## UTILIZATION OF OPEN SOURCE TECHNOLOGY TO CREATE COST EFFECTIVE PORTABLE CAMERA SYSTEMS IN TEACHING

Dr. Anil Reddy K (3<sup>rd</sup> year PG, Department of Pathology)

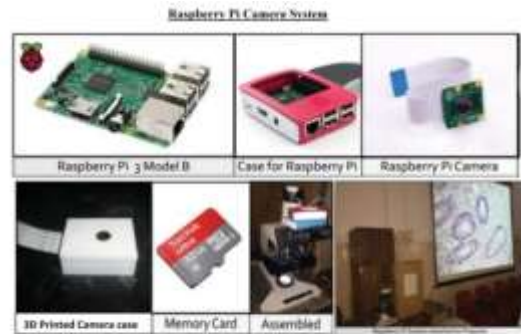

Pathology is the branch of Medicine, which characterizes the disease at the tissue level and at times to the cellular level. The present-day norm of teaching Pathology is digitalized and done as a combination of the High Definition LED panels or projectors, custom made manufacturer provided HD camera, adaptor and teaching trinocular head microscopes. But even with the digitization and rapidly advancing technologies, the cost of the Original Equipment Manufacturer (OEM) cameras and adapters is still high which amounts to a minimum of Rs.1,15,000/- for a single microscope.

With upgradation of the display panels and projectors to best possible resolutions at all the teaching galleries, demonstration rooms and practical halls, the high-resolution camera has become the missing piece to utilize these display devices to their full potential at all these locations. The department is equipped with a digital camera system in histopathology section for teaching purposes and low resolution closed circuit system for slide demonstration in practical hall.

The utilization of the open source technologies and 3D printing had helped us in achieving this digitization at fraction of the cost at a mere Rs.6000 and an additional advantage of portable camera system which can convert any binocular microscope to a teaching microscope enabling us to have the facility of slide demonstration in all the teaching locations.

The systems comprised of Raspberry Pi camera system and Mobile High Definition Link system (MHL). Raspberry Pi is the credit card sized, single board computer, which is an open source initiative. Pairing it with the Raspberry Pi camera, a Sony IMX219 8MP sensor, HD (30fps) fixed focus device, which delivers a high definition image to the LED panels available in the histopathology and cytology sections. The adapter which aligns the Pi camera system to the eye piece objective of any compound microscope is an open source design which enables this flexibility.

In case of MHL system, a list of mobiles with inbuilt MHL capability is provided in <http://www.mhltech.org/devices.aspx>, which needs to be paired with an adaptor and MHL cable available in the open market. Like the Raspberry Pi system this also provides

portability at a fraction of the cost. The Raspberry Pi system is being used for the Trinocular head microscopes and the MHL system is used for binocular microscopes successfully in the Department of Pathology for various teaching activities for the past one year.
