| $8.7 \times 10^{-10}$ | $1.1 \times 10^{-5}$ | 9.06 | 4.94 | basic |

Explanation for some of the above answers in the table;
85)

$K_{b}=K_{w} / K_{a}=\left[\mathrm{HNO}_{2}\right]\left[\mathrm{OH}^{-}\right] /\left[\mathrm{NO}_{2}\right]^{-}=x^{2} / 0.5=2.22 \times 10^{-11}$
$p H=14-p O H=8.52$
88) Only the first dissociation is significant so only $K_{a 1}$ is needed
89). From the first dissociation, $\left[\mathrm{H}^{+}\right]=\left[\mathrm{HCO}^{3-}\right]$. The second dissociation does not change this much. $\mathrm{Ka}_{\mathrm{a} 2}=\left[\mathrm{H}^{+}\right]\left[\mathrm{CO}_{3}{ }^{2-}\right] /\left[\mathrm{HCO}_{3}{ }^{-}\right]$. But $\left[\mathrm{H}^{+}\right]=\left[\mathrm{HCO}_{3}{ }^{-}\right]$and cancel each other out.

So $K_{a 2}=\left[\mathrm{CO}_{3}{ }^{2-}\right]=5.6 \times 10^{-11}$
90) Combine the two dissociations
$\mathrm{H}_{2} \mathrm{~S} \leftrightarrow \mathrm{H}^{+}+\mathrm{HS}^{-}$
$H S^{-} \leftrightarrow H^{+}+S^{2-}$
$H_{2} S \leftrightarrow 2 H^{+}+S^{2-}$

$$
\begin{array}{r}
K=K_{a 1} \times K_{a 2} 1.1 \times 10^{-21}=\left[H^{+}\right]^{2}\left[S^{2-}\right] \\
\left.---H_{2} \mathrm{~S}\right]
\end{array}
$$

$$
\left[S^{2-}\right]=k\left[H_{2} S\right] /\left[H^{+}\right]^{2}=1.1 \times 10^{-10}
$$

1. a) $\quad \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}^{-} \leftrightarrow \mathrm{H}^{+}+\mathrm{HC}_{2} \mathrm{O}_{4}^{-}$(eq. constant $=\mathrm{K}_{1}$ )
$\mathrm{HC}_{2} \mathrm{O}_{4}^{-} \leftrightarrow \mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$ (eq. constant $=\mathrm{K}_{2}$ )
b) $\quad \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \rightarrow \mathrm{H}^{+}+\mathrm{HC}_{2} \mathrm{O}_{4}^{-1} \mathrm{~K}_{1}$
$\mathrm{HC}_{2} \mathrm{O}_{4}^{-1} \rightarrow \mathrm{H}^{+}+\mathrm{HC}_{2} \mathrm{O}_{4}^{-2} \mathrm{~K} 2$
$\mathrm{K}=\mathrm{K}_{1} \times \mathrm{K}_{2}$
$K_{1}=K / K_{2}$
$=3.78 \times 10^{-6} / 6.40 \times 10^{-5}=5.91 \times 10^{-2}$

$K_{b}=K_{w} / K_{a} 1.0 \times 10^{-14} / 6.40 \times 10^{-5}=1.56 \times 10^{-10}$
2. (a) The structure for the three acids are as follows:

The hydrogen atom(s) bonded directly to the phosphorus atom is/are not acidic in aqueous solution; only those hydrogen atoms bonded to the oxygen atoms can be released as protons.
(b) The acid strength is successively greater as the number of oxygen atoms increases because the very electronegative oxygen atoms are able to draw electrons away from the chlorine atom and the $\mathrm{O}-\mathrm{H}$ bond. This effect is more important as the number of attached oxygen atoms increases. This means that a proton is most readily produced by the molecule with the largest number of attached oxygen atoms.
