## 7 <br> ALKENES AND ALKYNES I: <br> PROPERTIES AND SYNTHESIS. <br> ELIMINATION REACTIONS OF ALKYL HALIDES

## SOLUTIONS TO PROBLEMS

7.1 (a) ( $E$ )-1-Bromo-1-chloro-1-pentene or $(E)$-1-Bromo-1-chloropent-1-ene
(b) (E )-2-Bromo-1-chloro-1-iodo-1-butene or (E )-2-Bromo-1-chloro-1-iodobut-1-ene
(c) (Z)-3,5-Dimethyl-2-hexene or ( $Z$ )-3,5-Dimethylhex-2-ene
(d) (Z)-1-Chloro-1-iodo-2-methyl-1-butene or (Z)-1-Chloro-1-iodo-2-methylbut-1-ene
e) ( $Z, 4 S$ )-3,4-Dimethyl-2-hexene or ( $Z, 4 S$ )-3,4-Dimethylhex-2-ene
f) (Z,3S)-1-Bromo-2-chloro-3-methyl-1-hexene or ( $Z, 3 S$ )-1-Bromo-2-chloro-3-methylhex-1-ene

7.3 (a), (b)

(c) Yes, because hydrogenation converts each alkene into the same product.

## ALKENES AND ALKYNES I: PROPERTIES AND SYNTHESIS 107

(d)
 $>\mathrm{H}_{>}^{\mathrm{H}} \gg$

(trisubstituted)
(disubstituted)
(monosubstituted)
Notice that this predicted order of stability is confirmed by the heats of hydrogenation. 2-Methyl-2-butene evolves the least heat; therefore, it is the most stable. 3-Methyl-1-butene evolves the most heat; therefore, it is the least stable.
(e)

cis-2-Pentene

trans-2-Pentene
(f) Order of stability: trans-2-pentene $>$ cis-2-pentene $>$ 1-pentene
7.4 (a) 2,3-Dimethyl-2-butene would be the more stable because the double bond is tetrasubstituted. 2-Methyl-2-pentene has a trisubstituted double bond.
(b) trans-3-Hexene would be the more stable because alkenes with trans double bonds are more stable than those with cis double bonds.
(c) cis-3-Hexene would be more stable because its double bond is disubstituted. The double bond of 1-hexene is monosubstituted.
(d) 2-Methyl-2-pentene would be the more stable because its double bond is trisubstituted. The double bond of trans-2-hexene is disubstituted
7.5 The location of IR absorptions between $600 \mathrm{~cm}^{-1}$ and $1000 \mathrm{~cm}^{-1}$ due to out-of-plane bending of alkene $\mathrm{C}-\mathrm{H}$ bonds can be the basis of differentiation.
(a) 2-Methyl-2-pentene, $\sim 800 \mathrm{~cm}^{-1}$ 2,3-Dimethyl-2-butene, no alkene C - H bonds
(b) cis-3-Hexene, $650-750 \mathrm{~cm}^{-1}$ trans-3-Hexene, $\sim 960 \mathrm{~cm}^{-1}$
(c) 1-Hexene, $\sim 900 \mathrm{~cm}^{-1}$ and $\sim 1000 \mathrm{~cm}^{-1}$ cis-3-Hexene, 650-750 cm ${ }^{-1}$
(d) trans-2-Hexene, $\sim 960 \mathrm{~cm}^{-1}$ 2-Methyl-2-pentene, $\sim 800 \mathrm{~cm}^{-1}$

$7.8 t$-BuOK in $t$-BuOH
7.9 An anti coplanar transition state allows the molecule to assume the more stable staggered conformation,

whereas a syn coplanar transition state requires the molecule to assume the less stable eclipsed conformation.

7.10 cis-1-Bromo-4-tert-butylcyclohexane can assume an anti coplanar transition state in which the bulky tert-butyl group is equatorial.

The conformation (above), because it is relatively stable, is assumed by most of the molecules present, and, therefore, the reaction is rapid.

On the other hand, for trans-1-bromo-4-tert-butylcyclohexane to assume an anti coplanar transition state, the molecule must assume a conformation in which the large tert-butyl group is axial:

Such a conformation is of high energy; therefore, very few molecules assume this conformation. The reaction, consequently, is very slow.
7.11 (a) Anti coplanar elimination can occur in two ways with the cis isomer.

cis-1-Bromo-2-methylcyclohexane
(b) Anti coplanar elimination can occur in only one way with the trans isomer.

trans-1-Bromo-2-methylcyclohexane
7.12

(b) By donating a proton to the -OH group of the alcohol in step (1), the acid allows the loss of a relatively stable, weakly basic, leaving group $\left(\mathrm{H}_{2} \mathrm{O}\right)$ in step (2). In the absence of an acid, the leaving group would have to be the strongly basic $\mathrm{OH}^{-}$ion, and such steps almost never occur.

An IUPAC rule covers those cases in which a double bond and a triple bond occur in the same molecule:

Numbers as low as possible are given to double and triple bonds as a set, even though this may at times give "-yne" a lower number than "-ene." If a choice remains, preference for low locants is given to the double bonds.*

(k)

7.33 We notice that the deuterium atoms are cis to each other, and we conclude, therefore, that we need to choose a method that will cause a syn addition of deuterium. One way would be to use $\mathrm{D}_{2}$ and a metal catalyst (Section 7.14)

(d)

Dehydrohalogenation and Dehydration

7.36 Dehydration of trans-2-methylcyclohexanol proceeds through the formation of a carbocation (through an E1 reaction of the protonated alcohol) and leads preferentially to the more stable alkene. 1-Methylcyclohexene (below) is more stable than 3-methylcyclohexene (the minor product of the dehydration) because its double bond is more highly substituted.

Dehydrohalogenation of trans-1-bromo-2-methylcyclohexane is an E2 reaction and must proceed through an anti coplanar transition state. Such a transition state is possible only for the elimination leading to 3-methylcyclohexene (cf. Review Problem 7.11)

rearrangement
(
(e)

7.42 The alkene cannot be formed because the double bond in the product is too highly strained. Recall that the atoms at each carbon of a double bond prefer to be in the same plane.
7.43 Only the deuterium atom can assume the anti coplanar orientation necessary for an E2 reaction to occur

7.44 (a) A hydride shift occurs

(b) A methanide shift occurs.

124 ALKENES AND ALKYNES I: PROPERTIES AND SYNTHESIS
(c) A methanide shift occurs.

(d) The required anti coplanar transition state leads only to $(E)$ alkene:

Index of Hydrogen Deficiency
7.45 (a) Caryophyllene has the same molecular formula as zingiberene (Review Problem 4.21); thus it, too, has an index of hydrogen deficiency equal to 4 . That 1 mol of caryophyllene absorbs 2 mol of hydrogen on catalytic hydrogenation indicates the presence of two double bonds per molecule.
(b) Caryophyllene molecules must also have two rings. (See Review Problem 23.2 for the structure of caryophyllene.)
7.46 (a) $\mathrm{C}_{30} \mathrm{H}_{62}=$ formula of alkane
$\underline{\mathrm{C}_{30} \mathrm{H}_{50}}=$ formula of squalene
$\mathrm{H}_{12}=$ difference $=6$ pairs of hydrogen atoms
Index of hydrogen deficiency $=6$
(b) Molecules of squalene contain six double bonds.
(c) Squalene molecules contain no rings. (See Review Problem 23.2 for the structural formula of squalene.)

## Structure Elucidation

7.47 That $\mathbf{I}$ and $\mathbf{J}$ rotate plane-polarized light in the same direction tells us that $\mathbf{I}$ and $\mathbf{J}$ are not enantiomers of each other. Thus, the following are possible structures for $\mathbf{I}, \mathbf{J}$, and $\mathbf{K}$. (The enantiomers of $\mathbf{I}, \mathbf{J}$, and $\mathbf{K}$ would form another set of structures, and other answers are possible as well.)

Printer: Bind Rite
December 8, 2009 21:37

7.48 The following are possible structures:

(other answers are possible as well)

## Challenge Problems

7.49

```
P1:PBU/OVY P2: PBU/OVY QC:PBU/OVY T1:PBU

7.50 (a) We are given (Section 7.3A) the following heats of hydrogenation:
\[
\begin{aligned}
& \text { cis-2-Butene }+\mathrm{H}_{2} \xrightarrow{\mathrm{Pt}} \text { butane } \Delta H^{\circ}=-120 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
& \text { trans-2-Butene }+\mathrm{H}_{2} \xrightarrow{\mathrm{Pt}} \text { butane } \Delta H^{\circ}=-115 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
& \text { cis-2-Butene } \longrightarrow \text { trans-2-butene } \Delta H^{\circ}=-5.0 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
\]

Thus, for
(b) Converting cis-2-butene into trans-2-butene involves breaking the \(\pi\) bond. Therefore, we would expect the energy of activation to be at least as large as the \(\pi\)-bond strength, that is, at least \(264 \mathrm{~kJ} \mathrm{~mol}^{-1}\).
(c)

7.51 (a) With either the \((1 R, 2 R)\) - or the \((1 S, 2 S)\)-1,2-dibromo-1,2-diphenylethane, only one conformation will allow an anti coplanar arrangement of the H - and Br -. In either case, the elimination leads only to ( \(Z\) )-1-bromo-1,2-diphenylethene:

(1R,2R)-1,2-Dibromo-1,2-diphenylethane
(Z)-1-Bromo-1,2-diphenylethene (anti coplanar orientation of \(\mathrm{H}-\) and -Br )

B:-
(1S,2S)-1,2-Dibromo-1,2-diphenylethane (anti coplanar orientation of \(\mathrm{H}-\) and -Br )
