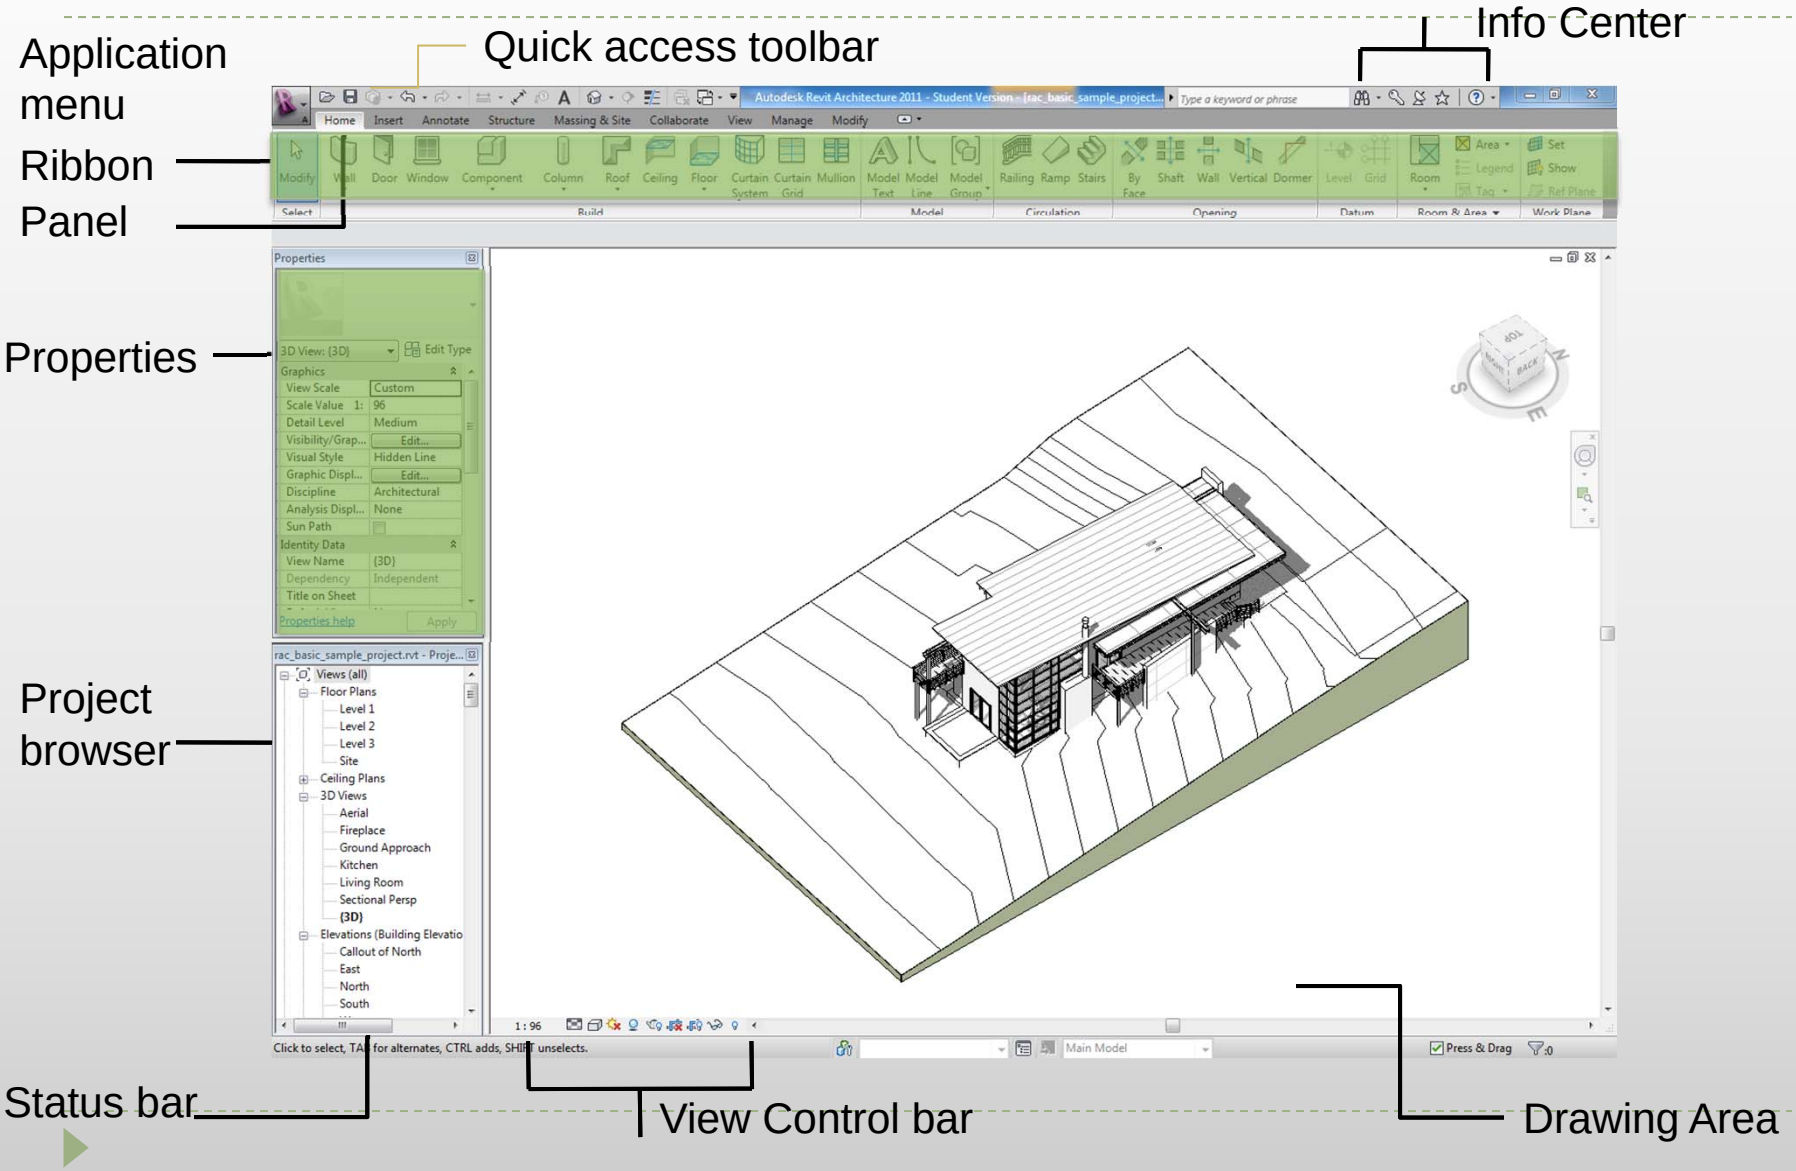
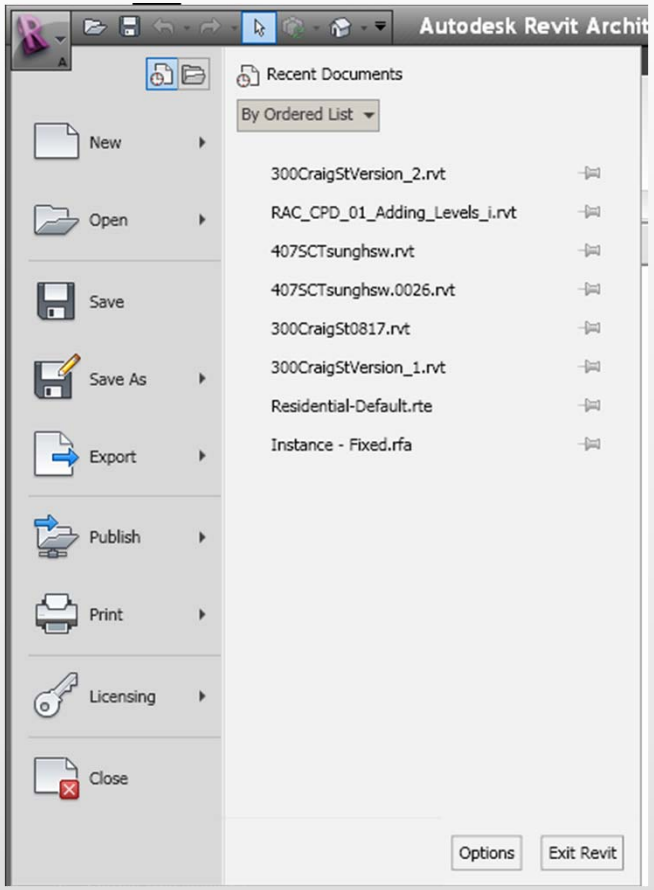
Revit 2011 Interface Overview



Revit 2011 Interface Overview

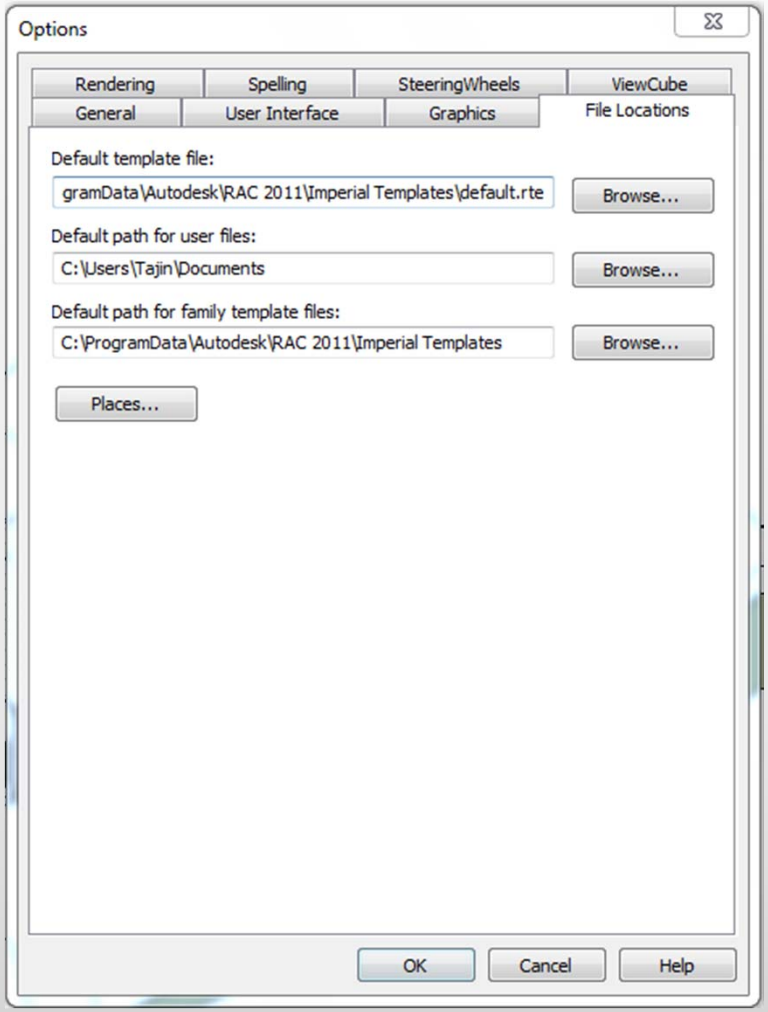


Revit 2011 Interface, Application menu



- The big purple R on top left
- It allows to open and create new/ existing projects/families
- Allows to save and export in various formats
  - RVT = Revit Projects
  - RTE= Revit Templates
  - RFA = RevitFamily

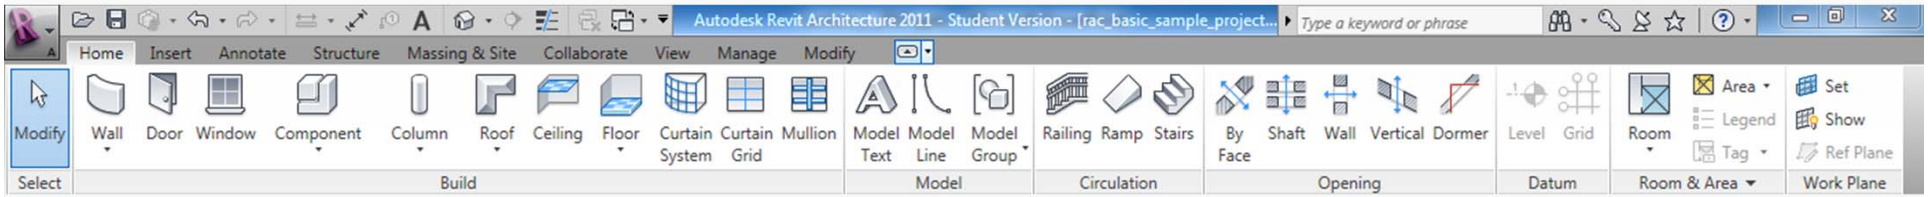
Revit 2011 Interface, Application menu



Option allows the following settings

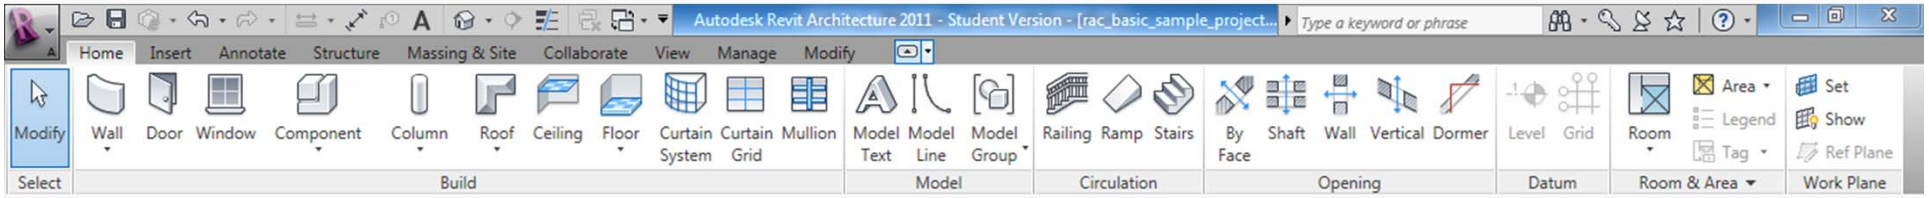
- File location
- Settings relevant to steering wheels
- The view cube
- Spelling
- Macro
- General settings-such as saving time intervals

Revit 2011 Interface, Ribbon

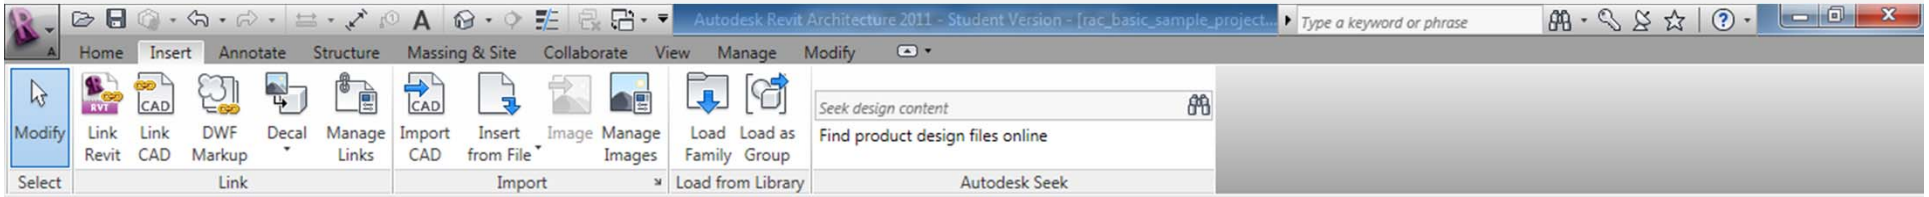


- The ribbon is organized in tabs and panels
- Nine Tabs
  - Home
  - Insert
  - Annotate
  - Structure (this is new in 2011)
  - Massing and Site
  - Collaborate
  - View
  - Manage
  - Modify

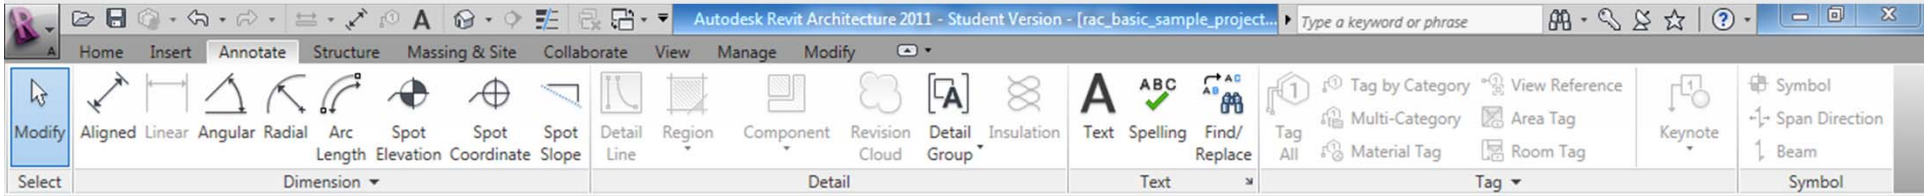
Revit 2011 Interface, Ribbon



Home- contains all tools to create 3D elements



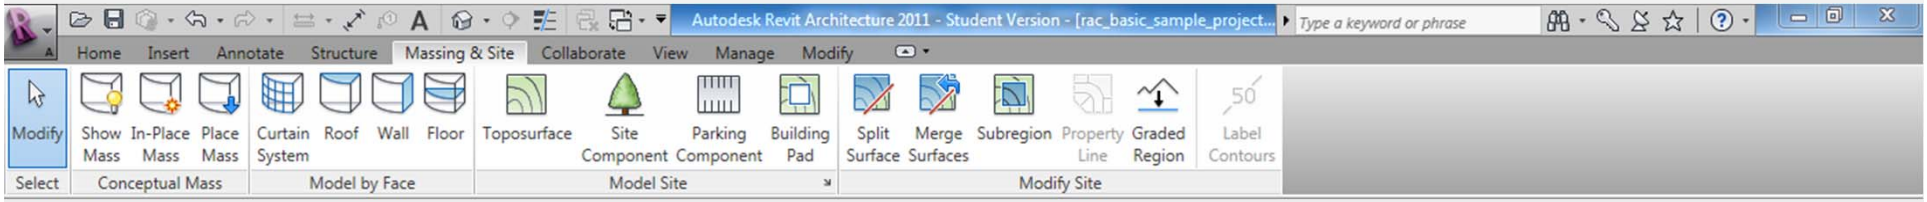
Insert – imports and manages CAD files and Raster images



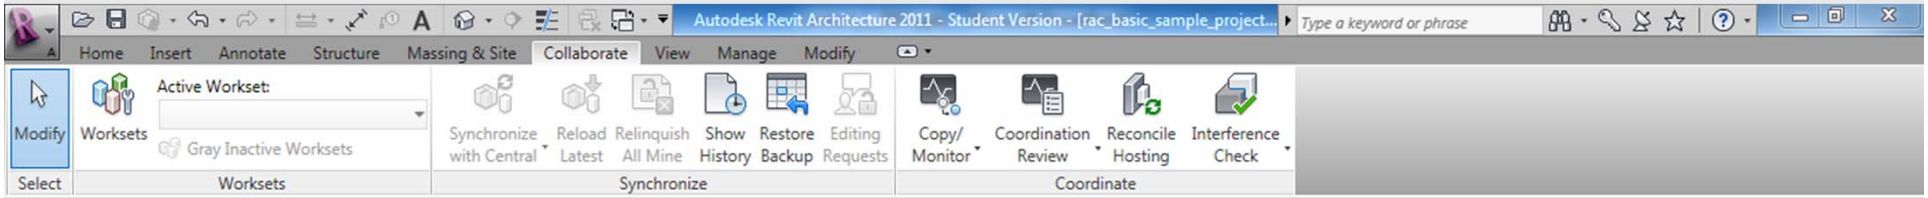
Annotate – Contains all tools for adding 2D elements to describe building model in a project

Revit 2011 Interface, Ribbon

Structure – Tools that deal with structural elements and their details

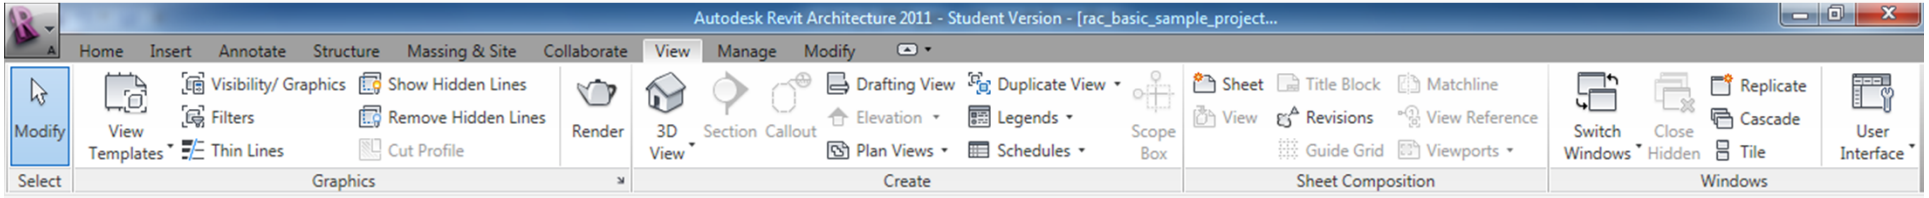


Massing and Site – creating and modifying conceptual mass models

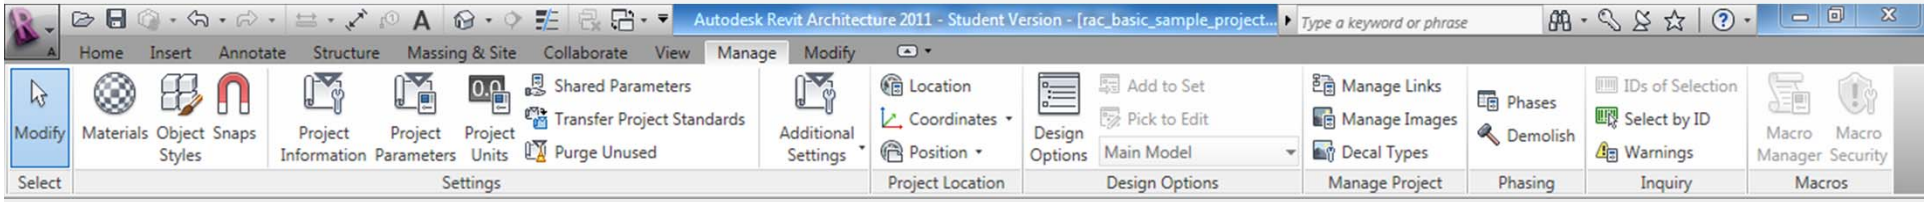


Collaborate – Tools that aid in collaboration on the same project

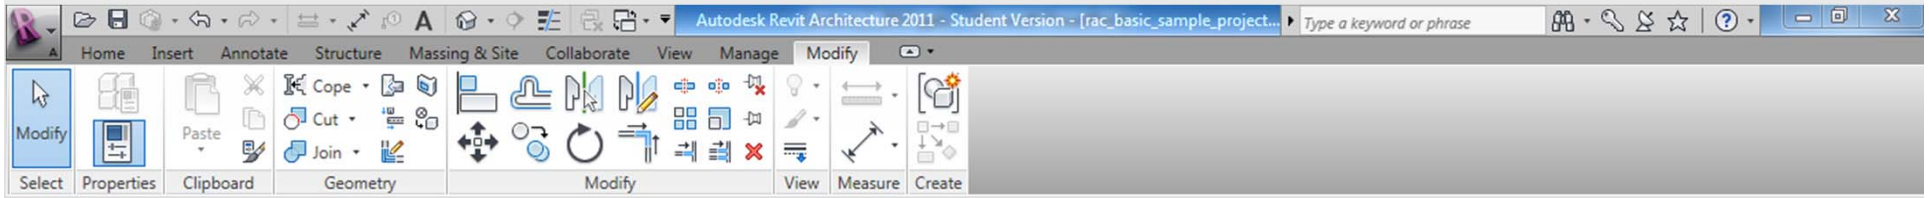
Revit 2010 Interface, Ribbon



View – Many views are different queries into the Revit database

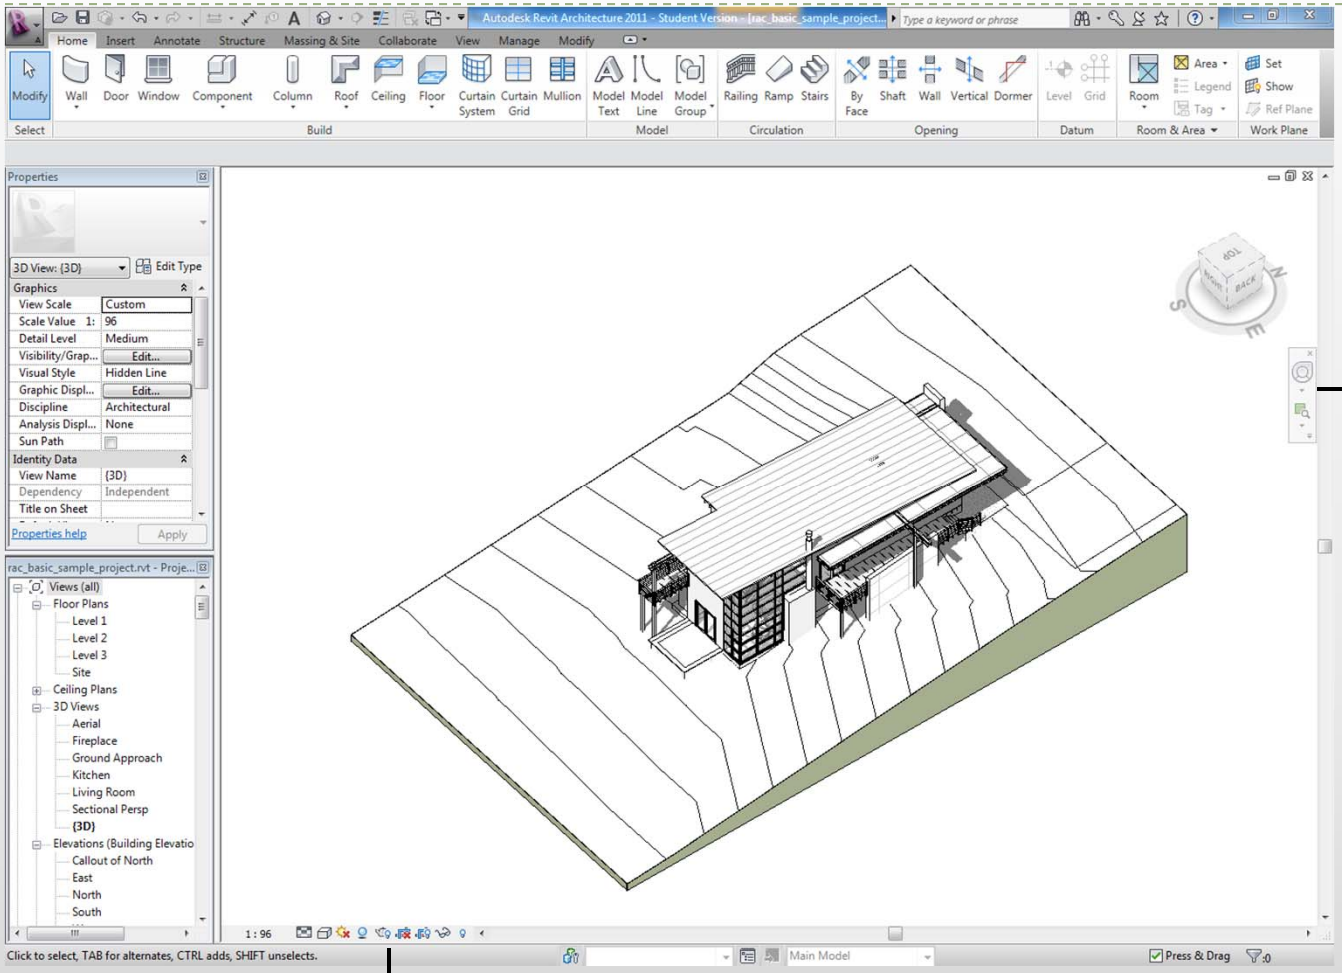


Manage – Design options as well as project related settings are located here



Modify – Once elements are created they have to be changed or edited

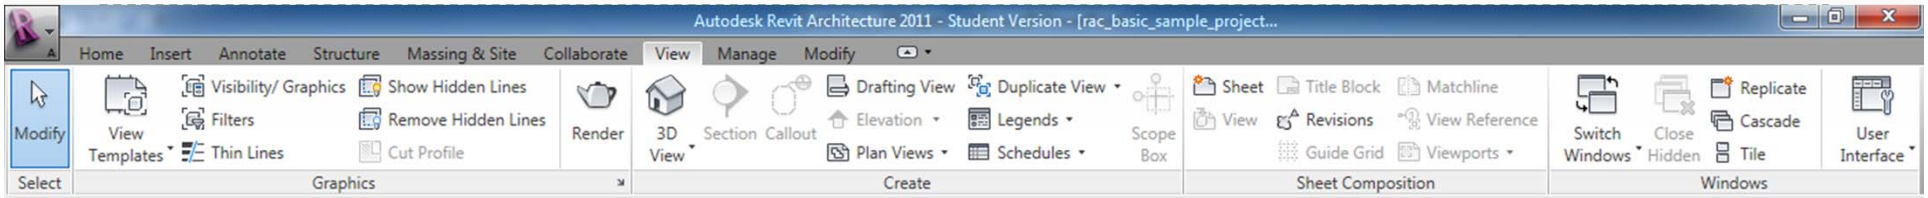
Revit 2011 Interface, View window

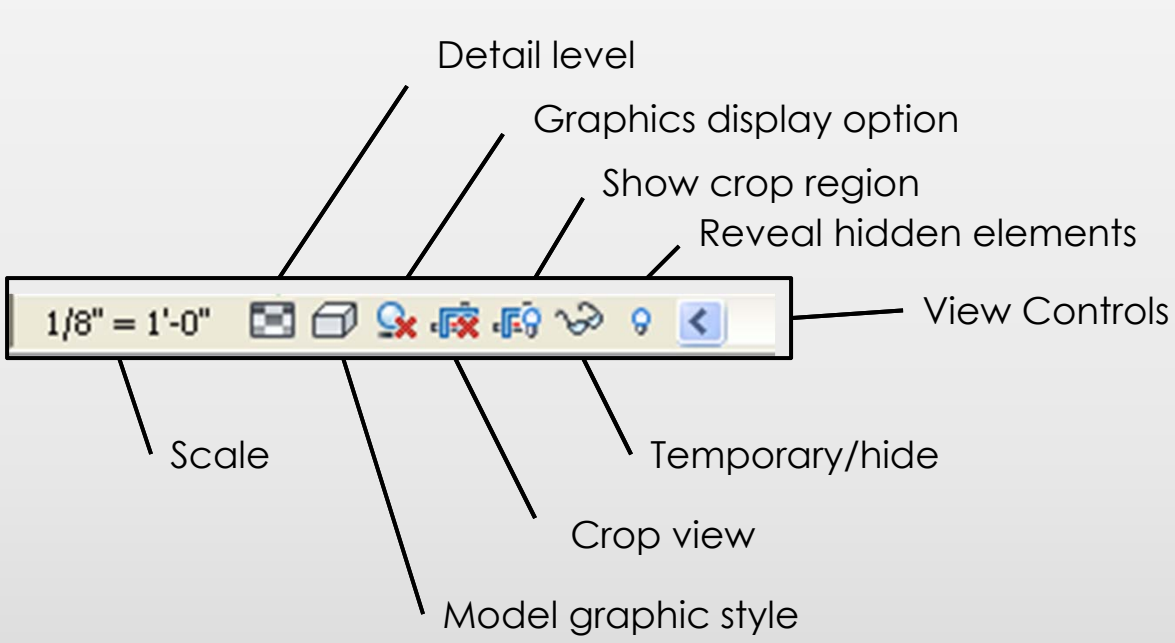


Steering wheel and View Cube

View Controls

Revit 2011 Interface, View window



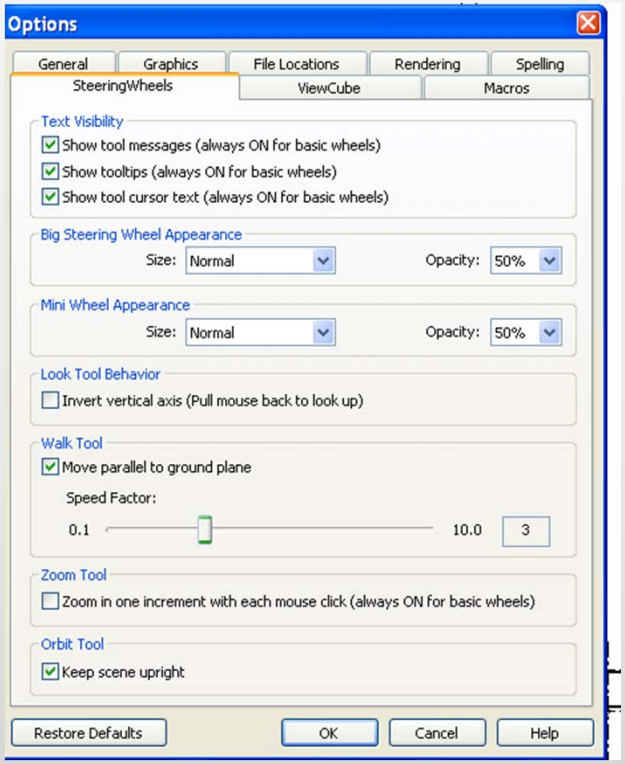


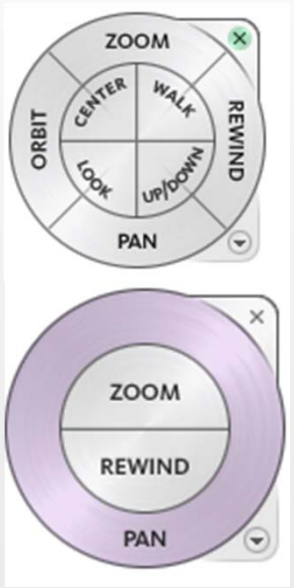
Steering wheel
Allows 2D zoom, pan and rewind

Revit 2011 Interface, View window

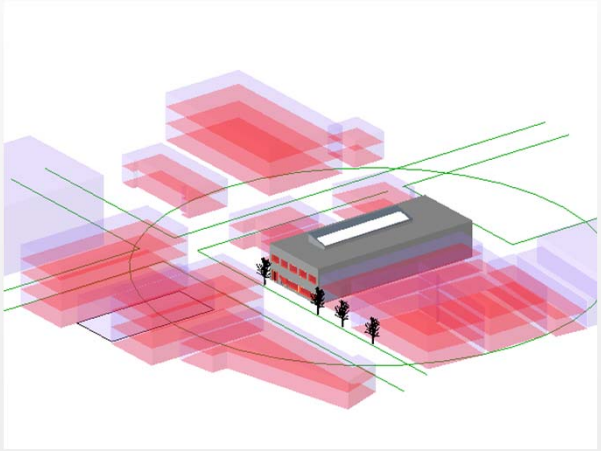
Navigation Wheel (F8)

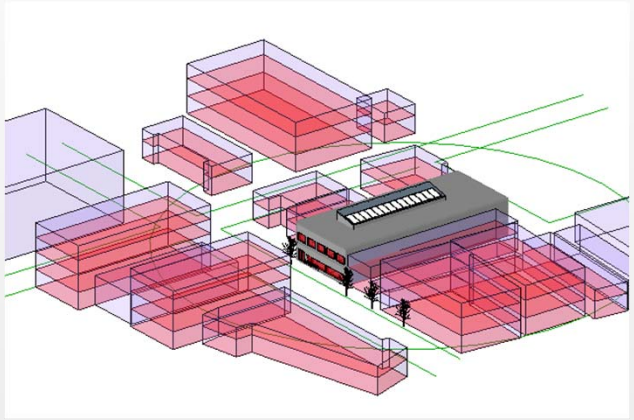
Right click and choose Options… to set the Steering Wheel parameters

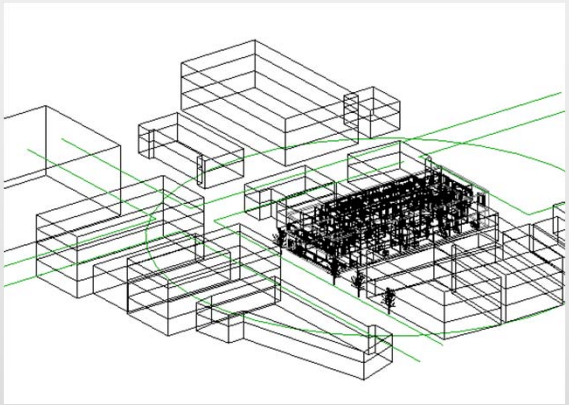


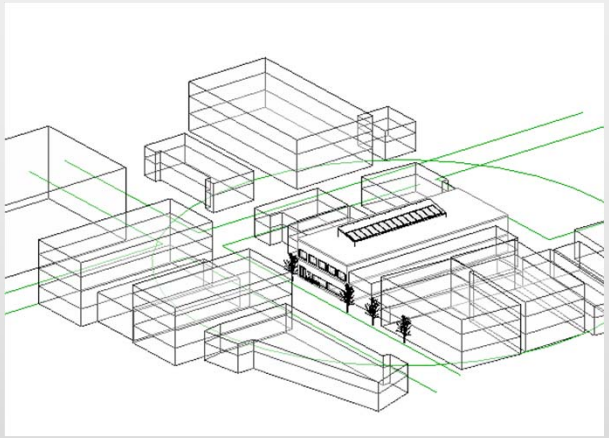


Revit 2011 Interface, View window

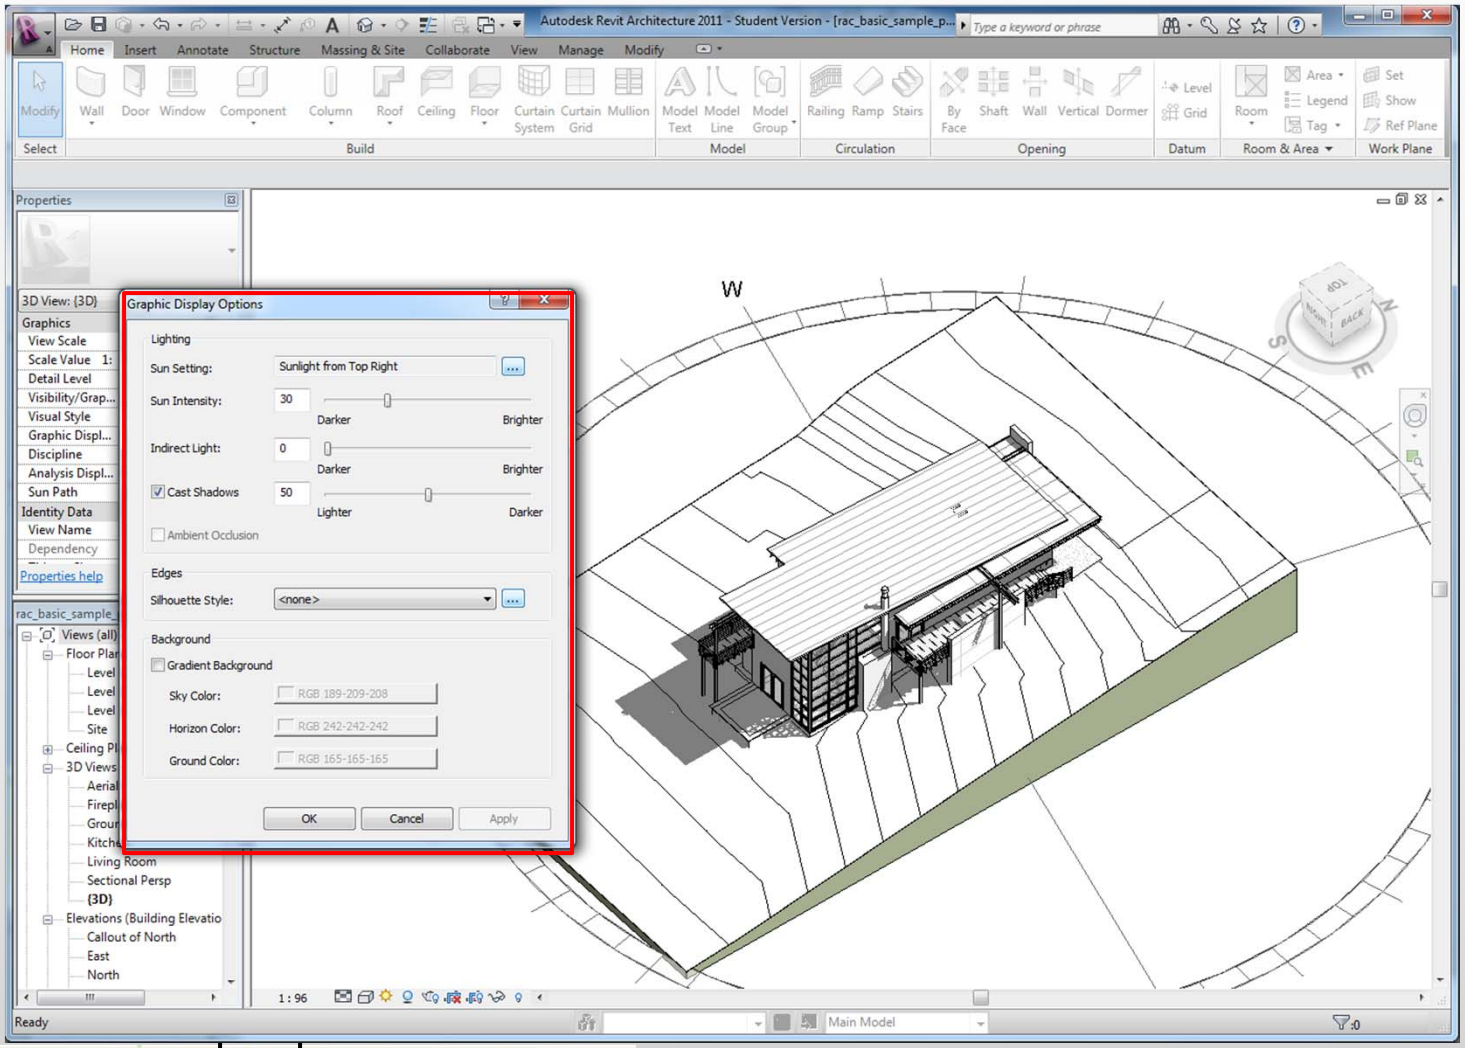








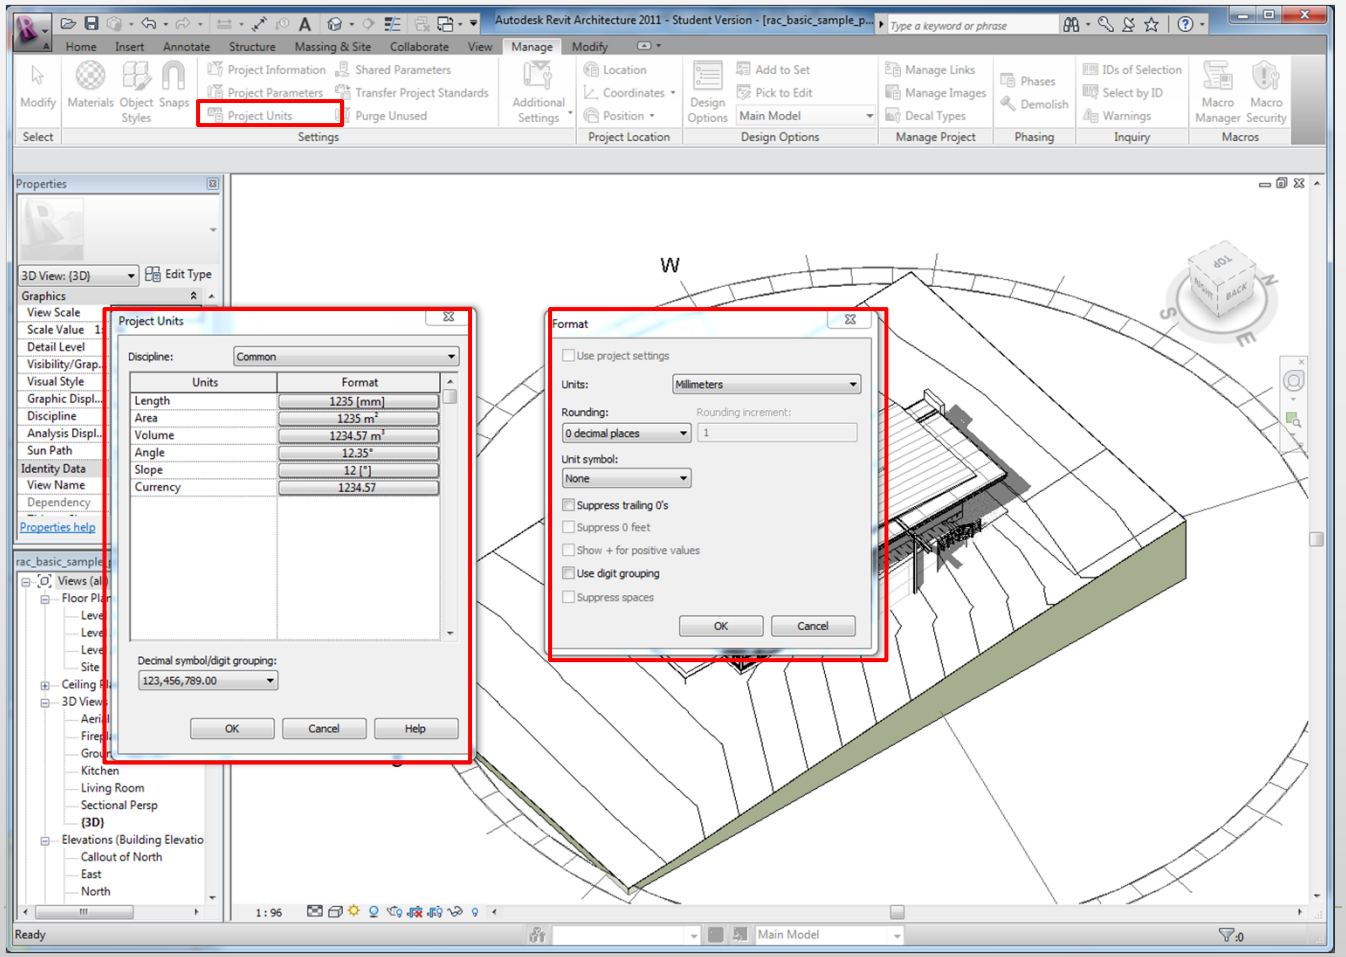
Revit 2011 Interface, View window



Graphic display options

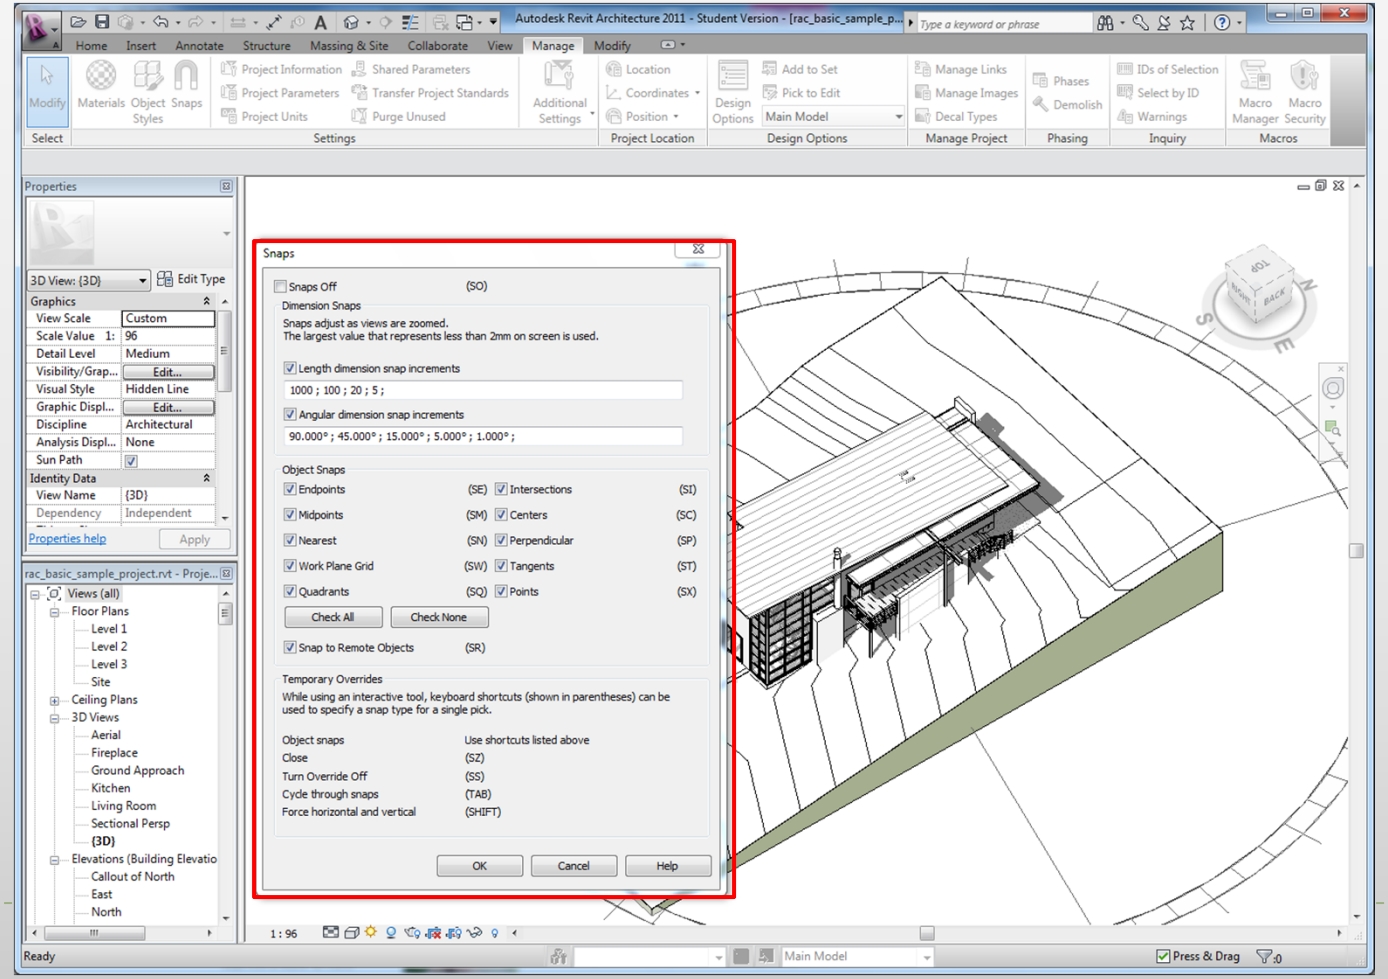
Revit 2011 Interface- Units and settings

- Units for the following can be set for a project by going to the Manage Tab> select Project Units

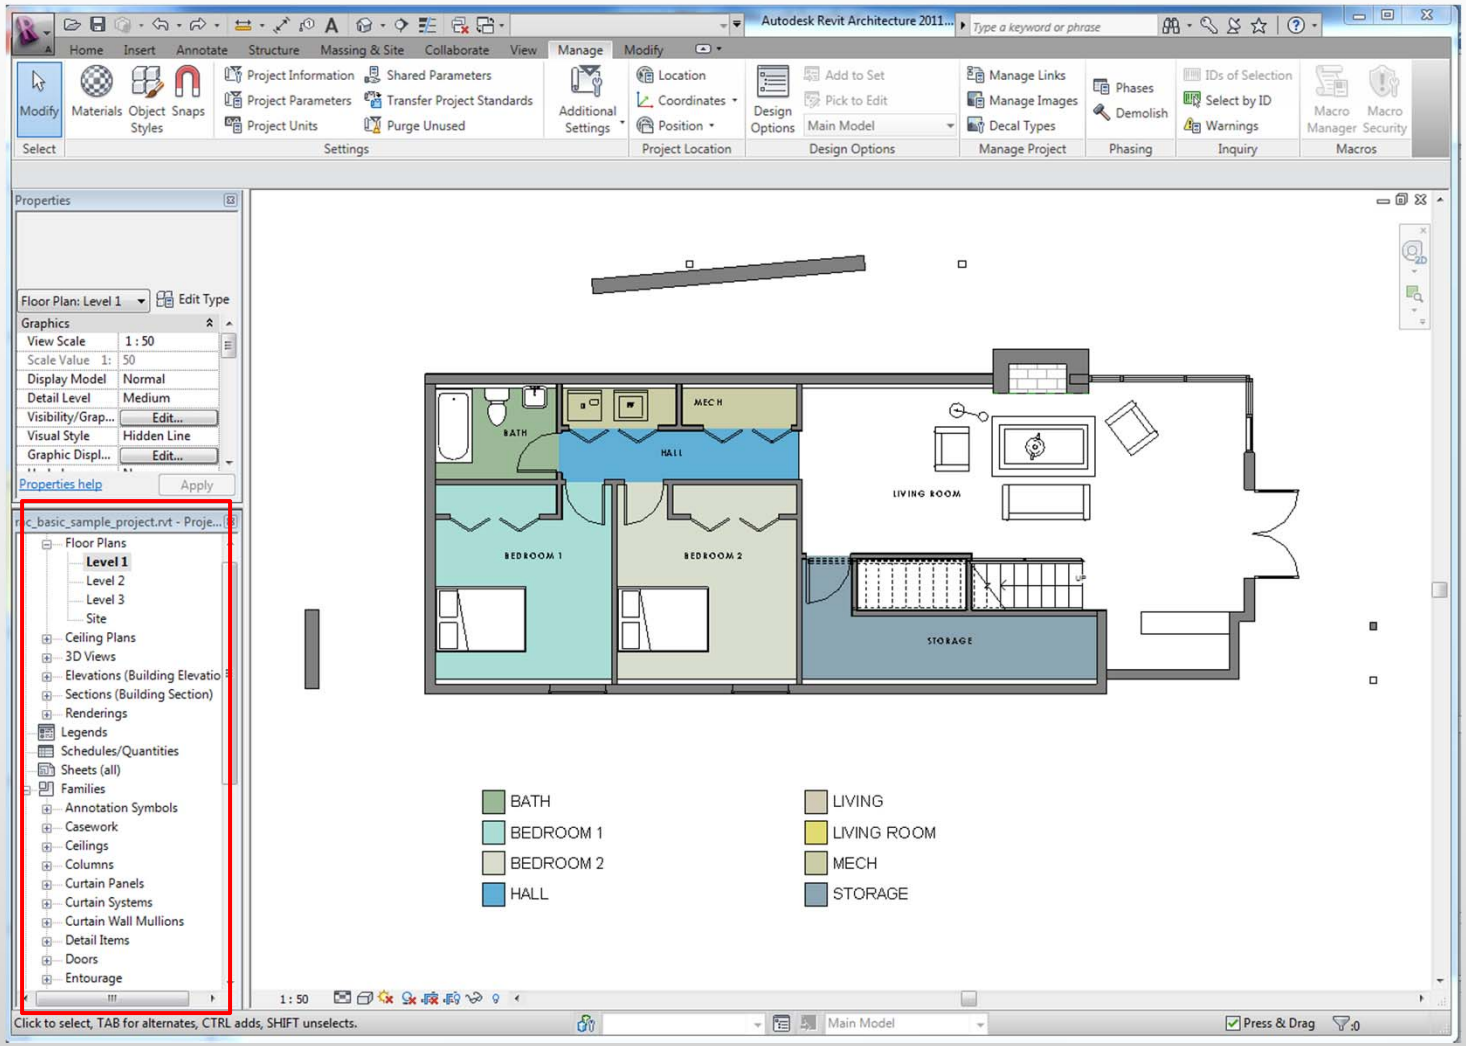


Revit 2011 Units and settings

- For Snaps go to Manage Tab> snap; The Dimension Snap is the increment, in which the cursor moves while creating components.

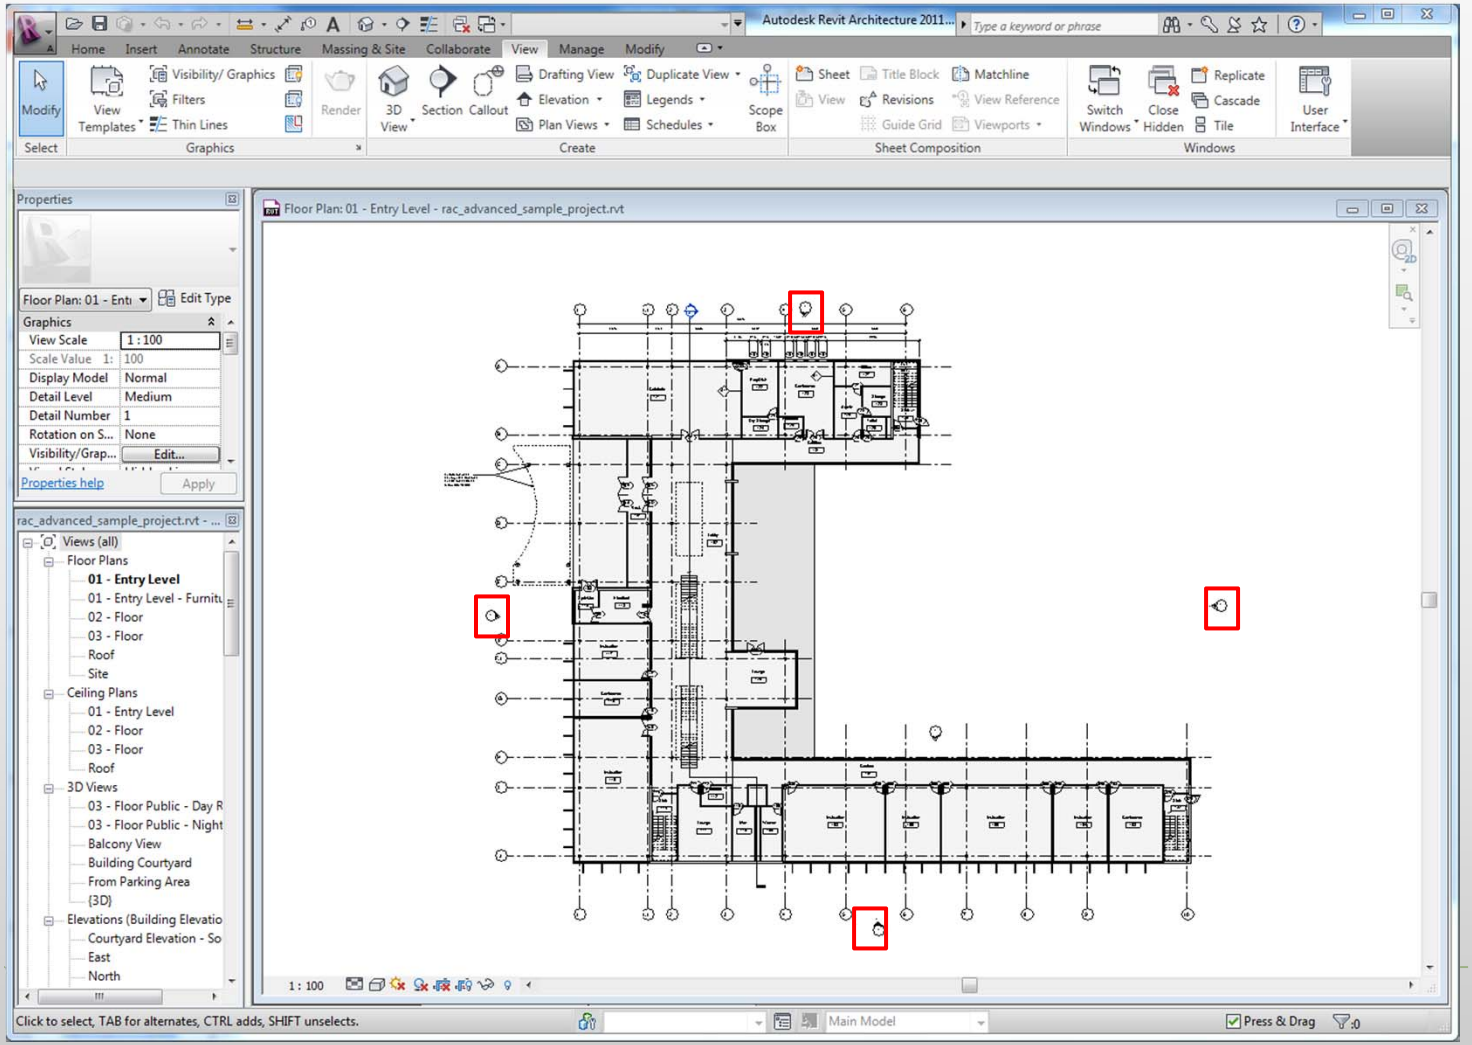


Revit 2011 Project browser

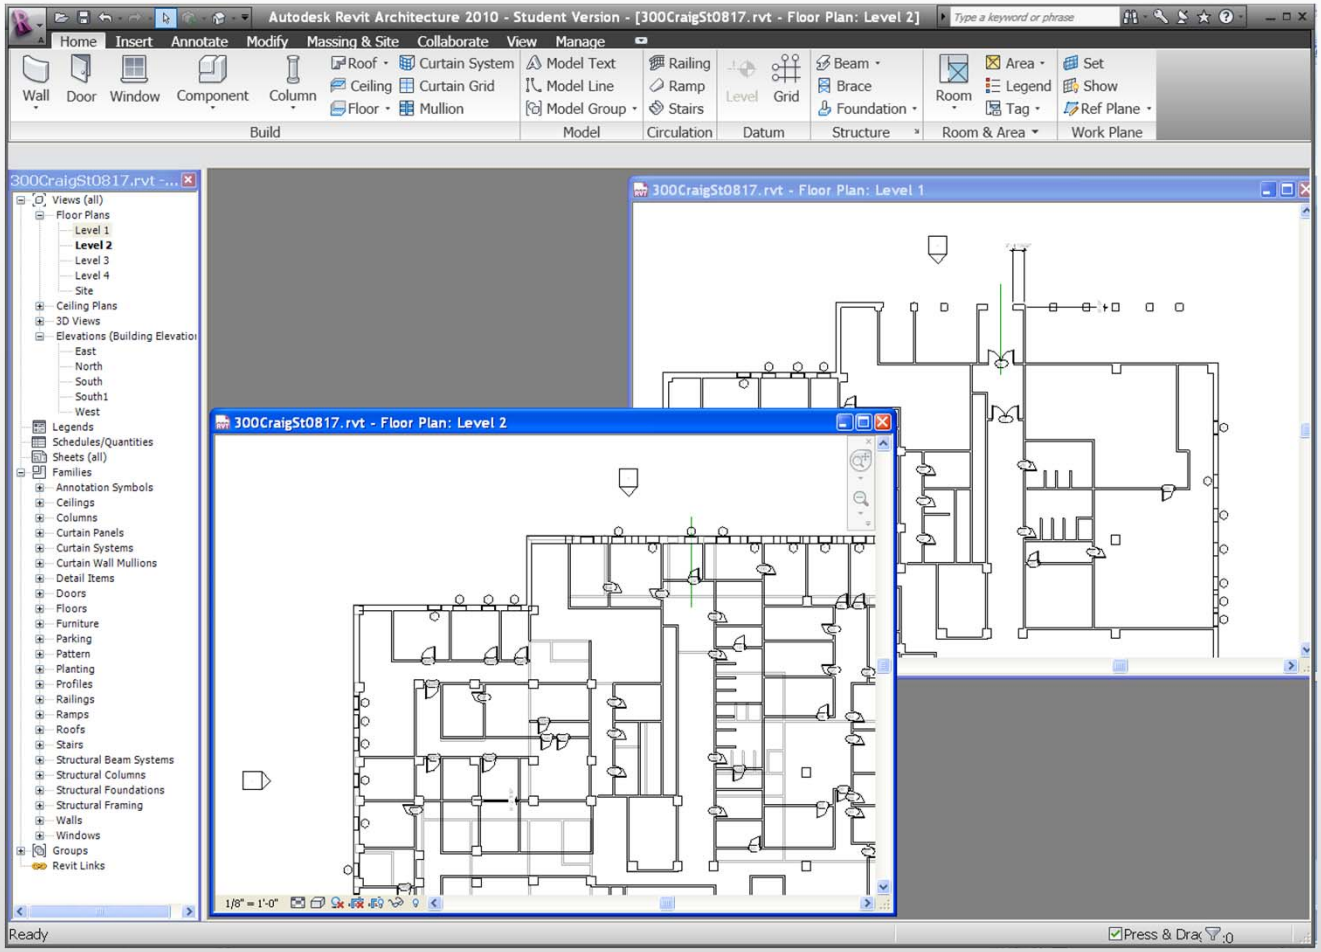


Revit 2011 Elevation markers

For Elevation markers View>Elevation



Revit 2011 Project windows

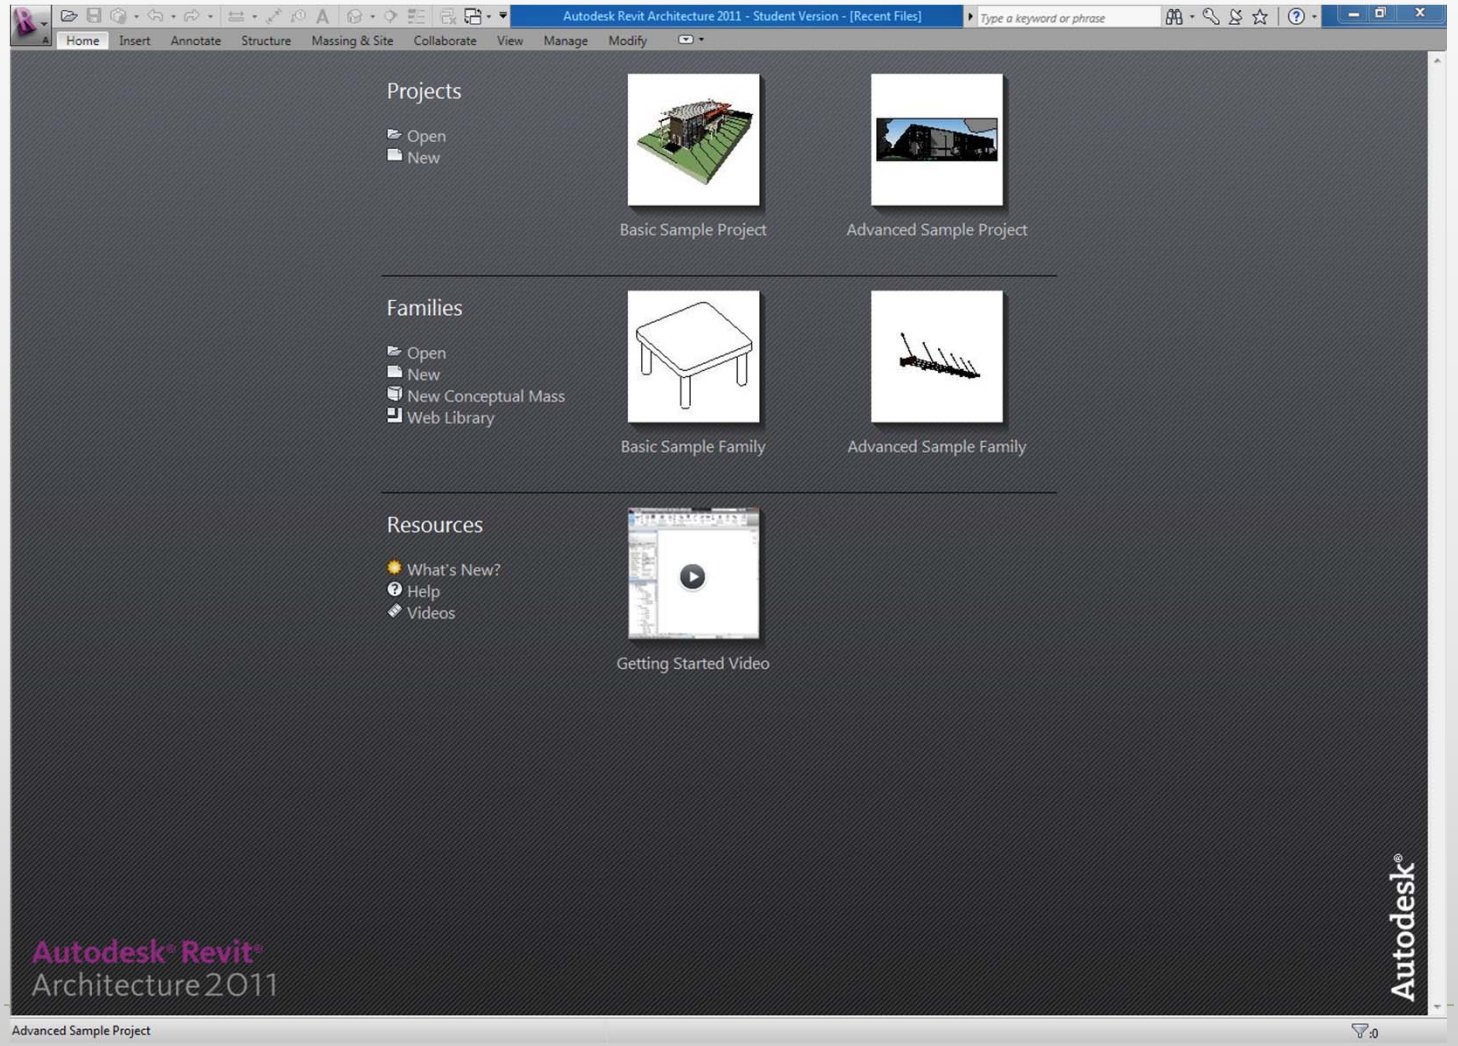


Revit 2011 Lesson1

- **Exercise 1- 3**
  - Open, Save, and Close an Existing Project
- **Exercise 4**
  - Creating a New Project
    - Set units
    - Set project information
- **Exercise 5**
  - Using Zoom & Pan to View Drawings
- **Exercise 6**
  - Using Revit's Help System

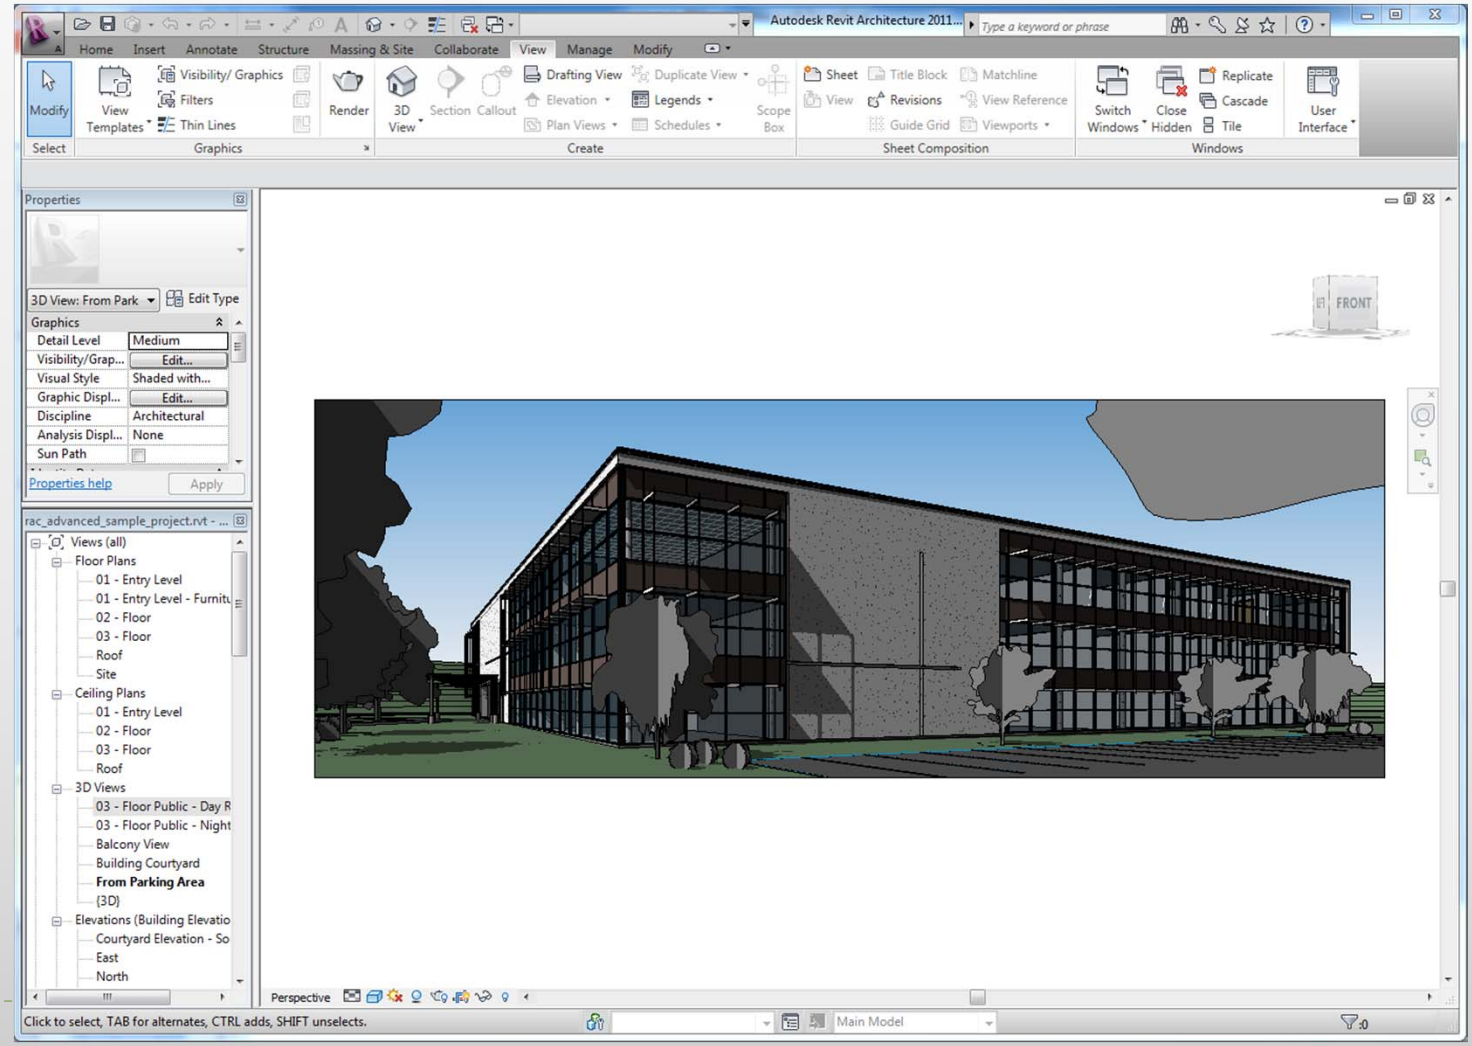
Exercise 1-3

Open Project Basic Sample Project



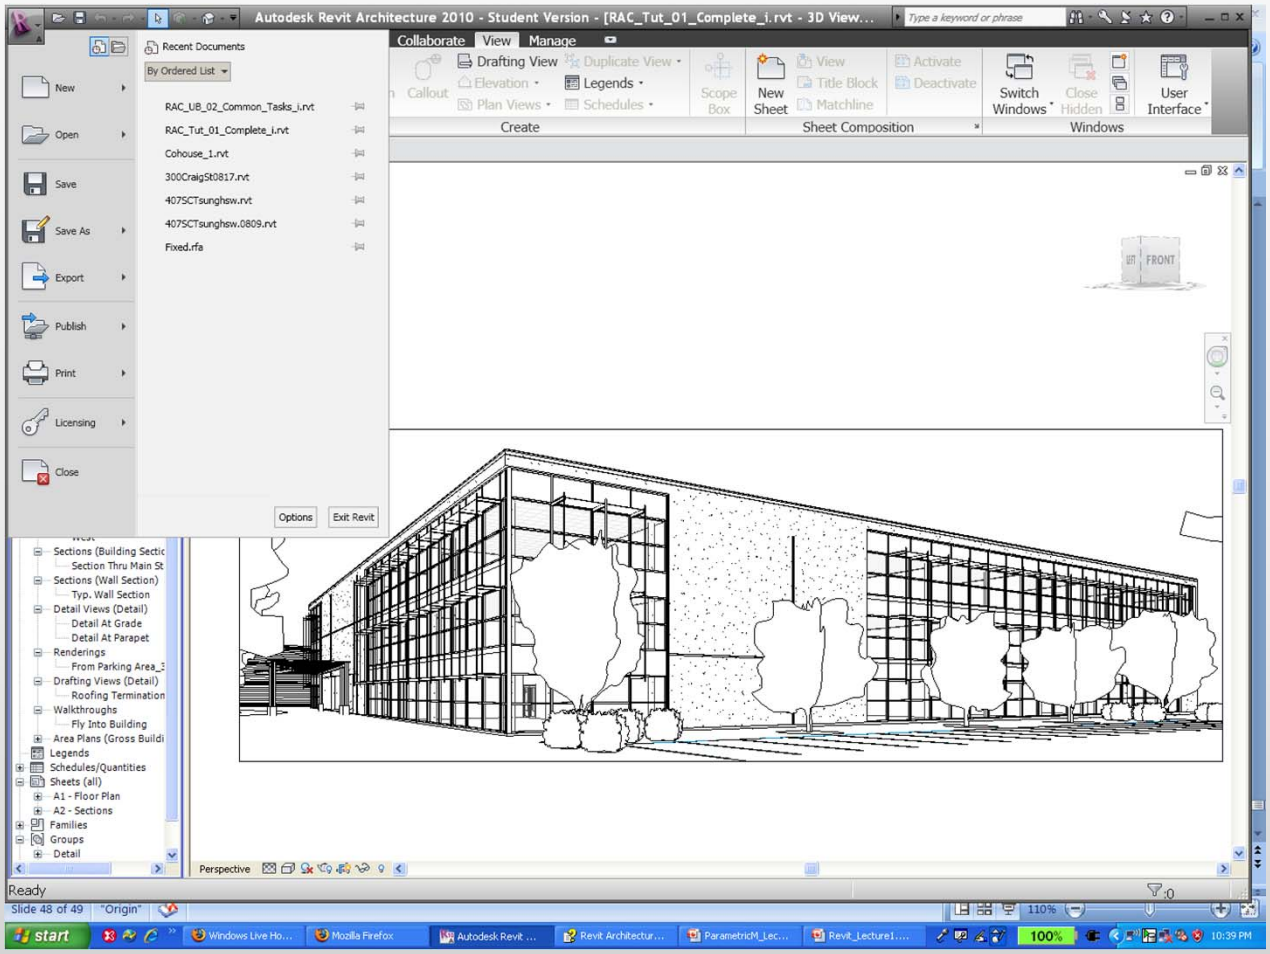
Exercise 1-3

Open Another Project : Advanced Sample Project



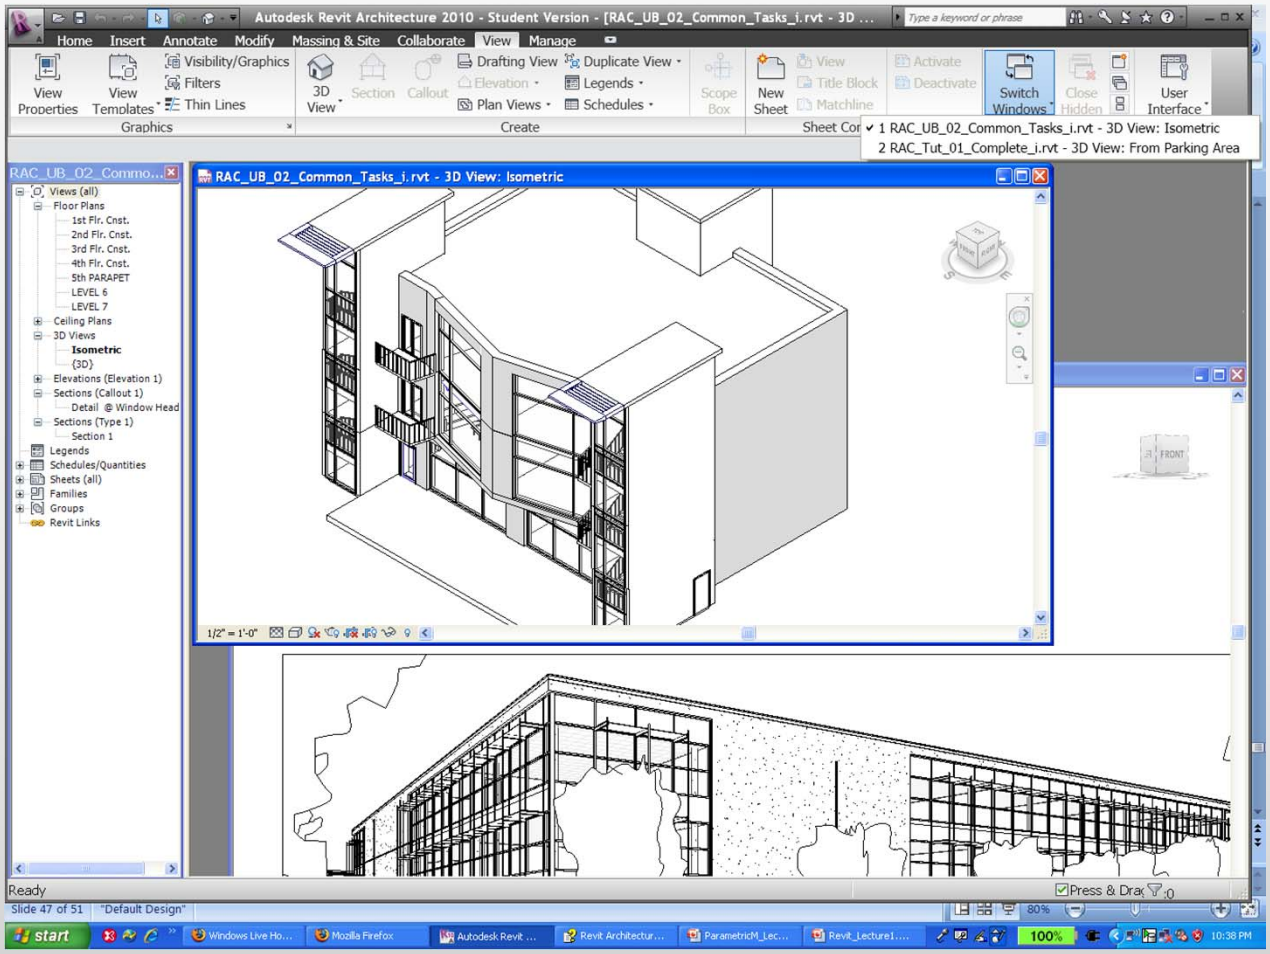
Exercise 1-3

And another project



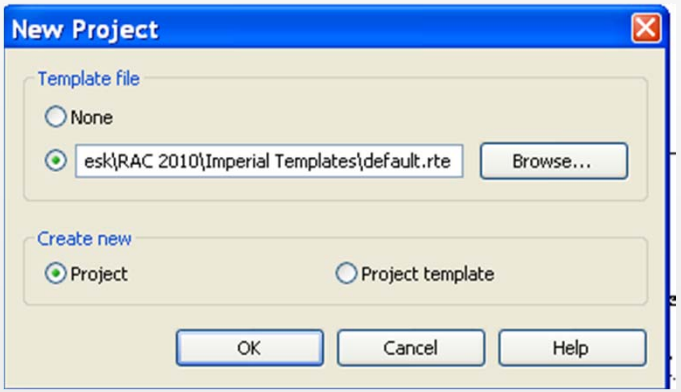
Exercise 1-3

Toggle between projects



Exercise 4

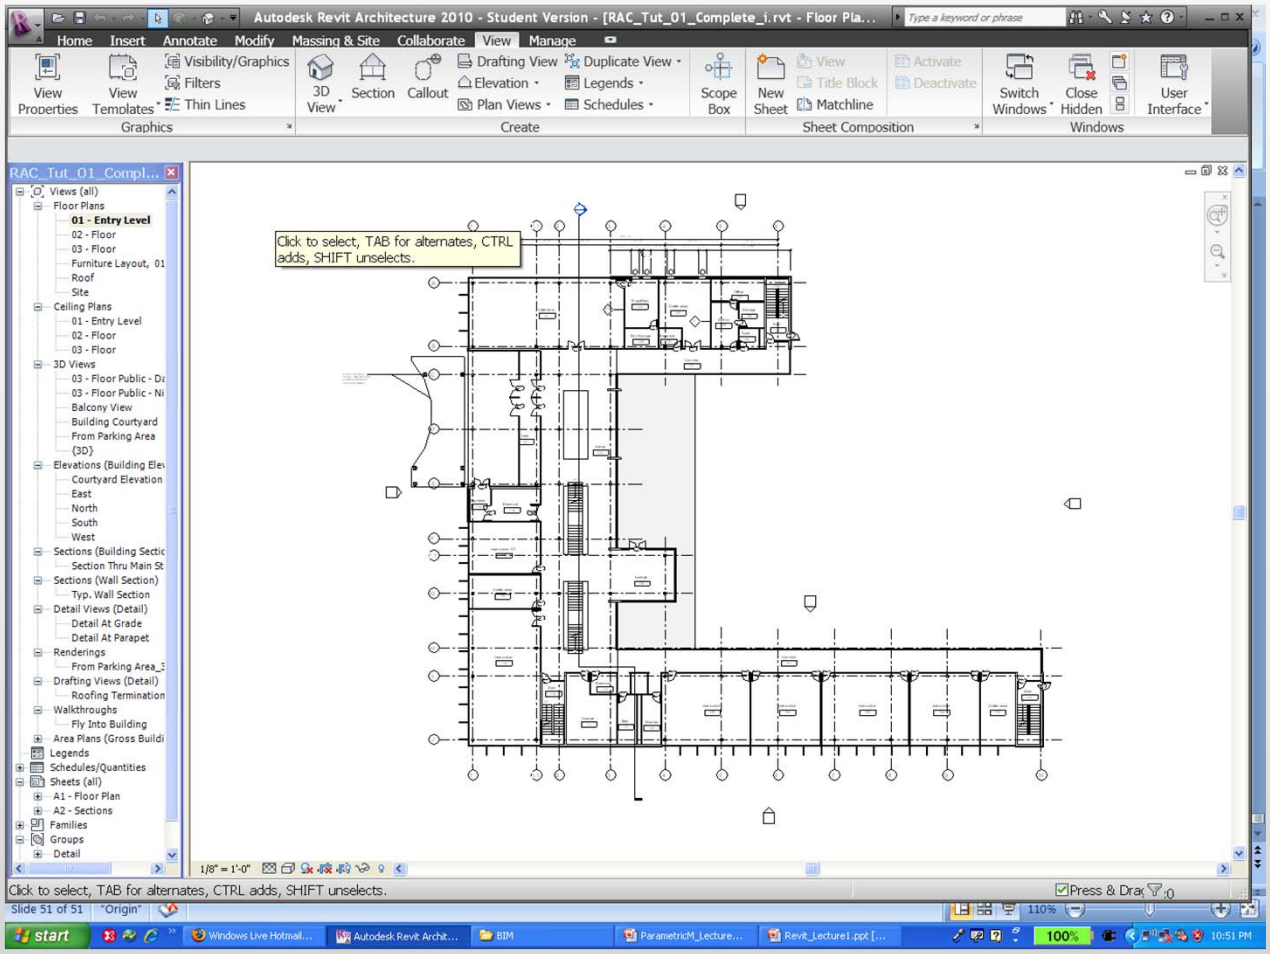
- Create a new Revit project



- Template Files
  - Units set (e.g. Imperial or Metric)
  - Wall, door, and window family styles defined
  - Title blocks inserted

Exercise 5

Using Zoom and Pan to View a Drawing



Exercise 6

Use Revit's Help System
