

5th Grade Mathematics • Unpacked Contents

For the new Standard Course of Study that will be effective in all North Carolina schools in the 2018-19 School Year.

This document is designed to help North Carolina educators teach the 5th Grade Mathematics Standard Course of Study. NCDPI staff are continually updating and improving these tools to better serve teachers and districts.

What is the purpose of this document?

The purpose of this document is to increase student achievement by ensuring educators understand the expectations of the new standards. This document may also be used to facilitate discussion among teachers and curriculum staff and to encourage coherence in the sequence, pacing, and units of study for grade-level curricula. This document, along with on-going professional development, is one of many resources used to understand and teach the NC SCOS.

What is in the document?

This document includes a detailed clarification of each standard in the grade level along with a *sample* of questions or directions that may be used during the instructional sequence to determine whether students are meeting the learning objective outlined by the standard. These items are included to support classroom instruction and are not intended to reflect summative assessment items. The examples included may not fully address the scope of the standard. The document also includes a table of contents of the standards organized by domain with hyperlinks to assist in navigating the electronic version of this instructional support tool.

How do I send Feedback?

Please send feedback to us at feedback@dpi.state.nc.us and we will use your input to refine our unpacking of the standards. Thank You!

Just want the standards alone?

You can find the standards alone at http://www.ncpublicschools.org/curriculum/mathematics/scos/.

North Carolina Course of Study – 5th Grade Standards

North Carolina Department of Public Instruction

Standards for Mathematical Practice

Pr	actice	Explanation and Example
1.	Make sense of problems and persevere in solving them.	Mathematically proficient students in grade 5 should solve problems by applying their understanding of operations with whole numbers, decimals, and fractions including mixed numbers. They solve problems related to volume and measurement conversions. Students seek the meaning of a problem and look for efficient ways to represent and solve it. They may check their thinking by asking themselves, "What is the most efficient way to solve the problem?", "Does this make sense?", and "Can I solve the problem in a different way?".
2.	Reason abstractly and quantitatively.	Mathematically proficient students in grade 5 should recognize that a number represents a specific quantity. They connect quantities to written symbols and create a logical representation of the problem at hand, considering both the appropriate units involved and the meaning of quantities. They extend this understanding from whole numbers to their work with fractions and decimals. Students write simple expressions that record calculations with numbers and represent or round numbers using place value concepts.
3.	Construct viable arguments and critique the reasoning of others.	In fifth grade mathematical proficient students may construct arguments using concrete referents, such as objects, pictures, and drawings. They explain calculations based upon models and properties of operations and rules that generate patterns. They demonstrate and explain the relationship between volume and multiplication. They refine their mathematical communication skills as they participate in mathematical discussions involving questions like "How did you get that?" and "Why is that true?" They explain their thinking to others and respond to others' thinking.
4.	Model with mathematics.	Mathematically proficient students in grade 5 experiment with representing problem situations in multiple ways including numbers, words (mathematical language), drawing pictures, using objects, making a chart, list, or graph, creating equations, etc. Students need opportunities to connect the different representations and explain the connections. They should be able to use all of these representations as needed. Fifth graders should evaluate their results in the context of the situation and whether the results make sense. They also evaluate the utility of models to determine which models are most useful and efficient to solve problems.
5.	Use appropriate tools strategically.	Mathematically proficient fifth graders consider the available tools (including estimation) when solving a mathematical problem and decide when certain tools might be helpful. For instance, they may use unit cubes to fill a rectangular prism and then use a ruler to measure the dimensions. They use graph paper to accurately create graphs and solve problems or make predictions from real world data.
6.	Attend to precision.	Mathematically proficient students in grade 5 continue to refine their mathematical communication skills by using clear and precise language in their discussions with others and in their own reasoning. Students use appropriate terminology when referring to expressions, fractions, geometric figures, and coordinate grids. They are careful about specifying units of measure and state the meaning of the symbols they choose. For instance, when figuring out the volume of a rectangular prism they record their answers in cubic units.
7.	Look for and make use of structure.	In fifth grade mathematically proficient students look closely to discover a pattern or structure. For instance, students use properties of operations as strategies to add, subtract, multiply and divide with whole numbers, fractions, and decimals. They examine numerical patterns and relate them to a rule or a graphical representation.
8.	Look for and express regularity in repeated reasoning.	Mathematically proficient fifth graders use repeated reasoning to understand algorithms and make generalizations about patterns. Students connect place value and their prior work with operations to understand algorithms to fluently multiply multi- digit numbers and perform all operations with decimals to hundredths. Students explore operations with fractions with visual models and begin to formulate generalizations.

Operations and Algebraic Thinking

Write and interpret numerical expressions.

NC.5.OA.2 Write, explain, and evaluate numerical expressions involving the four operations to solve up to two-step problems. Include expressions involving:

- Parentheses, using the order of operations.
- Commutative, associative and distributive properties.

Clarification	Checking for Understanding		
Clarification This standard calls for students to verbally describe the relationship between expressions without actually calculating them. Students will also need to apply their reasoning of the four operations as well as place value while describing the relationship between numbers. The standard does not include the use of variables, only numbers and signs for operations.	 Write an expression for the number of points Eric has at the end of the game. Do not evaluate the expression. The expression should keep track of what happens in each step listed below. John is playing a video game. At a certain point in the game, he has 32,700 points. Then, the following events happen, in order: He earns 1760 additional points. He loses 4890 points. The game ends, and his score doubles. John's sister Erica plays the same game. When she is finished playing, her score is given by the expression: 4(31,500 + 2560) – 8760. Describe a sequence of events that might have led to Erica earning this score. Adapted from Illustrative Mathematics (www.illustrativemathematics.org) Below is a picture that represents 7 + 4		
	 How many times bigger is the value of 3 x (7 + 4) than 7 + 4? Explain your reasoning. 		
	Possible responses:		
	7 + 4		
	The value of $3 \times (7 + 4)$ is three times the value of $7 + 4$. We can see this in the picture since $3 \times (7 + 4)$ is visually represented as 3 equal rows with		
	7 + 4 squares in each row.		

Write and interpret numerical expressions.

NC.5.OA.2 Write, explain, and evaluate numerical expressions involving the four operations to solve up to two-step problems. Include expressions involving:

- •
- Parentheses, using the order of operations. Commutative, associative and distributive properties. ٠

Clarification	Checking for Understanding
	In this type of picture, the stuent shows that the numbers 7 + 4 are represented by the number of objects, and the number of groups represents the multiplier. Adapted from Illustrative Mathematics (www.illustrativemathematics.org)
	Describe how the expression 5(10 x 10) relates to 10 x 10.
	Possible response: The expression 5(10 x 10) is 5 times larger than the expression 10 x 10 since I know that I that 5(10 x 10) means that I have 5 groups of (10 x 10).

Analyze patterns and relationships.

- NC.5.OA.3 Generate two numerical patterns using two given rules.
 Identify apparent relationships between corresponding terms.
 Form ordered pairs consisting of corresponding terms from the two patterns.
 - Graph the ordered pairs on a coordinate plane. •

Clarification	Checking for Understanding
Clarification	Checking for Understanding Cora and Cecilia each use chalk to make their own number patterns on the sidewalk. They make each of their patterns 10 boxes long and line their patterns up so they are next to each other. Cora puts 0 in her first box and decides that she will add 3 every time to get the next number. Cecilia puts 0 in her first box and decides that she will add 9 every time to get the next number. a. Complete each girl's sidewalk pattern. b. How many times greater is Cecilia's number in the 5th box than Cora's number in the 5th box? What about the numbers in the 8th box? The 10th box? c. What pattern do you notice in your answers for part b? Why do you
	 c. What pattern do you notice in your answers for part b? Why do you think that pattern exists?
	d. Write your data as ordered pairs and graph the points on a coordinate plane.e. What pattern do you notice about your graph? Why do you think that
	pattern exists?

Understand the place value system.

NC.5.NBT.1 Explain the patterns in the place value system from one million to the thousandths place.

- Explain that in a multi-digit number, a digit in one place represents 10 times as much as it represents in the place to its right and 1/10 of what it represents in the place to its left.
- Explain patterns in products and quotients when numbers are multiplied by 1,000, 100, 10, 0.1, and 0.01 and/or divided by 10 and 100.

Clarification	Checking for Understanding		
In this standard, students extend their understanding of the base-ten system and the magnitude of digits in a number to the relationship between adjacent places. This standard also extends student understanding of the relationships of digits in whole numbers to the relationship of decimal fractions. Students should work with the idea that the tens place is ten times as much as the ones place, and the ones place is 1/10 the size of the tens place.	 Danny and Delilah were playing a game where they drew digits and placed them on a game board. Danny built the number 247. Delilah built the number 724. How much bigger is the 2 in Danny's number than the 2 in Delilah's number? How much smaller is the 4 in Delilah's number than the 4 in Danny's 		
For example: In the number 55.55, each digit is 5, but the value of the digits is different because of the placement. The 5 that the arrow points to is $1/10$ of the 5 to the left and 10 times the 5 to the right. The 5 in the ones place is $1/10$ of 50 and 10 times five tenths	 Write a sentence explaining how the size of the 7 in Danny's number compares to the size of the 7 in Delilah's number. 		
555155 $\frac{5}{1}$ $\frac{5}{$	 In class Veronica told her teacher that when you multiply a number by 10, you just always add 0 to the end of the number. Think about her statement (conjecture), then answer the following questions. When does Veronica's statement (conjecture) work? When doesn't Veronica's statement (conjecture) work? Is the opposite true? When you divide a number by 10, can you just remove a 0 from the end of the number? When does that work? When 		
	doesn't that work?		

Understand the place value system.

NC.5.NBT.3 Read, write, and compare decimals to thousandths.

- Write decimals using base-ten numerals, number names, and expanded form.
- Compare two decimals to thousandths based on the value of the digits in each place, using >, =, and < symbols to record the results of comparisons.

Clarification	Checking for Understanding				
In this standard, students build on their previous understandings of reading	Mike's teacher asked him to write 987.654 in expanded notation. Mike wrote

Perform operations with multi-digit whole numbers.						
Clarification	Checking fo	r Understand	ling		onig	
In this standard, students connect the foundational, conceptual work for multiplication from third and fourth grade to an efficient algorithm. In third grade, students explored the meaning of whole number multiplication. In fourth grade,	There are 22 Possible resp	5 dozen cooki oonses:	es in the bakery.	How r	man	y cookies are there?
students built on that understanding by multiplying three-digit factors times a one- digit factor, and multiplying two two-digit factors. To develop understanding of multiplication, students used a variety of strategies, including area models, partial products, and the properties of operations. The area model helps students visualize the components of the product and connect partial products to an efficient algorithm. Students are fluent when they display accuracy, efficiency, and flexibility. Students develop fluency by understanding and internalizing the relationships that exist between and among numbers. By studying patterns and number relationships, students can internalize strategies for efficiently solving problems.	Student A 225 x 12 I broke 12 u and 2. 225 x 10 = 2 225 x 2 = 4 2,250 + 450	up into 10 2,250 50 0 = 2,700	Student B 225x12 I broke up 225 ii and 25. $200 \times 12 = 2,400$ I broke 25 up int so I had 5 x 5 x 12 12×5 . $5 \times 12 = 60$. 60 300 I then added 2,4 300 2,400 + 300 = 2	nto 20 0 10 5 x 12 or 1 2 or 1 x 5 = 100 an 700.	00 5, 5 x	Student C I doubled 225 and cut 12 in half to get 450 x 6. I then doubled 450 again and cut 6 in half to get 900 x 3. $900 \times 3 = 2,700.$

Return to Standards

Perform operations with multi-digit whole numbers.

NC.5.NBT.6 Find quotients with remainders when dividing whole numbers with up to four-digit dividends and two-digit divisors using rectangular arrays, area models, repeated subtraction, partial quotients, and/or the relationship between multiplication and division. Use models to make connections and develop the algorithm.

Clarification	Checking for Understanding			
In this standard, students extend their work with dividing a multi-digit number by a one-digit number to dividing by two-digit numbers. In previous grades, students built understanding of the meaning of division through partitive and measurement models. Students build deeper understanding of division through the use of various strategies and the relationship between multiplication and division. Experience with using arrays, area models, repeated subtraction, and partial quotients will help students connect to an efficient algorithm in subsequent grades. This standard also references interpreting remainders. Remainders should be put into context for interpretation. Ways to address remainders: • Remain as a left over • Partitioned into fractions or decimals • Discarded leaving only the whole number answer • Increase the whole number answer up one • Round to the nearest whole number for an approximate result	There are 1,716 students participating in Field Day. They are put into team16 for the competition. How many teams get created? If you have left over students, what do you do with them?Possible responses:Student A 1,716 divided by 16 There are 100 16's in 1,716. 1,716 - 1,600 = 116 I know there are at least 6 16's. 116 - 96 = 20 I can take out at least 1 more 16. 20 - 16 = 4 There were 107 teams with 4 students left over. If we put theStudent B 1,716 divided by 16. There are 100 16's in 1,716. There are 100 16's in 1,716. 			
The focus of this standard is to build conceptual understanding of division with larger numbers. Students are expected to use various strategies and explain their thinking. Although the traditional division algorithm may be introduced, students are not expected to master this algorithm until middle school.	Students of differentiationStudents of differentiation4 teams will have 17 students.Student D1,716 \div 16 =How many 16's are in 1,716?1 want to get to 1,716How many 16's are in 1,716?1 know that 100 16's equalsWe have an area of 1,716. I know that1,6001 know that 5 16's equals 801,600 + 80 = 1,680used 16 as the height. I am trying toTwo more groups of 16's equalsanswer the question what is the width of32, which gets us to 1,712nm 4 away from 1,716So we had 100 + 6 + 1 = 107100teams100Those other 4 students can just10016100 x 16 = 1,6001,716 - 1,600 = 116116 - 112 = 4			

Perform Operations with decimals.

NC.5.NBT.7 Compute and solve real-world problems with multi-digit whole numbers and decimal numbers.

- Add and subtract decimals to thousandths using models, drawings or strategies based on place value.
- Multiply decimals with a product to thousandths using models, drawings, or strategies based on place value.
- Divide a whole number by a decimal and divide a decimal by a whole number, using repeated subtraction or area models. Decimals should be limited to hundredths.
- Use estimation strategies to assess reasonableness of answers.

Clarification	Checking for Understanding		
This standard extends students' previous experiences with adding and subtracting whole numbers and their understanding of place value with decimals. In this standard, students use various strategies to compute problems in context with the four operations. Computation is limited to products to thousandths and division of decimals to hundredths. This standard requires that students utilize models, drawings, and strategies based on place value rather than relying on algorithms. This standard focuses on student understanding of use place value when computing rather than learning rules that involve moving the decimal point with little connection to the meaning of the operations. The use of symbolic notations involves having students record the answers to computations (2.25 x 3= 6.75), but should not be done without models or pictures.	 A recipe for a cake requires 1.25 cups of milk, 0.40 cups of oil, and 0.75 cups of water. How much liquid is in the mixing bowl? Possible responses: 1.25 + 0.40 + 0.75 Student A I broke 1.25 into 1.00 + 0.20 + 0.05 I left 0.40 like it was. I broke 0.75 into 0.70 + 0.05 I combined my two 0.05s to get 0.10. I combined 0.20, 0.10, and 0.70 to get 1.0. I added the 1 whole from 1.25. I ended up with 2 whole and 4 tenths, 		
 When adding 3.6 + 1.7, a student might estimate the sum to be larger than 5 because 3.6 is more than 3 ½ and 1.7 is more than 1 ½. When subtracting 5.4 - 0.8, student might estimate the answer to be a little more than 4.4 because a number less than 1 is being subtracted. When multiplying 6 x 2.4, a student might estimate an answer between 12 and 18 since 6 x 2 is 12 and 6 x 3 is 18. Another student might give an estimate of a little less than 15 because s/he figures the answer to be very close, but smaller than 6 x 2 ½ and thinks of 2 ½ groups of 6 as 12 (2 groups of 6) + 3 (½ of a group of 6). 	Which equals 2.40 cups. You live 14 hundredths of a mile from your friends' house. After walking 3 tenths of the distance, you stop to talk to another friend. How much of a mile have your walked? (0.3 x .14) Possible responses: Number Line Model 0 0.014 0.028 0.042 0.056 0.07 0.084 0.098 0.0112 0.0126 0.14 The number line shows the distance marked off from 0 to 0.14 and that distance is partitioned into 10 equal segments. Each segment represents a distance of 0.014 or a tenth of 0.14. Three tenths is 0.014 plus		
	Using the Distributive Property $0.3 \times 0.14 = 0.3 \times (0.1 + 0.04)$ $0.3 \times 0.1 = 0.03$ $0.3 \times 0.04 = 0.012$ $0.03 + 0.012 = 0.042$ miles		

Perform Operations with decimals.

NC.5.NBT.7 Compute and solve real-world problems with multi-digit whole numbers and decimal numbers.

- Add and subtract decimals to thousandths using models, drawings or strategies based on place value.
- Multiply decimals with a product to thousandths using models, drawings, or strategies based on place value.
- Divide a whole number by a decimal and divide a decimal by a whole number, using repeated subtraction or area models. Decimals should be limited to hundredths.
- Use estimation strategies to assess reasonableness of answers.

Use equivalent fractions as a strategy to add and subtract fractions.

NC.5.NF.1 Add and subtract fractions, including mixed numbers, with unlike denominators using related fractions: halves, fourths and eighths; thirds, sixths, and twelfths; fifths, tenths, and hundredths.

- Use benchmark fractions and number sense of fractions to estimate mentally and assess the reasonableness of answers.
- Solve one-and two-step word problems in context using area and length models to develop the algorithm. Represent the word problem in an equation.

While working on NC-5.NF 1 students should be able to estimate and find the answer to one- and two- step word problems involving fractions with unlike denominators using related fractions. Adding and subtracting only related fractions is new to 5 th grade. Related fractions and tuber, e.g., halves, fourths, and eighths. Ihree is some ham in the refrigerator. Tyrisha uses % of a pound to make sandwiches and Jacquel uses 7/8 of a pound to make sandwiches is and ultiple of the other, e.g., halves, fourths, and eighths. Students should be able to assess the reasonableness of answers by estimating sums and differences to the nearest half or whole number. Students should have ample experiences creating area and length models to build understanding. The use of these models allows students to use reasonableness to find a common denominator prior to using the algorithm. For example, when adding 1/3 + 1/6, Grade 5 students should apply their understanding of equivalent fractions and their ability to rewrite fractions in an equivalent form to find common denominators. Imments the refrigerator. Tyrisha uses % of a pound to make sandwiches. If there is and Jacquel uses 7/8 of a pound to make sandwiches. We do not know what we started with but we know we ended with 2 ½ pounds of ham. Before Jacquel took ham, there was 7/8 of a pound more ham. I need to solve 2 ½ + 7/8 + 3/4. I knew that since 7/8 and ½ were greater than a half but less than 1, that my total would be close to but less than 4 and ½. When I found the total amount shaded it was 4 and 1/8, which is close to my estimate. Student 2: I know that 2 ½ is the same as 2 and 4/8. I also know that ¼ is 6/8. So, 1 used the number line to jump from zero. Utage the number line to jump from zero. Imments in the jump from zero.	Clarification	Checking for Understanding
	While working on NC.5.NF.1 students should be able to estimate and find the answer to one- and two- step word problems involving fractions with unlike denominators using related fractions. Adding and subtracting only related fractions is new to 5 th grade. Related fractions are fractions in which one denominator is a multiple of the other, e.g., halves, fourths, and eighths. Students should be able to assess the reasonableness of answers by estimating sums and differences to the nearest half or whole number. Students should have ample experiences creating area and length models to build understanding. The use of these models allows students to use reasonableness to find a common denominator prior to using the algorithm. For example, when adding 1/3 + 1/6, Grade 5 students should apply their understanding of equivalent fractions and their ability to rewrite fractions in an equivalent form to find common denominators.	There is some ham in the refrigerator. Tyrisha uses ¾ of a pound to make sandwiches and Jacquel uses 7/8 of a pound to make sandwiches. If there is now 2 ½ pounds of ham left over, how much ham was there before Tyrisha and Jacquel used some. Possible responses: Student 1: We do not know what we started with but we know we ended with 2 ½ pounds of ham. Before Jacquel took ham, there was 7/8 of a pound more ham. I need to solve 2 ½ + 7/8 + 3/4. I knew that since 7/8 and ¾ were greater than a half but less than 1, that my total would be close to but less than 4 and ½. When I found the total amount shaded it was 4 and 1/8, which is close to my estimate. Student 2: I know that 2 ½ is the same as 2 and 4/8. I also know that ¾ is 6/8. So, I used the equation: 2 4/8 + 6/8 + 7/8. I used the number line to jump from zero.

Return to Standards

Apply and extend previous understandings of multiplication and division to multiply and divide fractions. NC.5.NF.3 Use fractions to model and solve division problems.

- Interpret a fraction as an equal sharing context, where a quantity is divided into equal parts.
- Model and interpret a fraction as the division of the numerator by the denominator.
- Solve one-step word problems involving division of whole numbers leading to answers in the form of fractions and mixed numbers, with denominators of 2, 3, 4, 5, 6, 8, 10, and 12, using area, length, and set models or equations.

Clarification	Chaoling for Understanding
Clarification	Checking for Understanding
While working on NC.5.NF.3, students are expected to associate fractions with division, understanding that 5 ÷ 3 can be written and expressed as 5/3. Students should explain this by working with their understanding of division as equal sharing and be able to represent this work using area, length, and set models with the denominators specified in the standard.	pounds of rice should each person get?
	Possible solutions: Students might partition each pound among the 3 people, so that each person gets 1/3 of every pound and since there are 50 pounds, each person's total weight would equal $50 \times 1/3 = 50/3 = 16$ and 2/3 pounds.
	Students may solve 50 divided by 3 by multiplying by 3 up to 50. $16 \times 3 = 48$ 50 is 2 away from 48 so there is a remainder of 2. The remaining 2 pounds would get divided among the 3 people, so each person gets 2/3 of those 2 pounds. Students would each get 16 + 2/3 or 16 and 2/3 pounds of rice.
	There are 7 packages of crackers on the counter. If Nina divides them equally between herself and 3 friends, how many packages does each person get?
	Possible student work: There are 7 packages that are being equally shared among 4 people. I can write that as 7 divided by 4.
	a b c d a b c d
	a b c d a b c d a b c d
	Each person gets 7 fourths, which can be represented as 7 x $\frac{1}{4}$ = 7/4.
	Possible student work: a b c d
	a b c d a b c d a b c d
	Each person will receive 1 whole package and 3 smaller portions of a package. The smaller portions are ¼ of a package each, so each person will receive 1 and ¾ packages.

Apply and extend previous understandings of multiplication and division to multiply and divide fractions.

NC.5.NF.4 Apply and extend previous understandings of multiplication to multiply a fraction or whole number by a fraction, including mixed numbers.

- Use area and length models to multiply two fractions, with the denominators 2, 3, 4.
- Explain why multiplying a given number by a fraction greater than 1 results in a product greater than the given number and when multiplying a given number by a fraction less than 1 results in a product smaller than the given number.
- Solve one-step word problems involving multiplication of fractions using models to develop the algorithm.

Clarification	Checking for Understanding
This standard extends students' work of multiplication from earlier grades. In fourth grade, students worked with recognizing that a fraction such as $3/4$ can be represented as 3 pieces that are each one-fourth (3 x (1/4)) and multiplied fractions less than one by whole numbers.	Use area and length models to multiply two fractions, with the denominators 2,3, and 4. There are 3 ¼ packages of pencils on the desk. One full package weighs 1 ½ pounds. How much do all of the containers weigh?
I his standard references both the multiplication of a fraction by a whole number and the multiplication of two fractions, including mixed numbers, with	
ONLY the denominators 2, 3, and 4. This is new for 5 th grade.	
Students are expected to create and use visual fraction models (area models,	
tape diagrams, number lines) during their work with this standard. The	
always be used and the algorithm is limited to only exposure at the same time	
as models in Grade 5.	
	1 ½ pounds 1 ½ pounds 1 ½ pounds 3/8 of a pound I know 3 packages = 1 ½ + 1 ½ + 1 ½ = 4 ½ pounds. For the last package in the picture I need ¼ of 1 1/2. Based on the picture 1 ½ = 12/8 so when I divided the 12/8 into fourths ¼ was equal to 3/8, which is 3/8 of a pound. I added 3/8 + 4 ½ to get my answer which is 3/8 + 4 and 4/8 which is 4 and 7/8. Paige has 1 ½ feet of rope for a project. She only needs 2/3 of it. How much rope does she need? 1 ½ is equal to 3/2. Since we needed 2/3 of the rope my picture shows that 1/3
	of $3/2$ is equal to $3/2$. Since we needed $2/3$ of the rope my picture shows that $1/3$ of $3/2$ is $\frac{1}{2}$. So, $2/3$ of $3/2$ is $\frac{1}{2}$ plus $\frac{1}{2}$ which is 1.

Apply and extend previous understandings of multiplication and division to multiply and divide fractions.

NC.5.NF.4 Apply and extend previous understandings of multiplication to multiply a fraction or whole number by a fraction, including mixed numbers.

	Write 2 survey questions. One should yield numerical data that can be represented on a bar graph. One should yield data that changes over time that can be represented on a line graph.
	Possible responses: Numerical data: <i>How many times does the pitcher strike out the batter in nine innings of baseball?</i>
	Changes over time: What is the average wind speed every day in April?

Understand concepts of volume.

NC.5.MD.4 Recognize volume as an attribute of solid figures and measure volume by counting unit cubes, using cubic centimeter, cubic inches, cubic feet, and improvised units.

Understand concepts of volume.

NC.5.MD.5 Relate volume to the operations of multiplication and addition.

- Find the volume of a rectangular prism with whole-number side lengths by packing it with unit cubes and show that the volume is the same as would be found by multiplying the edge lengths.
- Build understanding of the volume formula for rectangular prisms with whole-number edge lengths in the context of solving problems.
- Find volume of solid figures with one-digit dimensions composed of two non-overlapping rectangular prisms.

Geometry

Understand the coordinate plane.	
Clarification	Checking for Understanding
In this standard, students are introduced to the coordinate plane and learn to plot points in the first quadrant in order to solve real-world and mathematical problems. Problems include traveling from one point to another and identifying the coordinates of missing points in geometric figures, such as squares, rectangles, and parallelograms. Students should understand that the coordinate plane is formed by a horizontal number line, called the x-axis, and a vertical number line, called the y-axis. The two axes intersect at a point called the origin (0,0). Students need to understand coordinates define a distance from the y-axis and a distance from the x-axis.	Plot these points on a coordinate grid. Point A: (2,6); Point B: (4,6); Point C: (6,3); Point D: (2,3) Connect the points in order. Make sure to connect Point D back to Point A. 1. What geometric figure is formed? What attributes did you use to identify it? 2. What line segments in this figure are parallel? 3. What line segments in this figure are perpendicular? (<i>trapezoid, line segments AB and DC are parallel, segments AD and DC are perpendicular</i>)
Students should distinguish between two different ways of viewing the point (2, 3). First, they should view the coordinates as instructions: "right 2, up 3". They should also understand the coordinates as the point defined by being a distance 2 from the year's and a	Using the coordinate grid, which ordered pair represents the location of the school? Classify quadrilaterals.

NC.5.G.3 Classify quadrilaterals into categories based on their properties.

• Explain that attributes belonging to a category of quadrilaterals also belong to all subcategories of that category.

• Classify quadrilaterals in a hierarchy based on properties.

Clarification	Checking for Understanding
This standard calls for students to reason about the attributes (properties) of quadrilaterals in order to classify quadrilaterals into categories. Geometric attributes include properties of sides (parallel, perpendicular, equal length), properties of angles (type, measurement), and properties of symmetry. Students should understand that if a category contains certain attributes, then all quadrilaterals in that category have that attribute.	 Questions that might be posed to students include: A parallelogram has 4 sides with both sets of opposite sides parallel. What types of quadrilaterals are parallelograms? All rectangles have 4 right angles. Squares have 4 right angles so they are also rectangles. True or False? A trapezoid has 2 sides parallel so it must be a parallelogram. True or False? Create a Hierarchy Diagram using the following terms: polygons – a closed plane figure formed from line segments that meet only at their endpoints.
For example: If a parallelogram has four sides and opposite sides are parallel and equal, then all shapes that meet these criteria are parallelograms including squares, rectangles, and rhombuses.	
 The notion of congruence ("same size and same shape") may be part of classroom conversation but the concepts of congruence and similarity do not appear until middle school. Note: North Carolina has adopted the exclusive definition for a trapezoid. A trapezoid is a quadrilateral with <i>exactly</i> one pair of parallel sides. This standard also calls for students to classify quadrilaterals into a hierarchy based on the relationship between shapes based on attributes. 	quadrilaterals - a four-sided polygon.rectangles - a quadrilateral with two pairs of equal, parallel sides and four right angles.rhombus - a parallelogram with all four sides equal in length.square - a parallelogram with four equal sides and four right angles.square - a parallelogram with four equal sides and four right angles.square - a parallelogram with four equal sides and four right angles.square - a parallelogram with four equal sides and four right angles.
	Create a Hierarchy Diagram using the following terms: quadrilateral – a four-sided polygon. parallelogram – a quadrilateral with two pairs of parallel and congruent sides. rectangle – a quadrilateral with two pairs of equal, parallel sides and four right angles. rhombus – a parallelogram with all four sides equal in length. square – a parallelogram with four equal sides and four right angles. (Sample student response)
