```
Week 3 - 75% x 5, 85% x 3, 95% x 1 - After the cycle, you increase your maximum preparation for you squat and deadlift at ten pounds. Now you re-free to increase less than that, but never again. Progresses slowly, even for the more advanced lifter allows
more progress over a longer period of time. Plateaus happen very often, the stronger you get. Vincent Dizenzo likes to say that the harder the training gets: By inching forward, day in and day out, you've put yourself on a new PR. These two principles, start light and progress slowly,
work in tandem and need each other to succeed. If you start at the right weight and progress them slowly, you will make faster progress, even in the 4 I 5/3/1 F or E V ER short term. Too many people see learning as testing. Exercise is not a test. Just because you can't handle the maximum weights, day
in and day out doesn't mean you're not getting stronger. It's the accusatory mulation work you do over time that makes you better. PREMIER N9 3: USE MULTI-JOINT MOVEMENTS/EXERCISES Almost every publication about serious training will tel I you this: use big, basic movements to become
stronger. In the case of the 5/3/1 program, we use a squat, dead elevator, press and press bench. While some may add a few lifts to this list, it's hard to rgue with. These lifts are effective - they build g reat strength I have different muscles. They lso g reat for the development of muscle mass. But this idea
extends to other areas of tra i ning: we run; Push/pull sled for conditioning; Perform box jumping and medicine balls for speed and power. These re-simple, effective ways for you to become stronger. And stronger than j ust means to add weight on squats. It covers other areas:
mobility and cond itioning. A really strong person is strong in all these areas. And the best way to do this is not to waste your time. While quirks and trends come and go in this industry, it always comes back to a few basic ideas regardless of purpose. PRINCIPLES N94: SET PERS ONAL REC ORDS
(PRS) No matter what level of lift you re, noth ing com fends off to a personal record. Young lifts set PRs at an alarming rate; their bodies are re-changing and EM phase on the power installation ht. For the most experienced lift, PRs are re-harder and thus he learns a great
appreciation for them. But you have to understand that they don't happen all of me. Sometimes you don't. And it's not a sign of being weaker or that you need to give up all your The stronger you become, the longer you do it, the harder it gets; And once you get to that point, there is very little linear
progress in short term learning. Think of you learning I ife as a great schedule representing your progress on major lifts. If you take a lot of steps back, the line will gradually increase from the time you started lifting to date. Now, if you zoom in and look at a small part of the chart, there will be many peaks
and valleys. People spend too much time here; they're too worried about today, not the bigger picture. Not too wrapped up, looking at progress too close going on all the time. Dave Tate once said that the average life of 'fitness enthusiasts' is all three years old, then they move on to something new: 'It's ok,
we all have a few hobbies we don't stick to. Just check you have a basement or closet for some of your unfortunate interests. But perhaps not so casually, three years is also about time things get very difficult with weight lifting and physical changes and strength benefits really slow down. There is nothing
wrong with being disappointed by the lack of progress. But if you stay positive in your m ission, a big breakthrough will come. I've been working with this guy for years. He certainly made great progress in South Australia. Now, he has a lot of average workouts and he learned that PRINIPESTHE
5/3/1 P ROG R M I 5 many medium days end up making a few weeks of mazing where he gets into huge PRs and breaks boundaries. This period, of course, is followed by a lot of very average days. These are the average days that lead to paychecks, because the longer you do this thing, the more
average days you have along with some very bad days. You must learn to maintain faith and persevere. As Joey Waters once told me: The longer I get stuck, the bigger the payoff: Every 5/3/1 program gives you the opportunity to install PR. It may not be every day, every week or even every training
cycle, but if you take the job, you will enjoy the success of setting up the PR. And PR is much more than just doing one rep max: an extra rep or five extra pounds on you 10RM you get better and get stronger; learning and achieving the problem of conditioning is PR. I want you and others to know the joy
of success from hard work. PR doesn't always have to be a true personal record. On each PR set, I coach others (and myself) to have a goal for the set. You won't always do better than last time, and on those days, you still have to push the set hard. Before your PR set, make sure you have the ultimate
goal in mind that can i nolude effort, bar speed and shape. Always leave a rep or two in a tan k and be sure to stop the set when you form compromised. Perform each rep as explosive, it is possible, it has g reatest potential to increase strength. The lower bar is as slow as necessary to maintain the
maintenance form (and put yourself in the right position) and climb as fast as possible, still being in control. Control is the key phrase here. I see too many people, especially during their warm-up, lift the barbell quickly but without control - they look like an out-of-control piston. This is usually the result of
knowing the idea of lifting quickly, but not u nderstanding the idea of total control. And let's all be honest if the lift bench pushes 300 pounds, lifting 95 pounds in a sloppy, quick way does nothing to impress others and, most importantly, the load is too easy to even illegal gain force. And the idea of priming
the CNS with such light weights is ridiculous - that's why we jump, bound and throw heavy objects before training. In other words, there are better ways to achieve this. You'll never have the perfect shape when climbing, especially during a very hard set. Mark Rippetoe once said: The perfect enemy of the
good: This becomes especially true once you are no longer a beginner and have built a strong power base all over your body, not just a couple of elevators. This is one of the reasons why a lighter or athlete should have a strong base of different skills and training; A balanced, front-loaded approach to all
areas of learning gives the lift a better chance of long-term success. RIGHT NgS: BALANCE the newest principle of balance. Regardless of the purpose or level of the lift, tra ining should consider at least four areas: strength, mobility/flexibility, air conditioning and recovery. Some athletes will need more
space. And some people will need more than one Rea. But regardless of the situation, all these areas should be part of the program. Balance does not mean equal time or equal weight. Rather, balance the battle making sure that each area does not go away to such an extent that I nterferes with your
progress. The big problem is that people get pulled in all different directions regarding balance. There's a re-ness some people who seem to do nothing but mobility work or do recovery work despite not doing 6 I'm 5/3/1 FOREVER nything to recover from. Hell, if you think half the crap people write, N O
ONE is able to pick up if they don't pass 400 mobility tests. But if you stay with tra ining long enough, you will know the undeniable truth: I ittle bit goes a long way. 3-5 Air Dyne sessions per week and you'll be in better shape for a few weeks. Are you tough and sick? Run Agile 8, twice a day. It will take 10
minutes or so to com weave each session and in less than two weeks, you will feel better. So even if you ren't happy to do some things, it doesn't require much more than discipline to be com committed to your success. And discipline and comment don't require talent - so there's never an excuse. The
areas that we will try to balance are strength, conditioning, flexibility/mobility and recovery. They all work together. The better your recovery and Your strength training workouts. Mobility work will allow you to achieve comfortable and strong positions in the main lifts and help you recovery.
better between sessions. The better you recover, the easier it will be to train. None of them exist on their own, and they are all essential to your success. WARM-UP/MDBILITY/FLEXIBILITY This is done before each workout and is often done as part of the recovery. STRENGTH It consists of various
jumps and medicine ball throws, basic lifts, extra lifts and assis tance work. The main elevator as the main elevator or a slight
change. For example, a slanted press is an addition to the press and press movement. Relief work can be multi-part or insulation exercises that help basic I ifts and extra lifts. Examples are chin windows, dips and abdominal work. CDNDITIDNING I usually classify air conditioning into two very unscientific
categories: easy and difficult. A mild state of ING aerobic work that does not affect your strength training. The harder cond itioning and is that weighted/heavy and requires a lot of dea I physical and mental effort. Prowler and Ladder/Hill Sprint are re-best examples of
hard conditioning. RECOVERY This includes additional mobil ity/movement work, aerobic work, and diet and sleep. Recovery is essential for every lift/athlete, but not everyone has to recover from the same amount of work. Generally, the older/more experienced you reuse, the more recovery comes into
play. In addition, the more intensively you train (college/professional athlete), the more recovery becomes necessary. WAR M-U P/M O B I L I T Y /F L E I I B I L I T Y WARM-UP/M O B I L I T Y /F L E I I B I L I T Y WARM-UP/M O B I L I T Y /F L E I I B I L I T Y WARM-UP/M O B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B I L I T Y /F L E I I B
was given lower billing, sometimes not even on the undercard. There was even people writing that you should be ready for battle; aka training at all times - we can safely assume that people who say it's damn weak and slow. Well, of course you don't need much warm-up if you only squat 200 pounds and
measure vou 100m time with vour calendar. Then the pendulum swung the other way, and there re-humans who barely train yet do the 45th inute mobility session. They think that every part of their body should be aligned with their spine an D star before even picking up the p barbell. As Brad Arnett once
told me: At some point, you'll need to pick up something heavy: And, as always, the answer is I ies somewhere in the middle. Most importantly your warm-up and mobility work sequence. Some people may need more work than others, but if you constantly do 1 0-15 minutes of warm-up before it's more
than most will ever need. Now, if you ignore this for a long time, you may need a little more work, but as if by magic, once you catch up you only need that small box. It's all about consistency. Common sense tells us that a teenager needs less warm-up than a 40-year-old lifter who has been squatting
every week for 25 years. The senior lift has a few more miles on his body and it takes some time to oil the joints. But that doesn't mean the younger I ifter refuses to warm up; if he continues training throughout his life of interest he will build, consistently doing something will last long until his twilight years
And I know that a lot of older lifters read this and say, Jim's right. If I had given only 10 minutes each day dedicated to warming up, thi ngs would have been very different right now: 'So if you re-young lifter who ignored this area of learning, take some advice from people who actually did something: start
doing a warm-up habit today. Warming up should not include a million movements or require a special degree from Harvard. Joe DeFranco wrote a simple program called Agile 8. You perform the following pre-workout moves: I IT Band foam roll x 10-15 passes behind the leg. I! Addustor foam roll x 10-15
passes on the leg. 3 Glute / piriformis mifaxic release; Best done with a lacrosse ball or PVC pipe x 30 seconds on each side. 4 Rollovers in V sits x 10 reps. S Fire hydrant circles, 10 back and forth circles with each leg. 8 Hip flexor stretch x 3 kit for 10 seconds on the leg, perform all reps with one leg.
before moving on to the other. 8 I'm 5/3/1 F O R EV E R If you have ny questions on how to make ny out of these movements, a simple search on the web will help you. Obviously, the Agile 8 isn't the only warm-up you can do. The key is finding what you will do consistently. I have a genera I template for
warming up and mixing/match movements to avoid boredom. I move something: It's either an AirDyne bike, a rope, a prowler or a sled. Th usually takes 3-5 minutes and never did so to make me tired. Remember, it's not a job. Jumping is an inexpensive option, and anyone can do it...: the added benefit is
that your footwork can improve. I am! G roin/hips - it lways something done to the side: hurd le duck-unders, Cossack squats, side shuffling or side lunge. 3 Body movement - usually wring, pull up/ chin up, AB wheel or inch worm. 4 Legs/thigh flexors are usually Bulgarian one leg, squats with a pause at
the bottom, Spider-Man or some kind of lunge. 5 Shoulder movement - it is usually a band pull apart or a shoulder dislocate. Squats - fall i nto squat and hold for 30 seconds. That doesn't usually change. Here's the exact warm-up I did this week. Again, you can change/move any of the movements. Jump
rope x 50. - Hurdle Duck-Under x x - Push-up x 3, hold the bottom position for 3 seconds. Walking lunge x 5 reps/feet. Squats x 30 seconds. I did it three times with a focus on control and be as slow as possible. It's not a fight to do a lot of reps, but rather to perform reps slowly and do them right. If you
don't have access to anyth ing fantasies, use some basic calisthenics and weight movements to warm up. Jumping Jack x 25. - Squat on the bottom. - Push-up x 5 (hold the bottom position for 3-5 seconds. - Bulgarian one-legged squat x 5/leg (hold the bottom position for position for seconds).
5 seconds). Ju MPS/THROWSI9 There is an endless supply of movements you can make. In general, we stay away from nything, which is weighted, except for sleigh and prowler. We aim for a full range of different movements, especially with legs. You want to do something for the front (lunge or
one-legged squat) and have something to the side (obstacle duck-under or Cossack squat) and do some sort of body mass squat. We would also like to do whatever it takes to get on the ground and get out of the ground push-ups, rollovers or very light Turkish get-ups. Bottom line: move in different
directions and be slow and controlled. Anytime you perform a hard conditioning session or lifting session, you have to do a warm-up. Don't rush and don't ignore it - be slow and be consistent. The quality beats the quantity every time. JUMPS / THROWS Few things got less love I spend in ing circles than
using various psum jum and medicine ball throws. Well, let me clarify that and edit it to read the popular train ing circles: For those of you that were I nvolved in field activities in the track, you probably know this very well. I believe that the use of j umps and throws are essential to any overall curriculum,
provided they are programmed and executed correctly. Jumping and th strings should not have a goal of consistency. Don't worry too much about how high the field you jump on or how far you throw the ball. J ust goal to make some kind
of jump or throw before each tra ining session. Aside from being just fun to do, there's a practical reason to do it before you train. In plain English, performing explosive exercises before training helps to turn on your body. Your nervous system gets turned on and gets you ready to lift quickly. Now, if you
grew up learning in the 80s and 90s, you've probably heard about it. He made a big splash in athletics and plyometrics has become a big buzzword. Of course, people started using them by abusing them, and as the fitness pendulum swung the other way, pretty soon you weren't llowed to make them until
you squatted 8m illion pounds. I swear, someone made up which said you couldn't do any jump training y nless you reached squat twice you body weight. It became law for some. For the rest of the people who biting their tongue every time they ate, realized how stupid this rule was. Let's use a 10-year-
old kid - he j umps up and down and running. He flies off the couch, from playing ground equipment and from making a snr to the Pro Fight ring he and his friends did. Fast forward 2 years later when he starts to raise with his older brother and he no longer llowed even napkins on the dust of the rabbit
hanging from the ceiling of the fan. Remember that jumping on a box is not a plyometric movement. Pliometry include some kind of stretch or rebound. A simple jump of boxes from a standing position is not a plyometric. To illustrate the difference between the two, here's the best analogy: imagine
throwing the ball on top of the box. It's a box jump. Now imagine bouncing that same ball on the ground and bouncing it on top of the box. It's a plyometric. So if you move away from the box, land and immediately jump on another box; it's 1 0 I 5/3/1 F O R EV E R Pliometric movement (provided you don't
spend too much time on the ground). It's a rough analogy, but it's easy to imagine. Everyone can jump and throw. If you're picking up weig hts, you can throw a honey icine ball explosively. This is the best way to learn how to gather your strength and speed (power) and
  enerate it for one purpose. It's an amazing training tool for coaches young athletes - there's n immediate purpose and you can't jump on a high enough box slowly. You have to be fast. This is Imost dummy proof. Conversely, not everyone should do pliometry, at least not with jumps. It is incredibly
stressful and should be reserved for athletes that N EED to make them and can make them. For the most part, the average person shouldn't do them. There is I ittle reward for such a big risk. This is due to a lot of stress on the body, namely calves, knees and ankles. Before we get to the motions and
programming, let's look at what you shouldn't be doing. RULES DF THROWING AND JUMPING - Don't make highly marked boxes of i umps or something like a box jumping. There may be a practical basis for using high rep jumping as part of an advanced, specific training program for a particular
person. But I can assure you that it's not to get stronger, get in better condition or even improve your jumping ability. I'm not sure where this idea of training started, but it's horri ble. Do you know when you start dating someone and you have a common list of thi ngs that re-deal breakers or litmus test? For
a ple exam, how one relates to their parents, or if they ever want children. Well, jumping with a high rep box is one of my litmus test to define Ig training. Not so much for those who do it, but those who re-program it and to do it. If high rep box jumps were a medical procedure, it would be a relative of
bloodshed to balance bodily humor. Don't do j umping movements/exercises that you're not ready for. You don't need to do a 7-foot depth jump to get better. Sooo Sooo what is ppropriate for your skill level. Do not miss jumping and throwing. You will not spoil your strength by making jumps and throws
before training. Apparently, some people re-in form so that doing 3 sets of 5 box jumps makes them weaker. If it's you, suck it up and get in better shape. Don't worry if you can't box to jump 18 feet like many popular athletes. It's not about achieving the YouTube Olympics, it's about improving the training
vou're coaching. Do not sacrifice explosiveness for the sake of weight. You masculinity is not measured by the weight of the medicine ball will a found medicine ball will sacrifice explosiveness for the sake of weight. You masculinity is not measured by the weight of the medicine ball will sacrifice explosiveness for the sake of weight. You masculinity is not measured by the weight of the medicine ball will sacrifice explosiveness for the sake of weight. You masculinity is not measured by the weight of the medicine ball will
suffice. My general rule is to make 10-20 jumps or throws before each workout, but that will always change depending on what you do in the weight room. Every program in this book has my rec ommendations. You can mix/match any combination you want. The point of throws and j umps JU M P S / T H
R O W S J 1 should be as explosive as possible, so do not turn it into a session of conditioning. Make sure you have an adeq uate rest between each throw and jumps. The only danger is missing the box,
which can be prevented by using a dense foam box for jumping (they are sold everywhere) or padding the sides/top of the box with some carpet and using common sense. One down side to box jumping is that athletes often lym the hips of flexi bility flexi flexi - they can't bring their feet far enough on taller
boxes. So while box jump is an awesome test, it doesn't have a Itimate body explosive test. Box jump I'm ncredibly easy to perform and exactly what it sounds like: you jump on the box. Use you weapons as part of the jump (remember jumping and throwing re-full body exercise) and try to land soft.
Landing soft is a great way to learn how to be explosive (hard!) and still have a sense of calm and relaxation. Once you land on the field, either step down or jump down, and stick to the landing position and then reset for the next jump. The height of the box should not be the
maximum jump every time. Also you don't have to go through some heights of progression from exercise to exercise a box that you can make but still requires full effort to get on. The point of jumping into a box is not to jump on the highest box possible: Rather, it's a
way to turn your body on for a lifting session. All in all, we usually jump on a box that approximately 80%-90% of the athlete's best jump, It's not hard to see if you're a coach with some experience. If you are a re-trainer or athlete who doesn't have much experience, just start with a
low box and progress slowly over over Weeks. You don't have to go crazy when you first start i umping, and it's not a good idea to check the box iump max on the first day. This is especially true in the training of young or weak athletes. If you train yourself, think about it this way - you won't try to bench to
push 500 pounds on the first day you come to the weight room. You start with the bar and work slowly. Use the same common sense approach when jumping. Remember, the inclusion of the nervous system is not separated I nto y pper and lower body. Box jumping is a great way to prime your body for
pushing and bench clicking. So please, let's set up a body. If doing boxing jumps is solely for you jump training, I recommend 3-5 sets of 3-5 reps. You can change the height of the box between each set and I always recommend the first sets be lower than in the previous sets. Again, it's just common
sense. Here's an example of jump box workout: 3 jump - 24 box 3 jump - 24 box 3 jumps - 30 box 3 sets 3 reps - 36 box 12 I 5/3/1 F O R EV E R STANDING LONG JUMPS As a box jump, there is a slight confusion as to what it is. I nstead high jump, stand ing long jump at a distance. To perform, start
with both legs planted in a comfortable jump position. Swing you rms back naturally and push you thigh back and bend your legs. Push forward and up and jump the distance. Be sure to stick to the ground I ng after each jump. This means that the ground is strong on both legs and does not fall forward or
backward. Earth with the same knee bend as you need. Stand up and fold for the next jump. If you use them exclusively for your jumps. A good way to add some incentives for each set is to put 2 cones down. First, where you start your set of 3. The second
cone is where you would like to land your final jump. It gives you something to shoot and makes it a little more competitive with yourself. They can be a little more stressful than the window J umps due to the impact of the landing. Yet most people can cope with a standing long jump, and this is far from n
advanced movement. STANDING HURDLE JUMPS These re-look like box jumps, but you jump over an obstacle and land on the ground. It's more stressful than a window jump as landing is much more stressful. Obviously you don't have to use an obstacle to jump over, but it helps - the smaller surface of
the Rea at the top gives you a lot more room for maneu ver. The larger the top surface, the harder it is to cross. In other words, you have to jump over and over again. If you re-new to this, limit the work to 3 sets of 3 reps. Once you get used to it, you can use the same protocol as box jumps. STANDING
JUMP It looks like a stand-up long jump with only n added second and third tied after the first two-legged jump. The border is simple: you spend little time on the ground. Ground contact m inimal and you have to ppear like a rabbit on hot coals. You don't land to land Kicking when you're tied -- you only
stick to the final jump. You ust land on the balls of you feet and keep you body under control. It becomes very difficult if you don't have balance or you're out to jump your body. Too many people find themselves falling forward when they are limited and lose a lot of power during a transfer. It's not so much
about getting the distance between each jump, but about maintaining minimal contact with the ground. With that being said, you get more power in g round the further you jump. So it becomes balancing the game literally and figs uratively. When you first try this, aim for shorter jumps and focus on
minimizing ground contact and keeping your body in control. Be sure to use you rms. Related when jumping becomes a little more stressful for the body, especially the ankles and knees. It's not necessary for everyone! So don't be ashamed if you stick to the basics and con tinue to do so. J UMPS/T H R
O WS I 1 3 B OUNDING BOX JUMPS This can be done in two ways. First, install up two boxes. Stand on one box and go away (don't jump). Land on two legs and jump on another box. The boxes should be about 2-3 feet apart. You don't land flat feet - land on balls of you feet and bound on the field
This will require some practice to get the deadlines down - and again, be sure to use you rms. Now that you first try this, the field you jump on. For example, get off the 12-box and go to 30. The higher the box you step away from the more energy you can
bsorb and the higher vou can iump. However, it becomes infinitely more tense and very d ifficult. Use this method with caution. The best thing I did was in high school. 40box to 40th box. The second way to do this is to create 5 boxes in a row, with 2-3 feet in between. Go to the first box, stick to the
landing, get up and get out of the box. Land and tied on the second box. Repeat until you stick to the final landing. You can vary the height of the box from box to box. Yep in, it can be very stressful, so it's not for everyone. I recommend no more than 15 contacts per session. B O UNDING HURDLE
JUMPS These are re-the hardest of all J umps, and I doubt that most reading it will ever need to make them. Set up 5 obstacles with the appropriate distance between them; You will have to judge the distance based on your own needs. Jump through the first obstacle and are tied over the rest, minimizing
ground contact. It is incredibly stressful and requires very strong ankles and knees. It also requires a certain rhythm. We did it during the track season with my mentor and disc coach, Darren Llewellyn. They became the main jump during that time and we worked up to 10 high Sometimes I can't believe
what we used to do. But understand that this wasn't something for beginners - we all did a lot of box jumps and boundaries before that. If you can do this, use the same protocol as Box jumps. STANDING OVERHEAD MEDICINE BALL THROWS This can be done with kicks parallel to each other (jumps).
position) or with any foot forward. Bring the balm medicine L over your head, stretch back a bit and with you the whole body, throw the ball, not just you rms. Using your whole body means that your feet are leaving the ground. And that has
to happen with every version of these medicine ball throws. STANDING MEDICINE BACKWARD BALL THROWS Back to the area you want the ball to the ground, stand with a wide position. Bring the ball a little between your legs as you push your hips back and bend your knees a bit. Explosively throw
the ball over your head for height and distance. Like all ball medicine movements, your feet will leave the ground. One of the keys to this is to be sure to keep your mid-section strong so you don't fold on the way down or up. To make it a challenging task, I like to do it with a partner and with him a sign
where every ball lands. J ust make sure you throw from the same spot and try to beat your previous throw. 1 4 I 5/3/1 F O R E V R STANDING MEDICINE BALL CHEST PASSES These re pretty self-evident. You can do this with your feet parallel to each other or with any foot in front. One d ifference that I
preach with a breast pass to make sure you use you common body to throw the ball. Your feet will and should leave the ground. In fact, many times you will jump forward, just like abbreviated long jump when doing so. Be strong, be fast and don't do this upper body exercises. Turn on everything! With ball
medicine, I love m ix and match all the moves and aim for 1 5-20 throws per workout. Don't rush to give up. Not half you effort. Remember that the weight of a copper movie ball for most men should be about 10-12 pounds. Wea ker athletes should use the appropriate ball for their level of strength- don't let
you ego dictate the weight of the ball. Just make sure you re-make throws with a goal. You goal should always make 15-20 throws or jumps (or m ixture each) before each workout. This should ha ppen after the warm-up and before you start the climb. C OMBINING JUMPING. THROWING AND LIFTING
the combination of you weight training with you jumping and throwing will help make you more explo sive. I taught this in high school and believe that most people can use this once their bodies have adapted to consistently jumping, throwing and lifting. This is what I learned from reading about athletics
throwers. They did this in my opinion to help their weight training become more explosive. The idea is that when you combine something explosive with heavy weight training movement, you will become more explosive during the climb. First, let's consider the notion that your cancellation will suffer
because of this. As long as you've been lifting consistently, ren't And made jumps/throws consistently, you'll be fine. Or if you're just a hard bastard - it works too. I've found that the best way to do this is to use jumps/throws while warm-up sets out you main lift and maybe the first one or two set work. All in
all, we just do box jumps/throws between warm-up sets. Make sure you keep throwing and jumping for no more than 3 reps - it's not exercise conditioning, so don't turn it into a circus sideshow. It is imperative that each of the jumps/throws/lifts be done with a general focus - not just throw the ball or jump
on the 2 box. Be guick, be explosive. Here's an example of how to combine lifting and jumping/throwing. Let's say your first working set of dead elevators is 315 pounds. Here's how you'd approach it: D E ADLIFT/B O X JUMP S - Warm-up/mobility/flexibility. Box Jump - 3 reps x 24'. ST R E N GT H I 1 5 -

can do box jumps too. It doesn't matter what you choose as these re-all body movements and the point doesn't work muscles but prime your body. For example, in winter we do jumping into a box while we bench and click; We get the same effect as when we do medicine ball throws. I can't stress enough
the fact m uscles don't exist on the island; everything is interconnected. STRE N G TH Nothing has changed with regard to the main elevators: we still use squats, lift, press bench and press. If you get strong on these fou r movements, along with balance from other reas, you will be a strong person. If you
are injured and can't use one of these movements, change it. Just try to choose what I have in the same category; If you can't click, don't choose a slanted press or floor press. These alternative elevators take the place of the main elevator and reuse only when you can't tra
in the main elevator used in the program. SUPPLEMENTAL LIFTS These re always barbell lifts and very reminiscent of the main elevators. The 5/3/1 program has some popular extra programs boring, but a great, first set last, second set last and boring but strong. All of these additional programs can be
done with a major lift and they can lso be done with an alternative lift. If you use an extra lift you should find the right maximum preparation. The only downside to using n alternative lift is some people impatient and reluctant to spend 20 minutes and check out that lift and find training max. 1 6 I 5/3 1 1 F
ORERER Below are some additional options for each of the main lifts: DEADLIFTAL - Deficit Deadlift. Pull Stand. Pull out of the blocks. • Grip Deadlift. The Bar Deadlift. The Bar Deadlift Trap. SC WAT DOSELAL - Front squats. Box squats - A variety of different bars can be
used as well as a front squat. Safety Squat Bar. Football Bar. Football Bar. Football Bar. Football Bar. Football Bar. Football Bar Press. Football Bar Press. Football Bar Press. Football Bar Press. Football Bar Floor Press. - Log bar
bench press. - Log Bar Incline Press. - Entrance Bar Floor Press. - Entrance Bar Floor Press. - Loque Bar Press. PROGRAMMINGYOUR RAINNGJ17 Remember that not every 5/3/1 program has an extra lift. Also remember that there is a fac tion never-have-been that likes to talk about finding your weakness or some
other stupidity, which helps hide the fact that they know shit about training and programming. You can lways follow the trail turds these charlatans leave behind, looking at things like, front squats will help your deadlift and pause squats, probably the answer! And people who preach hip trick thrust. Actually,
I'm laughing out loud right now. Using d ifferent extra exercise has its place, but if you're weak as urine and can't do basic things like 10 chin ups, 20 perfect hanging leg raises, actually perform some mile run without choking on you tongue or clipping you own legs, let's keep the for later. As long as you
have some basic level of strength and some kind of fitness level, you don't need anything d ifferent. You weakness vou are not strong and you ren't in shape. You weakness listens to idiots - fix that before you add deficit pulls with chains to help you speed off the floor. The weak spots of people are rarely
muscles. It almost lways their head, their head, their heart or their lack of discipline and/or consistency. YDUII TRAINING Program Depending on your level, we program 3, 40 r 5 cycles in advance. The newer you re-structured training (and training in general), the longer you can plan ahead. The more advanced you
reuse, the shorter you plan. The preparatory plan will consist of two templates: the Leader template and the Anchor template and finally 2 leader
cycles and 1 anchor cycle. What model you use will depend on your level and the templates themselves. 3 Leaders / 2 Anchors - Used with beginners and people who make bored but big (BBB) and boring but strong (BBS) problems. I don't recommend this to most people. 2 Leaders / 2 Anchors - Rookie.
Intermediate Beginner, Intermediate, Advanced: I recommend this for almost every I ifter and Imost of each program (if applicable). Essentially it gives the lift/athlete enough time to to assess progress. For example, you can use BBS for two cycles, cycles, then go to PRs in the next cycle. Are you squate
and increasing the press with BBS? Okay - now you know you can use this to push your elevators. It didn't work for your bench press? Well done! Now you can try something new and build again. It's kind of like going through a mini-peak without having to spend six months building up to the maximum or
see if something works. With 2/1, we can also make sure that you reuse the correct maximum preparation for each elevator. I see too many people trying to hit their work kits with speed, strength and power. Also, many of these programs re-very difficult and spending more than two cycles will burn you
and disrupt any progress that you make. 2 Leaders/ 1 Anchor - 1 8 I'm 5/3/1 F O R EV E R So before the program starts, fig re-your plan. Use your learning experience to help you, or just try something different and/or fun. The problem most people have with programming their training is they want to do
everything on the same level; This is when injuries and overtraining occur. Things should be in the right proportions for contin ued success. Learning is like building a castle: every day you lay another brick. This can be done with lifting, jumping, throwing, conditioning or recovery work. Brick by brick you
slowly build a castle. Every brick is important, but the key is eventually looking and seeing that you have built a strong castle. So stop this nonsense by trying to build your body, or you target, on one training day. Train hard, but train smartly. LEADER SAGE - Increase the amount of work with the barbell,
usually in the form of additional work. Less aid. Less jumps and throws. Less tight conditioning. Focus on light conditioning. Focus on light conditioning. Easily air
conditioning can lso be done. Note: Mobil ity and flexibility tend to remain the same regardless of the template if you feel the need to do more. Typically, the Leader template is usually larger in volume for more work. The Anchor pattern will have a smaller total barbell volume, but will be more intense
(relative to 1RM) or the sets will push harder. Because Leader templates have a higher amount of barbell work, tight air conditioning will help mainta in or improve aerobic levels and help facilitate recovery. TH
E D E L O A D /7T H W E E K R OTO C O L J 1 9 Anchor patterns tend to be more intense. Help work, hard conditioning and jumping and throws I ncrease. But the volume of the barbell will be lower and you will stil I Easy air conditioning. Most of the programs in this book have both a leader and an
anchor template - all you need to decide is which one you want to do. The guidelines provided re-set I stone. There re certain n n that violate these guidelines will serve you well. Please remember that when choosing tem plates you have to be honest with yourself about your
goals, your commitment and what you body can take. Too many people think the pattern looks great, but the reality is that they are unable to handle the job. There must be some responsibility on the lift for its success. Sometimes having your heart is a good idea, but your head should at least consult.
There is ample variety and variation to choose from, no matter what your goals are. Some are re-incredibly simple, others are much more complicated. No matter which program you choose, I only ask that you buy everything in - quote Mike from Breaking Bad, No Half Measure: D EL OAD/7Te WEEK
PROT O C OL Another big change to the program is what I dubbed the Yalh Week Protocol. The reality is that the Yoh Protocol performs three functions: how to reboot, test week for your training max, or the chance to get into PR.
Where you are I have your training wil I determine how you use it. Common guidelines are: The Yoh Week Protocol will be used as a reboot between The Leader and Anchor Patterns. The Week of the Week protocol will be used to test the training maxes templates at the end of the Leader and Anchor
templates. This ensures that your training maxes re-fix for you the next round of training. The protocol of the week can also be used for shooting for a PR rep, but this is done rarely and only with certain programs. The week's protocol can be used as a reboot after any 5/3/1 cycle, no matter where you are
in the program. This is especially important for older lifts and during especially taxation pro gras ms. It's your responsibility. For each of these uses, the overall setting and percentages of the week's protocol will remain the same. What will change the re-repetitions done. This week will reduce the total, no
supplemen tal work is done and limited aid work, even if we use the protocol to test our training maxes or shoot for PR. 20 I 5/3/1 FOR EVER The biggest advantage of the vth Week protocol is allowing you to know if you are training the max properly. There will never be more issues having the right max
preparation. So if you can bench to push 300 pounds, your training max (the number you're based on all you interest on) will be 270 pounds. As I've added various extra variations and more volume and even different set/turnips for basic lifts, starting with 85% max training often Every that trains in my
weight room starts at 80-85% -progress is better, and the bar speed is never compromised. I always try to stay between 85-90% for most lifts. In genera I, stronger lifts use Learning max; There are some that use as low as 77%, but these guys are few and far between. But understand that learning max
has nothing to do with your machismo - you m ust use training max that better d rives you I ifts. And after that with hundreds of people over the years, the more progress you can make with the easier max training the better you will be. After staying with the program for a year or more, you Wil I understand
that some I ifts should have different maximum preparations than others. But if you're still in limbo, use the training highs that are recommended for each template. 7TH WEEK, TRAINING MAX TEST As a training maximum testing week, the protocol yth Week is very simple. We work up our max training
and attem pt to get 3-5 reps. If you re-shoot for 90% traini ng max, you want to get at least three reps. If you shoot for 85% tra ining max, you should get five reps. Personally, I riever want these test weeks to be true 3RM or 5RM; I want the representatives to be strong and fast. 70%x5, 80%x5, 90%x5,
100% (TM) x 3-5 Since this week's testing, there's no excuse for being too heavy out of max training. Do not increase more than the usual number These sets should not be taken to failure - as long as you hit 3-5 reps, you can stop the set. Let me make it clear again: You don't increase your preparation
max anymore if you can do more than five reps. If you are constantly making progress - don't change things if you re get stronger. This is one of the biggest mistakes that beginners make; they think that learning to max has some things to do with the level of strength. It is a tool to help the program you
train in a way that allows incontinence to uous success. This allows the bar's rope speed and allows you to take into account the bad days; not every training day will be awesome. In fact, the longer you train, the more average days you will have. And you'll have a lot of bad days too. There will be days
that make you reconsider what you do and the question that you effort. every cycle. PRS I answer the same question dozens of times a day: I got 8 reps on my final set at 95%. Should I increase my training max more than the standard five or ten pounds? The answer is NO every time. If you increase your
training max more than the allocated amount, bar speed will suffer, you will plateau faster and you will burn out and get weaker. That's common sense! If you do THEEELOAD/TTHWEEKPROTOLI21 progress, do don't sabotage you own training. Keep moving forward. Recently I had about 4
0 schoolchildren using the program We started the program using 85% of their max I had all the elevators. After three cycles, half of the children could do their training max for 15 or more reps. It's common with new lifts (1-5 years) that are new for good programming and run smart/eat well. The solution is
to keep saving Forward; Don't adjust your workout max other than the basic 5-10 pounds. If you only do one or two reps at your training max, you should adjust so that your preparation max round 85-90%. In other words, reduce the maximum preparation. In this case, use the formula to sort out your
intended max (weight x reps x .0333 weight) and adjust your maximum training to be 85-90% of that. Remember that many of the 5/3/1 training, many are re-done with 85% and several with 80%. Set you train the max properly to ensure progress. Personally, if
an athlete or lift can't perform at least five strong reps with their training max, I'll have them lower it. I've seen too much success around 85% TM for it to be a coincidence. Before any Leader template, I recommend that you spend the maximum training test week. 7<sup>TM</sup> WEEK, DELDAD Used as a
download, you just work up to one (1 rep) on your maximum training. This is for those of you who feel that you need a break and know that you are training max properly. 70%x5, 80%x3-5, 90%x1, 100% (TM) x 1 Remember that the reason for the reboot is that you never have to unload. If you're already
feeling the run down, you re-too late. As you get more experienced, you will know the signs and be able to take a week nd regroup. This is also a good option for those who know that their training maxes re-cor fix and don't need to test them. This de/oad pattern is always used between the Leader and
Anchor template. You can use it after any cycle if you feel you need it, 7<sup>TM</sup> WEEK. PR TEST Used as a PR week, you will work up to you training max and attempt to hit the target number of reps or PR. This is a good option for those who use progression S for most of your training. This is a great option
for athletes who need to keep most of their training easier (to account for all other stages of training), but still have a week where they can push and be competitive. 70% x 5, 80% x 5, 100% (TM) x PR or Target Now, obviously if you shoot for PR or purpose that day and you don't hit 3-5 reps.
you need to adjust the training max. 22 I 5/3/1 FOREVER 4 DAYS/WEEK M ONDAY TUESDAY Thursday FRIDAY Warm-up! Mobilify War1H-up! Warm up Mobilify Jumping /Tltrows 10 footy jumps / Throws 10 fufa leaps / Throws 10 furic jumps / Throws 10 fofaJ af r y ench

Push • Pull • Single Leg/Core - - 25-50 total reps per workout. 25
movements, switch to triceps pressed. This will give your shoulders a much-needed break. Help work I'm mportant but when it stops or inhi bits your basic elevators and other aspects of learning, then you re-do it wrong. Get out of you your own way - don't let your fetish help derail your goals. Conditioning.
7TH WEEK PROTO COL - 3-5 light days of air conditioning. - You can conduct air conditioning tests. I generally have people avoid doing any tight conditioning if they want to do a conditioning test. It's time to check your mile or attempt you prowler goal. If you decide to check, you should use your best J
udgment on which I ifts (if any) to click hard. Obviously, if you're using something like a Prowler or some kind of running test, it's best not to squat too hard the day before. Even if you do a conditioning test, I still recommend doing some recovery work with light conditioning other days. Don't just sit; Use this
time to get your body moving. Remember that restorative work is not a workout - it's there to make you feel better. If this doesn't happen, you re-do it wrong. Understand this important point: You will have to reset your learning highs often. The longer you train, the harder it is to make progress. And this
becomes especially relevant with the press and the press bench. So don't get upset; Just reset and attack with a nother strategy. Understand that not every elevator will increase at the same level. It's just the reality of learning. Many of the programs in this book re-very tough and may
require you to take a reboot after each cycle. Don't be so proud or so brainwashed to think that you don't need a reboot. You can't run your body into the red week after week and don't expect something bad to happen. Use your head, and use your experience. If you come to a point where you re-run too
down to train or you have too many bad days in a row, then this is on you. Plan better, recover better and use experience to teach you a lesson that you won't repeat again. Between Each Leader and Anchor Program: 7'h Deload Week Before New Programming: 7'h WeekTM Test or 7'h PR Test Week 24
I 5/3/1 FOREVER ASSISTANCE WORK One of the big problems 5/3/1 development of an aid program. I wanted something that was built enough flexibility to allow i ndividual lift to make a choice based on his preferences, his needs and what he
has access to in his weight room. Weight. It's in m Ind, I've developed a very simple solution; Each day the ING train will consist of three categories: push, pull and one foot/core. Each category is given a certain number of common reps. Genera L's recommendations for the basic 5/3/1 program are: - Push
- 50-100 total reps. You can do more or less, but understand that it has been tested and Wel I thought. This is not something I came up with on Monday and published on Tuesday. I have a specific list of movements in each category. You can mix and match any of the movements to hit your overall reps
for the workout. Using different relief exercises can add variety to your training; I don't see any problem in changing exercise to exercise that can work best for you or ones that you just enjoy doing. The key does a balanced amount of
work. So we have three main categories. From experience, most people have no problem doing dips, chin ups, rows and curls. They are blue in the face. One-legged work, hanging feet raises and backs up again another story. Even in the work of helping we
strive for balance without the need to completely d isregard what you probably want to do. So go head and do dips, but be sure to train your torso too. Understand that you should use common sense to choose the right help exercise for each program. If the program has a lot of squat and deadlift volume,
cut the lower back work and heavy rows. Instead, use face pulls, band pull-aparts and lighter abdominal exercises. Not everything should be in red when you train. ASSISTANCE WORK, PUSH D IP S Dips re a phenomenal way of developing you triceps, deltoids and chests. Not only do they build
strength, but they can add a great size deal, too, Building a large press and bench press is often limited to the lack of size in the upper body, and the dips are also good, but don't turn this exercise into a low-motion rep. While it may have some merit
to get traffic on socia I media websites, you better use the barbell movements for hard work. It's not S S S TA N C E W O R K I 2 5 means you can't download them, but doing heavy triple-to-dips isn't something I'll recommend. I recommend higher reps for this movement, 8 representatives. If you're re-
going to do 100 reps of the dips I'm training, you can do 50 common reps of weighted dips and fin-ish off with 50 repetitions of weight dips. Not everyone can make failures. This usually stems from shoulder issues, and is more common in old lifts, made more pressing in a week than most of them did in
their lives. Failures like a crazy ex-girlfriend, which is amazing in bed; it's fun at the time but you'll learn, learn Enduring repercus sions end up not worth the short-lived pleasure. If do dips leaves you shoulders in such pai n that you can't perform other movements, particularly mai barbell movements, then
it's time to give in and move on to something else. I don't recommend doing failures of every workout - I can imagine the number of men out there who think doing dips each school day will reduce the amount of time until women finally real ize how mazing they are. Well, it won't. So keep your shoulders
down and do dips once or twice a week, as a last resort. There are plenty of options you can do besides dips. P USH-UPS Don't laugh just yet. For whi le, I couldn't make dips because of shoulder problems and used push-ups in their place. Using a weight vest or chain/plate d raped across my
back/shoulders, push-ups have become an amazing alternative that I believe many have forgotten. Most people are more than strong enough to do weight push-ups, but I still have high rep kits sometimes with my weight for a change of pace. You can use pushable pens or blast straps/TAX if you are re-
so inclined. One of the best reasons for beginners to do push-ups is to find out how tight they need to be when they bench press or click. You can do this by holding the lower position for 3-5 seconds and not giving you air. Make sure your shoulder blades re-pulse brought together and your body doesn't
sag or-framing. If you don't know how to do it. do this, ask a qualified trainer who is strong and has more than than decade rea I world experience. It's a feeling at the top of your back/buttocks (and really all over) as you should feel when you bench the press or press. To practice, you should be able to
stay perfectly stiff in this position and still be able to relax you mind. You should also be able to do. I lways surprised at how
few people can do 25 straight push-ups; Don't be that guy. D UM B E L PR ESS This includes dumbbell bench press, tilt press and standing press, but only if you do them correctly. That's right to use a full range of motion, not cutting it down for the sake of
using more weight. Too many people are using dumbbells, believing they are better for wee development or whatever nonsense is being thrown at people abandoning the bar bell (or really writing an article, so it causes their name to be thrown about on social media and message boards). Unfortunately,
reducing the range of motion turns the movement into a modified press board. 26 I 5/3/1 FOREVER TRI C P S EXTENSIDNS/PUSHD OWNS I'm sure there are a dozen EMG studies that show that a straight bar is better than a rope better than a V-shaped bar for pushdowns. I honestly don't think it
matters; Use the one you want. The bands can lso be used and and Way to get a straight triceps work in your home gym. The extensions re-amazing exercise provided they don't hurt your elbows. If you decide to use extensions, my advice is to use the strictest form to reduce the weight that you use. I
see too many people turning extension into press; Hell, I was one of them, F ULL RANGE PLATE RAISE This is a great exercise for the shoulders and upper back. This is best done with a bumper plate, but you can also use the football bar, It's simple; with straight rms, you lift weights while you rms over
your head. Make sure you pinch you top of your back together at the top. This is best done for higher reps and is great for those who have to give their shoulders a break from heavy pressing. ASSISTANCE WDRK, PULL CHIN-UPS/PULL-UPS Chin-ups/Pull-ups is a term used to describe pulling your chin
over a bar without kicking/torso like an idiot. I can't recommend enough, using a wide range of grips, bars and tools to do so. You can change grips/implements each workout or between each set. I recommend using ropes and towels as part of your chin before training to help I mprove you g rip. Unlike
failures, however, you can do some lower reps on this movement, as this will not negatively affect the strength of the work done with the barbell. FAT MAN R OW S AKA INVERTED ROWS This is a great exercise for those of you who cannot do chin ups, and even for those who can make them. If you re-
strong enough to make a chin box, throw on a weighted vest and challenge you rself to some h igh-rep sets I nverted strings. It's a big change of pace. It's best to do this with a barbell installed in the rack in the appropriate position, sm ith machine or with Blast Straps/TRX straps. I even made them in my
garage with adjustable drop handles in my squat rack. Whatever you decide to do, make sure your body is tight-nosed llowed. If you re-sag too much, raise the bar/straps until you can make them right. Another great variation of doing chin ups/pull-ups/inverted strings is what I did years ago to build my
volume. I would have done a series of pull-ups on the chin bar I had a power rack. When I reached my goal, I would put my feet on the barbell, which was set in the rack, in front of my body. I'd call these Scammers, I'd finish off 10 more reps or so with my feet on the barbell. I'm sure there's a name for
them, but I'll stick to what I've got. Try this option if you suck at pulling your chin over a stationary bar. A S I S S T C E W O R K I 2 7 ROWS I personally recommend dumbbells string over the barbell due to lack of stress on the lower back. You can also T-Bar series. Apparently there's a re-20 different
versions of the barbell line now - it's amazing how complex the damn series can become. Whatever you decide to do, be sure to treat the barbell string as a muscle rather than movement: What does this mean is that you re-do exercises to help strengthen your back and compliment the core if. If. don't use
the by any means form to paddle the barbell. There is always a time and place for this, but not in this program. There's a re-a lot of fine rowing machines out there - Hammer Strength always has great string equipment. Unfortunately, they don't have the same training effect as a barbell or dumbbell. They
re great for muscle building, but they have virtually no ca rryover to create a strong dead I ift. Aside from creating big, strong backs for pressing, barbells and dumbbell rows are a great way to strengthen the lockout on a dead elevator. It's learning the economy at its best. If I had to choose one kind of
string that is carried over to most I ifts it would be dumbbell strings. For the press or press, it helps to build a strong upper back and lats, both of which provide stability and strength in these movements. For the deadlift, the dumbbell strings helps with the lockout and maintain ing proper position throughout the strings helps to build a strong upper back and lats, both of which provide stability and strength in these movements.
the elevator. For squats, it helps to develop a strong upper back to maintain position and provide a thick muscle pad to place the bar on. The real kicker clutch is the strength that dumbbell strings develops - essential to the press, bench press and especially the dead lift. It is best to develop with higher
reps (20-50) using the heaviest weight you can use while maintaining some semblance of proper shape. Guntel Row is a one-stop exercise and learning economy at its best. CURLS Coming from a sports background, I always lifted weights to be better on the field or on the track. It was never for cosmetic
reasons. So I never gave a curl at any time in my training. However, curls are still important in this program and curls help balance that as well as a great way to prevent shoulder injury. The body does not exist in individual parts, despite what popular
magazines tell you. It's an all-great system, and curls aren't just for bodybuilders. Strong hands are important, so don't neglect curls. You don't have to be a champion curl either. This can be done with a rod, dumbbell, or any of the millions of bars/cables or machines that someone invented to make curls.
LAT PULLDOWN After chin up/pull: the windows started to get all the love I'm fitness press: the lat retractables were relegated to the sideline and ashamed of being the second best. Lat pulling in order - the big problem with them is that you need a specialized machine to make them. You can do chin
ups/pull ups almost nywhere, so they re-program much easier. There are probably hundreds of different machines and attachments to use when making retractable lats. They're all right. I sti I I recommend chin-ups/pull-ups, rows and upside-down rows over pulldowns. But they 28 I 5/3/1 FOREVER BAND
PULL-APARTS This exercise wins the award for Most Bori ng, but effective exercise: Have I seen too many people fix their PR shoulder? blems by making pull-a strip parts; daily or or school day. Keeping a group pull parts every day (or train ing day) can fix a lot of problems. Not all of them, I'll be fine.
Most people do pull-aparts with m ini-band, monster mini-group, or light group. Which group you use doesn't really matter. Make sure you reuse the full range of movement and holding the top posi tion - you rms outstretched to you side. I like to use different angles, but I think it's m ight to be me struggling
with boredom. This can be done on you over the weekend and re-large when you re-perform your warm-up sets bench press and press. FA CE P U LLS Face pulls re very similar to the group pull parts, but a little more I ntensive. This line is done with a face/head. One day I saw an article deta iling how to
make a face pull; it's like teaching someone how to push a sled. Face pull is not a move you re-try to max on or install some kind of PR. Lots of reps and don't be n idiot; this is the face of Mantra Pull. Face pulls can be done with a band or any kind of cable machine/app. These exercises g reat to make in
home gymnastics; You can attach the strip to the chin bar (or something like that). If you're shoulder hurt, you can always make the sled face pulls - the lack of an eccentric phase can be a blessing to ing for you shoulders. REAR LATE RALS It can be done with plates, du mbbells or cables. They are best
made for higher reps with a fairly strict shape and are in the same class as the face pulls and strip pull parts. Let's not waste any more space on this movement. UPRIGHT ROW As an extension of the foot, the vertical row has been reviled b by every fitness expert, even those with no experience or
credentials that will qualify them to make this statement. It looks like there's a re-a lot of physiotherapists and orthopedic surgeons trolling around the internet. Fortunately for us, they have extra time on their hands and are once again willing to refuse counseling without seeing someone personally, all
masquerading as Mass4Ever: Who needs socialized medical care when the Internet can properly diagnose and treat most health problems? The vertical range is far from ideal, but people did them forever without prob lem; although some people have problems. It seems ike you have to make a choice;
freedom lways is a great thing for smart, active people who take responsibility for what they do and what happens to them. This can be done with a barbell or ny cable fastening attached to a low pulley. These are great for building big traps but not sure if they carry over to anything significant. A S I S S T
C E W O R K I 2 9 SHRUGS Despite my love of big traps, I'm not a big fan of shrugs, but I recognize their use. It can be done carelessly, rigorously and with various tools: barbell, trap bar, dumbbells, or weights. I use the term sloppy, please understand that it still means that the shoulders move up and
down - there must be a noticeable movement. Don't just move your head as the chicken pecks Food. You know these people, perhaps you are the aforementioned chicken; anyway, stop it, Everyone's laughing at you, AID WORK, One, LEG/CORE BACK RAISES or REVERSE HYPEREXTENSIONS.
Despite the trends today ignoring any direct work of the lower back, I still believe I need to do more than a squat and dead lift to strengthen the lower back. The average person who just wants to get a little stron ger and be more fit probably doesn't need it anymore. But there's no way you re-read this book
and looking to be more suited: there are a lot of lifts out there that have hurt or hurt your back despite being strong. Of course, many of these cases are inevitable - you lift a lot of weights and get an inch out of the shit position going on. But many of the injuries occur when picking up a plate or doing
            outside the weight room. Rear raise and reverse hyperextension (RH) is a way of minimizing this risk as well as strengthening squats and pull. The rear raise/RH allows you to train at higher ranges of rep, which is rarely involved in the strength training program. So not only do you streng
your back with heavy, low rep movements with a dead elevator, but you also use a high rep job. Both of these movements are reused also great for hamstrings and buttocks. Again, remember why you re-do what you do. Don't just make a move and do with it. Focus on your lower back, glute and
hamstrings - get them to do the job. If you don't have access to a reverse hyper extension machine, I reluctantly did because of using 20-pound ankle weights and lying on my kitchen counter. Back raises can be done almost anywhere; A 45-degree back raise is also acceptable and easier to use and
load. GLUTE HAM RAISE In order to make the right gluteus ham lift, you need specialized equipment. These re-g reat way of strengthening you lower back, hamstrings and buttocks without a barbell in your hands or on you back. There is also a Natural G lute ham lift or a North Glute Ham Ra ise that can
be made in any gym. This option is not very convenient and can accentuate the knees and back of the knees - but it is an option. STRAIGHT LE G D EADLIFT (SLDL) / G O O D MORNING (GM) These are two large movements to help strengthen the posterior, buttocks and hamstrings. However, too
many people do this and turn them into a mainstream movement instead of using the right shape. They d rop their hips, use their feet or cut a range of movement. You'd better use less weight and the right shape - it's a movement of help, not a powerlifting contest. 30 I 5/3/1 FOREVER Remember that
you use SLDL and G M as a n aid movement rather than a basic or flexible mental lift. So if you get too sore from these I you did it wrong. In fact, if you get too sore from any job help, you're either really out of shape or doing it wrong. BD OMINAL WORK (VARIO US) Tam re hu ndreds d ifferent
abdominal cavity Over there. So I'm not going to bother to I ist them II. But as the comments bove the fight back to lift, I believe that a serious strength athlete needs d I fix the bdominal work. Have I seen the way to C? many people add in direct abdominal work and I ncrease their elevators in order to be a
coincidence. I lso believe that most strength athletes should focus on h ig its repetitions (or at least more sets with slower reps) for abdominal work. If I had to choose two movements that most people re-familiar with and that re-I'm ncred ibly effective, I'd choose an AB wheel and a hanging leg lift. If you
have bad shoulders, buy some leg lift straps that attach to the chin bar and save you rself pain. AB wheel Iso g reat when using a weight vest, Whatever movements you choose, don't ignore it. I see too m ny soft stomachs n d weak lower backs in I ifting today - build you m idsection so that it's bulletproof.
Years ago I heard a throwing coach talk about training for his javelin throwers. During the WA someone asked for his bout of abdominal work, and he noted that it is expected for them to perform 50 hanging straight leg raises as part of their ING train. It was expected! The strength of torso-throwing
athletes is usually damn amazing, and it's no coincidence that they're also incredibly powerful. SINGLE LE G MOVEMENTS I'm going to lump all the most popular one-legged movements together: step-ups, lunge variations and one-legged squats (usually known as Bulgarian one-leg squats). Each of
them can be done with different tools: barbell, dumbbell, weight and weight vest. There is no better movement of one foot: every so often I read an article detailing the reasons why a reverse lunge is better than a walking lunge, and two things go through my mind. First of all, why the hell am I reading an
article about lunges? And secondly, it's a bloody lunge, who cares? So don't get caught up in the noise. One thing that is true for all these movements is to focus on form and performance rather than weight. As soon as the weight becomes too heavy, the form becomes compromised...:-with short steps on
lunges and Bulgarian squats and steps that become double movement of the legs. Feel free to challenge yourself on these movement itself. KETTLE B ELLS/SWIN G HANDLE Kettlebells re a g reat tool, but I would never consider them
essentia I for nyone, which wants to be strong, fast, explosive and conditional. In the early 2000s, the weights came back and promised everything: strength, speed, concussion and fat loss. And while they may have put the S S S S N T N C E W O R K J 31 for the public (for b e fair, any physical activity
for the entire public would matter), experienced athletes and lifts knew otherwise. It's hard to people who have been in the trenches for Years. How To The fitness trend that catches on, the weights have been zealous followers, ready to strike down a ny opponent and take to heart any criticism. This is
evident in any fitness trend; Untra ined people get some results and swear they have found gold. On the stake with the unbelievers! How dare you guestion our God! Like everything, time gives perspective, and weights have their place - I help work. I recommend doing a swing KB (which can LSO be
done with T-Handle), KB Clean and KB snatch. You can do it with one or a double KB, and a lot of it depends on what you have access to. Again, an amazing tool, but the barbell, for strength, is still the king and lways will be. FARMER WALK I like the farmer walk and think it can be a great way to build
you back, grip and core strength. Note that I didn't mention conditioning: Using a farmer's walk as conditioning is basically a bad idea of being committed to uneducated lifts that don't have the benefit of experience or even the brain. For advanced I ifter, this can be done for strength and conditioning. For a
beginner who lacks a physical background to even get up with a barbell and put it back down, it's a terrible idea. Asking someone to wal K with a heavy weight, while fatigue when h body is barely conditioned to do a squat asks for trouble. People love exercise and I get it - it's fun to do and looks pretty
cool. Used properly, I think it has merit. Used inappropriately and I think its funny. There's a re-enaction of many other ways to make heavy, weight is not one of them. G enerally, the farmer walk is done for 240-400 total yards in training.
Eight do not have to be harsh to get a positive effect and make progress. D B S OUAT Also known as Cup squats, this movement is good for beginners and for those that re-indicated cally do program Krypteia. N ECK I a lways d o some neck work after each workout and I don't find it in any particular
category assis tance - this j ust exists on its own. If you have access to a 4-way neck machine, get on it and use it. But gyms that have those are few and far between so let's stick to two simple movements to make: widening the neck and flexing the neck. 32 I 5/3/1 FOREVER neck extension is best done
with neck use; they are inexpensive and easy to bring with you to the gym. I'm not going to explain how to make a neck use as it's pretty simple. Use a light enough weight to use full range of motion. Bending your neck is best done with you head off the bench - just lie on the bench a11d scoot y ntil head
handing from the side. Place the plate on your forehead, and keep it steady using your hands. I recommend a folded towel or shirt between the forehead and the plate. From Ot lift and lower your head. With the extension and bending, it's best to keep the reps pretty high and keep the volume low until
you're used to the movements. Sleeping with a dense/tired neck is terrible. So take it slowly and build up over time. Neck work is not essential for most people, but if you play ny contact sports or just want to look stronger, neck work is recommended. Overall, I recommend 50-100 total reps per workout.
HELP WO RK. EXAMPLE In general, I recommend choosing only one or two exercises in each category, per workout. Obviously, some movements are re-done better done for a higher total number of reps. If you program calls for 50-100 total reps pulling, you can perform 25 common repetitions of
weighted chins and 75 common reps of facial pulls. For one foot/core work, you can combine leg raises (30 common reps) with KB swing 50 total reps). Some 5/3/1 patterns are re-harder than others, so it's best to choose a job to help that easier to recover from, such as body weight work and things like
face pulls and stripes to pull parts. If the template is simpler and you do less extra work, feel free to use motion aid that may challenge you. What I'm asking is to use common sense. B O DYWEIGHT HELP I'm a fan of h uge using body weight movements to work on aid. The work of weight assistance
itself is limited. Bodyweight only supporters wanted to see you that anyone can get great and strong using push-ups and their brothers. They often cite Hershel Walker and Olympic gymnasts as their examples - but Walker played pro-football and won the Heisman. Olympic gymnasts re in Olympics. So
let's not use an exception to prove the rule. However, body weight work as an aid when used as part of a balanced program of training barbells, jumping, throwing, work mobility and conditioning becomes another animal. One of the reasons why I like the job of weight relief is that it allows the lift to get
more volume in its preparation without much harm to its joints. It is possible to recover much faster from body weight work than barbell training. Of course, this becomes a problem if the lift uses a crappy shape; Just watch someone doing a half rep push up or using excessive momentum off the ring chin-
y p/pull up. It's a joke. If you want to get something out of exercise, do it right. So you push-u PS and dips with ful I range of motion, stopping at the top and bottom for a second. Don't flai I around L I'm a ke idiot when you hang from a bar - you're not impressing anyone with your self-destructive lifting. S S
ISTANCEWORKI33 Bodyweight work aid can lso act as a marker strength and (due to lack of a better term) fitness level. For example, expecting someone to perform 10 chin-ups/pull-ups, 25 push-ups, 15 dips n d 10 hanging leg raises don't ask for much; how many times have you seen
someone ask for a specialized squat plan or who can't figure out why his dead elevator lift stuck still can't perform these most basic physical tasks? If the lift does not have the strength to lift its feet on the chi bar for 10 slow, consecutive reps it does not have the basic bdominal power to get it very far into
the main ifts. If he can't make 20 back raises, do you really think it's his lack of front squats that re-encroaches on his dead elevator? So cover the basics before you even think about moving to something more advanced. Body work is not sexy and it is much more fun to think that your weakness is
something specific rather than general. But the fact remains that many of us, I am including uded, often ignore the basics and what I mportant. You can have all the fantasy football plays and the latter can't miss prospects, but if you don't block, tackle and hold on to the ball, you're not going to get very far.
Bodyweight work, along with different conditioning goals, ensures that your workouts and diets are balanced. It is difficult to get thicker and still maintain a high level of conditioning and relative strength. I like to measure body strength with more than just everything from the set. We use 1 0-minute tests for
dips, chin/pulse I-UPS, push-ups and hanging leg lifts. The test is simple: do as many repetitions of g iven exercises I have 10 minutes. The standards are not very high, but should g ive people the idea of their relative strength. Do not be alarmed if these standards, at this time, are out of reach. That's why
you train: to get better. These standards are for men. 100 r5 50 50 These tests can be done at any time I you train, but use common sense. If you're up for forming a heavy bench workout on Tuesday, don't do a push-up test on Monday. I recommend doing only one during a workout. You don't have to do
a test every time you use the training to help build your strength and test every couple of weeks. From a coaching point of the training to help build your strength and test every couple of weeks. From a coaching point of the training to help build your strength and test every couple of weeks. From a coaching point of the training to help build your strength and test every couple of weeks.
session. Understand that if you are re-weaker ifter, body weight help work should not be your only choice. You still have to use dumbbells, weights and make the face pull all the interesting things that everyone is talking about. For push-ups, dips, chin-ups and pull-ups, I also have a 10-minute test done
with a weight vest of 10% and 20% body weight. This is great for those of you who need a more challenging task. The goal of 34 I am 5/3/1 FOREVER simple - to reach the numbers above with 20% weight added to the weight of the vest. If a 200-pound man can knock out more than 75 d ips with 40 
pounds in 10 minutes, he will be on his way to pretty Strong. Training and assistance should not be difficult, nor should there be all isolation movements. If you're like me, me, j ust want to be strong and be able to keep you your own: Stick with the basics, add to the weight vest when appropriate and you
will never be weak and vou will never lose your way ... F... ' • . • • . . ... • .. PART Cl.. t 1' ... | ... • . ... ... TRAINING/pza a th illMMiliti . . .. • . ... J... J 36 I 5/3/1 FOREVER IN THE BEGINNING Over the past few years, I have been able to work with great group normal people. In
other words, none of these people have been ab termsing 500 pounds in 13 years. Of all these people, only one has been tra I ning seriously for more than five years. It was a welcome change for me as I am at the point of my life that I want to bring back to others. The point of starting a workout is simple:
build a foundation. While lifting weights and getting stronger is good, we're looking at a much bigger picture. I call it Getting Classical Learning: Think of it this way: a young student who starts with the education of various sciences, mathematics, history, art, music, g rammar, rhetoric, literature and physical
culture is much better at solving different jobs and problems than a person who just studies one thing. A healthy, educated person who has the right to absorb, think, u nderstand and apply is someone who has a chance to g reat to succeed in any pursuit he may want. For some, he is the most dangerous
man in the world. And it makes many of us wonder where the public education system gets their ideas for their odd curriculum choices. But this is a topic that should be reserved for not her time. The training world is divided into factions: strength, map io, mobility, speed, weights and a bunch of people
who champion the latest tra ining gadget or trend that gets hold of public interest. There's repeatedly thousands of experts with ion mill followers, and I I believe they are re-qualified. And in a way, they're over. The average person usually needs to just go out and do something. Our bodies have de-
evolved as our world has evolved. And that's just why: most of us don't require a strong body to work at the computer. Thus, the fact that people do SOM ETH ing is usually better than nothing for the average person. However, for the rest of us who believe that there is beauty in having a strong body and
mind, just doing something ing is not good enough. And the truth is that something, does not justify the crap that is being thrown away and marketed as fitness. At some point, there must be some responsibility for doing more harm than good. So while many of the factions have
some grains of wisdom, others like still outside common sense, that part of me views it as Darwin ism. The key to classical learning, education is to take the grain from different factions and combine them, Intel Intel give you are the best chance of success no matter you are stalking. I firmly believe that
once you get to your specialty or your training major: having a large amount of expe-. rience in other areas of learning will have a lot of skills to g raw from. Your set of Wil L G string tools and experiences. You will be better equipped to handle the training
plateau. Now, of course, there are re-outliers, Tiger Woods from the world of training. But never use an exception to prove the rule. Special ization in tra ining should be reserved after a decade or even more sical tra clas in ING. I N T H E B EG I N N N G I 37 I usually refer to classical training with athlete
training. Now I have deep roots in football preparation, but I have Iso trained for other sports. And I've coached OTHER for a variety of sports. And while each sport requires different skills on the field/court, physical needs. I've done dozens and dozens of workshops and the same questions seem to pop
up about preparing ATH letes. For example, suppose a person has a child who plays basketball and the parent wants their child to be better. I usually say something like this: Basketball is a unique sport. It requires strong hips, legs, abdomen and shoulders and rms. It requires you to be in good shape,
be fast and be explosive. This requires good footwork and full body awareness. This is very different from football, which requires and arms. It requires you to be in good shape, be fast and be explosive. This requires good footwork and full body awareness.
Looks like you son needs specialized training for a basketball player: The fact is an athlete, in general, requires the same basic things from sports to sports. When an athlete has been under the same physical training system for years, things can be specifically ized for his or her needs. However, very few
athletes re-I system long enough to do so. To add more fuel, in my opinion, several athletes are re-in the system with a long-term training result in mind. High school coaches, while I understand their plight, are not equipped with sufficient training knowledge or facilities to train their athletes. Often, the
youngest trainer is used to monitor the weight room and workouts placed on the weight room bulletin board. Let me make it clear: oh this is not an indictment of these coaches as they are doing their best. But if you put me in a classroom and expect me to teach chemistry, my only answer is to put a movie
with Will Ferrell and John C. Reilly and explain: Their partnership is real chemistry: At the college level, everything is certainly better. Although the trainers are better equipped and knowl edgeable, they badly outnumbered and answered too many coaches with lots of opinions and none of the experience.
It's like politicians are fleeing war, a very dangerous problem. But at least, for the most part, athletes re-given 4-5 years of progressive training, usually under the same system. While it's never perfect, it's what we shoot for. I confess that this style of learning is not perfect, but I tried to competently combine
different ideas and protocols in the whole curriculum. The problem with combining the different ideas and approaches I nto curriculum is that too often, everything becomes important. And with that comes a lack of balance. Too many times people equate balance to time spent on activities. One hour of
lifting weights should be balanced with one hour of stretching with one hour of conditioning and so on. This is what is known as really Fucking Stupid Training. I'm not sure, but I believe that zazirsky coined the term. Combining these things into an intelligent program is like making a good stew. You don't
iust th a pound of meat, pound vegetables, a pound of salt and a pound of carrots and expect it to be delicious. You have to proportion things correctly. It's not hard to understand the concept, 38 I 5/3/1 F O R EVER B E IiINII PRI P S CHO O L I have a great home gym. My garage is my dedicated tra
ining place. It has a platform, monolift, bench press, chin/drop/squat stand combo and a huge variety of bars and gadgets and other things that make this the ultimate gvm home for someone seriously taken to strength training. My wife also trains there, and hopefully my kids sometime too. But in the last
few years, I've opened a gym for some local kids, and the results have been outstanding. I have a soft spot for schoolchildren like this when I found out all about training. I also had a great mentor and was lucky enough to recognize the opportunity he gave me. I want to give these kids the same
opportunity as possible. No matter who comes here, no matter what level, we work to get to the most basic level of fitness. This is. Includes mobility, strength, jumping and cond itioni ng. The strength part is not about the bench or squatting a certain number. It's about nobility to do the appropriate work, so
don't get too cerned just yet that you have to squat 500 pounds before I recommend you move on. Once we ach ieve this level, I know that a person can handle just about any exercise opportunity or change. In other words, we are building a base that allows us to move on properly. But until then, we keep
working and knocking away. In general, children rise three times a week. This is usually due to the practice, school, activity and life of a high school student. Also, I know everyone can comm it three days a week lifting up at the gym while they train in other areas on their own. We divide the training
sessions A and B, which they rotate every training day. Thus great amount of flexibility in planning, running and wickets sthenics. This program is basic as it gets, but you would registed about how many people need it, adults included.
C:ALISTHENIC:S WARM-UP For beginners, a simple workout using all body weight movements works well. Jumping Nest 3 sets of 10 reps climbers 3 sets of 10 reps / legs - - - - The key to them is not rushing through them. You have to make jumping nests with
weapons as straight as possible. Body weight squats should be as low as you can go. Climbers should be made with huge steps. Remember, it's not easy to do it, it's about doing it right. This should be done as a circuit before each workout. So you do one set of jumping nests followed by one set of body
weight squats, then one set of mountain climbers. Do it a total of three times. JUMPING After the workout you start your Jumping routine. I recommend one of two things: a box jump or a standing long jump. The focus is on these jumps using a common body (hand!) and landing BEGINNER PREP
SCHOOL I 39 strong. We always do about 10-20 jumps per workout. You want to keep it as simple as possible and only have them do what they can handle. In other words, the depth of the jump is not recommended again. LIFTING We use two basic workouts with this program, n workout and workout B.
Each day has two basic lifts, each with its own extra work. Then we do some relief work, usu ally weight or something like that. This pattern helps to develop excellent shape on the main lifts and includes an additional volume to strengthen and strengthen the body and develop the relative strength of the
body. Once one of my lifts are solid with his appliances in the elevators, I will check it thoroughly in each elevator. We will work slowly to do sets of 5 reps. Overall, this is done with 5-10% J umps of what I believe is a single rep max or someth ing close) to be. All you have to do is make a just-out-of-the-
high school guess. So overall, you'll use a 5.10, 15, 20, or 25 pound pitch. Just be smart, and use you to make better judgment. You don't have to wait until it misses I use bar speed or blatant technical glitch as a stop point. - From there, we usually use about max training (TM) 85-90% - use the formula to
find the lift estimated max (weight raised x the number of reps performed x .0333 and weight raised) and then take 85-90% of this for TM. For stronger lifts, where the lift is either more experienced, but still begi nner, we use 90%. For elevators with which they either struggle in terms of weight or shape, we
use 85% for TM. This allows the lift to use some light weights when correcting its shape. WEEK ONE MONDA: WBD 3AЙ War1t1-up/Mobiliiy War1t1-up/Mobiliiy s! Броски 1 -20 фото/ Ju s! Броски 1 -20 fofal Ju s! Броски 1 -20 fofal Squ'f J)e'd/iff Squ'f »nch Press »nch Press

sets provide additional work (in this case, using First Last Set for 5 sets of 5 reps). Between the main squat work, we usually do push-ups. And no, it won't make you weaker on the bench. It's about getting your body ready for battle, so to speak. While working supplemental (in this case, this is First Set
Last), we will make another body weight movement such as squats, chin-ups or inverted rows or perform face pulls or pull bands. The key is to keep moving. It's all not to fail or is going to make a dent I'm a barbell lift - but it does add up over time. WORKOUT B D EADLIFT/PRESS Week 1 - 70% x 5,
80% x 5, 90% x 5, 5 sets 5 reps - 70% Week 2 - 65% x 5, 75% x 5, 85% x 5, 5 sets of 5 reps - 65% Week 3 - 75% x 5, 85% x 5, 95% x 5, 5 sets of 5 reps and 75% There is no difference between sets/reps of two days. However, we found that for weak lifts (those you reuse using 85% TM), we'll do a
second set last as the supplemental work. We do the same sets and reps (5 sets of 5 reps). The main thing I'm looking for is clear bar speed and good form. BEGINERPROLLI41 I'm not a form Nazi, nor do I think the elevator should be did one way. We have kids who have better
high bar squatters, some of whom are better low bar squatters and nother who uses only a squat box. Bar speed vil I always be a problem at the beginning, as they just learn to push hard. Eventually they learn to be strong, fast and under complete control. It just takes some time and constant reminders,
every representative and set. The whole point is that there is a re-quality of repetitions, not just a bunch of reps. I can't stress this idea enough. For the sake of learning movements and learning how to do them with GOOD, I'd rather have them do 5 great reps than 10 crappy ones. And no one can make
an easy set of 10 reps look worse than someone who hasn't learned 5 big reps. I know everyone wants to raise 12 times a week, but for what we do, a total balanced program that includes running, jumping, lifting and calisthen ICS, three days of lifting is enough. I can say this because I've trained almost
everything that comes here like this and they've all made huge jumps. In fact, we had one child come in one improve its squat from 95x5 reps to 185x23. Yes, part of it is his inability to show squatting, but I'll be honest with you -- his leg strength was terrible. We had to stick to this basic phase for 6
months until we were able to move on to something else. The purpose of this part of the training is to make each elevator, including an additional part, done in 15-18 minutes. Thus, the two main elevators and their extra work should take you 30-36 minutes. Until the lift can make this time, we will not move
on to another pattern. The first couple of workouts, I keep running the clock, but I don't push too hard. I just want to see where the athlete is at without him being too coached. For the sake of simplicity, we want to see where the lift is natural. I don't want to sacrifice coaching and technique to beat the timer
I also make sure the set is never in a hurry. It's not about beating the watch, it's about being in great shape tra ining so that the watch is not an issue. This is a very basic workout that almost everyone should be able to complete. Remember that there will obviously be a time lag between the lifts - this is
not considered to be by the total time. Make one lift, finish, and then take .break and adjust to the next. Please don't be an fighting time between elevators. No, as long as I feel the athlete is ready to push hard I will do the same. In other words, we don't test u ntil I know his mind and body re 100%. HELP
Aid work is a little different from what most people are used to: we use dumbbel I, body weight and kettlebel I movements to help work in chains like .fashion, There are four training exercises and we usually do 3-5 sets each. However, if someone can't do all the reps for this move. I'll have it go back to
him y nti I he completes all the reps. In the beginning, it is important to remember that the general grief of repetitions on these movements will vary greatly from person to person. Below is the list of the ultimate goal. I strongly advise you to err on the side of too few reps in motion if you are not used to it. If
you don't have weights (KB), you can easily build a T-Handle using a seal pipe for you nder $10. There are a dozen places to find instructions on the internet; You can load these things up to quite heavy (200 pounds) so that they can be used by different levels of strength. These homemade T-Handles fit
standard, not Olympic, plates; so make sure you have on hand or you can buy 42 I 5/3/1 FOREVER ones. I find that some places sell T-Handles, which take Olympic-style plates, so that's definitely. Option. The power of ath lete will largely determine the weight of the weight, but I n generally, high school
people all make 53 pounds on swing and 36 pounds with snatch. Again, adapt this as ever you see fit. If you don't want to do any swings or KB movements, squat body weight for sets of 1 0-25 or even a single foot movement can work in its place. foot work is great but if the lift is not strong enough to do
```

```
On two legs, be careful when trying to do it on one. Make sure it has the strength, coordination and balance to make the movement of one foot, One-legged works are performed for 5-10 repetitions; Representatives determ ined by how competent the lift is in motion, BXBRCJSB REPS Ke/Hebel/

the windows, use inverted strings instead. The scheme is done five times and it should be completed in 20 minutes. It's more than enough time to do it. The only problem is the KB snatch as you have to make both hands; It can take a long time. You can combine KB snatch with KB swing: One swing is
followed by one snatch. That would be two representatives. In genera I, I'll have lifts alternative traffic whenever they want - it really doesn't matter too much m ah as they are all basic whether the same traffic. It's incredi bly simple work, and just a fight ny man who has incredibly average
strength/conditioning can go through it. BEG In NER PREP SCHOOL I 43 RUNNING Sometimes, we will use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status, but most of the time we use Prowler for ING status for ING status
but on the days when he had to squat, we used Prowler and sleds to help strengthen his legs. So he was getting a good job for his h ips and legs without worrying about the technique. Remember that our ultimate goal is to get them stronger overall. If you have access to a foot press machine, it would be
a good time to use it. Running has also become one of the goals for beginner programs for my high school athletes. For running, the big focus at this stage was a one-mile run. I insisted that they run three times a week, at least one mile, no more than three. The main purpose of this was to be able to run
one mile; That's what it's about. I'm amazed at how few healthy people can run one mile, even at a slow pace. The only time I allowed this slide was in the season. To change the tempo, I gave them a few running workouts that could have been done on Track.
Remember, I'm L Ive in a small town, and the track is open to the public. You can't have this option, so I recommend working on the street or an open grass field; be creative. Choose from the distances/workouts listed below. D ISTANCE NUMBB R DP RUNS 100w, 10-16 200w, 6-8 'fOOw, If-6 800w, 2-3 I
Never about the rest time between the tracks - just do it. The only thing I stressed was a run, not a sprint. Keep your mouth/jaw loose and try to relax as much as you can. Some of the kids will run the stadium steps or the hill. I really didn't care too much until they ran. For kids who wanted something extra
in the days when they weren't I ifting, I made sure to stress that they could do whatever they wanted provided it was body weight. To make it simple, I instructed them to do the same basic relief work that we do in the weight room. Since few children had access to weights, they made one leg variations.
They were free to do it every day they weren't in the weight room, including the days they ran. So if you want to do more, that's the answer. The whole point that was emphasized is that we will lift weights in my room, nowhere else. No one screws their training more than people who aren't what the hell
they do. I can't tell you how many times I've had to knock this in their heads. And 100% of the time when they screw it up, it showed. Everyone who is committed to this plan has become better. And not just a little; seeing the changes in them was absolutely amazing. I had teachers, neighbors and parents
all commenting on the physical, emotional and social changes when they started learning. And to my surprise, it wasn't just a barbell. These kids loved to be challenged the running and body weight work, 44 I am 5/3/1 FOREVER Having this plan has done wonders for everyone who has used it. Having a
good birth base L training, the one that d raw on different ideas will set you up for the remainder of your training career. And in the case of these children, it helps them understand the importance of balance in learning. I emphasize this over and over again, especially when kids are going to go to college
again. I want to teach them how to train, how to be more than just the weight on the bar, and how to push themselves. I have five goals for the beginner program: Each main elevator and an additional elevator that will be finished in 15-18 minutes. The key to this is not to force-time; rather, they should be
able to achieve this goa I on their own. I didn't force the issue at the beginning, but as the lift gets in better shape, this time the rule should be light and easy. The total time, plug on both lifts, should be about 30-36 minutes. - Aid work done in 20 minutes. - Be able to run one mile. Learn to jump and land
properly. Install grou ndwork for a balanced curriculum. Running. Lifting. Jumping. Gymnastics. Not a bad way to start training. I have each of the lifts trying to milk this program for as long as they can. After each cycle, they will increase their maximums of preparation. Because some of them are terribly
weak in one or more of the lifts, we can only them five pounds for a squat and dead elevator; or we will repeat the cycle or r
offer these solutions: - Reserve time three cycles and repeat. Reserve time three cycles and start clicking the last set for PR or goal. That doesn't mean you go crazy on the last set for PR or goal. That doesn't mean you go crazy on the last set for PR or goal. That doesn't mean you go crazy on the last set for PR or goal.
increase the amount of additional work 7-10x5 and FSL). Reserve time three cycles and run 5x5/3/1 (see this book for an explanation). Other ways you could address diet and sleep. You have to eat to get strong. This may not be a
huge factor in the first couple of months as an additional learning incentive is frequent enough. People will get stronger, in general, as long as they re-train hard enough. At some point, you will re-have to eat to support you learning. Sleep essentia I for ny physical or mental effort - the only person who will
discuss it is the one who does not have enough sleep. B O R I N G U T B I G I 45 The ultimate way to take is to go about to nother pattern; Start all over again and attack it. Remember to never look at the plateau as bad; It's you way of showing that you have the struggle, discipline and consistency. B
ORING B UT B I G - Always a dark leader plate. Great for people wanting to gain some muscle. Power can be gained in you nger I ifters. Not a good option for athletes, real beginners and very advanced lifts. 85% RM for most I ifters, 90% for beginners. Of all the 5/3/1 extra work, Boring But Big (BBB) is
easily the most popular. Whether it's because it feeds a bodybuilder's closet, is very easy to implement or just works, it's a go-to pattern for many people. Let's clarify a few m isconceptions before we start. First, BBB is not a good template for very new beginners or advanced lifts. Beginners are not very
good with multiple sets of ten reps, as they do not have the strength or technique to make their crust fix. I have coached many beginners and have seen enough form to check the video to understand that beginners are not very good when fatigued. It's pa i nful. Actually, I feel good here. There is a very
simple test to determine whether or not you are a re-newbie. If you ask a question: I wonder if I'm a newbie?, then you're the one. If you want something specific, I would say, on the whole, a beginner has less than one year of consistently training the right way. So you can be a beginner if you've been
training for five years, and it's best to describe your training as sporadic or mish-mash every program read in a magazine or online: The latter is a good ple exam to have too much information and not having meaning to understand that not all the gospel. Do people really believe everything they read? I'm
looking for hope that they don't. It helps me, hope for the future. Advanced lifts instinctively realize that BBB is not for them, and if they try to do so, know that they have a percentage of their extra work very, very low. The reason for this is simple: 60% for n intermediates is not the same as 60% for an
advanced lift. If you can do 60% or 70% (or what ever percentage) without much mental/physical training or attention to technique, you are not over advanced. Let's use some numbers to make me llustrate this. Let's say a 200-pound guy who has been training for about two years has a 300-pound squat.
70% equals 210 pounds, which he can d.o in his sleep. For the same sized guy who has a 550-pound squat, 70% is 385 pounds. It's not a simple set and requires g reat focus, from start to finish. Also, the more advanced you reuse, the farther you reuse from your peak power. 46 I 5/3/1 F O R EVER
Also, advanced lifts have learned to use more myself I each set. Scientifically, we cal L this intermusclar (individual muscle fibers in muscle) coordination. To illustrate this point with m in young lifts, I use this simple analogy: When I I ift weight, I use
90% of my body and muscles to lift it. You (the newcomer) can only use 60%. This is why the advanced lift is usually more tired after the set and requires more rest. It just does more work: Now the percentages I give in the example are repeatedly not accurate - it's an example. The fact is that there is a
huge difference between the two types of lifts. And that's one of the reasons why 888, at least on prescribed interest, is notideal for advanced lift. It's just run it down and negatively affect the rest of his training. An interesting side point on the topic of i nter- and i ntramuscular coordination; this is one of the
reasons why the Bulgarian Olympic lifting team uses only a few lifts in its ING train. First, using multiple elevators llows I ifters to become more efficient when performing each I ift. Secondly, become more efficient when performing each I ift. Secondly, become more effective in each elevator, they can train them more often without getting too sore. That's the point
of HUGE when training ath letes, especially I n-season (but really in every aspect). Athletes don't need a ton of variety; They should get better at a few I ifts. It llows them to master these elevators and not too sore. Athletes need much more than just becoming stronger in the weight category. So th allows
them to train other aspects without strength training intervention. It is a simple approach that is rooted in common sense. Doing in this topic, let me touch y pon rid iculous idea of always changing exercises; confusing muscle or any nonsense is being touted as a fact I'm home I ies. This idea fi ne for you
mom, provided that she wants to exercise as well Train. Mark Rippetoe is best defined by the tra I'm like... physical activity performed for purpose to meet long-term goal, and therefore about the process, not the workout itself: On the other hand, exercising is ... Physics I activity is performed for
the effect it produces today - right now. with Iternating schedu le. In the first week you will be squatting, bench press and deadlift. In the second week you will press, squat and bench press and squats. This graph, especially when using BBB, is ideal for many people. With this schedule, you have four full
days of recovery at your disposal. Some of the variations I isted below may be slightly different from what is listed above. But most of the time, we'll raise three or four days a week. FOREVER BBB There are two forever BBB options. On e i s for more advanced lifts; this is me with one that has lower
interest rates. Another for beginners or I ntermediates. I must point out that a heavier version of this does not mean that you will make more progress. It's a fight to get more volume into your training, rather than trying to impress anyone or feed your ego. You will have to take some personal sibility
responsibility and choose the one that is right rather than the one you want to do. The exam is below the reuse of 3/5/1 programming style suits you better, use it. WBEK DNE WIEK TWD WDK THR E 70% x 5 65% x 5 75/o x 5 80% x 5 75/o x 5 85/o x 5
BORING BUT BIG I 49 W IK TWD WBBK T.-...- 90% x 85/o x 5 BORING BUT BIG I 49 W IK TWD WBBK T.-...- 90% x 5 5 sets of 10 reps - 50% 5 sefs out of 10 reps - 7-0% Second option for people who have trained much longer and would be considered
advanced intermediates. I also recommend this for people who have problems with recovery or are new to BBB. BBB makes you sore and not easy, especially if you're not doing proper recovery work. Uill 1t1rc WBIK THUB 7-0'/o x 5 65/o x 5 t5/o x 5 80% x 5 5 x 5 85/o x 5 90/o x 5 85/o x 5 90/o x 5 95/o x
sefs 10 reps of 10 reps and 'fOlo 5 sefs 10 reps and 60/o Note: I recommend that Forever BBB extra work will only be done with SAM E lift as the main work. I don't recommend squatting and then doing deadlift extra work. For those with low time or from their own experience with Boring But Big, you can
also use Forever BBB Light. This variation has you only doing three sets of work for an extra lift. So you'll do three sets of ten reps; ORIGINAL B ORING B UT BIG Now while Forever BBB is fairly new, most people use the original BBB, which uses one constant percentage
This is usually about 40-60% TM. To be safe, I usually recom wash 50-55%, since it is a good way to get extra volume without completely ruining and hindering your ability to sit on the toilet with a semblance of grace and integrity. By far the biggest mistake people make when
using BBB (and indeed 99% of all training) is that people are more than willing to throw away tomorrow's workout for today's ego. In fact, they carry out under the guise of training. Now that doesn't mean you're not exercising, or you're not going to get sore - it means that if you re-too sore to do the next
workout properly, you should consider one or more foul minimum three things: your recovery, your training or that you're kind of a wimp. The latter has nothing to do with being human or whatever cliches people use. This means that learning is not easy. And if you don't have a healthy set of proverbial
balls and stop and immortal will, you won't get that far. 50 I 5/3/1 FOREVER WIBK DNB WIBK TWD tO'lo x 5 65'/o x 5 85/o x 5 95/o o x 5 5 sefs 10 reps '10 -60'/o 5 sefs 10 reps '10 -60'/o 5 sefs 10 reps '10 -60'/o Note: You can do the bulk work with one
lift and supplementa I work with the opposite I ift. For example, you can do the basic work for the bench to click nd extra work with the press. The key is to keep the percentage that you use for BBB work constantly, at least for each individual upgrade. You would be surprised at how many lifts use a lower
percentage for a squat and dead lift (espe cially deadlift) and still g reat the amount of success. So don't be afraid to check which elevators respond better to different percentages when using BBB. For guidance, and you'll probably re-guess where I'm going with this, start easier than you think. If you do
that, you're not going to ruin your training. Start too heavy and you will dig your own grave and find it hard to get out. One thing I hope people learn, and then, I've been saying for a long time, it's you don't have to get it perfect right away. So when you learn to learn, and really learn something, it's best to
find your way through that won't ruin you physical whether or mentally. Think of it this way: when you learn how to play guitar, you don't tackle Van Halen's Eruption or Rush songs. You'll learn a few weights and give the AC/DC song Back in Black Noble Effort. This is one of the reasons of many why
starting too easy is such an important principle in a 5/3/1 program. You give yourself a bit of freedom in tra ining. Full BODY B ORING BUT B I G We've been doing this sporadically in less than a year, with about the jury I'm still on full body boring but great (for fun we'll call it FBBBB). The key to this is
simple: don't be an asshole. I see this completely out of control for those who have a huge ego, no learning experience, no quality preparatory work, or who have no training with them that can help them. All in all, I always start with 50% for extra work. As long as bar speeds are good on the main lifts, we
stick to that percentage. If one elevator seems to be suffering, we make adjustments in percentages, restorative work, training days, or even how many days/weeks we train. However, if you are lazy with you recovery it is not for you. Be honest with you level about F commitments. Below I'm taking an
example of what I've found to work best for those who want to train fou r days/weeks. BORING BUT BIG I 51 Thursday PRIDAY uof 5x1 No 50 /o S'luaf Mai11 work, 5 in PRO J)eadliff 5x10 and 50/o Press Mai work, 5 in PRO Press 5x10 y 50/o Nch Press Mai11 Job, 5 in PRO MONDAY TUESDAY
J)eodliff Mai11 work, 5 in PRO Nch Press 5 x10 y 50/o 5J I had to play a round with this, and there is no perfect scenario, but it is the best template for most people. The extra work for deadlift is whether the most taxing is on I ifter, so I would like to finish the week with this workout. This gives you two full
days of restoration work. Wednesday should be an active day of recovery too. As you can see, it's not for everyone. The three-day/weekly option is a little more palatable as it'll ows more rest between school days. L ifts/schedule you follow on Monday the first week of training is not repeated until St.
nesday the second week. Essentially you're re following A/B/C, D/A/B, CID! Programming style. WEEK ONE MONDAY WIDNBSDAY PRIDAY J)e'd/iff Mai work, 5 in PRO Squ'f 5x10 y 50/o J) e'dliff 5x10 y 50/o x Press 5 x 5 x 50/o Press Mai11 work, 5 in PRO Nch Press Main Job, 5 in PRO MONDAY
WIDNBSDAY PBIDAY S'luof Home Job, 5 in PRO J)e'dliff Mai job, 5 in PRO Squ'f 5x10 and 50/o Press 5 x10 work, 5 PRO WEEK TWO - Note: No matter what version of BBB you choose, one of the things we did for deadlift is to do all the extra work with double grip on top and interest work on an
estimated double double dead rise. This does a great job of limiting the load on the lower back at this stage, still getting in as the job with the added benefit of having a stronger grip. The dead elevator is a very stressful lift, especially for an intermediate or advanced lift. So there is nothing shameful in
doing the right thing for your preparation. Your meat doesn't grow when you martyr yourself in the weight room. 52 I 5/3/1 FOREVER B ORING BUT BIG CHALLENGE If you use the BBB pattern for three cycles, this may be a good time to try the BBB Challenge. It's also imperative that you use the right
tra ining max - it's not the time to more appreciate your max preparation in the desperate hope of adding mass: If you're new to BBB, don't make the call. Those who have done the BBB Challenge know that it is not easy. But there's a re n umber bugs that I see people making when trying to call: 1
Expecting that it won't be a problem. I know the word is a challenge in the title, but there are a lot of people expecting that it will be easy. It is not so, therefore, the name. Many people have completed the task, and many people have failed. It is nature to challenge yourself; sometimes you win, sometimes
you lose. I am! Poor nutrition. Eating right on the BBB Challenge is simple: you eat a lot. I listed exa mple d iet in the original posting of the features, but I'm not sure how many people followed it. So if you want to give yourself the best shot at the challenge, especially those that understand how hard it can
be for them, you should G I've got yourself the best shot at the gress. Just because FingerBangin78 on some random forum doesn't mean you shouldn't. Despite the modern harsh rhetoric, we are not equal. 3 Not using proper max training. 90% TM is the maximum, 85% better for
those with several years of consistent, proper training. The fact is, you have to make the program as written. 4 Not following the program as written. 4 Not following the program as written. This d rives me nuts because of the time and effort that I put into it. But in the end, the lift must take responsibility for its actions and its u nwill ingness to
follow what has been proven to work. Every program I write has been tested by arid rewritten and tested and rewritten. I take a lot of pride I have in what I do and the programs that I write. There's a reason for everything. S Not getting ready. It's not something to do to jump start training or after layoffs. If
your body is out of shape and ready for th is volume, you will suffer. For all that being said, the task is fun as hell. And what can G I've a few more means I ng to your training - nothing makes five sets of ten reps squatting or dead more tolerant than the ultimate goal. For you working sets, we will use 5's
Progression for each elevator. We're not going. PR on the final set. You can use a classic 5/3/1 or 3/5/1 installation; in regards to this problem, it really doesn't matter that much. So do what you want. Here's an example of 3/5/1. Just switch to the first two weeks if you want to do classic 5/3/1 programming
B O R I N G U T B I G I 53 CYCLE ONE WEBK DNE WBBK TWD WEBK THREE 7-0% x 5 65% x 5 t5/o x 5 80/o x 5 7-5% x 5 85/o x 5 '10% x 5 85/o x 5 '
5 15/0 x 5 80/0 x 5 t5% x 5 85/0 x 5 '10/0 x 5 85/0 x 5 '10/0 x 5 85/0 x 5 '10/0 x 5 sets of 10 reps - 60/0 5 sets of 10 
CYCLE CYCLE TWO CYCLE E BORING BUT BIG. FSL We did it quite a bit in my gym, but it requires you to be very conservative with training max. I'm hesitant to recommend this as I know people have a huge problem putting their ego aside and usi ng proper max training for the right program. In the
beginning, we start with 85% max training. If we use this bbb option, we re-tend to be looking very long term and making sure that the training max fits into the program. So many times, I won't base it on % of the maximum training, and 54 I'm 5/3/1 FOREVER on what numbers I know will work for extra
work. From there, we can plan very long in advance and still go further, then most. When I use the long term ph rase we generally re thinking about 10-12 cycles in advance. So if you use this variation, I advise you to look further down the line than j ust multiple cycles. In other words, it's a small part of a
larger plan, and that's fine if you just want to play by ear. But if you do that, ignore this pattern. This option will use the first set of works as you do extra work. WBBK DNI WBB K TWD WBBK THREB 65/o (5 10/o No (5 15/o) (5 15/o) (5 85/o B (5 85/o B (5 95/o g (5 5 sefs 10 reps - 65/o 6 sefs 10 reps - 65/
reps and 10/0 5 sefs 10 reps 15/0 You can also use 3/5/1 programming for this template. SLIGHTLY LESS BORING BUT B I G There's a re-run of several different variations of SLBBB, so stay with me on that. I will try to make it as clear as possible. The first option is for people who just don't have time to
make a normal BBB. Or from their own experience, they found out that the 5 x10 protocol doesn't work for them. Now, if you re-introduce the new BBB, make one of the previous listed BBB variations. It has been proven that it works. The following example uses a standard 5/3/1: WBBK DNB WBIK TWD
WBBK THRBB 65/o No (5 10/o ) (5 15/o ) (5 15/o ) (5 80/o ) (5 85. /o q( 5 85/o q( 5 90/o q( 5 '3 sefs 10 повторений - Если -60/o '3 sefs 10 герз - If -60/o is pretty hard, right? You re-just do three sets instead of five. Nothing that g roundbreak ing, I admit. But this is a
legitimate option. The second variation of the riff on Forever BBB. We'll call it SLFBBB. BORING BUT BIG I 55 WIIK THRII WBD D 65°/o 5 3 sefs of 10 reps @ 60°/o x x x 10°/o 5 80°/o 5 3 sefs of 10 reps @ 50°/o x x x 15°/o 5 85/o 5 95/o 5 3 sefs of 10 reps @ 10°/o x x x Agai n, I'm
not going to get a Nobel Prize for this one. However, this is a legitimate option for people. The third option is much smarter and ideal for people who need to be a little more conservative with their training. Using a four-day school week, here's how it's done: fll'tD T.UISU War1tt-up! Jumping War1tt-Up!

1x10 - 50/o, 1x10 - 60/o, 1x10 - 60/o, 1x10 - tOlo Aid Help! The above example is one of the best ways to shorten your learning time yet to get some heavy extra work. You could lso start with 70% and work you way up to 50%. This allows you to get more hard work when you are still fresh. JUMPING/THROWING. BO
RING BUT BIG - At this stage of training we have reduced the total number of jumps and throws in training. This is due to a large amount of additional volume. In general, we make about ten general jumps or throws for training during the phase. We also make sure to choose exercises that, for an
athlete/lifter, are quite low stress. So this is not the best time to ntroduce the boundaries. We generally keep it simple with box jumps and some medicine ball throws. B O R I N G U B B B I G I 57 AID WORK. B ORING BUT BIG - Click - 25-50 total reps. This is a great way to cut your workout as it has no
negative effect on you pushing strength. And if that happens, you're very out of shape and very weak. So there's even more reason for that. There is really no excuse that will save you. One thing that needs to be taken into account is the one leg/core work in this template. I don't recom dent ny lower back
work (back lifts, for example) and very little single foot work done. The only thing I recom to fix out of this category during BBB is bdominal work. I highly recommend you use the less strenuous help work during BBB. For example, you can use push-ups and extensions instead of weighted failures. BBB is
incredibly tense and it's not the time to burn a candle at both ends. CONDITIONING, BORING BUT BIG One of the biggest mistakes that people make when running Boring But Big is not that ki ng in consideration their condition ing. They either do nothing or attempt to launch themselves into the ground
If you want to do more difficult conditioning work such as running hills, click ing prowler or something like that, I recom you only be on school days. Preferably on the same day you perform a squat or deadlift OR on a training day that fol level on a day of
rest. I recom to cause you to perform some light conditioni ng-as many days as you want provided you do it in a way that al minimums recovery. Boring but great will make you sore and take a lot out of you - so make sure you ren't add more stuff to your tra ining that prevents you from recovering. To make
it simple, if it's that kes from your training, you re-doesn't make you rself any services. 2 days of hard conditioning, maximum. 3-5 days of light conditioning, when the bar of light conditioning is not not get in excellent condition, at least in terms of running or prowler. The goal is strength and size - so don't use this template
if your goal is conditioning based. BBB is always the Leader template. After completing two or three BBB cycles, you'll change the n Anchor pattern. There are several different templates to choose from, and they have all been tested by me or people I have worked with directly. In other words, they have
been proven to work and have been refined and tweaked so you don't have to. 58 I 5/3/1 F O R EVER - 5's Progression, Jokers and the first set last. - PR set, Jokers and the first set for the last time. 5/3/1 and widows. Progression 5 and the first set last. Full body, 5 in PRO.
Full Body, PR Set. Outside, FSL. Original 5/3/1. FIRST S E T L AS T can be used as a Anchor or Leader template. Great for increasing volume without crushing you. It can be used by lifts at all levels. RM between 85-90%. First Set Last (FSL) is one of the first ways I started adding extra volume to basic
elevators, and it con tinues be the most versatile for one reason - it's easy to program and numbers, if using appropriate maximum training, stay in line with your progress and you're programming. As you saw in the BBB nd variation, later, in Boring But Strong, using your first set of last can be used in
different ways. However, for clarity purposes, First Set Last usually refers to one of two things. First, using the first 5/3/1 work set for 5 sets of 5 reps. 65/0 x 3 85/0 x 3 85/0 x 3 85/0 x 3 15/0 x 1 5x5 - 65/0 5x5 - rO'/0 5x5 - rO'/0 5x5 - rS/0 FI RST SET LAST I 59 which I like to use 5x5 FSL, is the
speed of the bar, never compromised. The speed of the bar is hard for many to figu re out - people wou ld, and take everything to fail and believe that this is the only way to train. While there is a deal that needs to be done to take the lifts to failure, it is not a long-term solution for learning. Most lifts can't do
it all the time. Yes, there are always outliers, but for most, it is not sustainable. And indeed, if you have a mistake to take thi ngs to failure, then it is best to use the aid work to do so. This will have less excessive I effect on your training than usual by squatting and pulling until you are ok. Of all the additional
templates, the 5x5 FSL is the one that is most sustainable for a long period of time. It's not ideal and to be honest, doing this week after week would be pretty darn boring for most. The second way to do this is to run the Widowmaker set with the first work set; this term I got from Dante Trudel's DoggCra
PP program. Widowmaker set, usually done for 1 5-20 reps 20 reps is the goal). 65 euros/. x 5 tOlo x 6 7-5 /. x 5 7-5/. x 5 80 /. x 6 85 /. x 5 90/o x 1 1x20 1x20 - tOlo 1x20
you know exactly what I'm talking about, I once read, and I don't know who is credited with, that if everyone had made 20 reps of squats, the whole world would be stronger; mint IIv and physically. The unique thing about the 5x5 FSL is that I can be used as a leader and anchor template. And it's a kind of
files in the face of my general rules for programm ING leader plate themes; Used as the first plate theme in training is usually the least I ntense/tense. But it is also a very effective way of learning for many people. As a tem plate leader, it works for people with limited time and who are not very good at
recovering. It's also a great for more advanced lifts that should retreat harder/more intensive program mines than most lifts, they may need only six weeks to ram the p their lifting, and the rest of the time is devoted to getting quality
work without beating yourself up at the r. I know it doesn't scream HARDCORE 4 LI FE, but the reality of learning is that the older/more experienced you get, the more you need to stay on a slow road. Despite the rumors, the stronger you become, the less time you keep that peak level of strength. The 5x5
FSL is Iso the perfect way for athletes to train as it is easy to get from, volume is easy regulate, speed/power is maintained, and now you can actually do all the other things an athlete has to do: run, jump, agilities, skill work and in most cases, school work. Athletes and their coaches have known for a
long time that everything should be in balance. While strength is very important to all athletes, if the time/effort required for lifting takes time or reduces other reas training, it becomes a liability. Most of these plate themes can be done lifting three or four days a week unless stated, 60 I 5/3/1 FOREVER M

workout. Pull one leg/core - 50-100 reps per workout. - 50-100 total reps per training session. You can also use this template to increase the total number of reps in each of the help catego ries. However, if you do this, you don't have to push the conditioning at the same time. In general, if you use the next
help plan, cut out the hard conditioning and use nothing but general aerobic work. - Click - 100 total number of reps per workout. - 100 total repetitions per training session. If you decide to use this template when you press your conditioning, you will need to
reduce your relief work. To make it simple - if you're doing tighter conditioning, you have to do less help work. - Click - 25-50 total reps per workout. One leg/core - 25-50 reps per training. I also recommend you carefully choose your movement aid Duri ng this time-
choose help work that does not, in any case, interfere with you C O N D ИТИОНИОНИНГ. 5'S P R O . SXS FSL Кондиционирование может варьироваться g reatly на этом шаблоне и довольно Ended. If you reuse this as a regular basic program, I recommend 2-3 days of hard conditioning
and as many days of light conditioning as you want/need. All in all, once you start pushing your tight conditioning to four days/week, this is when help should reflect this change (i.e. doing less relief). We usually use bar speed on work kits and FSL work to determine how we do - if this becomes a constant
problem (usually over 2 weeks) we change something. This change can be ny of the following: change training days/weeks using a reboot and plans to use it before necessary, improving recovery (sleep, diet, etc.) by using more efficient conditioning or reducing volume at all I ifting (this may be help or
extra work). Many times we will reduce the elastic mental work to 3x5 FSL from the beginning to account for stress conditioning work. FI RST SET LAST I 63 Here is n an example of using this template as a leader. Using 5 PRO/FSL as a leader template violates general rules on how we program, but it
works very well. Essentially you're re-ging your body break from I ifting, focusing on bar speed and making sure everything is perfect for your anchor template. Also, it's a good way to program for those who tend to shit the bed, get h y RT or just suck on I ifting after six weeks (or even shorter). Leader: 5 in
PRO, 5x5 FSL Anchor: No.5 Progression, Jokers and first set last. - PR set and the first set last. - PR set and the first set for the last time. 5/3/1 and widows. Full body, PR Set. Outside, FSL. Original 5/3/1. Used as an Anchor template, this example is ideal for those who can't
perform PR sets very often: Cycles 3-4 - 5 PRO, 5x5 FSL. Rh Week Protocol, PR kits (adjust exercise highs if you don't hit the required number of reps). - 5 in PRO, BBB. Another example: Cycles 1-2 rh Week Protocol, PR sets. Cycles 3 - 5 PRO, 5x5 FSL. Rh Week Protocol, PR kits (adjust exercise
highs if you don't hit the required number of reps). - 5 in PRO, BBS for squats and press, 5 in PRO, 5x5 FSL for bench press and deadlift. S'S PRO GRESSION, J OKERS AND FIRST SET LAST Joker sets re-my biggest regret I haven't done a great job of explaining how they fit in throughout the
program. Even when writing this book, I had to leave a lot of things that I do, or there are other people - 64 I 5/3/1 F O R EV E R to do because I learned my lesson with Joker sets. Originally published as Private forum, and eventually in Beyond book, Joker sets have become so overused and exaggerated
that it had the exact opposite from what we want. Namely, to make people better. However, through this book I hope to clarify everything and G'i've people a correct way to program them. It was my mistake and it is my way Aton ing for ignorance. For the uninitiated, the Joker sets additional work kits
added to bove high high set for the day. They are usually done for 1-2 sets of 1-3 reps at 5-10% more than the highest set of the day. It's not very hard to program or u nderstand. You're just going a little harder. Now let's clear the air about the Jokers: they're fun to do, but never need to. The only people
who should feel weight are repeatedly either weak mentally or not doing the right help and athletic work; The right job produces a strong back and a mind capable of not folding like newspa on under minimal stress. Whenever I hear someone say that the weight felt heavy on a powerlifting
meet, I am struck by the stupidity. You are on a damn powerlifting meet- the weight must be heavy. You're doing a one-rep max! If you don't want to feel heavy, get stronger or lower your attempts. I recommend using only 31511 programming when running The Joker kits and the first set last. With this
setup, you only use Joker sets in the first and third weeks of the cycle. Below is an example showing how I program it. So we have two difficult weeks with a lighter week between them. This is especially important when training four days a week. Week 2 is all about speed and perfection; We emphasize
the quality of each representative and make sure that the athlete is recruited and fast. WIBK DNB WBBK TWD WDK THRII 70/o x 5 85/o x 5 75/o x 5 90/o x 5 85/o x 5 75/o x 5 90/o x 5 85/o x 5 75/o x 5 90/o x 5 85/o x 5 90/o x 5 90/
We never miss Joker sets. If you do, you don't have to do Joker sets. This is another difficult reality that people need to remember. You don't have to lose weight in training. Some programs thrive on lifting the missing weights - it's not one of them. If you like failure, I would recommend you try another
program. I recommend doing only 1-2 Joker kits per workout. Remember that they should be made in a 5-10% step over you final set of work day. All in all, I'd recommend you stick to sets of 1-3 reps for each Joker set. FIRST SET AND FIRST SET LAST PR set is one of the main
components of the original 5/3/1 program. Honestly, I think that's the funniest part of the program, because it's the hardest part. And I don't know a lot of people that I ift weights who don't like to be challenged. There is someth ing incredibly satisfying about setting up and achieving your goal. When using
PR and First Set Last, I recommend using 3/5/1 programming. Again, you only have PR sets on the first and thi rd weeks cycle. MO DAY TUESDAY PRID: 'I War1Jt-up/Mobili1y War1Jt-up/Mobili1y War1Jt-up/Mobili1y War1Jt-up/Mobili1y Jumps/Throws - 20 jumps/throws

```

- 5 sefs 5 repetitions Help Help Help You can use 5's Progression with this program (combined with a PR set) or simply use the standard number of reps per set of work. Both are good with me and I don't think it matters which one you choose to do. WBBK O N I WBEK TWO WBBK THRBI 10'/o x 6 65'/o x 5 15'/o x 5 80'/o x 6 15% x 5 85% x 6 90% x 8 CPR SefJ 85 x 5 95/o x 1 PPC Sef) 5x5 10/o 5x5 65/o 5x5 15/o Key to PR set remembering that it's not as many reps, As you can set. It's just setting a personal best or achieving a specific goal for the day. PR can be a record representative based on that particular weight or a record based on the rep-max formula. Setting a goal for a PR set is best done based on what you currently feel like or, if you have a coach, what it challenges you. Most coaches can observe your speed and attitude during warm-up and workouts and know the best way to challenge you. Do not I ift with m indset we will see what happens: There is a plan. Follow this plan. 66 I 5/3/1 FO R EVER I n general, once I reach my goal or my athlete reaches his goal, the set is over. When coaching athletes, I want them to have a specific goal for every set they do- whether it's a fight technique, a mental approach or even the odd signal that I think will help them. The amount of work is akin to a busy job - it is pointless in the long run. If you want shit to do, focus on doing it right. PR-SET, SKAKA RS AND the first SET LAST is the one we would use in my weight room. I got some feedback about the difficulties with doing Joker Kits after the PR set. It never made any sense to me as we never had this issue with athletes or lifts in my weight room. I assure you, this is not because of the loud and brazen style of coaching. There's nothing worse than cheerleaders in a weight room. People barking cliches battle as annoying as a thousand paper cuts. If you have to become a cheerleader when you're re-coaching, you're not a good coach. If you have to become a cheerleader when you are a spotter or a rising partner, you are doing no one any good. Cues and talk lift th rough set is what makes a good coach. If you're a family d's with UFC and M MA, or even a casual fan, you know great trainer Greg Jackson. By my estimation (and I'm not alone with that) he is the best corner man in the game. Watch him between rounds and watch his approach. First, he calms the fighter and speaks in a straight and calm voice. He then gives the fighter one thing to run for the next round. It's one thing. One signal. Watch other angles between rounds; Fighter gets five d ifferent guys. And smoke, they blow it up ridiculously. If a fighter loses or loses a round, he should know. The thing is, the coach isn't there, scream and be Tony Robbins. He's there to coach. And when the lift is already at an emotional peak before or during the set, the worst thing a coach can do is push it over the edge. Coach m est to be anchor, center, and he can't do that if he storms himself. As with previous templates, I recommend using a 3/5/1 programming style with this approach. You can also use S's PRO with a g is a template. WEBK DNI WEIK TWO WBEK THR81 rO/o x 6 65/o x 5 80/o x 6 90/o x 6 4 CPR Sefl 85°/o x 5 95/o x 1+ CPR Sefl Joker Sefs (1-6 reps) 5x5 @ rO/o No Joker sefs 5x5 @ 65/o Joker Sefs (1-6 reps) 5x5 @ 75°/o F I RST SET LAST I 67 MONDAY TUESDAY THURSDAY PRMAY Warm-up/Mobilify Warm-up/Mobilify Jumps/Throws - 20 Jumps/Throws -Sef, Jokers Press - Mai11 work, PR Sef, Jokers JJetAdliff - Mai11 work, PR Sef, Jokers & Sefs of 5 reps - FSL Press 5 sefs 5 reps - FSL JJetAdliff - 5 sefs 5 reps and FSL . Bench Press 5 sets of 5 reps and FSL help aid help -- - - Note: If you can't make a few Joker sets after PR, you just need to get in better shape, men counting and physically. Once again, the Jokers are re-usually done for one to three reps. Make sure you don't miss out. 5/3/1 And WID D WMAKERS If I had to pick one favorite tem plate to do, it would be it. I once wrote a template called Harden the Fuck Up: It had everything: specific conditioning, recovery, mobility, even lifestyle stuff. The climb was 5/3/1 and the widow, This uplift pattern is incredibly simple, and if you can't get excited about PR sets and widower sets, you might as well bow out I ifting. Let me give credit to where the credit is due. The term widower comes from Dante Trudel, he is DoggCrapp fame. While I claim little influence, at least d irek, from the world of bodybuilding, Trudel has been a breath of fresh air in all areas of training and programming. He believes in hard work and pushing the body (get stronger I'm a major movement up to d Rive size), but had some thought given how he programs. Nowadays it is very rare. Those of you that are once again familiar with different patterns and 5/3/1 problems recognize some similarity to this pattern and the rest of the Pause Challenge. But there are still some differences and I think you will see this as new and improved, at least in my eyes it is. One thing I should point out is that Widowmaker sets aren't for everyone - if you're forming no g reat and you don't have a good core strength, I don't recommend doing so. First, let's d iscuss sets and reps for this template. WBIK DNB WIBK TWD WBIK THRII 65% x 5 t0'!0 x 3 t5% x 5 t5% x 5 t5% x 5 t5% x 5 80% x 3 85% x .3 68 I 5/3/1 F O R EVER WBBK DNB WBBK TWD WBEK THRBE 85/0 x 5 CPR SefJ '10/0 x '3' SefJ 95/0 x 1 CPR SefJ 1x15-20 1x15-20 Click, S's PRO - Press Spi, a/Tap, '5 s PRO - Help Conaifio11in9 Note: You can mix and match movements: squat/click and dead lift/bench press. Kicker is what we superset squat and bench press on Monday and deadlift and click on Thursday. It would suck for me to fight 12 years ago. Now, not so much. And it was pretty easy to handle for younger kids. I've never had a good time training or rest periods, but it only took a couple of workouts to get into the groove and it never became a problem. But then again, these kids have been training a little bit and no one gets to train here and be out of shape. HELP, SPINAL CRAN H.S. Because we had limited time I weight room, I have them doing work on helping at home. Each child had different recommendations based on their strengths, but here's what I gave one of them: - - Bodyweight Squat - 100 common reps. This can be done up to five days a week. CDNDITIDNING, SPINAL TAP H.S. - 2-3 heavy days of air conditioning, maximum. 3-5 days of light conditioning. SP INAL TAP, H.S., ANCHOR There's a re-a couple of options you can try. The first simply makes three reps for each set, not five. Again, the superset are two main I ifts every day. You can choose not to do any additional reps or perform a PR set at 90%, 95% or 85% set. You could lso perform Joker sets in ny time during tra I ning. 1 24 I 5/3/1 F O R EV E R MUND Y TUBSD Y Thursday Warm-up / Mobiliiy Warm-up / Mobiliiy Jumping / Throws / Fofal Jum s/Throws 0 fi, fa/ Jum s/Throws 0 fofa/ Jumps/Throws 20 fi/fa/s 0's PRO Assistance J)eadliff Spi11al Tap, 3 in PRO Help Nch Press Spinal Tap, 0 in PRO Condifionin9 I The next variation can try as I originally started doing spinal click programming. SITS RIPS 70 3 80 3'10 3 (c.tl11 will be made for PR sef and/or Jokers wn to be made) 75 5 85 3 '15 1 (c.tlll will be made for PR sef and/or Jokers c.tltr to be done) 65 5 75 5 85 5 (c.tlll will be made for PR sef and/or Jokers c.tltr to be done) 65 5 75 5 85 5 (w.w., Be made for PR sef and/or Jokers c.tltr to be done) 65 5 75 5 85 5 (c.tlll will be made for PR sef and/or Jokers c.tltr to be done) 65 5 75 5 85 5 (c.tlll will be made for PR sef and/or Jokers c.tltr to be done) 65 5 75 5 85 5 (w.w., Be made for PR sef and/or Jokers c.'tr to be done) As vou can see, reps change at this stage. You can choose to do just prescribed reps or go for PR or Joker kits. In general, I prefer that people do a set of five reps at 95%. If the speed is good and the lift feels good, we will make one or two sets of Joker. Representatives tend to be between one and three. While this is an opportunity, we never go for additional reps or Jokers at 85%. But it can still be possibil ity. Note the i ncrease for jumping/y rows up to twenty per day training (they can lso be done in relief days). Speaking of aid work, it will remai in the same and should be done in at least two days a week and as much as five. Hard conditioning can be done three days a week, on C O F F I N R M J 125 any day. Recovery and easy to ease can be done as much as you need or want. For those of you who are re-stronger and in the form of a g reat, a weight vest can be added to the relief work. If it screws up your basic workout, don't do it off ntil you'll get stronger or in better shape. C D FFINW D RM - Great for strength. Ideal for intermediate and advanced lifts. 85-90% TM. The Coffinworm program is ideal for those who want to simplify their training and just handle heavy weights. This is very different from the original 5/3/1 program; The first two weeks re iden tical and the third week is a semi-reboot. I recommend doing this Leader program for two cycles. You can do this three or four days a week; If you choose the first, you can do I ittle more assist ance work on the day of training, but do not over-perform. Squats and deadlift re-aly is much more important than curl. The first two weeks of the programmed a little different from thi rd week. C O FFINWORM - WEEKS 1-C!
