An Introduction to
FFmpeg, DaVinci Resolve, Timelapse and Fulldome Video Production,
Special Effects, Color Grading, Streaming, Audio Processing,
Canon 5D-MK4, Panasonic LUMIX GH5S, Kodak PIXPRO SP360 4K, Ricoh Theta V,
Synthesizers, Image Processing and Astronomy Software
by

Michael Koch, astroelectronic@t-online.de

Version from March 11, 2022

## Contents

1 Introduction to FFmpeg ..... 10
1.1 What can be done with FFmpeg? ..... 12
1.2 If FFmpeg has no graphical user interface, how do we use it ..... 15
1.3 The first example ..... 15
1.4 Using variables ..... 16
2 FFmpeg in detail. ..... 17
2.1 Convert from one video format to another video format ..... 17
2.2 Change the container format. ..... 17
2.3 Fit timelapse length to music length ..... 18
2.4 Timelapse or slideshow from many images, with crossfading ..... 19
2.5 Slideshow with different durations ..... 21
2.6 Slideshow with scrolling images ..... 22
2.7 Extract many images from a video. ..... 25
2.8 Extract the first and last frame from a video ..... 26
2.9 Modify brightness, contrast, saturation, gamma and hue ..... 27
2.10 Strong contrast enhancement. ..... 28
2.11 Inverting a video or image (make a negative) ..... 30
2.12 Colorchannelmixer filter ..... 32
2.13 Shuffleplanes filter ..... 34
2.14 Day-for-Night ..... 35
2.15 Colorcorrect filter. ..... 36
2.16 Colortemperature filter ..... 38
2.17 Hue filter. ..... 40
2.18 Huesaturation filter. ..... 42
2.19 Selectivecolor filter ..... 44
2.20 Colorbalance filter ..... 46
2.21 Colorcontrast filter ..... 48
2.22 Monochrome filter ..... 50
2.23 Vibrance filter ..... 54
2.24 Swapuv filter ..... 57
2.25 Gradation curves. ..... 58
2.26 Color grading with color look-up tables, full workflow ..... 59
2.27 Color grading with color look-up tables, simplified workflow.... 61
2.28 Size of color-look-up tables ..... 62
2.29 Colorhold, chromahold and hsvhold ..... 66
2.30 Atmospheric dispersion correction ..... 68
2.31 Amplify filter. ..... 69
2.32 Sharpen or blur images ..... 69
2.33 FFT Filtering ..... 71
2.34 Extract a time segment from a video. ..... 78
2.35 Trim filter ..... 79
2.36 Tpad filter, add a few seconds black at the beginning or end80
2.37 Extract the last $\mathbf{3 0}$ seconds of a video ..... 81
2.38 Fade-in and fade-out ..... 82
2.39 Crossfading ..... 83
2.40 Crop a video ..... 84
2.41 Add borders to a video ..... 85
2.42 Zoompan ..... 85
2.43 Changing the speed: slow motion and timelapse ..... 86
2.44 Slow motion or timelapse only for a segment of the video. ..... 87
2.45 Time Remapping ..... 88
2.46 Insert a text which is visible for the whole duration. ..... 90
2.47 Slowly fade a text in and out. ..... 90
2.48 Vertical alignment of text ..... 92
2.49 Show a running clock in the video ..... 93
2.50 Generation of curved text for fulldome projection ..... 95
2.51 Write text on a transparent layer .....  98
2.52 Combine multiple videos with concat demuxer ..... 100
2.53 Combine multiple videos with concat filter ..... 102
2.54 The "fps" filter ..... 102
2.55 Split a video in multiple segments. ..... 103
2.56 Switch between two cameras, using audio from camera1 ..... 104
2.57 Stack videos side by side (or on top of each other) ..... 105
2.58 Horizontal and vertical flipping ..... 105
2.59 Stack four videos to a $2 \times 2$ mosaic ..... 106
2.60 Blink comparator. ..... 107
2.61 Creating animated GIF or PNG ..... 109
2.62 Overlay an animated GIF over a video ..... 110
2.63 Changing the size of an animated GIF ..... 110
2.64 Replace one frame in a video by another ..... 111
2.65 Blend filter ..... 112
2.66 Circular mask (View through eyepiece) ..... 114
2.67 Binocular view simulation ..... 116
2.68 Vignetting. ..... 117
2.69 Subtracting a darkframe ..... 118
2.70 Histogram ..... 118
2.71 Lagfun filter ..... 119
2.72 Deflicker a video ..... 121
2.73 Star trails ..... 124
2.74 Bird trails ..... 125
2.75 Rainbow-trail effect ..... 128
2.76 Temporal slice-stacking effect. ..... 129
2.77 Extract and merge planes, split planes. ..... 130
2.78 Extract the alpha channel ..... 131
2.79 Colorkey. ..... 132
2.80 Chromakey ..... 133
2.81 HSVkey ..... 134
2.82 Lumakey. ..... 135
2.83 Bluescreen / greenscreen ..... 136
2.84 Real-time bluescreening ..... 147
2.85 Extract moving objects from a video. ..... 149
2.86 Datascope. ..... 149
2.87 Video line jitter effect ..... 150
2.88 Vertical jitter effect ..... 151
2.89 CRT Screen Effect ..... 152
2.90 Macroblock motion vectors ..... 152
2.91 Deblock filter ..... 152
2.92 Gradfun filter ..... 153
2.93 Dilation filter. ..... 153
2.94 Morphological transforms ..... 154
2.95 Correct the radial distortion of (fisheye-) lenses. ..... 157
2.96 V360 filter for rotation of equirectangular $360^{\circ}$ videos ..... 160
2.97 Equirectangular images of the night sky ..... 163
2.98 Undo spherical rotations ..... 164
2.99 Remap a fisheye video to an equirectangular video ..... 165
2.100 Remap an equirectangular video to a fisheye video ..... 169
2.101 Realtime remapping from equirectangular to fisheye ..... 171
2.102 How to replace the v360 filter by the remap filter. ..... 175
2.103 Off-center fisheye projection ..... 181
2.104 DLP Beamer output ..... 186
2.105 Remap from equirectangular to double-fisheye ..... 187
2.106 Remap an equirectangular video to a "Little planet" video..... 188
2.107 Remap an equirectangular video to a "Mirror sphere" video.. 190
2.108 Shifting the viewing direction in a fisheye image or video...... 194 ..... 194
2.109 How the "drawbox" filter works. ..... 196
2.110 Stitching together double-fisheye videos. ..... 197
2.111 Remove stitching artefacts
2.112 Stitch double-fisheye images with alignment errors ..... 203
2.113 Preprocessing a flat video for fulldome projection. ..... 207
2.114 Rotating the earth, moon or planet ..... 210
2.115 Live rotation of the moon. ..... 216
2.116 Insert a crosshair in a live video ..... 218
2.117 Enlarge the corners of a live video ..... 219
2.118 Tunnel effect ..... 220
2.119 Black hole simulation with remap filter ..... 224
2.120 Wormhole simulation ..... 229
2.121 Simulation of a moving wormhole ..... 234
2.122 Dynamically change commands with "sendcmd" or "zmq".... 238
2.123 Sendemd and commands ..... 239
2.124 Sending commands with ZMQ ..... 244
2.125 Changing an input image while FFmpeg is running ..... 246
2.126 FFmpeg and C\# Programming ..... 247
2.127 Video stabilization ..... 250
2.128 Stabilization of $360^{\circ}$ Videos ..... 253
2.129 Stabilization of $360^{\circ}$ Videos, improved ..... 258
2.130 Remap Video-in-Video with perspective filter ..... 260
2.131 Image warping with displace filter ..... 262
2.132 Noise reduction ..... 267
2.133 -filter_complex_script. ..... 268
2.134 Time delay within a filter chain ..... 268
2.135 Recording one-time events with pre-trigger ..... 269
2.136 Chroma subsampling, pixel formats of images or videos ..... 270
2.137 Automatic format conversions ..... 277
2.138 RGB Color Cube ..... 279
2.139 Convert RGB to HSV or HSL ..... 283
2.140 Convert HSV to RGB. ..... 284
2.141 Video Codecs ..... 285
2.142 Keyframes ..... 287
2.143 Open GOP and closed GOP ..... 287
2.144 Video codecs with alpha channel. ..... 288
2.145 Metadata ..... 289
2.146 Video filters "copy" and "null" ..... 290
2.147 Re-numbering images ..... 290
2.148 Filenames for images ..... 291
2.149 Create two-dimensional gradients ..... 292
2.150 Make spectrum images ..... 293
2.151 Radial Gradients. ..... 304
2.152 Make an additive color mixing image ..... 305
2.153 Make a test image with shifted RGB channels. ..... 306
2.154 Make a 8-color test image. ..... 307
2.155 Redshift ..... 308
2.156 SMPTE Color Bars. ..... 310
2.157 Make many JPG test images ..... 310
2.158 Make a grid video ..... 311
2.159 Make a chessboard video. ..... 311
2.160 Make a test video with audio ..... 311
2.161 Make a noise video ..... 312
2.162 Make a grayscale test image. ..... 312
2.163 Pseudocolor filter ..... 313
2.164 Test a filtergraph for 10 -bit compatibility ..... 314
2.165 Make a 10-bit test video with audio ..... 318
2.166 Find an object in a video and hide it ..... 318
2.167 Find the coordinates of a moving object in a video ..... 319
2.168 Detect black frames and replace them by previous frame... ..... 320
2.169 Image formats. ..... 321
2.170 Image size limits ..... 322
2.171 CR2 and DNG Images. ..... 323
2.172 Colorspace. ..... 325
2.173 Video sizes ..... 326
2.174 Editing videos from PanoView XDV360 fulldome camera. ..... 329
2.175 Editing videos from the Kodak SP360 4K camera. ..... 330
2.176 Postprocessing of real time videos of the night sky ..... 331
2.177 Workflow for night sky videos with GH5S ..... 334
2.178 Combine many options and filters ..... 335
2.179 Timelapse example with masking, deflicker, rotation, fading. 336
2.180 Slow motion with Panasonic GH5S at 240fps ..... 337
2.181 Create a light curve of a star occultation ..... 339
2.182 Oscilloscope ..... 345
2.183 Vectorscope. ..... 345
2.184 Capture a video from a webcam ..... 346
2.185 Capture video from the desktop or from a window ..... 347
2.186 Capture video and audio from a HDMI to USB converter. ..... 349
2.187 Adding *. srt subtitles to a video. ..... 353
2.188 Adding *.ass subtitles or credit files to a video. ..... 355
2.189 Removing subtitles ..... 356
2.190 freiOr. ..... 357
2.191 Mapping streams to the output (-map) ..... 357
2.192 Creating multiple outputs ..... 357
2.193 Attaching a preview image to a video. ..... 358
2.194 Attach Cover Art to a Video. ..... 359
2.195 Timeline support ..... 360
2.196 Expression evaluation ..... 371
2.197 Downloading videos from Facebook ..... 374
2.198 Uploading spherical 360 images to Facebook ..... 374
2.199 Uploading videos to Facebook ..... 375
2.200 Downloading videos from Youtube. ..... 375
2.201 Youtube recommended settings ..... 376
2.202 Streaming from FFmpeg to YouTube Live ..... 377
2.203 Limiting FFmpeg's encoding speed to realtime ..... 377
2.204 Streaming a video to a multicast address ..... 378
2.205 Hardware acceleration ..... 381
2.206 FFmpeg console output. ..... 382
2.207 FFmpeg source code ..... 382
2.208 FFmpeg: Suggestions for improvement ..... 383
3 Audio processing with FFmpeg. ..... 402
3.1 Combine multiple audio files with crossfadings ..... 402
3.2 Change audio volume ..... 403
3.3 Change audio sample rate and number of audio channels ..... 403
3.4 Change audio length, sample rate and/or pitch ..... 404
Replace a segment of the audio stream by silence. ..... 405
Add an audio stream to a video, if no audio stream exists ..... 405
Stereo --> mix into one mono channel. ..... 406
Check if both stereo channels are equal ..... 407
Check if two mono inputs are equal. ..... 407
3.10 Extract one mono channel from stereo ..... 407
3.11 Stereo --> two mono channels ..... 408
3.12 Mono --> stereo. ..... 408
3.13 Two mono channels --> stereo ..... 409
Mix two stereo channels to one stereo channel ..... 409
Create a file with multiple audio streams. ..... 410
How to choose the correct audio volume level ..... 410
Remove low frequencies (wind noise) from an audio track ..... 411
Remove silence from an audio stream ..... 411
Make a video from an audio file ..... 412
Convert ultrasound to the audible range, e.g. to hear bats. ..... 413
Record sound with the computer's built-in microphone. ..... 416
Record a "Voice-Over" audio track ..... 417
Passing the FFmpeg output to FFplay ..... 419
Record sound and pass the output to FFplay ..... 419
Live ultrasound conversion ..... 420
Extract the audio from a video ..... 422
Split a video into audio-only and video-only ..... 422
Synchronize audio with video ..... 422
Sources for royalty-free music ..... 423
Sound effects, from frequency domain to time domain ..... 424
Gravitational waves from binary black hole mergers ..... 430
Create band-limited noise ..... 434
3.33 Show the frequency response of a filter. ..... 435
3.34 Make an audio file with a short test tone ..... 436
Measuring the audio volume ..... 436
3.36 Convert an audio waveform to a picture. ..... 437
3.37 Optical sound effect ..... 443
3.38 Which equipment is useful for making sound records? ..... 444
Create an alternating left/right stereo sound. ..... 445 ..... 445
3.40 Comparison of Rode NT1 and NTG2 microphones ..... 446
3.41 Mathematical properties of sample rates 44100 and 48000 ..... 447
3.42 Speed of sound ..... 449
4 FFprobe ..... 450
4.1 Count the number of frames. ..... 451
4.2 Find the keyframe timestamps. ..... 451
5 FFplay. ..... 452
6 DaVinci Resolve 15/16/17 ..... 454
6.1 Tutorials on Youtube ..... 455
6.2 Mouse buttons and keyboard shortcuts ..... 457
6.3 GUI Controls. ..... 459
6.4 Preferences ..... 460
6.5 Project settings ..... 461
6.6 Timeline Proxy Mode and Timeline Resolution ..... 462
6.7 The "Media" page in DaVinci Resolve. ..... 463
6.8 Archive projects ..... 464
6.9 The "Cut" page in DaVinci Resolve. ..... 465
6.10 The "Edit" page in DaVinci Resolve ..... 466
6.11 Speed Change. ..... 470
6.12 Change the framerate of a clip ..... 470
6.13 GUI Controls in the "Edit" page ..... 471
6.14 Markers ..... 471
6.15 Edit the audio volume of a clip ..... 472
6.16 Normalize Audio. ..... 472
6.17 The "Fusion" page in DaVinci Resolve. ..... 473
6.18 Add a new "Medialn" node ..... 474
6.19 Fusion Clips. ..... 475
6.20 The "Color" page in DaVinci Resolve ..... 476
6.21 Corrector nodes in "Color" page ..... 478
6.22 Secondary Adjustments ..... 479
6.23 Save Color Gradings ..... 479
6.24 Wipes. ..... 480
6.25 The "Fairlight" page in DaVinci Resolve ..... 480
6.26 The "Deliver" page in DaVinci Resolve. ..... 481
6.27 Day-for-Night. ..... 482
6.28 Dynamic Zoom ..... 482
6.29 Synchronize audio with video ..... 483
6.30 Cutting on the beat of the music.. ..... 483
6.31 Video stabilization ..... 484
6.32 Processing of drone videos ..... 484
6.33 Track an object ..... 485
6.34 Track and blur (or pixelize) an object ..... 488
6.35 Track an object and cover it by a colored rectangle ..... 489
6.36 Track an object and cover it by an image ..... 490
6.37 Track an object and corner pin an image ..... 491
6.38 Isolate Humans with "Magic Mask" ..... 491
6.39 Overlay text ..... 492
6.40 Color matching ..... 493
6.41 Generate a LUT ..... 494
6.42 Apply a look-up-table to a clip ..... 494
6.43 Spline Editor ..... 494
6.44 Special effects. ..... 495
6.45 Alpha masking ..... 499
6.46 Qualifier. ..... 500
6.47 Exclude two regions from a mask ..... 501
6.48 Snowfall ..... 502
6.49 Polyline toolbar ..... 503
6.50 Artificial lightning ..... 504
6.51 Adjustment clips ..... 506
6.52 Trails ..... 507
6.53 Fog Effect ..... 508
6.54 Explosion effect. ..... 509
6.55 Bluescreen / greenscreen. ..... 511
6.56 3D Effects. ..... 512
6.57 3D Water Effect. ..... 513
6.58 3D Camera Tracking ..... 514
6.59 3D Plant Models ..... 518
6.60 Resolve Live. ..... 518
6.61 Time remapping. ..... 519
6.62 Slow motion and timelapse. ..... 519
6.63 Reducing the framerate (Super 8 simulation) ..... 519
6.64 Noise reduction ..... 520
6.65 Reverse a video ..... 521
6.66 Recording a Voice-Over audio track ..... 522
6.67 ADR (Automated Dialog Replacement) ..... 524
6.68 VR360. ..... 525
6.69 Reframing $360^{\circ}$ videos with KartaVR ..... 526
6.70 Little Planet ..... 528
6.71 Spherical stabilizer ..... 530
6.72 Mirror sphere ..... 532
6.73 Black hole effect ..... 534
6.74 Wormhole effect. ..... 536
6.75 Programming fuses ..... 537
6.76 Multicam Editing ..... 537
6.77 Subtracting a darkframe ..... 537
6.78 Subtitles. ..... 538
6.79 Supported Codecs ..... 539
6.80 Convert *.mkv videos for DaVinci Resolve. ..... 539
6.81 Convert 10-bit videos from GH5S for DaVinci Resolve ..... 540
6.82 Metadata ..... 543
6.83 Sound library. ..... 543
6.84 Blackmagic RAW speed test ..... 544
6.85 DaVinci Resolve, Problems and Solutions ..... 544
6.86 Miscellaneous unsorted things ..... 546
7 Shotcut. ..... 546
8 Exiftool ..... 547
9 IrfanView. ..... 549
9.1 Create an image with a transparent color ..... 550
10 Faststone Image Viewer ..... 550
11 Adobe DNG converter. ..... 550
12 Batch files (DOS, Windows 7 and 10) ..... 551
12.1 Wildcards in filenames. ..... 551
12.2 Create beeps in a batch file ..... 552
12.3 Loop over all files in a directory. ..... 553
12.4 Create short text files or append text to a file ..... 553
12.5 Calculate variables in a batch file ..... 553
12.6 if conditions ..... 554
12.7 Start a new process ..... 554
13 Batch files (Unix, Linux) ..... 554
14 VLC Player ..... 555
MPV. ..... 556
CD Rippers. ..... 557
DVD Rippers ..... 557
18 SpyderX Elite, Monitor calibration ..... 557
19 Color grading with 3D LUT Creator ..... 558
19.1 Known problems and solutions ..... 561
19.2 Beginner tutorials for 3D LUT Creator ..... 563
19.3 Advanced tutorials for 3D LUT Creator ..... 564
19.4 Working with Color Targets in for 3D LUT Creator ..... 565
19.5 Working with video in for 3D LUT Creator ..... 565
20 OBS - Open Broadcaster Software ..... 567
20.1 OBS - Problems and solutions ..... 568
20.2 CPU Load ..... 569
20.3 Facebook Live ..... 570
20.4 Facebook Live - Mode "Camera ..... 570
20.5 Facebook Live - Mode "Connect" ..... 571
20.6 YouTube Live. ..... 572
20.7 Desktop for live broadcasting ..... 572
20.8 Live broadcasting, or recording in advance? ..... 573
20.9 Using the same source multiple times ..... 574
21 Tips and tricks for video ..... 575
21.1 Neutral Density Filters ..... 576
22 Screenwriting ..... 578
23 Unix (Ubuntu), compiling FFmpeg ..... 579
23.1 GIT ..... 581
23.2 Compiling FFmpeg under Windows ..... 583
24 Cameras and lenses for fulldome video production ..... 584
24.1 Read-out chip size of cameras at different video modes ..... 585
24.2 Overview of available fisheye lenses. ..... 586
24.3 Favorable camera / fisheye combinations ..... 588
24.4 Fisheye projection lenses. ..... 590
24.5 Other projection lenses. ..... 591
24.6 Flange distances ..... 592
24.7 Aperture numbers, rounded and exac ..... 592
24.8 Test patterns for fulldome projection ..... 593
25 Canon 5D-Mark4 ..... 595
25.1 All Canon 5D-Mark4 video modes for PAL video system ..... 595
25.2 All Canon 5D-Mark4 video modes for NTSC video system ..... 596
25.3 Canon 5D-Mark4 Field of view. ..... 597
25.4 Video tutorials for Canon 5D-Mark4 ..... 599
26 Panasonic LUMIX GH5S ..... 603
26.1 GH5S Record formats. ..... 603
26.2 GH5S Exposing for VLog-L ..... 604
26.3 GH5S HLG (Hybrid Log Gamma) ..... 609
26.4 GH5S Metering Modes ..... 610
26.5 GH5S Autofocus ..... 610
26.6 GH5S Recommended settings ..... 611
26.7 GH5S Custom settings C1, C2, C3-1, C3-2, C3-2. ..... 612
26.8 GH5S Luminance level ..... 613
26.9 GH5S Master pedestal level ..... 613
26.10 GH5S Video size ..... 613
26.11 GH5S Mechanical / electronic shutter ..... 614
26.12 GH5S Longer exposure time than framerate allows. ..... 614
26.13 GH5S Variable frame rate ..... 615
26.14 Recording duration on SD cards. ..... 616
26.15 GH5S Cable remote trigger ..... 616
26.16 GH5S Cheap chinese battery adapters ..... 617
26.17 GH5S Telescopic effect ..... 617
26.18 GH5S External HDMI ..... 617
26.19 GH5S Synchro Scan. ..... 617
26.20 GH5S Field of view with and without SpeedBooster 0.64x. ..... 618
26.21 GH5S, all 77 video modes ..... 620
26.22 GH5S, all C4K 8 bit modes ..... 623
26.23 GH5S, all C4K 10 bit modes ..... 623
26.24 GH5S, all 4K 8 bit modes ..... 624
26.25 GH5S, all 4K 10 bit modes ..... 625
26.26 GH5S, all anamorphic 8 bit modes ..... 625
26.27 GH5S, all anamorphic 10 bit modes ..... 626
26.28 GH5S, all FHD 8 bit modes ..... 627
26.29 GH5S, all FHD 10 bit modes ..... 628
27 Immersive $360^{\circ}$ videos ..... 629
28 PanoView XDV360 camera ..... 630
29 Kodak PIXPRO SP360 4K camera ..... 631
29.1 Remote control ..... 632
29.2 Convert $235^{\circ}$ fisheye image to equirectangular panorama. ..... 632
30 Chinese $360^{\circ}$ Panoramic camera ..... 633
31 Ricoh Theta V ..... 634
31.1 Plugins. ..... 635
31.2 Bluetooth remote control ..... 635
31.3 Change the viewing direction ..... 636
31.4 How to hide something from a $360^{\circ}$ image. ..... 636
31.5 Make an equirectangular $360^{\circ}$ image or video ..... 639

FFmpeg is an open-source software and available for Linux, Windows and OS-X. It's a very powerful command line tool and has no graphic user interface.

Main project website: www.ffmpeg.org
Download site for the Windows builds: https://www.gyan.dev/ffmpeg/builds/

How to install the Windows build:
Download the file "ffmpeg-git-essentials.7z", open the ZIP file, open the "bin" folder and copy ffmpeg.exe, ffprobe.exe and ffplay.exe to a new folder, for example to c:lffmpeg\That's all.
In rare cases, if you need some special libraries, you might want to download the "ffmpeg-git-full" version instead. But you won't need it for the examples in this book.

An alternative download site is here: https://github.com/BtbN/FFmpeg-Builds/releases
ffmpeg.exe is the very powerful software for manipulating videos.
ffprobe.exe is a program for viewing the properties of videos, pictures or audio files. It's useful for troubleshooting.
ffplay.exe is a video player. In most cases we don't need it if we use the VLC player instead.
It's also a good idea to save the file doclffmpeg-all.html somewhere on your own computer. This file contains (almost) the full documentation for FFmpeg. The most important chapters are "Audio Filters" and "Video Filters".

Additional to the official documentation, there are also two wikis available:

- https://trac.ffmpeg.org/wiki This wiki contains many useful informations. All available pages are listed here: https://trac.ffmpeg.org/wiki/Titlelndex
- https://en.wikibooks.org/wiki/FFMPEG_An_Intermediate_Guide This wiki is very incomplete and outdated.

## Other websites with FFmpeg examples:

https://hhsprings.bitbucket.io/docs/programming/examples/ffmpeg/index.html\#

Most examples in this document were tested with Windows 7, and beginning in March 2020 I also used Windows 10.

## What are the pros and cons of FFmpeg, compared to other programs for video manipulation?

- Very powerful capabilities.
- It's an active project, updates come almost daily.
- Conversion from almost all formats to almost all other formats.
- In most cases, there are no restrictions for video size (width * height), except for extremely large sizes.
- There is a mailing list where you can ask questions in english. Before you ask, make sure that the problem is reproducible in the latest FFmpeg version. Always include the complete FFmpeg console output, because it contains many useful informations.
- FFmpeg is a command line program and has no graphical user interface. At first glimpse this sounds like a big drawback. But it's a nice idea to have all commands in a batch file, because later you can easily make modifications at all arbitrary steps in the workflow. Just modify the batch file and execute it again.
- You will need some time for learning FFmpeg.
- Unfortunately the documentation is the weak point of the project, and many times I wished that the documentation contained more informations and especially more examples. ${ }^{1}$
- It's always a good idea to begin with a working example, and then modify it step by step. I hope that the examples in this book are a good starting point for you.
- FFmpeg and DaVinci Resolve complement each other. It's best if you know and use both of them.

[^0]
### 1.1 What can be done with FFmpeg?

- Convert a video, picture or sound from one format to another.
- Make a (timelapse) video from many pictures.
- Make many pictures from a video.
- Cut segments from a video, for example remove the beginning or the end.
- Add or remove audio, or modify the audio volume.
- Change the video size (width $\mathbf{x}$ height).
- Enlarge parts of the video or cut away the borders, for example make a rectangular video square.
- Change the speed, timelapse or slow motion.
- Rotate, mirror or flip.
- Add texts to a video.
- Correct brightness, contrast, gamma, saturation, color temperature, also with look-up-tables.
- Masking, for example superimpose a circular mask over a video
- Fade-in, fade-out and crossfade for video and audio.
- Morphing, for example curved texts for fulldome projection, or simulation of curved spacetime near block holes.
- Stabilizing of shaky videos
- Deflicker, for reducing brightness steps in timelapse.
- Change the video compression, to make the video smaller
- and many, many more interesting things...

### 1.2 If FFmpeg has no graphical user interface, how do we use it?

There are three possible ways:

1. Open a console window All_Programs / Accessories / Command_Promt (german) Alle_Programme / Zubehör / Eingabeaufforderung Another way to open the console window is to press WINDOW R and then enter "cmd".
2. In the Windows File Explorer, in the address bar, you can type cmd and press enter to get a command prompt in the directory you are currently examining.
3. But the above ways aren't recommended, because in many cases the command lines are quite long and you don't want to type the same command line over and over again. The recommended way is to write a batch file which contains the FFmpeg command line:

- A batch file has the extension *.bat and can be created and modified with any text editor. When you save a batch file with Notepad, make sure that you choose "all files" and save it as *.bat and don't choose "text files", because then the extension would be *.bat.txt (Hint: Configure the explorer so that all file extensions are visible!)
- You can edit a batch file by right clicking on it, and then choose "Edit".
- You can execute a batch file by double clicking on the icon or filename.
- Once you've created a batch file, you can place either it, or a short to it, on your Windows desktop. Then you can drag-and-drop one or more (depending on how you've designed it) media files onto the icon for processing by the batch file.
- It's recommended to begin with a working example, and then modify it step by step. Make small steps and always make a test run. If it fails, go back to the last working version.
- The \% character has a special meaning inside a batch file. If you need a one \% character in the FFmpeg command line, you must replace it in the batch file by two \%\% characters.
- It's recommended to insert the command "pause" at the end of the batch file. This means the batch file waits for a keypress. Without this command, the console window would close immediately when FFmpeg has finished, and you wouldn't see if there were any error messages.
- With the command "set" you can define variables in the batch file.
- With the command "rem" you can insert comments, so that you later understand how the batch file works. Comments can also begin with :: in the same line as a command. Everything from :: to the end of the line is a comment.
- If the command line becomes too long, you can insert a ${ }^{\wedge}$ character at the end of the line and continue in the next line.
- How to copy and paste the content of the console window: Right click in the title of the Command_Prompt window, Edit -> Select_All, then Edit ->

Copy, then paste the content with ctrl-v somewhere else.

- (german) Wenn man den Inhalt des CMD-Fensters kopieren möchte, geht man so vor: Rechtsklick auf die Titelleiste des Fensters, Bearbeiten --> Alles auswählen, dann Bearbeiten -> Kopieren, dann mit Control-V irgendwo anders einfügen.
- If you don't want to write to full path to FFmpeg in each batch file, then you should add the path to the PATH system variable. In this article is described how to do this: https://www.computerhope.com/issues/ch000549.htm

The following was copied from the above link:
For Windows 7:

1. From the desktop, right-click the Computer icon and select Properties. If you don't have a Computer icon on your desktop, click Start, right-click the Computer option in the Start menu, and select Properties.
2. Click the Advanced System Settings link in the left column.
3. In the System Properties window, click the Advanced tab, then click the Environment Variables button near the bottom of that tab.
4. In the Environment Variables window (pictured below), highlight the Path variable in the System variables section and click the Edit button. Add or modify the path lines with the paths you want the computer to access. Each different directory is separated with a semicolon.

## For Windows 10:

1. From the desktop, right-click the very bottom-left corner of the screen to get the "Power User Task Menu".
2. From the Power User Task Menu, click System.
3. In the Settings window, scroll down to the Related settings section and click the System info link.
4. In the System window, click the Advanced system settings link in the left navigation pane.
5. In the System Properties window, click the Advanced tab, then click the Environment Variables button near the bottom of that tab.
6. In the Environment Variables window (pictured below), highlight the Path variable in the System variables section and click the Edit button. Add or modify the path lines with the paths you want the computer to access. Each different directory is separated with a semicolon [...].

### 1.3 The first example

This is a simple batch file:

```
rem A simple batch file for making a video from many pictures
c:\ffmpeg\ffmpeg -framerate 5 -start_number 3551 -i IMG_%%4d.jpg -i birds.mp3 ^
-shortest -codec:v mpeg4 -q:v 3 out.mp4
pause :: wait for a keypress
```

What's the meaning of the parts?

| rem A simple ... | This is a comment |
| :---: | :---: |
| c: \ffmpeg\ffmpeg | This is the path to ffmpeg.exe |
| -framerate 5 | This defines how fast the pictures are read in, in this case 5 pictures per second. |
| -start_number 3551 | This is the number of the first picture, in this case 3551 |
| -i IMG_\%\%4d.jpg | This is the filename of the input pictures. The term \%\%4d stands for a 4-digit number. The filename of the first picture is IMG_3551.jpg and the number will be increased by 1, until no more picture is found. For 3-digit numbers you would write \%\%3d instead. The double \%\% characters are only required in batch files, because the \% character must be escaped. If you type the command line directly in the console window, then you must use a single \% character instead. |
| -i birds.mp3 | This is the second input file, in this case an audio file. |
| $\wedge$ ^ | If the command line becomes too long in the batch file, you can break it with the ${ }^{\wedge}$ character and continue in the next line. FFmpeg will get the whole line without the ${ }^{\wedge}$ character. |
| -shortest | This option means that the length of the output video is determined by the shortest of the two input files. |
| -codec:v mpeg4 | This option means that a MPEG4 video will be produced. |
| -q:v 2 | This is an option for the quality of the output video. 1 is best quality, $\mathbf{3}$ is normal, 31 is strongest compression. |
| out.mp4 | Filename of the output video |
| pause | This command waits for a keypress, so that you have a chance to see any error messages before the console window closes. |
| : : wait for | Everything right of :: is a comment until the end of the line. |

Important: Options are always written before the file they refer to.
The options "-framerate 5" and "-start_number 3551" refer to the first input file "IMG_\%\%4d.jpg".
The second input file "birds.mp3" doesn't have any options in this case.
The options "-shortest -codec:v mpeg4 -q:v 3" refer to the output video "out.mp4".

### 1.4 Using variables

Using variables is much better programming style. This batch file has exactly the same function as the first example:

```
rem A simple batch file for making a video from many pictures
set "FF=c:\ffmpeg\ffmpeg" :: Path to ffmpeg.exe
set "FR=5"
set "SN=3551"
set "IN=IMG_%%4d.jpg"
set "AUDIO=\overline{b}irds.mp3"
set "QU=3"
set "OUT=out.mp4" :: Output filemane
%FF% -framerate %FR% -start_number %SN% -i %IN% -i %AUDIO% -shortest -codec:v mpeg4 -q:v %QU% %OUT%
pause :: wait for a keypress
```

This is much clearer, because each variable is written in a new line and has its own comment.
It's recommended to use capital letters for the variables, so that you can easily distinguish them from command line options.
All variable names are allowed, but don't use special characters like ÄÖÜ.
You can copy a batch file and save it under a new name for a new project. Then you must only set the variables, so that they fit to the new project. There is no need to modify (or even understand) the command line.
Why are the variable definitions written in " " quotation marks? This is only necessary if you want to add a comment in the same line. Without comments the quotation marks are unnecessary.

## 2 FFmpeg in detail

### 2.1 Convert from one video format to another video format

Some examples for format conversion:

```
rem Convert any input format to any output format
ffmpeg -i anyinput.xxx anyoutput.xxx
rem Convert MP4 to mov
ffmpeg -i in.mp4 -acodec copy -vcodec copy -f mov out.mov
rem Convert mov to MP4
ffmpeg -i in.mov -acodec copy -vcodec copy out.mp4
rem Convert mov to MP4 using h265 compression, default preset is medium, default crf is 28
ffmpeg -i in.mov -c:v libx265 -preset slow -crf 25 -acodec copy out.mp4
```

### 2.2 Change the container format

If want to change only the container format from mkv to mp4, it's not necessary to re-encode the video and audio streams. These commands are very fast:

```
ffmpeg -i in.mkv -vcodec copy -acodec copy out.mp4
Or
ffmpeg -i in.mkv -c:v copy -c:a copy out.mp4
```

### 2.3 Fit timelapse length to music length

How to give a timelapse video exactly the same length as the music?
We don't want to cut off the end of the music, and we don't want to hear silence at the end of the timelapse video.
The solution is to adjust the framerate, so that the length of the timelapse becomes equal to the music length.
Framerate = Number_of_images / Time_in_seconds
In this example we have 30 images and the music is 20 seconds long, so that the framerate must be 1.5.

```
rem A simple batch file for combining many images to a video
set "FR=1.5" :: Framerate for reading in the images (frames per second)
set "RATE=30" :: Output framerate
set "SN=3551" :: Number of the first image
set "IN=IMG_%%4d.jpg" :: Filename of the images
set "AUDIO=\overline{birds.mp3"}
set "QU=3"
set "OUT=out.mp4" :: Output file
    :: MP4 Quality, 1 is best Quality, 3 is normal, 31 is strongest compression
ffmpeg -framerate %FR% -start_number %SN% -i %IN% -i %AUDIO% -r %RATE% -shortest -codec:v mpeg4 -q:v %QU% %OUT%
pause :: Wait for a keypress
```

In this example we have two different framerates, which have different purpose:

- -framerate \%FR\% this is the framerate for reading in the images
- -r \%RATE\% this is the framerate of the output video.

These two framerates are totally independent from each other, and can be different. If the images are read in slower than the output framerate, FFmpeg will automatically duplicate images. If the images are read in faster, then FFmpeg will automatically skip images.

### 2.4 Timelapse or slideshow from many images, with crossfading

```
rem Make a timelapse or slideshow from many images, with crossfading
set "RATE=30" :: Output framerate
set "SN=3551" :: Number of first image
set "IN=IMG_%%4d.jpg" :: Filename of the images
set "W=2000"
set "H=1500"
set "OUT=out.mp4"
set "C=3"
set "D=2"
ffmpeg -start number %SN% -i %IN% ^
-vf zoompan=d=%C%:fps=%D%:s=%W%x%H%,framerate=fps=%RATE%:interp_start=0:interp_end=255:scene=100 ^
-codec:v mpeg4 -q:v %QU% %OUT%
pause
    Wait for a keypress
```

Inside the video filter (beginning with -vf) we have in this example two filters, which are applied one after the other. The first is "zoompan" and the second is "framerate".

You must calculate the variables C and D manually, because there are no expressions allowed inside the "zoompan" filter.

Detailed explanations for this filter chain:
-vf zoompan $=d=\% C \%: f p s=\% D \%: s=\% W \% x \% H \%$, framerate $=\% R A T E \%:$ interp_start=0 $:$ interp_end $=255: s c e n e=100$

In this filter chain two video filters are applied consevitively, separated by a (,) comma.

1. "zoompan", with the parameters "d" , "fps" and "s"
2. "framerate", with the parameters "fps", "interp_start", "interp_end", and "scene"
https://www.ffmpeg.org/ffmpeg-all.html\#zoompan
The zoompan filter is here not used for zooming in, but for duplicating the frames and passing them to the next filter with a certain framerate.
" $d$ " specifies how often each frame is repeated.
"fps" is the output framerate of this filter.
" s " is the size of the output frames. It must be specified in most cases, because the default is $1280 \times 720$.

## https://www.ffmpeg.org/ffmpeg-all.html\#framerate

The framerate filter can calculate intermediate images between consecutive images. This is not a motion interpolation but a crossfade.
"fps" is the output framerate. It's not required to explicitely write this parameter; you could also write framerate=fps=\%RATE\%:...
The remaining three parameters "interp_start", "interp_end", and "scene" specify, when interpolation is active and when not. With those values that I used ( $0,255,100$ ), interpolation is always active.

These two filters together produce a video in which each image is shown for a certain duration, followed by a crossfade to the next image which also has a certain duration. Both durations can be choosen freely, these are the values $A$ and $B$ in the comments. From these values you must manually calculate the variables C and D, which are used in the command line. I haven't yet found a way to make this calculation automatically. It's possible to make calculations in the batch file, but this works only with integer precision.
If you omit the zoompan filter and use only the framerate filter, the next crossfade would immediately follow when the previous has ended. With other words: You always have a crossfade and there is no time where the image is shown without crossfade. That's why we use the trick with the zoompan filter. Now it's still the case that one crossfade follows immediately on the prevoius one, but now we have crosssfades between identical images, because the images were duplicated by the zoompan filter. A crossfade between identical images isn't visible, of course.

How to repeat the frames, so that the length fits to the music length:
Add -loop 1 and -shortest

```
ffmpeg -i img%4d.jpg -vf zoompan=d=25+'50*eq(in,3)'+'100*eq(in,5)' out.mp4
pause
```

In this example each frame is shown one second ( 25 frames), except the 4th image which is shown $\mathbf{3}$ seconds ( $25+50$ frames) and the 6 th image which is shown 5 seconds ( $25+100$ frames). Please note that the image numbering starts with 0 , if not specififed differently with "-start number".

Please note that it might also be useful to specify the size of the output frames with the "s" option, because the default size is $1280 x 720$.

It's also possible to do the same thing with the concat demuxer. Make a text file with this content:

```
file '/path/to/dog.png
duration 5
file '/path/to/cat.png'
duration 1
file '/path/to/rat.png
duration 3
file '/path/to/tapeworm.png'
duration 2
file '/path/to/tapeworm.png
```

Note: The last image has to be specified twice - the 2nd time without any duration.
Then use this command line:

```
ffmpeg -f concat -i input.txt -vsync vfr -pix fmt yuv420p output.mp4
pause
```

See also: https://trac.ffmpeg.org/wiki/Slideshow

### 2.6 Slideshow with scrolling images

Images scrolling from left to right:

```
set "IN=test%%3d.jpg" :: Input images
set "N=6" :: Number of image
set "SX=400" :: X Size
set "SY=300" :: Y Size
set "T=5" :: Time in seconds for scrolling from one image to the next image
set "FPS=30" :: Output framerate
set "OUT=out.mp4" :: Output filename
rem Make some test images
ffmpeg -f lavfi -i testsrc2=size=%SX%x%SY%:duration=%N%:rate=1 -start_number 0 - % test%%3d.jpg
rem Make a scrolling slideshow
ffmpeg -framerate 1/%T% -start_number 1 -i %IN% -framerate 1/%T% -start_number 0 -i %IN% -filter_complex [0]
[1]hstack, fps=%FPS%,crop=w=iw/2 : x='iw/2*(1-mod (t,%T%)/%T%)' -y %OUT%
```

pause

Images scrolling from right to left:

```
ffmpeg -framerate 1/%T% -start_number 0 -i %IN% -framerate 1/%T% -start_number 1 -i %IN% -filter_complex [0]
[1]hstack,fps=%FPS%,crop=w=iw/\overline{2}:x='iw/2*mod(t,%T%)/%T%' -y %OUT%
pause
```

Images scrolling from top to bottom:

```
ffmpeg -framerate 1/%T% -start number 1 -i %IN% -framerate 1/%T% -start number 0 -i %IN% -filter complex [0]
[1]vstack, fps=%FPS%,crop=h=ih/\overline{2}:y='ih/2*(1-mod (t,%T%)/%T%)' -y %OUT%
pause
```

## Images scrolling from bottom to top:

```
ffmpeg -framerate 1/%T% -start number 0 -i %IN% -framerate 1/%T% -start number 1 -i %IN% -filter complex [0]
[1]vstack, fps =%FPS%,crop=h=ih/\overline{2}:y='ih/2*mod (t,%T%)/%T%' - y %OUT%
pause
```

This is similar, but now showing two images simultaneously side by side. The width of the output video is twice the width of the input images:

```
set "IN=test%%3d.jpg" :: Input images
set "N=6" :: Number of images
set "SX=400" :: X Size
set "SY=300" :: Y Size
set "T=5" :: Time in seconds for scrolling from one image to the next image
set /a "D=%T%*(%N%-2)" :: Total duration in seconds
set "FPS=30" :: Output framerate
set "OUT=out.mp4" :: Output filename
rem Make some test images
ffmpeg -f lavfi -i testsrc2=size=%SX%x%SY%:duration=%N%:rate=1 -start_number 0 - y test%% 3d.jpg
rem Make a scrolling slideshow
ffmpeg -framerate 1/%T% -start_number 2 -i %IN% -framerate 1/%T% -start_number 1 -i %IN% -framerate 1/%T% -start_number
0 -i %IN% -filter_complex [0][\overline{1] [2]hstack=inputs=3,fps=%FPS%,crop=w=2*iw/3:x='iw/3*(1-mod(t,%T%)/%T%)' -t %D% -y % %OUT%}
pause
```

Note: "set /a" is a Windows batch command and calculates a variable (in this case: the total duration of the output video). Only integer arithmetic is possible, no floating point. This is necessary in this batch file, because the "-t" option doesn't accept expressions, and using the "trim" filter as a
workaround is also impossible, because it doen's accept expressions.

Same thing as before, but scrolling from right to left:

```
ffmpeg -framerate 1/%T% -start_number 0 -i %IN% -framerate 1/%T% -start_number 1 -i %IN% -framerate 1/%T% -start_number
2 -i %IN% -filter_complex [0][\overline{1] [2]hstack=inputs=3,fps=%FPS%,crop=w=2*iw/3:x='iw/3*mod(t,%T%)/%T%' -t %D% -y %OUT%}
pause
```

Same thing as before, but scrolling from top to bottom:

```
ffmpeg -framerate 1/%T% -start number 2 -i %IN% -framerate 1/%T% -start number 1 -i %IN% -framerate 1/%T% -start number
0 -i %IN% -filter_complex [0][\overline{1][2]vstack=inputs=3,fps=%FPS%,crop=h=2*i\overline{O}/3:y='ih/3*(1-mod(t,%T%)/%T%)' -t %D% - % %OUT%}
pause
```

Same thing as before, but scrolling from bottom to top:

```
ffmpeg -framerate 1/%T% -start number 0 -i %IN% -framerate 1/%T% -start number 1 -i %IN% -framerate 1/%T% -start number
2 -i %IN% -filter_complex [0][\overline{1]}[2]vstack=inputs=3,fps=%FPS%,crop=h=2*ih/3:y='ih/3*mod(t,%T%)/%T%' -t %D% -y %OUT%
pause
```

```
rem Extract many images from a video
ffmpeg -i in.mp4 -vf fps=0.2 -y image%%4d.jpg
pause :: Wait for a keypress
```

This batch file reads the file in.mp4 and produces images with the filenames image0000.jpg, image0001.jpg, image0002.jpg, and so on.
$-v f \mathrm{fps}=0.2$ this specifies that images are extracted with a framerate of 0.2 , which means one frame every 5 seconds.
Omit this option if you want to extract all images.
-y this option means that FFmpeg will overwrite any output files that already exist with the same filename, without asking. If you omit this option, FFmpeg would ask before overwriting a file.

This example extracts each n_th frame from a video, beginning with the 0_th frame:

```
set "IN=video.mp4" :: Input video
set "STEP=10" :: Step width
set "OUT=image%%4d.jpg" :: Output images filename
ffmpeg -i %IN% -vf framestep=%STEP% -y %OUT%
pause
```

```
rem Extract the first frame
ffmpeg -i in.mp4 -frames 1 -y first_frame.jpg
rem Extract the last frame
ffmpeg -sseof -0.2 -i in.mp4 -update 1 -y last_frame.jpg
pause
```

### 2.9 Modify brightness, contrast, saturation, gamma and hue

```
rem Modify brightness, contrast, saturation, gamma and hue
set "INPUT=PanoView.mp4" :: Input video
set "OUTPUT=out.mp4" :: Output video
set "CONTRAST=1.0" :: Contrast in range -1000 to 1000, normal is 1.0
set "BRIGHT=0.0" :: Brightness in range -1.0 bis 1.0, normal is 0.0
set "SATUR=1.2" :: Saturation in range 0.0 bis 3.0, normal is 1.0
set "GAMMA=1.0" :: Gamma in range 0.1 to 10.0, normal is 1.0
set "HUE=20" :: Color correction (hue), negative shifts towards red and positive towards blue, normal is 0
:: Typical values are in the -30...+30 range
set "QU=3" :: MP4 Quality, 1 is best Quality, 3 is normal, 31 is strongest compression
ffmpeg -i %INPUT% -vf hue=h=%HUE%,eq=contrast=%CONTRAST%:brightness=%BRIGHT%:saturation=%SATUR%:gamma=%GAMMA% ^
-q:v %QU% -codec:v mpeg4 %OUTPUT%
pause
```

-vf is the command for "Video Filter". There are many different filters, see chapter "Video Filter" in the FFmpeg documentation. In this case we use two filters, which are separated by a (,) comma.

- The first filter is "hue" and makes a rotation of the color circle.
- The second filter is "eq" and adjusts contrast, brightness, saturation and gamma.

From a mathematically point of view these functions work as follows:

- Contrast is a multiplication by a constant. Please note that what contrast does is scale the distance of a pixel's value from the median value i.e. 128 for a 8 -bit input. So, if a pixel channel has a value of 100 , then a contrast of 3 results in a value of $128+3^{*}(100-128)=44$.
- Brightness is the addition of a constant.
- Saturation is difficult to describe mathematically. Setting saturation to 0 would produce a black and white video.
- Gamma is a nonlinear distortion of the transfer function. When you increase the gamma value, details in dark areas become better visible.
it doesn't care in which order you write the parameters in the command line. They are always executed in the order contrast, brightness, gamma.

There are several filters that can be used for a strong contrast enhancement:

| Filter | Example for strong contrast enhancement by a factor 5: Input range [0.1 ... 0.3 ], Output range [ 0.0 ... 1.0], Output = 5 * (Input - 0.1) | Notes |
| :---: | :---: | :---: |
| eq | eq=brightness=0.3,eq=contrast=5 | The pivot point for contrast is always at 0.5 which means you have to adjust both brightness and contrast. The eq filter must be invoked two times, because we need first the brightness adjustment and then the contrast adjustment. <br> Warning: The eq filter introduces dithering when used with 10-bit data. |
|  | eq=brightness=0.3: contrast=5 | This doesn't work as expected because the eq filter is invoked only one time, which means the order is contrast before brightness and that's the wrong order in this case. |
|  | eq=brightness=1.5 : contrast=5 | This doesn't work because the brightness value isn't in the allowed range [-1 $\ldots+1]$ |
| geq | ```For 8-bit video: geq=lum='5*(lum(X,Y)-25.6)':cr='cr (X,Y)':cb='cb (X,Y)' For 8-bit video with limiter: geq=lum='clip(5*(lum(X,Y) - 25.6),0,255)':cr='cr(X,Y)':cb='cb (X,Y)'``` | The drawback of the geq filter is that it's slow, has no built-in limiter and the function must be different for 8-bit and 10-bit videos. |
|  | ```For 10-bit video: geq=lum='5*(lum(X,Y)-102.4)':cr='cr (X,Y)':cb='cb (X,Y)' For 10-bit video with limiter: geq=lum='clip(5*(lum(X,Y)- 102.4),0,1023)':cr='cr(X,Y)':cb='cb (X,Y)'``` | For 10-bit data the geq filter produces the correct result without dithering. Best method for 10-bit data, if it's used together with the clip function as limiter. |
| lutyuv | Version 1: lutyuv=y='5*(val-0.1*maxval)' <br> Version 2: lutyuv=y='5*val-0.5*maxval' <br> With limiter: lutyuv=y='clip(5*(val-0.1*maxval),minval,maxval)' <br> For 10-bit data: <br> lutyuv=y='32*val-16384' (This works, but I don't understand why) | Both versions work fine with 8-bit data and the additional limiter seems to be unnecessary. <br> Warning: This filter fails with 10-bit data! |

| colorlevels | $\begin{aligned} & \text { colorlevels=rimin=0.1:gimin=0.1:bimin=0.1:rimax=0.3:gimax=0.3:bi } \\ & \max =0.3 \end{aligned}$ | Best method for 8-bit data because you can directly set the black and white points. The only drawback is that you have to write the same values three times, but that can be done with variables in the batch file. <br> Warning: This filter fails with 10-bit data! |
| :---: | :---: | :---: |
| curves | curves=all='0/0 0.1/0 0.3/1 1/1' | This is a nonlinear transfer function because it uses a smooth curve through the specified points. |
| exposure | ```exposure=exposure=2.3219:black=-0.1 Note: log(5)/log(2)=2.3219 With additional limiter: exposure=exposure=2.3219:black=-0.1,limiter``` | The order is first "black level", then "exposure". This filter works internally with floats. "exposure" is limited to the [-3..+3] range, which corresponds to a factor from 0.125 to 8.0. <br> Because it has no built-in limiter, it's highly recommended to use an additional limiter. |

### 2.11 Inverting a video or image (make a negative)

There are several methods for inverting (which means black becomes white, and vice versa):

| Filter | Example | Notes |
| :--- | :--- | :--- |
| eq | eq=contrast=-1 | This changes only bright to dark and vice versa, but keeps the colors as they are. |
| negate | negate | This negates all channels and changes the colors to their complementary colors. |
| geq | geq=r='255-r(X,Y)':g='255-g(X,Y)':b='255-b(X,Y)' | Same result as negate. Can also be used if only one or two channels are to be <br> inverted. For 10-bit videos you must replace 255 by 1023. |

This is an example. The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255) +clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -vf eq=contrast=-1 -y eq.png
ffmpeg -i spectrum.png -vf negate -y negate.png
ffmpeg -i spectrum.png -vf geq=r='255-r(X,Y)':g='g(X,Y)':b='b(X,Y)' - y geq r.png
ffmpeg -i spectrum.png -vf geq=r='r(X,Y)':g='255-g(X,Y)':b='b(X,Y)' -y geq_g.png
ffmpeg -i spectrum.png -vf geq=r='r(X,Y)':g='g(X,Y)':b='255-b(X,Y)' -y geq_b.png
ffmpeg -i spectrum.png -vf geq=r='255-r(X,Y)':g='255-g(X,Y)':b='b(X,Y)' -y geq_rg.png
ffmpeg -i spectrum.png -vf geq=r='255-r(X,Y)':g='g(X,Y)':b='255-b(X,Y)' -Y geq_rb.png
ffmpeg -i spectrum.png -vf geq=r='r(X,Y)':g='255-g(X,Y)':b='255-b(X,Y)' -Y geq_gb.png
ffmpeg -i spectrum.png -vf geq=r='255-r(X,Y)':g='255-g(X,Y)':b='255-b(X,Y)' -y geq_rgb.png
pause
```

These are the input and output images:
These are the input and output images:

Input

Output geq (only red channel inverted)

Output eq=contrast=-1

Output geq (only green channel inverted)

Output geq (only blue channel inverted)

Color corrections can be made with the "colorchannelmixer" filter. In this example the red channel is enhanced by a factor 1.2 and the blue channel is attenuated by a factor 0.8 . The values must be in the $[-2 \ldots+2]$ range. The input image is a spectrum with white at the top and black at the bottom:

```
set "R=1.2" :: Factor for red channel
set "G=1.0" :: Factor for green channel
set "B=0.8" :: Factor for blue channel
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255) +clip (X-
1024,0,255));if(lt(Y,256) ,255+Y* (ld(0)/255-1) ,(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255) +gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,1t(X,1024)*clip(X-
512,0,255)+gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colorchannelmixer=rr=%R%:gg=%G%:bb=%B% out.png
pause
```

These are the input and output images:

Cyclic swapping of the RGB channels in one or the other direction:

| colorchannelmixer $=0: 0: 1: 0: 1: 0: 0: 0: 0: 1: 0: 0$ | $::$ red becomes green, green becomes blue, blue becomes red |
| :--- | :--- | :--- |
| colorchannelmixer $=0: 1: 0: 0: 0: 0: 1: 0: 1: 0: 0: 0$ | $::$ red becomes blue, green becomes red, blue becomes green |

## Example for exchanging the red and green components:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte (X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -vf colorchannelmixer=0:1:0:0:1:0:0:0:0:0:1:0 - y out.png
pause
```

These are the input and output images:

The options of the "colorchannelmixer" filter are specified in this order:

## Copy the red channel to the green and blue channels

colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0 : copy the red channel to the green and blue channels

### 2.13

 Shuffleplanes filterThis filter can swap or copy planes. What's stored in a plane depends on the pixel format. It must be a planar pixel format like GBGP or YUV for example. If the input pixel format isn't planar (like RGB24), it will be automatically converted to a planar format and you might get unexpected results. In the following examples the pixel format is GBRP:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip (1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi format=gbrp,shuffleplanes=1:2:0 - y redshift.png
ffmpeg -i spectrum.png -lavfi format=gbrp,shuffleplanes=2:0:1 -y blueshift.png
ffmpeg -i spectrum.png -lavfi format=gbrp,shuffleplanes=0:0:0 - y green2gray.png
ffmpeg -i spectrum.png -lavfi format=gbrp,shuffleplanes=2:1:0 -y red_green_swapped.png
```

pause

These are the input and output images:

### 2.14

 Day-for-NightDay-for-Night is a technique for shooting night scenes in daytime. In times of analog filming, it was realized by using a red filter (which darkens the blue sky) and underexposing by about 2 stops.

It can be simulated as follows. The input image is a spectrum with white at the top and black at the bottom:

```
set "BW=0.3" :: This parameter sets how much of the red channel is converted to black and white
set "RGB=0.1" :: This parameter sets how much of the original RGB channels is kept
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255)) ;if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255)) ;if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colorchannelmixer=rr=%BW%+%RGB%:gr=%BW%:br=%BW%:gg=%RGB%:bb=%RGB% - y out.png
pause
```

See also https://en.wikipedia.org/wiki/Day for night
For example, day-for-night was used in Wim Wenders' film "Kings of the Road" (german: "Im Lauf der Zeit"): https://en.wikipedia.org/wiki/Kings_of the_Road

### 2.15 Colorcorrect filter

The "colorcorrect" filter has 4 parameters, which can be set to any value in the $[-1 \ldots+1]$ range. The default values are 0 :

| rl | Correction value for red shadows |
| :--- | :--- |
| bl | Correction value for blue shadows |
| rh | Correction value for red highlights |
| bh | Correction value for blue highlights |

This is an example. The input image is a spectrum with white at the top and black at the bottom:

```
Emmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r=st(0,clip (512-x,0,255)+clip (X
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip (X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colorcorrect=rl=-0.2 -y rl_-02.png
ffmpeg -i spectrum.png -lavfi colorcorrect=rl=0.2 -y rl +02.png
ffmpeg -i spectrum.png -lavfi colorcorrect=rh=-0.2 -y rh}-02.pn
ffmpeg -i spectrum.png -lavfi colorcorrect=rh=0.2 -y rh_ +02.png
pause
```

These are the input and output images:

The colorcorrect filter does also have a "saturation" option which is pretty clear. There is also an "analyze" option, but I didn't fully understand it. If you know how it works, please let me know.

### 2.16 Colortemperature filter

This is an example for the "colortemperature" filter. The default temperature is 6500 K . The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256) ,255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255) +gte(X,512)*clip(1024-
X,0,255)) ;if(lt (Y,256),255+Y* (ld (0)/255-1) , (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colortemperature=3000 -y 3000.png
ffmpeg -i spectrum.png -lavfi colortemperature=9000 - y 9000.png
ffmpeg -i spectrum.png -lavfi colortemperature=3000:pl=1 -y 3000pl.png
ffmpeg -i spectrum.png -lavfi colortemperature=9000:pl=1 -y 9000pl.png
pause
```

These are the input and output images:

This filter changes hue, saturation and brightness:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip (512-X,0,255) +clip (X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte (X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1), (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi hue=h=60 -y h_60.png
ffmpeg -i spectrum.png -lavfi hue=h=30 -y h_30.png
ffmpeg -i spectrum.png -lavfi hue=h=-60 -y \overline{h}-60.png
ffmpeg -i spectrum.png -lavfi hue=h=-30 -y h_-30.png
ffmpeg -i spectrum.png -lavfi hue=s=2 -y s_2.png
ffmpeg -i spectrum.png -lavfi hue=s=0 -y s_0.png
ffmpeg -i spectrum.png -lavfi hue=s=0.5 -y s_05.png
ffmpeg -i spectrum.png -lavfi hue=s=-1 -y s_-1.png
ffmpeg -i spectrum.png -lavfi hue=b=2 -y b_\overline{2}.png
ffmpeg -i spectrum.png -lavfi hue=b=-2 -y \overline{b}-2.png
pause
```

These are the input and output images:

|  |  |  |
| :---: | :---: | :---: |
| Input | $\mathrm{b}=-2$ | $\mathrm{b}=2$ |
|  |  |  |
| $h=-60$ | $h=-30$ | $\mathrm{h}=30$ |
|  |  |  |
| $h=60$ | $s=2$ | $\mathrm{s}=0.5$ |
|  |  |  |
| s=0 | $s=-1$ |  |

### 2.18 Huesaturation filter

This filter works in RGB color space and changes hue, saturation and intensity:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255) +clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,1t(X,512)*clip(X,0,255)+gte (X,512)*clip(1024-
X,0,255)) ; if(lt(Y,256),255+Y*(ld(0)/255-1), (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi huesaturation=hue=60 -y h 60.png
ffmpeg -i spectrum.png -lavfi huesaturation=hue=30 -y h_30.png
ffmpeg -i spectrum.png -lavfi huesaturation=hue=-60 -y \overline{h}-60.png
ffmpeg -i spectrum.png -lavfi huesaturation=hue=-30 -y h_-30.png
ffmpeg -i spectrum.png -lavfi huesaturation=saturation=0.5 -y s_05.png
ffmpeg -i spectrum.png -lavfi huesaturation=saturation=-0.5 -y s
ffmpeg -i spectrum.png -lavfi huesaturation=intensity=0.5 -y i_05.png
ffmpeg -i spectrum.png -lavfi huesaturation=intensity=-0.5 -y i_-05.png
ffmpeg -i spectrum.png -lavfi huesaturation=saturation=-1:colors}=c - y cyan_s_-1.pn
ffmpeg -i spectrum.png -lavfi huesaturation=saturation=-1:colors=c:strength=\overline{3}-y cyan_s_-1_strength_3.png
ffmpeg -i spectrum.png -lavfi huesaturation=hue=120:colors=c -y cyan_h_120.png
pause
```

These are the input and output images:

|  |  |  |
| :---: | :---: | :---: |
| Input | intensity=-0.5 | intensity=0.5 |
|  |  |  |
| hue $=-60$ | hue $=-30$ | hue=30 |
|  |  |  |
| hue=60 | saturation=-0.5 | saturation=0.5 |
|  |  |  |
| saturation=-1:colors=c | saturation=-1:colors=c:strength=3 | hue=120:colors=c |

How does it work? There are 9 ranges of colors:

| reds | Adjustments for red pixels (pixels where the red component is the maximum) |
| :--- | :--- |
| yellows | Adjustments for yellow pixels (pixels where the blue component is the minimum) |
| greens | Adjustments for green pixels (pixels where the green component is the maximum) |
| cyans | Adjustments for cyan pixels (pixels where the red component is the minimum) |
| blues | Adjustments for blue pixels (pixels where the blue component is the maximum) |
| magentas | Adjustments for magenta pixels (pixels where the green component is the minimum) |
| whites | Adjustments for white pixels (pixels where all components are greater than 128) |
| neutrals | Adjustments for all pixels except pure black and pure white |
| blacks | Adjustments for black pixels (pixels where all components are less than 128) |

For each of these color ranges, four values in the [-1 .. 1] range can be specified for adjustment of cyan, magenta, yellow and black.
There are absolute and relative modes, however the difference between them isn't easy to understand.
That's why I calculated some example images. The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255) +clip(X-
1024,0,255));if(lt(Y,256) ,255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,1t(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi selectivecolor=greens="0 1 0 0":correction_method=absolute -y abs_greens_0_1_0_0.png
ffmpeg -i spectrum.png -lavfi selectivecolor=greens="0 1 0 0":correction_method=relative -y rel_greens_0_1_0_0.png
ffmpeg -i spectrum.png -lavfi selectivecolor=greens="0 -1 0 0":correction_method=absolute -y abs_greens_0_-1_0_0.png
ffmpeg -i spectrum.png -lavfi selectivecolor=greens="0 -1 0 0":correction_method=relative -y rel_greens_0_-1_0_0.png
ffmpeg -i abs_greens_0_-1_0_0.png -i rel_greens_0_-1_0_0.png -lavfi blend=all_mode=grainextract _
pause
```

These are the input and output images:

Obviously there is no difference between absolute and relative modes, if the correction value is negative (this was verified by calculating the difference image in the last FFmpeg command).
I find it quite surprising that pure green with +1 correction for magenta (in absolute mode) gives black output (and not white).
The same filter is also in Photoshop (including the absolute and relative modes) and you can google how it is assumed to work.
In my opinion the behaviour of this filter is difficult to understand.

This is an example for the colorbalance filter. The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip (X-
1024,0,255));if(lt(Y,256),255+Y* (ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt (Y,256),255+Y* (ld (0)/255-1), (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colorbalance=gs=0.5 -y gs_05.png
ffmpeg -i spectrum.png -lavfi colorbalance=gm=0.5 -y gm 05.png
ffmpeg -i spectrum.png -lavfi colorbalance=gh=0.5 -y gh_05.png
pause
```

| Input | Output gs $=0.5$ |
| :---: | :---: |
| Output gm = 0.5 | Output gh = 0.5 |

## There is also a "preserve lightness" option which can be enabled:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
X,0,255)) ;if(lt (Y,256),255+Y* (ld (0)/255-1) , (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colorbalance=gs=0.5:pl=1 -y gs_05.png
ffmpeg -i spectrum.png -lavfi colorbalance=gm=0.5:pl=1 -y gm_05.png
ffmpeg -i spectrum.png -lavfi colorbalance=gh=0.5:pl=1 -y gh_05.png
pause
```

$1024,0,255)$ ) ;if $(\operatorname{lt}(Y, 256), 255+Y *(\operatorname{ld}(0) / 255-1),(511-Y) * l d(0) / 255) ': g=' s t(0,1 t(X, 512) * c l i p(X, 0,255)+g t e(X, 512) * c l i p(1024-$
$512,0,255)+g \operatorname{te}(X, 1024) * \operatorname{clip}(1536-X, 0,255)$ ) ;if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4-frames

| Input | Output gs = 0.5, pl =1 |
| :---: | :---: |
| Output $\mathrm{gm}=0.5, \mathrm{pl}=1$ | Output gh = 0.5, pl = 1 |

### 2.21 Colorcontrast filter

This is an example for the colorcontrast filter. The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt (X,512)*clip (X,0,255) +gte (X,512)*clip (1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255)+gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:in/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colorcontrast=gm=0.5:gmw=1 -y gm_05.png
ffmpeg -i spectrum.png -lavfi colorcontrast=gm=-0.5:gmw=1 -y gm_-05.png
pause
```

## There is also a "preserve lightness" option which can be enabled:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255) +clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255)) ; if(lt (Y,256),255+Y* (ld (0)/255-1), (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi colorcontrast=gm=0.5:gmw=1:pl=1 -y gm_05.png
ffmpeg -i spectrum.png -lavfi colorcontrast=gm=-0.5:gmw=1:pl=1 -y gm -05.png
pause
```

The "monochrome" filter can be used to convert a colored video to monochrome.
This is an example. The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255) +clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip (X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi monochrome -y cb_0_cr_0.png
ffmpeg -i spectrum.png -lavfi monochrome=cb=0.\overline{5}:\overline{cr}=\overline{0}.5 - y cb 05 cr 05.png
ffmpeg -i spectrum.png -lavfi monochrome=cb=-0.5:cr=0.5 -y c\overline{b}_-\overline{05_\overline{cr_05.png}}\mathbf{~}=0,0
ffmpeg -i spectrum.png -lavfi monochrome=cb=0.5:cr=-0.5 - y cb_05_cr_-05.png
ffmpeg -i spectrum.png - lavfi monochrome=cb=-0.5:cr=-0.5 -y c\overline{b}_-05_\overline{cr_-05.png}
pause
```

These are the input and output images:

This is an example for the "size" option, which can be set in the [0.1 ... 10] range:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip (512-X,0,255) +clip(X
X,0,255)) ;if(lt (Y,256),255+Y* (ld (0)/255-1) , (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi monochrome=cr=0:cb=0:size=.1 -y size01.png
ffmpeg -i spectrum.png -lavfi monochrome=cr=0:cb=0:size=1 -y sizel.png
ffmpeg -i spectrum.png -lavfi monochrome=cr=0:cb=0:size=10 -y size10.png
pause
```

$1024,0,255)$ ) ;if $(\operatorname{lt}(Y, 256), 255+Y *(\operatorname{ld}(0) / 255-1),(511-Y) * l d(0) / 255)^{\prime}: g=' s t(0,1 t(X, 512) * c l i p(X, 0,255)+g t e(X, 512) * c l i p(1024-$
$512,0,255)+g \operatorname{te}(X, 1024) * \operatorname{clip}(1536-X, 0,255)$ ) ;if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4-frames

These are the input and output images:

| Input | Output size $=0.1$ |
| :---: | :---: |
|  |  |
| Output size $=1$ | Output size $=10$ |

It's also possible to make a video monochrome by setting the saturation to 0 , for example with the "eq" filter.

```
ffmpeg -i in.mp4 -lavfi eq=saturation=0 -y out.mp4
```

pause

This is a very simple method for converting a YUV color video to a monochrome video. The Y plane is extracted:

```
ffmpeg -i in.mp4 -lavfi extractplanes=y -y out.mp4
pause
```

Vibrance is difficult to unerstand. It's similar to saturation, but it protects skintones.
See also: https://patkay.com/blogs/pk/the-difference-between-vibrance-and-saturation-in-lightroom

This is an example. The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255) +clip (X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,1t(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255)) ;if(lt(Y,256),255+Y*(ld(0)/255-1) , (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=1 -y int_1.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1 -y int_-1.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:alternäte=1 -y int_-1_alt.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=1:gbal=-3 -y int_1_gbal_-3.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:gbal=-3 -y in\overline{t_}_1_gb\overline{al_-3.png}
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:alternate=1:gb\overline{al== 3 -y int -1 alt gbal - 3.png}
ffmpeg -i spectrum.png -lavfi vibrance=intensity=1:gbal=3 -y int_1_gbal_3.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:gbal=3 -y int_-1_gbal_3.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:alternate=1:gbal=3 -y int_-1_alt_gbal_3.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=1:glum=0 -y int_1_glum_0.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:glum=0 -y int -1 glum 0.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:alternate=1:glum=0 -y int_-1_alt_glum_0.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=1:glum=1 -y int_1_glum_1.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:glum=1 -y int -1 glum_1.png
ffmpeg -i spectrum.png -lavfi vibrance=intensity=-1:alternate=1:glum=1 -y int_-1_alt_glum_1.png
pause
```

These are the input and output images:

Note: The default value of the "glum" value seems to be about 0.7.

This filter swaps the $U$ and $V$ planes. This is an example. The input image is a spectrum with white at the top and black at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt (Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -lavfi swapuv -y swapuv.png
pause
```

These are the input and output images:

### 2.25 Gradation curves

Note: This is obsolete. It's better to do this with a color-look-up-table.
-- An image is opened in GIMP.
-- Colors::Values --> Select suitable points for black, white and gray in the image.
-- Click on "Edit these settings as curves".
-- make fine corrections on the curves
-- Set as many points as possible on the curves, because later they will be interpolated by straight lines.
-- Click on "Export settings as file".
-- Check the box "Use old file format for curves".
-- filename: curves.gimp
-- Save
-- Then call the GIMP2ACV converter (1). This converter reads the file curves.gimp, converts it and saves it as curves.acv. The file curves.gimp must be located in the same folder where the converter is called.
-- In the batch file for the FFmpeg editing the corresponding video filter is called: -vf curves=psfile='curves.acv'

## Example:

```
ffmpeg -i input.png -vf curves=psfile='curves.acv' -y out.png
pause
```

### 2.26 Color grading with color look-up tables, full workflow

A color look-up table (CLUT) is a mathematical rule according to which any color is replaced by another color.
There are different file formats for the CLUT:
The *.cube format normally has a color space of typically 25 * 25 * 25 or 33 * 33 * 33 entries, so that the table contains 25^3 = 15625 or $33^{\wedge} 3=35937$ different colors. Colors between the specified table entries are interpolated. You can also create tables with $64^{\wedge} 3$ entries, but for most applications $25^{\wedge} 3$ or 33^3 entries are sufficient.

Specification of cube lut format: https://wwwimages2.adobe.com/content/dam/acom/en/products/speedgrade/cc/pdfs/cube-lut-specification-1.0.pdf It's also possible to save a CLUT in any uncompressed image format. The complete workflow is now described step by step for a 10-bit video. This workflow can be simplified, see the next chapter.

Step 1: With this batch file a single image is extracted from the 10 -bit video at a suitable location and saved lossless as 16-bit PNG:

```
set "IN=Video_62.mov" :: Input video
set "T=35" :: Time where image is extracted
ffmpeg -ss %T% -i %IN% -frames 1 -y image.png
pause
```

Step 2: This batch file is used to create a CLUT ( = Color-look-up-Table). This is a PNG image with $512 \times 512$ pixels that contains exactly one pixel of each possible color. I'm not yet sure if the image has to have 16 bit resolution at this point. At least it doesn't hurt. If 8 bits are enough, you would omit "pix_fmt rgb48be".

The LEVEL parameter determines how many different colors are contained in the CLUT. The height and width of the square image is LEVEL*LEVEL*LEVEL, at LEVEL=8 there are 64*64*64=262144 colors and the image has $512 * 512=262144$ pixels. It is important that the file is saved in an uncompressed or lossless compressed format, so PNG is well suited.

```
set "LEVEL=8'
ffmpeg -f lavfi -i haldclutsrc=%LEVEL% -frames 1 -pix_fmt rgb48be clut.png
pause
```

Step 3: The extracted image is opened in GIMP.
Step 4: The color table will be opened in GIMP, selected with "Select all" and copied with ctrl-c.
Step 5: The first image is clicked and then the color table is inserted in the upper left corner with "Paste in Place". Since the first image is much greater than the color table, the table does not interfere at this position.
Step 6: Right click on "Floating Selection" and select "To New Layer".
Step 7: Right click on the newly created "Pasted Layer" and select "Merge Down".
Step 8: Now the image is edited as it should look in the video. And of course the color table in the upper left corner will be edited as well. Color corrections, color temperature, color saturation, gradation curve, brightness, contrast. The image may contain visible noise. Later in the video, the noise doesn't stand out so much, because it is partly averted by the fast sequence of images. Operations that cannot be described by a color look-up table, such as noise reduction, soft focus or sharpening, are not permitted.

Step 9: The finished image is trimmed to a size of $512 \times 512$ pixels so that only the color table in the upper left corner remains. Image > Canvas Size > Width=512, Height=512, then click on "Resize".
Step 10: Export the image under the name clut2.png as 16 -bit PNG and select "16bpc RGB" as pixel format. GIMP can now be closed.
Step 11: This color look-up table is now applied to the whole video with FFmpeg. The color table is applied with 10 bit accuracy. Colors not included in the table are interpolated. Only then is the color table converted to 8 bit accuracy and an MP4 generated:

```
set "IN=Video_62.mov" :: Input video
ffmpeg -i %IN% -i clut2.png -filter_complex [O][1]haldclut out.mp4
pause
```

### 2.27 Color grading with color look-up tables, simplified workflow

The above workflow can be simplified as follows:
Step 1: In this batch file FFmpeg does immediately combine the CLUT with the extracted image:

```
set "IN=P1000099.mov" :: Input video
set "T=5" :: Time where image is extracted
ffmpeg -ss %T% -i %IN% -f lavfi -i haldclutsrc=8 -filter complex "[1]format=pix fmts=rgb48be[a];[a]
[0]xstack=inputs=2:layout=0_0|w0_0" -frames 1 -y Image_with_CLUT.png
pause
```

Step 2: This image is now processed in GIMP (or any other suitable image processing software) and then exported with the same file name as 16-bit PNG. You can edit brightness, contrast, gamma, saturation and hue. You can also adjust the curves. Of course, all modifications must be applied to the whole image consisting of the video frame and the clut. Filters like noise reduction, sharpening or softening are not allowed.

Step 3: This batch file does first use the crop filter to remove the image so that only the CLUT remains. Why the small brightness correction is necessary before applying the haldclut filter isn't yet fully understood. In the second FFmpeg run the CLUT is applied to the input video. Then the CLUT is deleted because it's no longer required.

```
set "IN=P1000099.mov" :: Input video
set "BR=0.06" :: Small brightness adjustment before applying the CLUT
ffmpeg -i Image_with_CLUT.png -vf crop=512:512:0:0 -y clut.png
ffmpeg -i %IN% -i CLUT.png -filter complex [0]eq=brightness=%BR%[a];[a][1]haldclut -y out.mp4
del clut.png
pause
```

### 2.28

 Size of color-look-up tablesThe size of the Color-look-up table for the haldclut filter depends on the "Level" parameter as follows:

| Level <br> n | Size of CLUT $n^{\wedge} 3 \times n^{\wedge} 3$ | Typical file size of CLUT as 16-bit PNG | Edge length of the RGB cube $\mathrm{n}^{\wedge} 2$ | Number of support points (= number of pixels) $\mathrm{n}^{\wedge} 6$ | Distance of support points 8-bit $256 / n^{\wedge} 2$ | Distance of support points 16-bit $65536 / n^{\wedge} 2$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | 64x64 Pixels | 16.4 kB | 16 | 4096 | 16 | 4096 |
| 5 | 125x125 Pixels | 61.9 kB | 25 | 15625 | 10.2 | 2621 |
| 6 | 216x216 Pixels | 179 kB | 36 | 46656 | 7.11 | 1820 |
| 7 | 343x343 Pixels | 436 kB | 49 | 117649 | 5.22 | 1337 |
| 8 | 512x512 Pixels | 0.97 MB | 64 | 262144 | 4 | 1024 |
| 9 | 729x729 Pixels |  | 81 | 531441 | 3.16 | 809 |
| 10 | 1000x1000 Pixels |  | 100 | 1000000 | 2.56 | 655 |
| 11 | 1331x1331 Pixels |  | 121 | 1771561 | 2.12 | 542 |
| 12 | 1728x1728 Pixels |  | 144 | 2985984 | 1.78 | 455 |
| 13 | 2197x2197 Pixels |  | 169 | 4826809 | 1.51 | 388 |
| 14 | 2744x2744 Pixels |  | 196 | 7529536 | 1.31 | 334 |
| 15 | 3375x3375 Pixels |  | 225 | 11390625 | 1.14 | 291 |
| 16 | 4096x4096 Pixels |  | 256 | 16777216 | 1 | 256 |

The size of *.cube files is as follows:

| LUT_3D_SIZE <br> $n$ | Number of points <br> $n^{\wedge} 3$ | Typical file size | Distance of support points (8-bit color) <br> $256 /(n-1)$ |
| :--- | :--- | :--- | :--- |
| 2 | 8 |  | 256 |
| 3 | 27 |  | 128 |
| 5 | 125 |  | 64 |
| 9 | 729 |  | 32 |
| 17 | 4913 | 16 |  |
| 25 | 15625 |  | 10.667 |
| 33 | 35937 | 7 MB | 8 |
| 64 | 262144 | 7 MB | 4.063 |
| 65 | 274625 | 4 | 4 |

*.cube LUT files can be loaded into the FOTGA DP500/A70TLS monitor as follows:
Save the *.cube file in the root folder of a FAT32 USB stick. Insert the USB stick into the monitor. Press on the menu wheel, select "LUT Settings" and "LUT Import". All LUTs from the USB stick will be imported (up to 8 of them), and all already existing LUTs will be deleted, except those that are in the firmware (VLOG is one of them). Each single LUT file must be less than 7.9 MB.

It's also possible to apply LUTs to the HDMI output of the GH5S camera. Use "HDMI Rec Output" -> "apply LUT". The LUT must be saved on the SD card.

This is the identity *.cube LUT for 8 colors:

```
LUT_3D_SIZE 2
# blac\overline{k}
000
\# red
100
\# green
010
\# yellow
110
\# blue
\(\begin{array}{ll}\# & 0 \\ 0 & 1\end{array}\)
\# magenta
101
\# cyan
011
\# white
\begin{tabular}{ll}
\(\#\) & whit \\
1 & 1 \\
\hline
\end{tabular}
```

This is the identity *.cube LUT for 27 colors:

```
LUT_3D_SIZE 3
# black
0.0 0.0 0.0
# dark red
# dark red
# red
# red
1.0 0.0 0.0
# dark green
0.0 0.5 0.0
# dark yello
0.5 0.5 0.0
# red-green = orange
1.0 0.5 0.0
# green
# green (
# yellow-green
0.5 1.0 0.0
# yellow
1.0 1.0 0.0
# dark blue
# dark blue
# dark magenta
# dark magenta

# blue-white
0.5 0.5 1.0
# magenta-white
1.0 0.5 1.0
# cyan
0.0 1.0 1.0
# cyan-white
0.5 1.0 1.0
# white
1.0 1.0 1.0
```

My C\# source code for creating *.cube LUT files can be downloaded here: http://www.astro-electronic.de/source/My_LUT_Creator.zip (In this case it's a simple gamma function)

This video filter removes all color informations except for one certain color. It has three parameters:
"color" is the color to be preserved, can be specified by name or by RGB values, for example "orange" can be replaced by FFA500 (or 0xFFA500 or \#FFA500)
"similarity" is a fraction, 0.01 means only the specified color is preserved, 1.0 means all colors are preserved.
Note: The normalization of the "similarity" value was changed in May 2020. Old values must now be divided by sqrt(3) to get the same result as before.
"blend" is a fraction, 0.0 makes pixels fully gray, higher values result in more preserved color.
This example preserves only colors from yellow to orange to light brown:
ffmpeg -i 7Z7A2027.jpg -filter_complex split[1][2];[1]colorhold=color="orange":similarity=0.29:blend=0[3];[2][3]hstack -y out.jpg
pause

Output of this example:

There is also a "chromahold" filter which is similar to the "colorhold" filter but works in YUV range.
There is also a "hsvhold" filter, which is similar to the "colorhold" filter but works in the HSV (Hue-Saturation-Value) range:
ffmpeg -i 7Z7A2027.jpg -filter_complex split[1][2]; [1]hsvhold=hue=45:sat=0.7:val=0.5:similarity=0.30:blend=0[3];[2]
[3]hstack -y hsv.jpg
pause

## Output of this example:

The problem with these filters is that it's difficult to adjust the parameters properly, without seeing the result in real time.
Hint: Use the "FastStone Image Viewer" for showing the result image. This viewer does automatically detect when the image is overwritten by a new image, and shows the new image automatically.

### 2.30 Atmospheric dispersion correction

It's possible to shift the RGB channels with respect to each other:

| set "IN=P1000479.mov" | $::$ Input video |
| :--- | :--- |
| set "OUT=out.mp4" | $::$ Output video |
| set "RV=5" | : Vertical shift of red channel |
| set "BV=-5" | $:$ : Vertical shift of blue channel |
| ffmpeg -i \%IN\% -lavfi "rgbashift=rv=\%RV\%:bv=\%BV\%" -y \%OUT\% |  |
| pause |  |

This example shows a white square before and after applying the correction:

```
set "RV=5" :: Vertical shift of red channel
set "BV=-5" :: Vertical shift of blue channel
ffmpeg -f lavfi -i color=black:s=100x100 -lavfi drawbox=color=white:x=40:y=40:w=20:h=20:t=fill,split[a][b];
[b] rgbashift=rv=%RV%:bv=%BV%[c];[a][c]hstack -frames 1 -y out.png
pause
```

This is the output image:

The chromashift filter seems to be similar, but I haven't yet tested it.

### 2.31 Amplify filter

The "amplify" filter amplifies differences between adjacent frames. Good for motion detection, but it's also sensitive to noise.

### 2.32 Sharpen or blur images

Images or videos can be blurred or sharpened with the "unsharp" filter:

```
ffmpeg -i 7z7a1256.jpg -vf unsharp=la=2 -y out.jpg
pause
```

These are the parameters of the "unsharp" filter:

| Parameter | Default value | Description |
| :--- | :--- | :--- |
| lx | 5 | Luma matrix horizontal size, it must be an odd integer between 3 and 23. |
| ly | 5 | Luma matrix vertical size, it must be an odd integer between 3 and 23. |
| la | 1 | Luma effect strength, it must be a floating point number, reasonable values are between -1.5 and 1.5. <br> Negative values will blur the input video, while positive values will sharpen it, a value of zero will disable the effect. |
| cx | 5 | Chroma matrix horizontal size, it must be an odd integer between 3 and 23. |
| cy | 5 | Chroma matrix vertical size, it must be an odd integer between 3 and 23. |
| ca | 0 | Chroma effect strength, it must be a floating point number, reasonable values are between -1.5 and 1.5. <br> Negative values will blur the input video, while positive values will sharpen it, a value of zero will disable the effect. |

For blurring you can also use the "avgblur" filter.

For variable blur you can use the "varblur" filter:

```
rem Create a circular mask
ffmpeg -f lavfi -i nullsrc=size=vga -lavfi format=gray8,geq='25*lt(hypot(X-W/2,Y-H/2),200)' -frames 1 -y mask.png
rem Apply variable blurring:
ffmpeg -f lavfi -i testsrc2=size=vga -i mask.png -lavfi [0]format=gbrp[a];[a][1]varblur=max r=25 -t 10 -y out.mp4
pause
```

For directional blur, see the "dblur" filter.

First let's make a test image which contains different wavelengths, both horizontal and vertical:

```
ffmpeg -f lavfi -i color=black:s=300x50 -lavfi drawgrid=c=white:y=-1:w=2:h=51,split[a][b];^
[b] crop=iw/2:x=0,scale=2*iw:ih:flags=neighbor,split[b][c];^
[c] crop=iw/2:x=0,scale=2*iw:ih:flags=neighbor,split[c][d];
[d]crop=iw/2:x=0,scale=2*iw:ih:flags=neighbor,split[d][e];^
[e]crop=iw/2:x=0, scale=2*iw:ih:flags=neighbor,split[e][f];^
[f]crop=iw/2:x=0,scale=2*iw:ih:flags=neighbor[f];^
[a][b][c][d][e][f]vstack=6,split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y test.png
```

pause

This is the test image. The wavelengths are $2,4,8,16,32$ and 64 pixels per linepair:

## After some experimenting I found out that it's better to use sine waves:

ffmpeg -f lavfi -i color=black: $s=300 \times 300$-lavfi geq='r=127.5+127.5*cos (X*PI/
(pow (2,trunc $(Y / 50))$ ))', colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0, split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y test.png

This is the test image. The wavelengths are $2,4,8,16,32$ and 64 pixels per linepair:

Now let's test the lowpass example from the official documentation:

```
ffmpeg -f lavfi -i color=black:s=300x300 -lavfi geq='r=127.5+127.5*cos(X*PI/
(pow(2,trunc(Y/50))))',colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0,split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y
test.png
ffmpeg -i test.png -vf fftfilt=dc_Y=0:weight_Y='squish((Y+X)/100-1)' - Y out1.png
pause
```

## This is the output image:

It's clearly visible that the horizontal filtering frequency is different from the vertical filtering frequency. That's because the image has a $2: 1$ aspect ratio, but in the expression the $X$ and $Y$ values are simply added with the same weight.
It's also visible that the highest frequency isn't fully filtered out. This problem can be solved by scaling the image to double size before filtering and scaling down to the original size after filtering.
If the weight_U and weight_V expressions aren't set, they are by default copied from weight_Y. That's why the output image has a greenish tint in this example. To solve this problem, you should always set weight_U and weight_V to 1.

This is an infinitely sharp lowpass filter which has the same cutoff frequencies in both directions:

```
ffmpeg -f lavfi -i color=black:s=300x300 -lavfi geq='r=127.5+127.5*cos(X*PI/
(pow(2,trunc(Y/50))))',colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0,split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y
test.png
ffmpeg -i test.png -vf
scale=2*iw:2*ih,fftfilt=dc_Y=0:dc_U=0:dc_V=0:weight_Y='lt(hypot(Y/H,X/W),0.333)':weight_U=1:weight_V=1,scale=iw/2:ih/2
-y out2.png
pause
```

Note: In the above example, the "colorchannelmixer" copies the red channel to the green and blue channels.

This is the output image:

Note: The "fftfilt" filter works only in YUV pixel format.

It's better to sine intensity profiles for testing, because square waves contain many harmonics. This command creates a test image where the wavelength changes continuously from 4 to 8 (in the center) to 16 pixels per linepair. The size can be changed, but width and height of the "color" source must be equal, because otherwise the hstack at the end filter would fail:
ffmpeg -f lavfi -i color=black:s=256x256-lavfi geq='r=127.5+127.5*cos ((X-W/2)*PI/(pow(2)
$(1+2 * Y / H)))^{\prime}$, colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0,split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y test.png
pause

This is the test image:

Note: The internal FFT array size changes between image size=230 and image size=232, as can be shown by the following example. This is probably because the FFt size is always a power of 2 and it's chosen at least about $10 \%$ bigger than the input size because a window function is used.
See also vf_fftfilt.c line 285: for (rdft_hbits = 1; 1 << rdft_hbits < w*10/9; rdft_hbits++);

```
set "P=8"
ffmpeg -f lavfi -i color=black:s=230x230 -lavfi geq='r=127.5+127.5*cos((X-W/2)*PI/(pow(2,
(1+2*Y/H))))',colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0,split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y test.png
ffmpeg -i test.png -vf scale=2*iw:2*ih,fftfilt=dc_Y=128:dc_U=1:dc_V=1:weight_Y='between(hypot(Y/H,X/W),1.9/%P%,2.1/%P
%)' :weight_U=1:weight_V=1,scale=iw/2:ih/2 -y out2\overline{3}0.png
ffmpeg -f lavfi -i color=black:s=232x232 -lavfi geq='r=127.5+127.5*cos((X-W/2)*PI/(pow(2,
(1+2*Y/H))))',colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0,split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y test.png
ffmpeg -i test.png -vf scale=2*iw:2*ih,fftfilt=dc_Y=128:dc_U=1:dc_V=1:weight_Y='between(hypot(Y/H,X/W),1.9/%P%,2.1/%P
%)':weight_U=1:weight_V=1,scale=iw/2:ih/2 -y out2\overline{3}2.png
pause
```

The size of the FFT arrays in the "fftfilt" filter is accessible vis the "WS" and "HS" variables, or could be calculated as follows:

```
set "ARRAY H=pow(2,ceil(log(ceil(W*10/9))/log(2)))"
set "ARRAY V Oow(2,ceil(log(ceil(H*10/9))/log(2)))"
```

## Example for lowpass, highpass, bandpass and notch filters, where the filter wavelength is independent of the image size:

```
set "P=8" :: filter wavelength = pixels per linepair
set "SIZE=512" :: vertical size of test image
:: create test image, wavelength varies continuously from 4 to 8 (in the center) to 16 pixels per linepair:
ffmpeg -f lavfi -i color=black:s=%SIZE%x%SIZE% -lavfi geq='r=127.5+127.5*cos((X-W/2)*PI/(pow(2,
(1+2*Y/H))))',colorchannelmixer=1:0:0:0:1:0:0:0:1:0:0:0,split[h][v];[v]transpose[v];[v][h]hstack -frames 1 -y test.png
:: lowpass, highpass, bandpass and notch filtering:
ffmpeg -i test.png -vf scale=2*iw:2*ih,fftfilt=dc_Y=0:dc_U=0:dc_V=0:weight_Y='lte (hypot(X/WS,Y/HS),1.0/%P
%)':weight_U=1:weight_V=1,scale=iw/2:ih/2 -y lowpāss.png
ffmpeg -i test.png -vf scale=2*iw:2*ih,fftfilt=dc_Y=128:dc_U=1:dc_V=1:weight_Y='gte(hypot(X/WS,Y/HS),1.0/%P
%)':weight_U=1:weight_V=1,scale=iw/2:ih/2 -y highpass.png
ffmpeg -i test.png -vf scale=2*iw:2*ih,fftfilt=dc_Y=128:dc_U=1:dc_V=1:weight_Y='between(hypot(X/WS,Y/HS),0.8/%P%,1.2/%P
%)':weight_U=1:weight_V=1,scale=iw/2:ih/2 -y bandpass.png
ffmpeg -i test.png -vf scale=2*iw:2*ih,fftfilt=dc_Y=0:dc_U=0:dc_V=0:weight_Y='1-between(hypot(X/WS,Y/HS),0.8/%P%,1.2/%P
%)':weight_U=1:weight_V=1,scale=iw/2:ih/2 -y notch.png
pause
```

Why is the image scaled up before filtering and scaled down after filtering? If the image contains the highest possible frequency (2 pixels per linepair), this frequency wouldn't be filtered out with a lowpass filter. I think that's because of the YUV subsampling. As a workaround the image is scaled up before filtering and scaled down after filtering.

### 2.34 Extract a time segment from a video

When you have a fisheye camera pointing upwards, it's unavoidable that you are visible in the video at the beginning and the end, because you must start and stop the camera. That means we must cut off the beginning and the end.

```
rem Extract a time segment from a video
set "INPUT=PanoView.mp4" :: Input video
set "OUTPUT=out.mp4" : : Output video
set "START=2.0" :: Start time in seconds
set "LENGTH=3.0" :: Length of the segment in seconds
ffmpeg -ss %START% -t %LENGTH% -i %INPUT% -c copy %OUTPUT%
pause
```

The arguments for -ss and -t can also be specified in hours, minutes and seconds:
1:20 = 1 minute, 20 seconds
1:10:30 = 1 hour, 10 minutes, 30 seconds

Instead of the length it's also possible to specify the end time with the -to option.

If you want to save the output video with exactly the same quality as the input video (without re-encoding), then use the -c copy option. In this case it makes no sense to specify the output video quality.

```
ffmpeg -ss 5 -i input.mov -t 10 -c copy output.mov
pause
```

The same thing can also be done with the "trim" filter.
For more informations about seeking, see also https://trac.ffmpeg.org/wiki/Seeking

Note: If -ss is written before the input file, the cut will be at the nearest keyframe but not at the accurate time. However if -ss is written after the input file, the cut will be at the accurate time but there may be an empty part at the beginning of the file, until the next keyframe.

### 2.35 Trim filter

## Drop everything except the second minute of input:

```
ffmpeg -i in.mp4 -vf trim=60:120 out.mp4
pause
```

Keep only the first second:

```
ffmpeg -i in.mp4 -vf trim=duration=1 out.mp4
pause
```

See also https://transang.me/practical-ffmpeg-commands-to-manipulate-a-video/

### 2.36 Tpad filter, add a few seconds black at the beginning or end

Method 1, using the "tpad" filter:

```
set "IN=my_video.mp4" :: Input video
set "DUR=3" : : Duration in seconds
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -vf tpad=start_duration=%DUR% %OUT%
pause
```

The "tpad" filter inserts frames at the beginning or at the end of a video. These frames contain either a uniform color or a copy of the first or last frame. The default color is black.

## Method 2, using the concat filter:

```
set "IN=my_video.mp4" :: Input video
set "DUR=3" :: Duration in seconds
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -an -filter_complex 'color=black:duration=%DUR%[black];[black][0:0]concat=n=2:v=1:a=0[v]' -map [v] %OUT%
pause
```

When I make real-time videos of meteors, I let the Panasonic LUMIX GH5S camera record continuously. When I see a meteor, I speak to the soundtrack in which part of the sky l've seen it, and after about 10 seconds I press the REC button to stop the recording, and immediately start a new recording. That means after downloading the videos to the computer, meteors are always at the end of the videos. There is no need to watch the videos in full length (that would be boring). This batch file extracts the last 30 seconds of the video which is drag-and-dropped over it, and for the output filename the string "P1" is replaced by "CUT" (e.g. P1000336.MOV becomes CUT000336.MOV). It's lossless because the "-c copy" option is used.

```
set INPUT=%1
set OUTPUT=%INPUT:P1=CUT%
ffmpeg -sseof -30 -i %INPUT% -c copy %OUTPUT%
pause
```

This batch file (for Windows 7) does the same thing for all P1*.MOV files in the current folder:

```
for %%f in (P1*.MOV) do call :for_body %%f
goto :the_end
    :for_body
    set INPUT=%1
    set OUTPUT=%INPUT: P1=CUT%
    ffmpeg -sseof -30 -i %INPUT% -c copy -y %OUTPUT%
exit /b
: the_end
pause
```

Fade-in and fade-out for a video of known length (only for video, not for audio). Here the times are expressed in frames:
ffmpeg -i input.mp4 -vf 'fade=in:0:30,fade=out:9650:30' output.mp4
pause

Fade-in and fade-out of a video of known length (both video and audio). Here the times are in seconds:
ffmpeg -i input.mp4 -vf 'fade=in:st=0:f=1,fade=out:st=32:d=1' -af 'afade=in:st=0:d=1,afade=out:st=32:d=1' output.mp4 pause

This is a workaround for fade in/out a video with unknown duration:

```
ffmpeg -i input.mp4 -sseof -1 -copyts -i input.mp4 -filter_complex
"[1] fade=out:0:30[t];[0][t] overlay,fade=in:0:30[v]; anullsrrc,atrim=0:2[at];[0][at]acrossfade=d=1,afade=d=1[a]"
-map "[v]" -map "[a]" -c:v libx264 -crf 22 -preset veryfast -shortest output.mp4
pause
```

The trick is to feed the same input twice. From the second input only the last second is used. The timestamps are preserved. A fade-out is applied to the short second input, and then both files are combined with overlay. For audio a 2 seconds dummy with silence is created, and then crossfaded with the input audio. The -shortest option cuts the output to the same length as the input.

Another workaround for making fade-in and fade-out for audio of unknown length:

```
ffmpeg -i input.mp4 -filter_complex "afade=d=0.5, areverse, afade=d=0.5, areverse" output.mp4
pause
```

The same thing does also work for video, but keep in mind that you need a lot of memory for the reverse filter:
ffmpeg -i input.mp4 -filter_complex "fade=d=0.5, reverse, fade=d=0.5, reverse" output.mp4
pause

Another option is to use acrossfade with a silent track, but this works not for video because there is no crossfade filter for video:

```
ffmpeg -i input.mp4 -filter_complex "aevalsrc=0:d=0.6 [a_silence]; [0:a:0] [a_silence] acrossfade=d=0.6" output.mp4
pause
```

Afade curves are shown on this wiki page: https://trac.ffmpeg.org/wiki/AfadeCurves

### 2.39 Crossfading

The different types of xfade crossfadings are shown on this wiki page:
https://trac.ffmpeg.org/wiki/Xfade

Both inputs must be constant frame-rate and have the same resolution, pixel format, framerate and timebase.

Cropping means to cut off the borders, and in the next step you can also set the size (width * height) of the output video:

```
rem Crop and set the output size
set "INPUT=PanoView.mp4" :: Input video
set "OUTPUT=out.mp4" :: Output video
set "CROP=1224:1224:0:0"
set "SIZE=800x800
    : Specify the visible part: Width, height, left edge, top edge
    :: Width and height of the output video (can be smaller or greater than the input video)
    Keep the width/height ratio constant, otherwise the video looks distorted,
    for example a circle would become an ellipse.
set "QU=3" :: MP4 Quality, 1 is best Quality, 3 is normal, 31 is strongest compression
ffmpeg -i %INPUT% -vf crop=%CROP% -s %SIZE% -q:v %QU% -codec:v mpeg4 %OUTPUT%
pause
```

In the crop filter you can use the variables "iw" and "ih", which are the width and height of the input video.
If the 3rd and 4th parameter (coordinates of top left corner) isn't specified, the crop will be automatically centered.
crop=ih:ih makes a centered square crop, useful for fulldome videos
crop=iw/2:ih:0 returns the left half of the input video
crop=iw/2:ih:iw/2 returns the right half of the input video
crop=iw/4:ih/4 strong enlargement by a factor 4 in the center of the video

The "pad" filter does the opposite thing, it adds paddings with a uniform color to the video. See next chapter.

### 2.41 Add borders to a video

Borders can be added with the "pad" filter. This example adds a black 40 pixel border at the bottom of the video, for example for writing text into it:

```
ffmpeg -i input.mp4 -vf pad=iw:ih+32 -y output.mp4
pause
```

### 2.42 Zoompan

This is a very powerful filter. It can also be used for making slideshows. The "d" option specifies how long each image in shown.

Parameters:
'out_time' or 'ot' Timestamp in seconds of each output frame produced by zoompan.
'in_time' or 'it' Timestamp in seconds of each input frame to the zoompan filter.

In most cases it's useful to specify the size of the output frames with the "s" option, because the defaulf is $1280 \times 720$.

See also "Use of 'geq' as 'zoompan' alternative":
https://hhsprings.bitbucket.io/docs/programming/examples/ffmpeg/manipulating_video_colors/use_of_geq_as_zoompan_alternative.html
(I'm still working on this chapter...)

```
rem Changing the speed (slow motion ot timelapse)
set "INPUT=PanoView.mp4" :: Input video
set "OUTPUT=out.mp4" :: Output video
set "RATE=30" :: Output framerate
set "SPEED=3.0" :: Speed factor, smaller than 1 = timelapse, 1 = real time, greater than 1 = slow motion
set "QU=3" :: MP4 Quality, 1 is best Quality, 3 is normal, 31 is strongest compression
ffmpeg -i %INPUT% -vf setpts=%SPEED%*PTS -r %RATE% -q:v %QU% -codec:v mpeg4 -an -y %OUTPUT%
pause
```

In this example the settings for "RATE" and "SPEED" are totally independent of each other. FFmpeg will automatically skip or duplicate frames, if required.
Example: If both input and output frame rate are 30 , and if SPEED $=3$, then each frame will automatically duplicated 2 times, so that we see it 3 times in the output video. If SPEED $=0.5$, then each second frame is skipped.
In this example the slow motion or timelapse effect affects only video and not audio. It makes sense to disable the audio channel with the -an option.
The "setpts" filter is described in the "Multimedia Filters" section in the FFmpeg documentation.
The timebase (TB in setpts filter) is expressed in seconds [ s ].
The framerate ( $F R$ in setpts filter) is expressed in $1 /$ seconds [s $\left.s^{\wedge}-1\right]$
In many cases the timebase is the reciprocal of the framerate, but this isn't always the case.
Some more examples:

| setpts $=0.5 *$ PTS | Double speed |
| :--- | :--- |
| setpts $=2.0 *$ PTS | Half speed |
| setpts $=P T S+x /(F R \star T B)$ or tpad=x | Delay by $x$ frames (assuming the framerate is constant) |
| setpts $=P T S+x /$ TB or tpad=x/framerate | Delay by $x$ seconds |
| setpts $=$ PTS-STARTPTS | Start counting PTS from zero |

### 2.44 Slow motion or timelapse only for a segment of the video

See the comments for explanation.

```
set "IN=7Z7A2089.mov" :: Input Video
set "T1=5" :: Start time T1
set "T2=8.5" :: Time T2 when slow motion begins
set "T3=9.7" :: Time T3 when slow motion ends
set "T4=11" :: End time T4
set "SPEED=5" :: Speed factor, smaller than 1 = timelapse, greater than 1 = slow motion
set "FR=30" :: Output framerate
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -filter_complex "[0:v]trim=%T1%:%T2%,setpts=PTS-STARTPTS[v1]; [0:v]trim=%T2%:%T3%,setpts=%SPEED%*(PTS-
STARTPTS)[v2];[0:v]trim=%T3%:%T4%,setpts=PTS-STARTPTS[v3];[v1][v2][v3]concat=n=3:v=1" -an -r %FR% -q:v 2 -y out.mp4
pause
```

### 2.45

 Time RemappingThis is an example for a gradual ramp into and out of slow motion:

```
ffmpeg -f lavfi -i testsrc2=size=vga:duration=10:rate=20 -lavfi "n
    [0]trim=0.0:3.2, setpts=(PTS-STARTPTS) [1];^
    [0] trim=3.2:3.6,setpts=(PTS-STARTPTS)/0.80[2] ;^
    [0] trim=3.6:4.0,setpts=(PTS-STARTPTS)/0.60[3];^
    [0] trim=4.0:6.0, setpts=(PTS-STARTPTS)/0.40[4] ;^
    [0] trim=6.0:6.4,setpts=(PTS-STARTPTS)/0.60[5] ;^
    [0]trim=6.4:6.8, setpts=(PTS-STARTPTS)/0.80[6] ;^
    [0] trim=6.8:10.0, setpts=(PTS-STARTPTS) [7];^
    [1][2][3][4][5][6][7] concat=n=7:v=1" -y out.mp4
```

pause

This is an example for a 10s input video where the framerate changes linearly from 20 to $\mathbf{1 0}$ :

```
ffmpeg -f lavfi -i testsrc2=size=vga:duration=10:rate=20 -lavfi
    [0]trim=0:1, setpts=(PTS-STARTPTS)/0.975[1];
    [0] trim=1:2,setpts=(PTS-STARTPTS)/0.925[2];
    [0]trim=2:3,setpts=(PTS-STARTPTS)/0.875[3]
    [0] trim=3:4, setpts=(PTS-STARTPTS)/0.825[4];
    [0] trim=4:5, setpts=(PTS-STARTPTS)/0.775 [5];
    [0]trim=5:6,setpts=(PTS-STARTPTS)/0.725[6]
    [0] trim=6:7, setpts=(PTS-STARTPTS)/0.675[7];
    [0] trim=7:8, setpts=(PTS-STARTPTS)/0.625[8];
    [0]trim=8:9,setpts=(PTS-STARTPTS)/0.575 [9];
    [0]trim=9:10,setpts=(PTS-STARTPTS)/0.525[10];[1][2][3][4][5][6][7][8][9][10]concat=n=10:v=1" -y out.mp4
```

pause

The length of the output video is $\mathbf{1 3 . 6 5 s}$

Use the following example carefully, as I'm not $100 \%$ convinced that the approach is correct. This is based on an posting from Nicolas George in the FFmpeg user mailing list, September 23, 2019. In the first equation it's unclear if $t$ is the time in the input video or in the output video.

```
rem > So, to compute the timestamp of a frame with variable speed:
rem >
rem > * Express your frame rate as a complete formula: t }->
rem
rem > * Integrate it: t }->\mathrm{ f
rem >
rem > * Find the reciprocal: f }->
rem
rem Let's assume we have a 10s video and the framerate changes linearly from 20 at the beginning to 10 at the end:
rem v = 20 - t
    v(0)=20 v(10)=10
rem
rem After integrating we get: f = 20 * t - 0.5 * t^2
<
rem The inverse function is: t = 20- sqrt(400 - 2 * f)
rem Creaste a test video with framerate=20 and length=10s
ffmpeg -f lavfi -i testsrc2=size=vga:duration=10:rate=20 -y test.mp4
rem Apply the time remapping:
ffmpeg -i test.mp4 -lavfi setpts='(20-sqrt(400-2*N))/TB' -y out.mp4
pause
```

The resulting video gets slower towards the end (too slow, in fact), and the length is 18.95 s and that seems to be wrong. With a constant framerate of 20 the length is 10 s , with a constant framerate of 10 the length is 20 s , and if the framerate changes from 20 to 10 the length should be about 15 s . I don't fully understand what's going on here.

Note: It's much easier to do time remapping in DaVinci Resolve.

Keywords for searching: "Time remapping", "Time ramp", "Slow motion ramp", "Speed ramp"

```
set "IN=input.mov" :: Input video
set "IN=input.mov" 
set "FONT=arial.ttf"
set "TEXT=Hello World"
set "COLOR=yellow"
set "SIZE=20"
set "POS_X=(w-tw)/2"
set "POS_Y=(h-th)/2"

mpeg4 -q:v 1 -y %OUT%
pause
```

### 2.47 Slowly fade a text in and out

```
rem Slowly fade a text in and out
set "INPUT=PanoView.mp4" :: Input video
set "OUTPUT=out.mp4" :: Output video
set "QU=3"
set "NAME=TEXT1"
set "FONT=arial.ttf"
set "TEXT=MeinText.txt"
    Font
    Text filename (must be UTF-8 coded, if the text contains non-ASCII characters like
    ä, ö, ü. The text can be ASCII coded if no special characters are used.
set "COLOR=yellow"
    Text color
set "SIZE=250"
set "POS X=(w-tw)/2"
set "POS_Y=(h-th)/2" :: Y position of text, use (h-th)/2 for centering
```

```
set "DS=0.5" :: Start time
set "DE=4.5"
set "FID=1.0"
End time
set "FOD=1.0"
Fade-in duration (may be small, but not zero)
:: Fade-out duration (may be small, but not zero)
set %NAME%=drawtext='fontfile=%FONT%:textfile=%TEXT%:fontcolor_expr=%COLOR%@%%{e\:clip(((t-%DS%)/%FID%)*^
```

```
set "NAME=TEXT2"
Unique name for this text
set "FONT=arial.ttf"
    Font
set "TEXT=MeinText.txt"
    Text filename (must be UTF-8 coded, if the text contains non-ASCII characters like
    ä, Ö, ü. The text can be ASCII coded if no special characters are used.
set "COLOR=red"
    Text color
set "SIZE=250"
Font size
set "POS X=(w-tw)/2"
    X position of text, use (w-tw)/2 for centering
set "POS_Y=(h-th)/3"
    Y position of text, use (h-th)/2 for centering
set "DS=\overline{0}.0"
Start time
End time
set "DE=3.0"
set "FID=0.5"
Fade-in duration (may be small, but not zero)
set "FOD=0.5" :: Fade-out duration (may be small, but not zero)
set %NAME%=drawtext='fontfile=%FONT%:textfile=%TEXT%:fontcolor expr=%COLOR%@%%{e\:clip (((t-%DS%)/%FID%)*^
between (t, %DS%,(%DS%+%DE%)/2)+(%DE%-t)/%FOD%*between(t, (%DS%+%DE%)/2, %DE%),0,1)}:fontsize= %SIZE%:x= %POS_X%:Y= %POS_Y%'
ffmpeg -i %INPUT% -vf "%TEXT1%,%TEXT2%" -q:v %QU% -codec:v mpeg4 -an -y %OUTPUT%
pause
```

The text must be saved as a *.txt file. If the text contains non-ASCII special characters like ä, $\mathbf{o ̈}$, ü then the encoding must be UTF-8. If the text contains only ASCII characters, then "ANSI" encoding is possible as well.
In some cases drawtext shows a non-printable character (for example an empty rectangle) at the beginning of the text. This is a BOM (Byte Order Mark) that was automatically added to the text by some Windows programs at the beginning of the file. Older versions of Notepad (on Windows 7 ) show this behaviour and you can't disable it. The BOM consists of three bytes $E F_{\text {hex }} B B B_{\text {hex }}{B F_{\text {hex }} \text {. }}$
See also here: https://en.wikipedia.org/wiki/UTF-8\#Byte_order_mark
There are several solutions for this problem:

- Open the text file with a hex editor and remove the first three characters ( $\mathrm{EF}_{\text {hex }} \mathrm{BB}_{\text {hex }} \mathrm{BF}_{\text {hex }}$ ). For example you can use Hex Editor MX: http://hexedit.nextsoft.de/
- If you can't find a newer 32-bit Notepad version for Windows 7, you can use Notepad++ instead. Select "UTF-8" in the "Encoding" menue. https://notepad-plus-plus.org/
Notepad++ has the unexpected behaviour that it always restores the last session when you start it. To disable this behaviour, go to Settings --> Preferences --> Backup and untick "Remember current session for next launch". Then it just opens a new empty file when you start it by doubleclicking on the Notepad++ icon.
- Newer versions of Notepad (on Windows 10) have a selection between "UTF-8" and "UTF-8 with BOM". Using "UTF-8" will solve the problem.

Problem: You want to show the content of a credits file scrolling up. The file contains many lines of different lengths.
drawtext=textfile=credits.txt: $x=\left(w-t e x t \_w\right) / 2: y=h-100 * t$

The variable text_w is the width of the longest line in the text file. This line is center-aligned in the frame, and all other (shorter) lines are left-aligned to the same $X$ position as the longest line. But that's not what you want. Is it somehow possible that each line is center-aligned?
Solution: See the workaround with *.ass subtitles in this document.

### 2.48 Vertical alignment of text

Problem: In the "drawtext" filter, the content of the variable "text_h" depends on which characters are printed. For example, the characters "a", "A", " g ", "_" and "^" do all have different heights.

| Vertical position | What does it do? |
| :--- | :--- |
| $y=100$ | The highest point of the string (the ascent) is used for vertical alignment. <br> Warning: The vertical alignment depends on the content of the string. |
| $y=100$-text_h | The lowest point of the string (the descent) is used for vertical alignment. <br> Warning: The vertical alignment depends on the content of the string. |
| $y=100$-ascent | The baseline of the string is used for alignment. The vertical alignment doesn't depend on the content of the string. <br> This is the recommended method when you want to print several strings in the same line. |

In this example a running clock is inserted in each frame of the video, in the format "hours:minutes:seconds.milliseconds"

```
set "IN=P1000479.mov" :: Input video
set "OUT=sylvia.mp4" :: Output video
set "BP R=0.015"
set "BP-G=0.005'
set "BP_B=0.015'
set "WP=0.26"
set "S=300"
set "T=40"
set "FONT=arial.ttf"
set "COLOR=white"
set "BOXCOLOR=black"
set "SIZE=30"
set "POSITION_X=0"
set "POSITION_Y=(h-th)"
set "OF=2340"
set "I=0.04"
Black point red, positive value makes background darker
Black point green, positive value makes background darker
Black point blue, positive value makes background darker
White point
Start time
Duration
Font
Font color
Background color
Font size
: X position of clock
Y position of clock
Offset time in seconds, shown in the first frame
Time intervall from one frame to the next = 1/framerate
set CLOCK=drawtext='fontfile=%FONT%:text=%%{eif\:mod((%OF%+%I%*n)/3600,24)\:'d'\:2}"\:"%%{eif\:mod((%OF%+%I
%*n)/60,60)\:'d'\:2}"\:"%%{eif\:mod(%OF%+%I%*n, 60)\:'d'\:2}"."%%{eif\:mod((%OF%+%I%*n)*1000,1000)\:'d'\:3}:fontcolor=
%COLOR%:boxcolor=%BOXCOLOR%:box=1 : fontsize=%SIZE%:X=%POSITION_X%:Y=%POSITION_Y%'
```

```
-pix_fmt yuv420p -t %T% -y %OUT%
pause
```

This batch file does the same thing and is simpler:

```
set "IN=P1000479.mov"
Input video
set "OUT=sylvia.mp4" :: Output video
set "BP_R=0.015" :: Black point red, positive value makes background darker
set "BP_G=0.005" :: Black point green, positive value makes background darker
set "BP_B=0.015" :: Black point blue, positive value makes background darker
set "WP=0.26" :: White point
set "S=300" :: Start time
set "T=40"
set "FONT=arial.ttf"
set "COLOR=white"
set "BCOLOR=black"
set "SIZE=30"
set "POS_X=0"
set "POS_Y=(h-th)"
set "OFF\overline{SET=2340"}
```

```
%: x=%POS_X%:y=%POS_Y%'
```

```
-pix_fmt yuv420p -t %T% -y %OUT%
pause
```

This is another example, using the "timecode" option of the drawtext filter:

```
ffmpeg -f lavfi -i testsrc2=size=hd720:duration=10 -vf
drawtext=fontsize=60:fontcolor=Black:fontfile='arial.ttf':timecode='00\:00\:00\:00':r=25:x=20:y=40 - y out.mp4
pause
```

```
rem Create a video with curved text fade-in fade-out, silent audio
set "SIZE=1200" :: Video size (square)
set "QU=3" :: MP4 quality level, 1 is best quality, 3 is normal, 31 is strong compression
set "FPS=30"
set "FONT=arial.ttf"
set "FSIZE=60"
set "COLOR=white"
set "BACK=black"
set "DUR=10"
set "TEXT=text13.txt"
set "POS X=(w-tw)/2"
set "POS_Y=h*0.9"
set "S=1"
set "E=9"
set "FO=2" :: fade-in duration (may be (may be small, but not zero)
set "OUTPUT=text13.mp4" :: Output filename
ffmpeg -f lavfi -i color=c=%BACK% -i xmap_3648.pgm -i ymap_3648.pgm -f lavfi -i anullsrc -r %FPS% -t %DUR% -aspect "1:1"
-lavfi scale=3648:3648,drawtext='fontfile=%FONT%:textfile=%TEXT%:fontcolor expr=%COLOR%@%%{e\:clip((t-%S%)/%FI
%*between (t, %S%,%S%+%FI%) + (%E%-t)/%FO%*between(t, %S%+%FI%,%E%),0,1)}:fontsizze=%FSIZE%:x=%POS X%:Y=%POS Y
%',format=pix_fmts=rgb24,remap -s %SIZE%x%SIZE% -c:v mpeg4 -c:a aac -shortest -q:v %QU% -Y %OUTPUT%
pause
```

I have to admit that this is a complicated command line. The actual core is the "remap" filter, with which you can create arbitrary distortions. The distortion is described in the two files xmap_3648.pgm and ymap_3648.pgm. In these files the pixel in the input video from which it is retrieved is indicated for each pixel. You have to write a (C\#) program that can create these files.
-i color=c=black creates a black image
-i anullsrc creates an empty audio track

This is the C\# code for generating the xmap and ymap files:

```
int a = (int)numericUpDown1.Value; // get the size of the square map
double c = (double)numericUpDown2.Value; // this is the aspect ratio of the text, normal = 1
int b = a/2;
int xx, yy;
TextWriter xmap = File.CreateText("xmap_" + a.ToString() + ".pgm");
xmap.Write("P2\n");
xmap.Write("# Xmap file for fulldome remap \n");
xmap.Write(a.ToString() + " " + a.ToString() + " \n");
xmap.Write("65535\n");
TextWriter ymap = File.CreateText("ymap_" + a.ToString() + ".pgm");
ymap.Write("P2\n");
ymap.Write("# Ymap file for fulldome remap \n");
ymap.Write(a.ToString() + " " + a.ToString() + " \n");
ymap.Write("65535\n");
for (int y = 0; y < a; y++)
{
    for (int x = 0; x < a; x++)
    {
        xx = x;
        yy = y;
        if (y > b)
        {
            xx = b + (int) (b / c * Math.Atan((double) (x - b) / (double) (y - b)));
            yy = b + (int)Math.Sqrt((x - b) * (x - b) + (y - b) * (y - b));
            if (xx < 0) xx = 0.
            if (yy<0) yy = 0;
            if (xx > a - 1) xx = a - 1;
            if (yy > a - 1) yY = a - 1;
        }
        xmap.Write(xx + " ");
        ymap.Write (yy + " ");
    }
    xmap.Write("\n");
    ymap.Write("\n");
}
xmap.Write("\n");
ymap.Write("\n");
xmap.Close()
ymap.Close()
```

This is a simpler example for generating curved text for fulldome projection, using the v360 filter:

```
set "UP=30" :: Up-looking angle in degrees (center of the rectangular video)
Horizontal field of view, this is for 16:9 aspect ratio
set "V=36"
set "SIZE=1200"
set "FONT=arial.ttf"
set "FSIZE=120"
set "COLOR=white"
set "BACK=black"
set "TEXT=text13.txt"
set "TEXT=text13.txt
set "POS Y=(h-th)/2"
set "S=1"
set "E=9"
set "FI=2"
set "FO=2"
set "DUR=10"
set "OUT=out.mp4"
Vertical field of view, this is for 16:9 aspect ratio
Square size of the output video
    font
    : font size
    text color
background color
text file
X text position, for centered text: (w-tw)/2
Y text position, for centered text: (h-th)/2
start time for text
end time for text
: fade-in duration (may be small, but not zero)
fade-out duration (may be small, but not zero)
duration of video
Output video
ffmpeg -f lavfi -i color=%BACK%:size=hd1080 -vf drawtext='fontfile=%FONT%:textfile=%TEXT%:fontcolor_expr=%COLOR%@%%
{e\:clip ( (t-%S%)/%FI%*between (t,%S%,%S%+%FI%) + (%E%-t)/%FO%*between (t,%S%+%FI%,%E
%) ,0,1)}:fontsize=%FSIZE%:x=%POS X%:y=%POS Y%',v360=input=flat:ih fov=%H%:iv fov=%V
%:output=fisheye:h_fov=180:v_fov=180:pitch='90-%UP%':w=%SIZE%:h=%SIZE% -t %DUR% -y %OUT%
```

pause

### 2.51 Write text on a transparent layer

In this example text is written on a transparent background (black@0). This video is scaled to the same size as the input video with the "scale2ref" filter. Finally the text video is overlaid over the main video.
The advantage of this method is that you can modify the geometry of the text before overlaying it. For example you can use the "displace", "perspective", "remap", "rotate" or "v360" filters for modifying the geometry.

```
set "IN=R0010008_er.mp4" :: Input video
set "OUT=out.mp4"" :: Output video with overlaid test
ffmpeg -i %IN% -f lavfi -i color=black@0,format=rgba -lavfi [1][0]scale2ref[a][b],
[a]drawtext="fontsize=80 : text='TEST':box=1 :boxcolor=red:boxborderw=10:fontcolor=yellow:x=(w-text_w)/2 :y=(h-
text_h)/2"[c];[b][c]overlay -t 5 -y %OUT%
pause
```

Note: It is required to add "format=rgba" after the "color" video source. Otherwise the format negotiation could fail and agree on a yuv420 format (which doesn't have a transparency layer).

## How the "scale2ref" filter works:

This filter has two inputs and two outputs. The first input is the video that shall be scaled, and the second input is the reference video from which the size is used. The first output is the scaled video, and the second output is a copy of the second input. The filter has many options but none of them are required for the basic function, as in this example.

In this example the white square has a dynamically changing size, and "scale2ref" is used to scale the red input to the same size:

```
ffmpeg -f lavfi -i color=black:size=400x400 ^
-f lavfi -i color=white:size=100x100 ^
-f lavfi -i color=red ^
```

```
[0][w]overlay -t 4 -y gif.mp4
```

pause

It's unclear why the "null" filter is required in this example. If the "null" filter is omitted, then it seems there a one frame delay so that the red square is one pixel too small, which is visible as a white border. See also https://trac.ffmpeg.org/ticket/9680

The concat demuxer combines several videos without re-encoding. It's very fast.

```
rem Final cut with concat demuxer
ffmpeg -f concat -i concat_list.txt -c copy -y MyVideo.mp4
pause
```

You simply write all existing scenes into a text file (here: concat_list.txt), which looks like this:

| file text1.mp4 | $:: 10$ | Title: A year in the woods |
| :--- | :--- | :--- |
| file text2.mp4 | $:: 10$ | When and where |
| file Videos/scene20.mp4 | $:: 12$ | Live video in the wood |
| $\#$ This is a comment | $:: 10$ | In 15 months... |
| file text22.mp4 | $:: 52$ Live video, camera |  |
| file Videos/scene22.mp4 | $:: 10$ | the end |
| file text98.mp4 |  |  |

To the right of the double colons are optional comments (e.g. the length of the scenes and a short description). Comments can also begin with \#.
This method, however, requires that all scenes have

- the same size (width and height)
- the same pixel format
- the same video codec
- the same framerate
- the same audio codec
- the same number of audio tracks (take care when you use a camera which writes only a mono soundtrack)
- the same audio sample rate

If one of these conditions isn't met, an error message is issued. You can then look at the properties of the files with FFprobe or Exiftool to find out where the files differ.

How to create a concat_list file which contains all *.mp4 files from a folder:

```
if exist concat_list.txt del concat_list.txt
(for %%G in (*.mp4) do @echo file '%%G') >> concat_list.txt
```

pause

See also here: https://trac.ffmpeg.org/wiki/Concatenate

In this example the concat filter is used for input videos of the same size and no audio.
Each of the -ss and -t specifies the start time and length of the next input file. You can remove these options if you want to use the full videos.
The value $n=3$ passed to the concat filter should match the number of input files.
This filter does re-encode the videos, so the process is slow but you can also specify the encoding quality.

```
set "I1=my_video1.mp4" :: Input video 1
set "S1=0"- :: Set start time 1
set "L1=4" :: Set length 1
set "I2=my_video2.mp4" :: Input video 2
set "S2=3"- :: Set start time 2
set "L2=3" :: Set length 2
set "I3=my video3.mp4" :: Input video 3
set "S3=6"- :: Set start time 3
set "L3=2" :: Set length 3
set "OUT=out.mp4" :: Output video
ffmpeg -ss %S1%-t %L1% -i %I1% -ss %S2%-t %L2% -i %I2% -ss %S3% -t %L3% -i %I3% -lavfi "concat=n=3:v=1:a=0" -an %OUT%
pause
```

See also here: https://trac.ffmpeg.org/wiki/Concatenate
The opposite of the "concat" filter is the "segment" filter, which splits a video into several streams.

### 2.54 The "fps" filter

This filter is described in detail on Jim DeLaHunt's website: http://blog.jdih.com/en/2020/04/30/ffmpeg-fps-documented/

### 2.55 Split a video in multiple segments

A video can be split in multiple segments with the segment muxer. All segments will have the same length, except the last one.

| set "IN=my_video.mov" | $::$ Input video |
| :--- | :--- |
| set "L=10" | $::$ Segment length in seconds |
| seu "OUT=out\%\%2d.mov" | $:$ Output filename |
| ffmpeg -i \%IN\% -f segment |  |
| pause segment_time $\% L \%-c$ copy \%OUT\% |  |

This batch fill extracts a segment with known start and end frame numbers:

```
set "start=100" :: First frame number
set "end=200" :: Last frame number
set /a startms=%start%*1001/30
set /a endms=(%end%+1)*1001/30
    : This calculation is for framerate 30000/1001 = 29.97
    Note that in the batch file only integer arithmetic is possible!
    : It's important to do first the multiplication and then the division
ffmpeg -i in.mp4 -ss %startms%ms -to %endms%ms -c copy -y out.mp4
pause
```

Note: The above command line with "-c copy" works only for intraframe codecs, meaning that all frames are l-frames. For interframe codecs you must remove "-c copy", but then then the video will be re-encoded and the process is much slower.

### 2.56 Switch between two cameras, using audio from camera1

```
rem Create a 6 seconds red video with 400Hz tone
ffmpeg -f lavfi -i color=c=red:s=vga -f lavfi -i sine=frequency=400 -t 6 -y video1.mp4
rem Create a 6 seconds test video with 1200Hz tone
ffmpeg -f lavfi -i testsrc2=s=vga -f lavfi -i sine=frequency=1200 -t 6 -y video2.mp4
rem Switch to video2 from 2 to 4 seconds, but use always the audio from video1
ffmpeg -i video1.mp4 -i video2.mp4 -filter_complex blend=all_expr='if(between(T,2,4) ,B,A)' -y test.mp4
pause
```

Note: In this example both videos start at the same time. The video2 segment from 2 to $\mathbf{4}$ seconds is inserted in the output video from 2 to 4 seconds. You get this output video:

|  | $0<\mathrm{t}<2$ | $2<\mathrm{t}<4$ | $4<\mathrm{t}<6$ |
| :--- | :--- | :--- | :--- |
| Video | from video1 (0...2) | from video2 (2...4) | from video1 (4...6) |
| Audio | from video1 (0...2) | from video1 (2...4) | from video1 (4...6) |

If you want to insert the video2 segment from $\mathbf{0}$ to $\mathbf{2}$ seconds in the output video from $\mathbf{2}$ to $\mathbf{4}$ seconds, use this command line instead:

```
ffmpeg -i video1.mp4 -i video2.mp4 -filter_complex [1]tpad=start_duration=2[2];[0][2]blend=all_expr='if(between
(T, 2,4) , B, A)' - y test.mp4
pause
```

In this case you get this output video:

|  | $0<\mathrm{t}<2$ | $2<\mathrm{t}<4$ | $4<\mathrm{t}<\mathbf{6}$ |
| :--- | :--- | :--- | :--- |
| Video | from video1 (0...2) | from video2 (0...2) | from video1 (4...6) |
| Audio | from video1 (0...2) | from video1 (2...4) | from video1 (4...6) |

```
set "IN1=left.mp4"
set "IN2=right.mp4"
set "OUT=out.mp4"
rem use "hstack" for horizontal stacking and "vstack" for vertical stacking
ffmpeg -i %IN1% -i %IN2% -filter_complex hstack -an -shortest -c:v mpeg4 -y %OUT%
pause
```

Note: If the videos have different width or height, use the "xstack" filter instead.

### 2.58 Horizontal and vertical flipping

This can be done with the "hflip" and "vflip" filters.

```
set "IN1=topleft.mp4"
set "IN2=topright.mp4"
set "IN3=bottomleft.mp4"
set "IN4=bottomright.mp4"
set "OUT=mosaic.mp4"
ffmpeg -i %IN1% -i %IN2% -i %IN3% -i %IN4% -filter_complex [0:v][1:v]hstack[t];[2:v][3:v]hstack[b];[t][b]vstack -an
-shortest -c:v mpeg4 -q:v 1 -y %OUT%
pause
```

Other method using xstack:

```
set "IN1=topleft.mp4"
set "IN2=topright.mp4"
set "IN3=bottomleft.mp4"
set "IN4=bottomright.mp4"
set "OUT=mosaic.mp4"
ffmpeg -i %IN1% -i %IN2% -i %IN3% -i %IN4% -filter_complex "xstack=inputs=4:layout=0_0|0_h0|w0_0|w0_h0" -shortest %OUT%
pause
```

Display 4 inputs into a vertical $1 \times 4$ grid, note that the input videos may have different widths (vstack can't handle this case).

```
ffmpeg -i %IN1% -i %IN2% -i %IN3% -i %IN4% -filter_complex "xstack=inputs=4:layout=0_0|0_h0|0_h0+h1|0_h0+h1+h2" %OUT%
pause
```

This is an example of a blink comparator. It creates an animated GIF that continuously toggles between two (or more) images.

```
rem Blink comparator, animated GIF
set "IN=pluto_%%1d.jpg" :: Filename of the images
set "FR=2.0" :: Frame rate
set "OUT=out.gif" :: Animated GIF output file
ffmpeg -framerate %FR% -i %IN% -q:v 1 -y %OUT%
pause
```

Please note that there is a known problem with FFmpeg's GIF encoder which may result in wrong colors in the output file. See the next chapter for a workaround.

If you want to create an MP4 instead, then you have to specify how long it should be and the input and output framerates:

```
rem Blink comparator, MP4
set "IN=pluto_%%1d.jpg" :: Filename of the images
set "FI=2.0" :: Framerate for reading in the pictures
set "T=10" :: Lenght in seconds
set "FO=25" :: Output framerate
set "OUT=out.mp4" :: Output MP4 file
ffmpeg -loop 1 -framerate %FI% -i %IN% -t %T% -r %FO% -q:v 1 -y %OUT%
pause
```

The parameter "-loop 1" causes the same images to be read in again and again. If you do this, you have to limit the length of the video somehow, in this case with "-t 10".

This is an example for toggling between two images or two video streams:

```
ffmpeg -f lavfi -i color=yellow -vf drawtext='text=1:fontcolor=red:fontsize=100:x=140:y=80' -frames 1 -y 1.png
ffmpeg -f lavfi -i color=yellow -vf drawtext='text=2:fontcolor=red:fontsize=100:x=140:y=80' -frames 1 -y 2.png
ffmpeg -loop 1 -i 1.png -loop 1 -i 2.png -lavfi blend=all_expr='if(lt(mod(T,2),1),A,B)' -t 10 -y out.mp4
pause
```

Note: "blend" is slow.

It's also possible to toggle between two images or video streams with "sendemd" and "streamselect", but it's quite complicated to escape the commas:

```
ffmpeg -f lavfi -i color=yellow -vf drawtext='text=1:fontcolor=red:fontsize=100:x=140:y=80' -frames 1 -y 1.png
ffmpeg -f lavfi -i color=yellow -vf drawtext='text=2:fontcolor=red:fontsize=100:x=140:y=80' -frames 1 -y 2.png
ffmpeg -loop 1 -i 1.png -loop 1 -i 2.png
-lavfi "sendcmd=c='0 [expr] streamselect map '\''gte(mod(T\,2)\,1)'\''',streamselect=map=0" -t 10 -y out.mp4
pause
```

Note: I have inserted a line feed in the command line only for clarity. Of course it must all be written in one line.

There is a known problem with FFmpeg's GIF encoder which may result in wrong colors in the animated GIF output file. If you encounter this problem, you can use the following workaround which uses the palettegen and paletteuse filters. Thanks to Javier Infante Porro for posting this workaround in the FFmpeg user mailing list on September 26, 2019.

```
set "IN=in.gif" :: Input video (animated GIF)
set "COL=8" :: Number of colors (including one transparent color)
set "OUT=out.gif" :: Output video (animated GIF)
ffmpeg -i %IN% -lavfi "split[s0][s1];[s0]palettegen=max_colors=%COL%[p];[s1][p]paletteuse" -y %OUT%
pause
```

Please note that one entry in the palette is reserved for the transparent color by default. So when you set the max_colors parameter to 8 , you have only 7 different visible colors. If you don't want a transparent color, you must disable it with the reserve_transparent=0 option.

Much more about this subject can be found here:
http://blog.pkh.me/p/21-high-quality-gif-with-ffmpeg.html

For animated PNG (APNG) see: https://stackoverflow.com/questions/43795518/using-ffmpeg-to-create-looping-apng

```
set "BACK=background.MOV"
    Background video
set "OVL=thumbsUp.gif"
Overlay video
set "OUT=out.mp4"
Output video
set "X=200"
X position of overlay
set "Y=400"
Y position of overlay
set "Y=400" 
set "T=10" :: Maximum length in seconds
ffmpeg -i %BACK% -ignore_loop 0 -i %OVL% -lavfi [1]scale=iw*%S%:ih*%S%[a];[0][a]overlay=x=%X%:y=%Y% -t %T% -y %OUT%
pause
```

Note: Use "-ignore_loop 0" if you want to loop the GIF, or remove this option if you want to play the GIF only one time.

### 2.63 Changing the size of an animated GIF

```
set "IN=thumbsUp.gif" :: Input file
set "S=0.5" :: Size factor
set "OUT=out.gif" :: Output file
ffmpeg -i %IN% -lavfi scale=iw*%S%:-1,split[a][b];[a]palettegen=reserve_transparent=on:transparency_color=ffffff[p];[b]
[p]paletteuse -y %OUT%
pause
```

The trick with palettegen and paletteuse is required to keep the transparency color.

This example shows how to replace a single image in a video with another image.
You may have heard of a trick to insert a product image into a film for advertising purposes, only for the duration of a singe frame. For example, if the frame rate is 25 frames per second, then a single frame will be shown for 40 ms . That's too short to recognize the product clearly, but it's long enough to make viewers feel that they want this product. If, for example, a bratwurst or popcorn is shown for 40 ms in the film, the sales figures for exactly these products increase after the end of the film. Although the viewer is not aware of why he has now gotten an appetite for a bratwurst or popcorn.

```
set "IN=scene8.mp4"
set "BW=bratwurst.jpg"
set "W=1920"
set "H=1080"
set "T=3.0"
set "T=3.0" 
:: Input video
    :: Image of bratwurst
    Width of input video
    :: Height of input video
ffmpeg -i %IN% -i %BW% -lavfi "[1]scale=w=%W%:h=%H%,setpts=%T%/TB[im];[0][im]overlay=eof action=pass" -c:a copy -q:v 0
%OUT%
```

pause

The "scale" filter scales the image to the same size as the input video. If the image already has the correct size, you can omit this filter. The "setpts" filter sets the time for the image. The "overlay" filter then combines the two sources. The audio track is taken unchanged from the input video.

The same thing can also be done with the freezeframes filter:

```
set "IN=scene8.mp4" :: Input video
set "IN2=test.mp4" :: Second input which contains the replacement frame
set "F=75" :: Number of the frame to be replaced
set "R=1" :: Number of the replacement frame from the second input
ffmpeg -i %IN% -i %IN2% -lavfi freezeframes=first=%F%:last=%F%:replace=%R% out.mp4
pause
```

Unfortunately the FFmpeg documentation doesn't explain what all the modes do. So you have to look it up in the source code (the filename is "blend_modes.c") or in the wiki page. The default mode is "normal".

| Mode | Function | Notes |
| :---: | :---: | :---: |
| normal | A* opacity + B * (1-opacity) | Output is a mix of $A$ and $B$, the default opacity is 1 |
| addition | A + B | Output is ( $A+B$ ) with an upper limit at white level |
| average | $(A+B) / 2$ | Output is the arithmetic mean of $A$ and $B$ |
| subtract | A-B | Output is (A-B) with a lower limit at black level |
| multiply | A*B | Output is the product of $A$ by $B$. Both inputs are normalized to the [0..1] range before multiplication. |
| difference | abs(A-B) | Output is the absolute difference of $A$ and $B$ |
| grainextract | 50\%_gray_level + A - B | Output is (A-B), shifted to 50\% gray level, with limits at black and white levels |
| darken | $\min (A, B)$ | Output is the minimum of $A$ and $B$ |
| lighten | $\max (A, B)$ | Output is the maximum of $A$ and $B$ |
| and | A \& B | Output is bitwise AND of $A$ and $B$ |
| or | A\|B | Output is bitwise OR of $A$ and $B$ |
| xor | $A^{\wedge} B$ | Output is bitwise XOR of A and B |
| screen | 1-(1-A) * (1-B) | Output is inverse of product of inverted $A$ by inverted $B$. Might be usable for clips which have no alpha channel, black becomes transparent? |

This table contains only a subset of the modes. There are more of them.
For a comparison of all blend modes, see also: https://trac.ffmpeg.org/wiki/Blend

Note: When using one of the preset modes of the blend filter, don't forget to write "all_mode", as it's not the default!
Note: The "opacity" options aren't used if a user-defined expression is used. They are only used used if one of the "mode" options is used. The default is "all_opacity=1", which means the full blend effect is applied. A smaller opacity value means the output is mixed with the first input stream.
"all_opacity=0" means the effect is disabled and the first input stream is returned. But there is one exception from this rule: If the mode is "normal", then "all_opacity=1" returns the first stream and "all_opacity=0" returns the second stream.

This batch file can be used for showing the different modes of the blend filter:

```
ffmpeg -f lavfi -i color=s=256x256,geq=r='H-1-Y':g='H-1-Y':b='H-1-Y' -frames 1 -y test.png
ffmpeg -i test.png -vf "split[a][b];[b]transpose[b];[a][b]blend=all_mode=harmonic,pseudocolor=preset=turbo" -y
harmonic.png
pause
```

See also: http://oioiiooixiii.blogspot.com/2017/01/ffmpeg-generate-image-of-tiled-results.html

Calculate the difference between two images. If the images are identical, the output is $\mathbf{5 0 \%}$ gray:

```
ffmpeg -i image1.png -i image2.png -lavfi blend=all_mode=grainextract -y diff.png
```

pause

## Apply a 5 second sine-shaped crossfade to two videos:

```
ffmpeg -f lavfi -i color=red -f lavfi -i color=yellow -lavfi blend=all_expr='A*(0.5+0.5*sin(T*2*PI/5))+B*(0.5-
0.5*sin(T*2*PI/5))' -t 30 -y out.mp4
pause
```

This batch file simulates the view through an eyepiece of a telescope. The outside of the circular field of view is black.

```
set "IN=P1000715.mov" :: Input video
set "SIZE=3840x2160" :: Video size
set "D=0.7" :: Circle diameter relative to image height
set "OUT=out.mp4" :: Output video
ffmpeg -f lavfi -i color=black:s=%SIZE% -lavfi format=argb,geq=a='255*gt(hypot(((2*X-W)/H),(2*Y/H)-1),%D%)':r=0:g=0:b=0
-frames 1 -y mask.png
ffmpeg -i %IN% -i mask.png -lavfi overlay=format=yuv422p10 -y %OUT%
pause
```

Note: format=yuv422p10 is only required for 10-bit videos. The default output format of the overlay filter is yuv420.

This batch file simulates the view through an eyepiece with an unsharp edge:

```
set "IN=P1000715.mov" :: Input video
set "SIZE=3840x2160" :: Video size
set "D=0.95"
set "T=0.1" 
Circle diameter, relative to image height
set "OUT=out.mp4" :: Output video
ffmpeg -f lavfi -i color=black:s=%SIZE% -lavfi format=argb,geq=a='clip(128+128/%T%*(hypot(((2*X-W)/H),(2*Y/H) -1) -%D
%) ,0,255)':r=0 -frames 1 -y mask.png
ffmpeg -i %IN% -i mask.png -lavfi overlay=format=yuv422p10 -y %OUT%
```

pause

## How is the circle with the unsharp edge made?

```
hypot(X-x0,Y-y0)
```

This is the distance from the center $\mathrm{x} 0, \mathrm{y} 0$ of the circle.

| gt(hypot(X-x0,Y-y0),radius) | If you compare with a radius (in pixels), then you get a circle with a sharp edge. This function is 0 <br> inside and 1 outside of the circle. Multiply by 255 and you are done. <br> However if you want a smooth edge, you must get rid of the gt() function. |
| :--- | :--- |
| hypot(X-x0,Y-y0)-radius | This is the distance of a point from the edge of the circle. This function is negative inside the <br> circle, it's 0 at the edge and it's positive outside of the circle. |
| 256/width*(hypot(X-x0,Y-y0)-radius) | Multiply by a factor 256 and divide by the width of the transition band (in pixels). |
| $128+256 /$ width*(hypot(X-x0,Y-y0)-radius) | Add 128 (for middle gray). This means at the exact radius you have middle gray. <br> If you don't add 128, then you have black at the exact radius, and the transition is fully outside of <br> the circle. If you add 255, then you have white at the exact radius, and the transition is fully inside <br> of the circle. |
| clip(128+256/width*(hypot(X-x0,Y-y0)-radius),0,255) | Finally you must clip to the $0 \ldots 255$ range (black to white). The result is a circular mask with a <br> smooth edge. |

This batch file simulates the view through a binocular:

```
set "IN=P1000715.mov" :: Input video
set "SIZE=3840x2160" :: Video size
set "D=0.8" :: Circle diameter, relative to image height
set "P=0.5" :: Pupil distance, relative to image height
set "T=0.05" :: Width of smooth transition region, relative to image height
set "OUT=out.mp4" :: Output video
```

```
1) -%D%),(hypot (((2*X-W+%P%*H)/H),(2*Y/H)-1)-%D%)),0,255)':r=0 -frames 1 -y mask.png
ffmpeg -i %IN% -i mask.png -lavfi overlay=format=yuv422p10 -y %OUT%
pause
```

Note: format=yuv422p10 is only required for 10-bit videos. The default output format of the overlay filter is yuv420.
This is an output image:

Vignetting at the edge of the image can be compensated with the "vignette" filter. "mode=backward" makes the corners brighter and "mode=forward" makes them darker. The value must be set so that the corners are neither too bright nor too dark.

## Example:

ffmpeg -i imput.png -vf vignette=a=0.5:mode=backward -y out.png
pause

Note: The "a" value is clipped to the [0...pi/2] range.

### 2.69

## Subtracting a darkframe

Noise, hot pixels and amplifier glow in a low-light video can be reduced by subtracting a darkframe. Make a dark video with the same settings and at the same temperature as your main video. The only difference is that you put the cap on the lens. Then you can average many (up to 1024) frames from the dark video and save the darkframe lossless as 16-bit PNG:

```
set "DARKVID=Dark.mov" :: Dark video
ffmpeg -i %DARKVID% -vf "tmix=128,format=rgb48" -frames 1 -y dark.png
pause
```

Now you can subtract this darkframe from all frames of your video:

```
set "IN=meteor.mov" :: Input video
set "OUT=meteor-dark.mp4" :: Output video
ffmpeg -i %IN% -i dark.png -filter_complex "format=rgb48[a];[a][1]blend=all_mode=subtract" -y %OUT%
pause
```

### 2.70 Histogram

This batch file generates a histogram for the $R, G, B$ components from a video:

```
set "IN=MVI_2562.mov" :: Input video
ffmpeg -i %IN% -vf format=pix_fmts=rgb24,histogram=levels_mode=logarithmic -y out.mp4
pause
```

### 2.71 Lagfun filter

The lagfun filter makes short pulses of light appear longer, with an exponential decay curve. Good for meteors in the night sky. It works as follows:

The previous output frame is multiplied by the decay constant, which is in the range [0... 1] and a typical value is 0.95 . This image is used as the next output frame. But if a pixel in the next input frame is brighter, then the brighter value is used. So all pixels have a fast rise time constant and a slow decay time constant. Like an oscilloscope screen with a long persistance time.

Time_constant_in_seconds = 1 / ((1-decay) * framerate)
The time constant is the duration during which a signal drops from level 1.0 to 1 / $\mathrm{e} \approx 0.368$

```
rem Example for lagfun, left side of output video is without lagfun and right side is with lagfun
set "SN=1400" :: Start number
set "CONTRAST=2.0" :: Contrast im range [-1000 ... 1000], normal is 1.0
set "BRIGHT=0.22" :: Brightness in range [-1.0 ... 1.0], normal is 0.0
set "GAMMA=2.5" :: Gamma in range [0.1 ... 10.0], normal is 1.0
set "DEF=10" :: Deflicker frames
set "DECAY=0.95" :: Decay factor
set "QU=3"
set "FPS=30"
MP4 quality level, 1 is best quality, 3 is normal, 31 is strong compression
Output framerate
set "OUT=meteors.mp4" :: Output filename
ffmpeg -start number %SN% -i IMG %%4d.jpg ^
-filter_compl\overline{ex "eq=contrast=%CONTRAST%:brightness=%BRIGHT%:gamma=%GAMMA%,deflicker=size=%DEF%,split[a][b];}
[b]lagfun=decay=%DECAY%[c];[a][c]hstack" -r 30-codec:v mpeg4 -q:v %QU% -y %OUT%
pause
```

The lagfun filter has a "planes" option, but this option doesn't work with pixel format RGB24. You must use GBRP pixel format. See also the workaround in the next chapter.

In this example the lagfun filter is only applied to the green channel:

```
set "IN=input.mov" :: Input video
set "DECAY=0.95" :: Decay factor
set "OUT=out.mp4" :: Output video
ffmpeg -i \%IN\% -vf "format=gbrp,lagfun=decay=\%DECAY\%:planes=1" -y \%OUT\%
pause
```

| planes $=$ | color |
| :--- | :--- |
| 1 | green |
| 2 | blue |
| 3 | cyan |
| 4 | red |
| 5 | yellow |
| 6 | magenta |
| 7 | white |

This is an example for the deflicker filter:

```
rem Make a flickering video
ffmpeg -f lavfi -i color=gray -vf geq=lum='128+mod(13*N,20):cb=128:cr=128' -t 10 -y flicker.mp4
rem Deflicker the video
ffmpeg -i flicker.mp4 -vf deflicker -y out.mp4
pause
```

Note: A much better deflickered result can be obtained with DaVinci Resolve (ResolveFX Revival --> Deflicker). Surprisingly, the default "Timelapse" mode is better than the "Fluoro Light" mode, although in my example it clearly was flicker from fluorescent lights.

If the video was made with fluorescent light and rolling shutter, the deflickered video won't be acceptable because flicker isn't uniform over the whole frame. In this case it helps to split the video into many horizontal stripes, deflicker all of them separately, and then stitch the deflickered stripes together. This is an example for input size $1280 \times 720$ :

```
set "S=10" :: number of frames for deflicker filter
set "T=6" :: duration
rem This is the simple version without stripes:
ffmpeg -i in.mp4 -lavfi deflicker=%S% -t %T% -y deflicker1.mp4
rem 2 stripes:
ffmpeg -i in.mp4 -lavfi split=2[a][b];[a]crop=1280:360:0:0,deflicker=%S%[aa];[b]crop=1280:360:0:360,deflicker=%S%[bb];
[aa][bb]vstack=2 -t %T% -y deflicker2.mp4
rem 4 stripes:
ffmpeg -i in.mp4 -lavfi split=4[a][b][c][d];[a]crop=1280:180:0:0,deflicker=%S%[aa];[b]crop=1280:180:0:180,deflicker=%S%
[bb];[c] crop=1280:180:0:360,deflicker=%S%[cc];[d] crop=1280:180:0:540,deflicker=%S%[dd];[aa][bb][cc][dd]vstack=4 -t %T%
-y deflicker4.mp4
rem 8 stripes:
ffmpeg -i in.mp4 -lavfi split=8[a][b][c][d][e][f][g][h];[a]crop=1280:90:0:0,deflicker=%S%[aa];
[b] crop=1280:90:0:90,deflicker=%S%[bb]; [c] crop=1280:90:0:180,deflicker=%S%[cc];[d] crop=1280:90:0:270,deflicker=%S%[dd];
[e] crop=1280:90:0:360,deflicker=%S%[ee];[f] crop=1280:90:0:450,deflicker=%S%[ff];[g] crop=1280:90:0:540,deflicker=%S%[gg];
[h] crop=1280:90:0:630,deflicker=%S%[hh];[aa][bb][cc][dd][ee][ff][gg][hh]vstack=8 -t %T% -y deflicker8.mp4
rem 15 stripes:
ffmpeg -i in.mp4 -lavfi split=15[a][b][c][d][e][f][g][h][i][j][k][l][m][n][0];[a]crop=1280:48:0:0,deflicker=%S%[aa];
[b] crop=1280:48:0:48,deflicker=%S% [bb] ; [c] crop=1280:48:0:96,deflicker=%S%[cc];[d] crop=1280:48:0:144,deflicker=%S%[dd];
[e] crop=1280:48:0:192,deflicker=%S%[ee];[f] crop=1280:48:0:240,deflicker=%S%[ff];[g] crop=1280:48:0:288,deflicker=%S%[gg];

[k] crop=1280:48:0:480,deflicker=%S%[kk] ; [l] crop=1280:48:0:528,deflicker=%S%[11]; [m] crop=1280:48:0:576,deflicker=%S%[mm];
[n] crop=1280:48:0:624,deflicker=%S%[nn];[o]crop=1280:48:0:672,deflicker=%S%[oo];[aa][bb][cc][dd][ee][ff][gg][hh][ii][jj]
[kk][ll][mm][nn][00]vstack=15 -t %T% -y deflicker15.mp4
rem Compare the simple deflickered video with the 15-stripes version:
ffmpeg -i deflicker1.mp4 -i deflicker15.mp4 -lavfi hstack -y out.mp4
pause
```

Note: Further improvement might be possible if the RGB channels are deflickered separately, because fluorescent light does also have color flicker. Note: Why didn't I use 16 stripes instead of 15 ? Because $720 / 16=45$, that's an invalid odd number for the height of a video stream.

This is an example for splitting the video into 8 horizontal stripes and RBG colors and deflickering all 24 stripes separately. Unfortunately the result isn't better than the previous example.

```
set "S=10" : : number of frames for deflicker filter
set "T=6" :: duration
rem This is the simple version without stripes:
ffmpeg -i in.mp4 -lavfi deflicker=%S% -t %T% -y deflicker1.mp4
rem 8 stripes rgb:
ffmpeg -i in.mp4 -lavfi format=rgb24,extractplanes=r+g+b[r][g][b]
[r]split=8[r1][r2][r3][r4][r5][r6][r7][r8];
[g] split=8 [g1][g2][g3][g4][g5][g6][g7][g8];
[b] split=8 [b1] [b2] [b3] [b4] [b5] [b6] [b7] [b8];
[r1] crop=1280:90:0:0,deflicker=%S%[r1d]; [r2] crop=1280:90:0:90,deflicker=%S% [r2d] ;
[r3] crop=1280:90:0:180,deflicker=%S% [r3d]; [r4] crop=1280:90:0:270, deflicker=%S% [r4d] ;
[r5] crop=1280:90:0:360,deflicker=%S% [r5d] ; [r6] crop=1280:90:0:450, deflicker=%S% [r6d];
[r7] crop=1280:90:0:540,deflicker=%S%[r7d]; [r8] crop=1280:90:0:630,deflicker=%S%[r8d];
[r1d] [r2d][r3d][r4d] [r5d] [r6d][r7d][r8d] vstack=8[rr] ;
[g1] crop=1280:90:0:0,deflicker=%S%[g1d]; [g2] crop=1280:90:0:90,deflicker=%S% [g2d] ;
[g3] crop=1280:90:0:180,deflicker=%S% [g3d]; [g4] crop=1280:90:0:270, deflicker=%S% [g4d] ;
[g5] crop=1280:90:0:360,deflicker=%S%[g5d]; [g6] crop=1280:90:0:450,deflicker=%S%[g6d];
[g7] crop=1280:90:0:540,deflicker=%S%[g7d] ; [g8] crop=1280:90:0:630,deflicker=%S%[g8d] ;
[g1d] [g2d] [g3d] [g4d] [g5d] [g6d] [g7d] [g8d] vstack=8 [gg] ;
[b1] crop=1280:90:0:0,deflicker=%S% [b1d] ; [b2] crop=1280:90:0:90,deflicker=%S%[b2d];
[b3] crop=1280:90:0:180,deflicker=%S%[b3d]; [b4] crop=1280:90:0:270, deflicker=%S% [b4d] ;
[b5] crop=1280:90:0:360,deflicker=%S%[b5d]; [b6] crop=1280:90:0:450, deflicker=%S%[b6d];
[b7] crop=1280:90:0:540,deflicker=%S%[b7d]; [b8] crop=1280:90:0:630,deflicker=%S%[b8d] ;
[b1d] [b2d] [b3d] [b4d] [b5d] [b6d] [b7d] [b8d] vstack=8 [bb] ;
[gg] [bb][rr]mergeplanes=0x001020:gbrp -t %T% -y deflicker8rgb.mp4
```

rem Compare the simple deflickered video with the 8-stripes-rgb version:
ffmpeg -i deflicker1.mp4 -i deflicker8rgb.mp4 -lavfi hstack -y out.mp4
pause

Note: Line feeds were inserted only for clarity. Of course it must all be written in one command line.

The lagfun filter can also be used for making startrail videos:

```
rem Make a small white star
ffmpeg -f lavfi -i color=white:s=2x2 -y -frames 1 star.png
rem Make a 10 seconds video of a moving white star over a black background
ffmpeg -f lavfi -i color=black:s=1920x1080 -loop 1 -i star.png -lavfi overlay=x=10+190*t:y=10+100*t -t 10 -y star.mp4
rem Make a startrail video
ffmpeg -i star.mp4 -vf lagfun=decay=1 -y startrail.mp4
pause
```

Note: The first two command lines in this batch file are only for generating a simulated star in front of a black background. If you have a real input video, you can directly feed it to the third command line.

If you set the decay option to 1 , the trains will remain for intinite time.
If you set the value slightly smaller than 1.0 , for example 0.95 , then the trails will decay.

It's also possible to make star trails of finite length with the tmedian filter:

```
set "R=10" :: Set radius for tmedian filter
rem Make star trails of finite length
ffmpeg -i star.mp4 -vf tmedian=radius=%R%:percentile=1 -y startrail.mp4
pause
```

Note: The number of frames seems to be twice the number that is specified as "radius".

Paul Bourke did make a nice image of bird trails here: http://paulbourke.net/fun/garminfun/birdtrails.jpg
It's also possible to do this with FFmpeg's lagfun filter. Because the filter works only with bright objects in front of a dark background, I'm using here a trick: Negate the input video, apply lagfun with decay=1, then negate again.

```
set "S=5" :: Specify that only each n-th frame is used
rem Make a small black bird
ffmpeg -f lavfi -i color=black:s=6x6 -y -frames 1 bird.png
rem Make a 10 seconds video of a moving black bird over a white background
ffmpeg -f lavfi -i color=white:s=1920x1080 -loop 1 -i bird.png -lavfi overlay=x=10+190*t:y=10+100*t -t 10 -y bird.mp4
rem Make a bird trail video
ffmpeg -i bird.mp4 -vf select='not(mod(n,%S%))',negate,lagfun=decay=1,negate -y birdtrail.mp4
pause
```

Note: The first two command lines in this batch file are only for generating a simulated black bird in front of a white background. If you have a real input video, you can directly feed it to the third command line.

A similar effect can be achieved with the "tmedian" filter, which picks the smallest pixel value out of the last $\mathbf{n}$ frames. In this case the trails have a finite length. Please note that the number seems to be twice the number that you specified.

```
set "S=5"
set "R=10"
:: Specify that only each n-th frame is used
rem Make a bird trail video, with trails of finite length
ffmpeg -i bird.mp4 -vf select='not(mod(n,%S%))',tmedian=radius=%R%:percentile=0 -y birdtrail.mp4
pause
```

This is an example for a bird trails video from a Kodak PIXPRO SP360 4K camera:

```
set "IN=116_0002.mp4" 
set "FOV=235" : : Input field of view in degrees
set "YAW=-25" :: Yaw angle in degrees
set "PITCH=-50" :: Pitch angle in degrees
set "HFOV=60" :: Output horizontal field of viev in degrees
set "VFOV=60"
set "W=800"
set "H=800"
set "CONTR=1.5"
set "BRIGHT=-0.2"
set "S=0"
set "T=32"
set "OUT=birdtrail.mp4"
rem Make a bird trail video
ffmpeg -ss %S% -i %IN% -vf select='not(mod(n,%N%))',v360=input=fisheye:output=rectilinear:ih fov=%FOV%:iv fov=%FOV%:yaw=
%YAW%:pitch=%PITCH%:h_fov=%HFOV%:v_fov=%VFOV%:w=%W%:h=%H%,negate,lagfun=decay=1:planes=1, negate, eq=contrast=%CONTR
%:brightness=%BRIGHT%-t %T% -y %OUT%
pause
```

Note: The planes=1 option for the lagfun filter means that the filter is only applied to the luminance plane. The colors stay as they are.

## This is an image from the output video:

I found the original version of this effect here: http://oioiiooixiii.blogspot.com/2020/07/ffmpeg-improved-rainbow-trail-effect.html This is my version as a Windows batch file:

```
rem Make a }10\mathrm{ seconds test video of a white dot moving over a bluescreen
ffmpeg -f lavfi -i color=blue:s=1920x1080 -f lavfi -i color=white:s=60x60 -lavfi
overlay=x=960+800*sin(t):y=540+300*sin(2*t) -t 10 -y dot.mp4
rem Rainbow-trail effect
set "IN=dot.mp4" :: Input video
set "KEY=0x0000FF" :: Color key, use 0x00FF00 for greenscreen or 0x0000FF for bluescreen
set "D=0.1" :: Delay time per color
set "OUT=out.mp4" :: Output video
set "VIOLET=colorchannelmixer=2:0:0:0:0:0:0:0:2:0:0:0"
set "INDIGO=colorchannelmixer=.5:0:0:0:0:0:0:0:2:0:0:0"
set "BLUE=colorchannelmixer=0:0:0:0:0:0:0:0:2:0:0:0"
set "GREEN=colorchannelmixer=0:0:0:0:2:0:0:0:0:0:0:0"
set "YELLOW=colorchannelmixer=2:0:0:0:2:0:0:0:0:0:0:0"
set "ORANGE=colorchannelmixer=2:0:0:0:.5:0:0:0:0:0:0:0"
set "RED=colorchannelmixer=2:0:0:0:0:0:0:0:0:0:0:0"
ffmpeg -i %IN% -lavfi "split[a][b]; [b]colorkey=%KEY%:0.3:0.1,extractplanes=a,split=7[b1][b2][b3][b4][b5][b6][b7];
[b1] %RED%,setpts=PTS+%D%*7/TB[b1]; [b2] %ORANGE%,setpts=PTS+%D%*6/TB,chromakey=black:0.01:0.1[b2] ; [b1] [b2]overlay[b1];
[b3]%YELLOW%,setpts=PTS+%D%*5/TB , chromakey=black:0.01:0.1 [b3]; [b1] [b3] overlay [b1]; [b4]%GREEN% ,setpts=PTS+%D
```

```
[b5] overlay[b1]; [b6]%INDIGO%,setpts=PTS+%D%*2/TB, chromakey=black:0.01:0.1 [b6]; [b1] [b6]overlay[b1];[b7]%VIOLET
%,setpts=PTS+%D%/TB, chromakey=black:0.01:0.1[b7];[b1][b7]overlay[b1];[a]colorkey=%KEY%:0.4:0.1[a];[b1] [a]overlay" -y
%OUT%
```

pause

### 2.76

## Temporal slice-stacking effect

In this example the video is split into 6 horizontal slices, which are delayed by 0-5 frames. Nice effect for dancing videos.

```
rem Make a 10 seconds video of a white vertical bar
ffmpeg -f lavfi -i color=black:s=1920x1080 -f lavfi -i color=white:s=20x1080 -lavfi overlay=x=960+800*sin(t):y=0 -t 10
-y bar.mp4
ffmpeg -i bar.mp4 -vf "split=6[a0][a1][a2][a3][a4][a5];[a0]crop=h=ih/6:y=0[b0];[a1]setpts=PTS+1/
(FR*TB) , crop=h=ih/6:y=ih/6[b1]; [a2]setpts=PTS+2/(FR*TB) ,crop=h=ih/6:y=2*ih/6[b2]; [a3]setpts=PTS+3/
(FR*TB) , crop=h=ih/6:y=3*ih/6[b3]; [a4] setpts=PTS+4/(FR*TB) ,crop=h=ih/6:y=4*ih/6[b4]; [a5]setpts=PTS+5/
(FR*TB),crop=h=ih/6:y=5*ih/6[b5]; [b0][b1][b2][b3][b4][b5]vstack=6" -y out.mp4
pause
```

For a different approach see also http://oioiiooixiii.blogspot.com/2017/11/ffmpeg-temporal-slice-stacking-effect.html
The same can also be done with the tpad filter instead of setpts:

```
ffmpeg -i bar.mp4 -vf "split=6[a0][a1][a2][a3][a4][a5];[a0]crop=h=ih/6:y=0[b0];[a1]tpad=1,crop=h=ih/6:y=ih/6[b1];
[a2] tpad=2 , crop=h=ih/6:y=2*ih/6[b2];[a3]tpad=3,crop=h=ih/6:y=3*ih/6[b3];[a4]tpad=4,crop=h=ih/6:y=4*ih/6[b4];
[a5]tpad=5,crop=h=ih/6:y=5*ih/6[b5];[b0][b1][b2][b3][b4][b5]vstack=6" -y out.mp4
pause
```

The main idea in the above script is to combine the video with one or more delayed versions of itself:

```
ffmpeg -i test.mp4 -vf "split[a][b];[b]setpts=PTS+5/(FR*TB)[c];[a][c]vstack" -y out.mp4
pause
```

Or with tpad filter:

```
ffmpeg -i test.mp4 -vf "split[a][b];[b]tpad=start=5:start_mode=clone[c];[a][c]vstack" -y out.mp4
pause
```

The two above examples consume less memory if the split filter is omitted, and instead the same input video is loaded twice:

```
ffmpeg -i test.mp4 -i test.mp4 -vf "[0]setpts=PTS+5/(FR*TB)[a];[a][1]vstack" -y out.mp4
pause
```

### 2.77 Extract and merge planes, split planes

Extract RGB channels, apply a filter to the G channel, then merge all channels to the output video:

```
set "IN=input.mov" :: Input video
set "DECAY=0.95" :: Decay factor
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -lavfi "format=rgb24,extractplanes=r+g+b[r][g][b];[g]lagfun=decay=%DECAY%[gg];[gg][b]
[r]mergeplanes=0x001020:gbrp" -y %OUT%
pause
```

```
Use different delay for RGB planes:
```

```
set "IN=test.mp4" :: Input video
```

set "IN=test.mp4" :: Input video
set "DELAY_R=2" :: Number of delayed frames for red
set "DELAY_R=2" :: Number of delayed frames for red
set "DELAY_G=1" :: Number of delayed frames for green
set "DELAY_G=1" :: Number of delayed frames for green
set "OUT=out.mp4" :: Output video
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -lavfi "format=rgb24,extractplanes=r+g+b[r][g][b];[r]tpad=%DELAY_R%[rr];[g]tpad=%DELAY_G%[gg];[gg][b]
[rr]mergeplanes=0x001020:gbrp" -y %OUT%
pause

```
```

rem Make a short test video with alpha channel

```

```

prores_ks -y test.mov
rem Extract the RGB channels
ffmpeg -i test.mov -pix_fmt rgb48le -y rgb.mov
rem Extract the alpha channel
ffmpeg -i test.mov -lavfi extractplanes=a -y alpha.mov
pause

```

Note: alpha=0 means transparent, alpha=255 means opaque

\section*{Colorkey}

This filter works in RGB colorspace. The color is defined as a RGB color and a similarity value.
Example for "colorkey" filter:
```

ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip (X,0,255)+gte(X,512)*clip(1024-
X,0,255)) ;if(lt(Y,256),255+Y*(ld(0)/255-1), (511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -f lavfi -i color=lightblue:size=384x128 -lavfi [0]colorkey=color=orange:similarity=0.1[a];[1]
[a]overlay -frames 1 -y out.png
pause

```

These are the input and output images:

\section*{Chromakey}

This filter works in YUV colorspace. The color is defined alternativley as a RGB or YUV color and a similarity value.
Example for "chromakey" filter:
```

ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip (X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255)) ;if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -f lavfi -i color=lightblue:size=384x128 -lavfi [0]chromakey=color=orange:similarity=0.1[a];[1]
[a]overlay -frames 1 -y out.png
pause

```

These are the input and output images:

\subsection*{2.81 HSVkey}

In this filter the color is defined as a HSV color (Hue-Saturation-Value) and a similarity value.
Example for "hsvkey" filter:
```

ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip (X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip (X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1) ,(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte(X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -f lavfi -i color=lightblue:size=384x128 -lavfi
[0]hsvkey=hue=45:sat=0.7:val=0.5:similarity=0.2[a];[1][a]overlay -frames 1 -y out.png

```
pause

These are the input and output images:

\section*{Lumakey}

In this filter the color is defined by a luminance value (threshold) and a tolerance value. The edges can be softened by a "softness" parameter. Example for "lumakey" filter:
```

ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip(512-X,0,255)+clip(X-
1024,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip (X,0,255)+gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255)) ;if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)',scale=iw/4:ih/4 -frames
1 -y spectrum.png
ffmpeg -i spectrum.png -f lavfi -i color=yellow:size=384x128 -lavfi
[0]lumakey=threshold=0.5:tolerance=0.02:softness=0.05[a];[1][a]overlay -frames 1 -y out.png
pause

```

These are the input and output images:

```

set "BG=background.mov" :: Background video
set "S1=10"
set "BGSAT=1.4"
set "BLUE=blue.mov"
set "S2=13"
set "CW=800"
set "CH=1080"
set "CX=500"
set "CY=0"
set "COLOR=0x223395"
set "SIM=0.11"
set "SC=0.35"
set "X=800"
set "Y=310"
set "T=28"
set "OUT=out.mp4"
rem Extract an image from the bluescreen video, for measuring the average bluescreen color
ffmpeg -ss 5 -i %BLUE% -vf crop=%CW%:%CH%:%CX%:%CY% -frames 1 -y image.png
ffmpeg -ss %S1%-i %BG% -ss %S2% -i %BLUE% -filter_complex "[0]eq=saturation=%BGSAT%[BG];[1]crop=%CW%:%CH%:%CX%:%CY
%, chromakey =%COLOR%:%SIM%,scale=iw*%SC%:ih*%SC%[FG];[BG][FG]overlay=%X%:%Y%" -t %T% -y %OUT%
pause

```

Note: For measuring the average color of the bluescreen, you can extract an image and save is as PNG. Open this image with Fitswork, draw a rectangle and then make a right click in the rectangle and choose "Statistik für den Bereich anzeigen".

Note: The normalization of chromakey's "similarity" value was changed in May 2020. Old values must now be divided by sqrt(2) to get the same result as before.

Note: It's much easier to make the greenscreen and despill process in DaVinci Recolve.
Note: There is also a "colorkey" filter which is similar to the "chromakey" filter, but works in RBG (Red-Green-Blue) range.
Note: There is also a "hsvkey" filter which is similar to the "chromakey" filter, but works in HSV (Hue-Saturation-Value) range.

I did try to insert an "eq=gamma=1.4" filter after the scale filter, but that didn't work. It seems that the eq filter destroys the alpha channel. This workaround works with "alphaextract" and "alphamerge" filters. This workaround is no longer required because the "eq" filter was changed in October 2021 and does now support streams with alpha channel (the alpha channel remains unchanged):
ffmpeg -ss \%S1\% -i \%BG\% -ss \%S2\% -i \%BLUE\% -filter_complex "[0]eq=saturation=\%BGSAT\%[BG];[1]crop=\%CW\%:\%CH\%:\%CX\%:\%CY \(\%\), chromakey \(=\%\) COLOR \(\%: \% S I M \%\), SCale \(=i w * \% S C \%: i h * \% S C \%\), format=rgba, split [FG1][FG2]; [FG1]alphaextract
[A] ; [FG2] eq=gamma=1.4[FG3]; [FG3][A]alphamerge[FG4]; [BG][FG4]overlay=\%X\%: \%Y\%" -t \%T\% -y \%OUT\%
pause
Note: When the person in the bluescreen video makes fast movements, it's best to use short exposure times. Otherwise the fast moving object gets smeared with the blue background, and in extreme cases might become so blue that it's detected as background.

Note about "alphamerge" filter: If the input video has no alpha channel, then an alpha channel is added, using the greyscale data from the second input. If the input video has an alpha channel, then the alpha channel is replaced by the greyscale data from the second input.

See also: despill filter, colorkey filter, hsvkey filter

The documentation for the "despill" filter is rather incomplete:
\begin{tabular}{|ll}
\hline This filter accepts the following options: \\
'type' & Set what type of despill to use. \\
'mix' & Set how spillmap will be generated. \\
'expand' & Set how much to get rid of still remaining spill. \\
'red' & Controls amount of red in spill area. \\
'green' & Controls amount of green in spill area. Should be -1 for greenscreen. \\
'blue' & Controls amount of blue in spill area. Should be - 1 for bluescreen. \\
'brightness' & Controls brightness of spill area, preserving colors. \\
'alpha' & Modify alpha from generated spillmap.
\end{tabular}

Some more informations are available through the command ffmpeg -h filter=despill
\begin{tabular}{|c|c|c|}
\hline type & <int> & FV...... set the screen type (from 0 to 1) (default green) \\
\hline green & 0 & ..FV...... greenscreen \\
\hline blue & 1 & . .FV. . . . . bluescreen \\
\hline mix & <float> & ..FV..... set the spillmap mix (from 0 to 1) (default 0.5) \\
\hline expand & <float> & FV..... set the spillmap expand (from 0 to 1) (default 0) \\
\hline red & <float> & .FV..... set red scale (from -100 to 100) (default 0) \\
\hline green & <float> & FV..... set green scale (from -100 to 100) (default -1) \\
\hline blue & <float> & . FV...... set blue scale (from 100 to 100) (default 0) \\
\hline
\end{tabular}

This is the same bluescreen example as before, with additional despill filter:
```

set "BG=background.mov" :: Background video
set "S1=10"
: Start time for background video

rem Extract an image from the bluescreen video, for measuring the average bluescreen color
rem ffmpeg -ss 10-i %BLUE% -vf crop=%CW%:%CH%:%CX%:%CY% -frames 1 -y image.png
ffmpeg -ss %S1% -i %BG% -ss %S2% -i %BLUE% -filter_complex "[0]eq=saturation=%BGSAT%[BG];[1]crop=%CW%:%CH%:%CX%:%CY
%, chromakey=%COLOR%:%SIM%,despill=type=%D_TYPE%:mix=%D_MIX%:expand=%D_EXP%:brightness=%D BR
%:green=%D_GREEN%:blue=%D_BLUE%,scale=iw*%SC%:ih*%SC%[FG]; [BG][FG]overlay=%X%:%Y%" -t %T% - % %OUT%
pause

```

This is an example for real-time bluescreen processing. The background video comes from a file and the foreground video comes from the Panasonic GH5S camera via a HDMI to USB converter. I'm here using FFplay instead of FFmpeg, so that the result is visible in real time:
```

set "BG=background.mov" :: Background video
set "LOOP N=50"
set "COLO\overline{R}=0x0000ff"
set "SIM=0.35"
set "SC=0.6"
set "D TYPE=blue"
set "D_MIX=0.7"
set "D EXP=1.0"
set "D BR=1.0"
set "D_GREEN=0"
set "D_BLUE=-1"
set "X=0"
set "Y=0" :: Y Position
rem ffplay -f dshow -video_size 1920x1080 -framerate 30 -vcodec mjpeg video="USB Video"
rem ffplay -f lavfi movie=filename="video=USB Video":f=dshow

```
ffplay -f lavfi movie=filename="video=USB Video":f=dshow:discontinuity=0.5,scale=iw*0.5*\%SC\%:ih*0.5*\%SC\%, chromakey=

[FG] ; movie \(=\%\) BG\% , loop \(=-1: \%\) LOOP_N\%, scale \(=960 \bar{x} 540\) [BG] ; [BG] [FG] overlay \(=\% \mathrm{X} \%: \% \mathrm{Y} \%\)
pause

Why is the "movie" source used in this example? That's because FFplay doesn't allow "filter_complex", which means you have only one input stream. But the workaround with the "movie" source inside "-lavfi" allows multiple inputs. The drawback of this method is that you can't specify the properties of the input device, which means you can't tell the HDMI to USB converter which size, framerate and codec it shall use. It seems it uses some default values.

It's better to use FFmpeg with the sdl2 output devive:
ffmpeg -f dshow -video_size 1920x1080 -framerate 30 -vcodec mjpeg -i video="USB Video" -i \%BG\% -lavfi [0]scale=iw*0.5*

 -window_y 0 -f sdil2 -

Same as before, but use low-framerate uncompressed output from the HDMI to USB converter:
```

ffmpeg -f dshow -video size 1920x1080 -framerate 5 -pixel format yuyv422 -i video="USB Video" -i %BG% -lavfi

```

```

%D_BR%:green=%D_GREEN%:blue=%D_BLUE%[FG] ; [1] loop=-1:%LOOP_N%,scale=960x5\overline{40}[BG]; [BG] [FG
-wīndow_x 0 -wiñdow_y 0 -f sdl\overline{2}

```

\section*{How does the "despill" algorithm work?}
```

factor = (1 - spillmix) * (1 - spillexpand)
if (type == "bluescreen")
spillmap = blue - (red * spillmix + green * factor)
else
spillmap = green - (red * spillmix + blue * factor)
if (spillmap < 0)
spillmap = 0;
red = red + spillmap * (redscale + brightness)
green = green + spillmap * (greenscale + brightness)
blue = blue + spillmap * (bluescale + brightness)
if (alpha == true)
alpha = 1 - spillmap

```

It's difficult to understand, and it sems to be totally different from the algorithm described here (in german):
http://av-wiki.htwk-leipzig.de/index.php/Despill
This table shows the spillmap value for 7 input colors and different values for "mix" and "expand", for type \(=\) bluescreen and brightness \(=0\). All non-zero spillmap values are marked in yellow.
"spillmap" is for the original formula: spillmap = blue - (red * spillmix + green * factor)
"spillmap2" is for a modified formula: spillmap2 = blue - (red * spillmix + blue * factor)
Differences between "spillmap" and "spillmap2" are markend with

\end{tabular}

Even after seeing these results, it's still difficult to describe what the mix and expand parameters do:
- If \(\mathbf{m i x}=\mathbf{0}\), then more or less all colors are despilled (not only blue).
- If \(\mathbf{m i x}=1\), then the expand value doesn't care.
- Useful mix values seem to be in the range 0.5 to 1.0
- Using mix \(=0\) and expand= 0 doesn't deactivate the despill filter with the original formula. But it does so with the modified formula.
- If expand=1, the results are identical for the original and the modified formula.

Here is the C\# source code for making the above table:
```

using System;
using System.Windows.Forms;
using System.Globalization;
namespace despill
{
public partial class Form1 : Form
{
public Form1(
{
InitializeComponent();
}
private void Form1_Load(object sender, EventArgs e)
{

```
            block (0.0, 0.0);
            block (0.0, 0.5)
            block (0.0, 1.0)
            block (0.5, 0.0) ;
            block (0.5, 0.5)
            block(0.5, 1.0);
            block(1.0, 0.0);
            block(1.0, 0.5) ;
            block(1.0, 1.0);
        \(\}\)
    void block (double mix, double exp)
        \{
            desp (0.3, 0.3, 0.3, "gray ", mix, exp) ;
            desp (0.3, 0.3, 0.4, "blue-gray ", mix, exp)
            desp(0.3, 0.4, 0.3, "green-gray ", mix, exp)
            desp (0.3, 0.4, 0.4, "cyan-gray ", mix, exp).
            desp \((0.4,0.3,0.3\), "red-gray \(", \operatorname{mix}\), exp)
            desp (0.4, 0.3, 0.4, "magenta-gray", mix, exp) ;
            desp (0.4, 0.4, 0.3, "yellow-gray ", mix, exp);
            richTextBox1.AppendText("\n");
        \}
    void desp (double \(r\), double \(g\), double \(b\), string color, double mix, double exp)
```

    {
        CultureInfo invC = CultureInfo.InvariantCulture;
        richTextBox1.AppendText("Input: ");
        richTextBox1.AppendText("R=" + r.ToString("F2", invC) + " ");
        richTextBox1.AppendText("G=" + g.ToString("F2", invC) + " ");
        richTextBox1.AppendText("B=" + b.ToString("F2", invC) + " ");
        richTextBox1.AppendText(color + " ");
        richTextBox1.AppendText("mix=" + mix.ToString("F2", invC) +
        richTextBox1.AppendText("expand=" + exp.ToString("F2", invC) + " ");
        double factor = (1 - mix) * (1 - exp);
        double map = b - (r * mix + g * factor)
        if (map < 0) map = 0;
        richTextBox1.AppendText("spillmap=" + map.ToString("F2", invC) + " ");
        map = b - (r * mix + b * factor)
        if (map < 0) map = 0
        richTextBox1.AppendText("spillmap2=" + map.ToString("F2", invC) + " ");
        richTextBox1.AppendText("\n")
    }
    }
    ```
\}

In this example I did try different values ( \(0,0.3,0.5,0.7,1.0\) ) for the "mix" and "expand" parameters. The "brightness" parameter was set to 0 and the "blue" parameter was \(\mathbf{- 1}\). My arm was moving fast in front of a bluescreen, and so it got smeared with the blue color. The three images marked in red
rectangles show a small improvement
This is a test for different values of the brightness parameter ( 0,1 and 2 ), for mix \(=0.7\), expand \(=1.0\), red \(=0\), green \(=0\), blue \(=-1\).

mix07_bright1_blue-1.png

mix07_bright2_blue-1.png

\subsection*{2.84 Real-time bluescreening}

This is an example of a C\# program as a real-time GUI for FFmpeg. FFmpeg gets a live foreground video from the GH5S camera via HDMI to USB converter, and the background video is looped from a file. The GUl has scrollbars for scaling and moving the foreground video, and for choosing the parameters for colorkey and despill. The parameters can be changed in real time and are sent to the FFmpeg process via ZMQ.
Hint: If you click on "Start FFmpeg" and nothing happens, you may have forgotten to plug in the HDMI to USB converter. You must plug it in after you have started the computer. It doesn't work if it's already plugged in when you start the computer. However it's not necessary to plug in a HDMI signal from a camera, because the converter has a built-in test image ( 8 color bars).

The source code can be downloaded here: http://www.astro-electronic.de/source/FFbluescreen.zip

As you can see in the source code, I didn't find a way to move the console window to another position (to make sure that it doesn't overlap the video output and the GUI of this program).
Moving the video output is no problem, there are even two ways how to do it. You can use the window_x and window_y options in the FFmpeg command line, or you can use this code:
```

Process[] allProcesses = Process.GetProcessesByName("ffmpeg"); // this is unnecessary, if you already know the
IntPtr ffmpegHandle = allProcesses.First(); // process handle because you have started the process
WinAPI.MoveWindow(ffmpegHandle.MainWindowHandle, 960, 0, 960, 540, true); // move the video output window
public class WinAPI
qu
[DllImport("user32.dll")]
public static extern bool MoveWindow(IntPtr hWnd, int X, int Y, int nWidth, int nHeight, bool bRepaint);
}

```

If you know how the programmatically move the console window, please let me know.
Note: If you want to find out to which process a window belongs, you can use the ProcessExplorer:
https://docs.microsoft.com/de-de/sysinternals/downloads/process-explorer
According to ProcessExplorer, both FFmpeg windows (console and video output) belong to the "ffmpeg" process (it's not the "conhost" process!). There is only one "ffmpeg" process running. I don't know how to get the handle of the console window.

But there is an easy workaround for moving the console window:
Open a console window and move it to the right of the desktop, then right click in the title line, then choose "layout" and then set the "Window position" and uncheck the box "Let system position window". This adjustment is only required one time and now the console window will always appear at the same position.

Note: I did try to scale the foreground video dynamically before the colorkey filter, but that didn't work. In general, Most FFmpeg filters don't support changing the size of a video stream while it is running. In some cases it works (for example if no other filters are between "scale" and "overlay"), but in many other cases it doesn't work.

My results of using this bluescreening program:
By far the most important thing is to set the colorkey parameters correctly: color and similarity.
The despill filter is not as important and the possible improvements are quite small. The "modify alpha" option is useless and should be deactivated. In many cases it totally destroys the background image.
Recommended settings for despill filter: type = blue, blue \(=\mathbf{- 1}\), alpha = false, all other options = 0 . The most important parameter is "brightness".
```

ffmpeg -ss 2 -i in.mov -lavfi tmix=10 -frames 1 -y background.jpg

```

```

[b]; [2] format=rgb24 [c], [a] smartblur=3, format=rgb24[blurred_in]; [blurred_ref]
[blurred_in]blend=all_mode=difference,eq=brightness=0.4:sa\overline{turation=0,eq=contrast=1000,format=rgb24[mask];[c][b]}
[mask]mas\overline{skedmerge,format=rgb24" -shortest -pix_fmt yuv422p -y out.mkv}
pause

```

Note: It's not working very good.
See also: http://oioiiooixiii.blogspot.com/2017/06/ffmpeg-predator-1987-movie-adaptive.htmI See also: http://oioiiooixiii.blogspot.com/2016/09/ffmpeg-extract-foreground-moving.html

\subsection*{2.86 Datascope}

The "datascope" filter can be used to measure the RGB color components of the bluescreen. In this example the input video comes from the HDMI to USB converter:
```

ffmpeg -f dshow -video_size 1920x1080 -framerate 5 -pixel_format yuyv422 -i video="USB Video" -lavfi
format=rgb24,scale=64:20,datascope=mode=color2 -f sdl -

```

Note: The default size seems to be \(1280 \times 720\) pixels.

This is an analyzer for one pixel in the center of the field of view. The input video comes from the HDMI to USB converter:
```

ffmpeg -f dshow -video size 1920x1080 -framerate 5 -pixel format yuyv422 -i video="USB Video" -lavfi
format=rgb24, crop=1:1,\overline{datascope=s=20x36:mode=color2,scale=iw*10:ih*10:flags=gauss -f sdl -}

```

Note: One block consisting of three hex digits has the size \(20 x 36\) pixels, which is in this example enlarged by a factor 10 to \(200 x 360\) pixels.
See also: "pixscope" filter

I wanted to create a special effect, adding jitter to the video lines. Like in this video at 3:40 https://www.youtube.com/watch?v=A9D_PlfpBH4 This is the first version:
```

ffmpeg -f lavfi -i testsrc2=size=vga -vf format=gray,geq=lum='lum(X-5+10*random(0),y)' -t 3 -y out.mp4
pause

```

The problem is that this is a pixel-wise jitter. Each pixel gets it's own jitter value. That's not what I want. I want that all pixels in the same line get the same random jitter value. This should be possible by setting ga seed value for the random generator. The seed value must be a function of \(\mathbf{N}\) (frame number) and \(Y\) (line number). This is me next (unsuccesful) test:
```

ffmpeg -f lavfi -i testsrc2=size=vga -vf format=gray,geq=lum='st(0,mod(0.001*(N+Y),1));lum(X-5+10*random(0),Y)' -t 3 -y
out.mp4
pause

```

The random() function uses the variable 0 to save it's seed value. But it seems that it's impossible to write a seed value for the random function. I don't understand why it doesn't work.

Finally I replaced the random() function by a selfmade workaround. It's not a perfect random function, but good enough for this purpose:
```

ffmpeg -f lavfi -i testsrc2=size=vga -vf format=gray,geq=lum='st(0,mod(PI*(N+Y*(Y-N+PI)),1));lum(X-5+10*ld(0),Y)' -t 3
y out.mp4
pause

```

This is a simulation of vertical jitter, like in a defect film projector.

This is an interesting example because it shows that a variable can be saved with st(0, expr) and that it keeps its value from one frame to the next. It's currently not possible to share variables between expressions.

This is another approach for creating a vertical jitter, using the "rgbashift" filter::
```

ffmpeg -f lavfi -i testsrc2=d=10 -lavfi sendcmd=f=cmd.txt,rgbashift=rv=0:gv=0:bv=0 -y jitter.mp4
pause

```

This is the content of the file cmd.txt:
```

0 [expr] rgbashift rv 'mod(3*N,10)';
0 [expr] rgbashift gv 'mod(3*N,10)'
0 [expr] rgbashift bv 'mod(3*N,10)';

```

\subsection*{2.89 CRT Screen Effect}

Found here: http://oioiiooixiii.blogspot.com/2019/04/ffmpeg-crt-screen-effect.html

\subsection*{2.90 Macroblock motion vectors}

Found here: http://oioiiooixiii.blogspot.com/2018/04/ffmpeg-colour-animation-from-macroblock.html
See also: http://oioiiooixiii.blogspot.com/2016/09/ffmpeg-create-video-composite-of.html
See also: http://oioiiooixiii.blogspot.com/2016/04/ffmpeg-display-and-isolate-macroblock.htm|

\subsection*{2.91 Deblock filter}

This filter removes unwanted blocking artefacts from low-quality input images or videos.

This filter removes unwanted banding artefacts that appear in backgrounds with a brightness gradient, especially in the sky towards the horizon.
```

set "IN=MVI_2562.mov" :: Input video
set "OUT=output.mp4" :: Output vodeo
ffmpeg -i %IN% -vf gradfun=3.5:8 -y %OUT%
pause

```

The first parameter is the strength, this is the maximum amout the filter will change any one pixel. Allowed values are from 0.51 to 64 , the default value is 1.2

The second parameter is the radius, which defines the neighborhood to fit the gradient to. Accepted values are from 8 to 32 , the default is 16. Don't use this filter before lossy compression.

\subsection*{2.93 Dilation filter}

This filter replaces each pixel by the brightest pixel in the \(3 \times 3\) neighborhood. It's very useful if you have fisheye images of the night sky (taken with Canon 6D, height 3648 pixels) and want to scale them down to height 1200 pixels (for projection in the planetarium). Scaling down would remove the fainter stars, because each pixel in the resulting image would be the average of \(3 \times 3\) pixels in the original limage. You can avoid this by using the dilation filter prior to scaling down.
See also the "morpho" filter.

\subsection*{2.94}

Morphological transforms

See also: https://en.wikipedia.org/wiki/Mathematical_morphology
This is an example for morphological transforms. The structure is a \(9 \times 9\) image with black background and a white circular mask:
```

rem Make an input image for testing
ffmpeg -f lavfi -i color=black:s=400x160,format=rgb24 -lavfi drawtext=text="Test":font="arial
black": fontcolor=white:fontsize=140:x=20:y=25,rgbashift=gh=20:bh=10:bv=10 -frames 1 -y rgb_text.png
rem Make a 9x9 structure with a white circle

```
ffmpeg -f lavfi -i color=black:s=9x9,format=gray8 -lavfi geq=lum='255*lte (hypot(( 2 *X+1)/H-1), ((2*Y+1)/H-
1)) ,1)',format=rgb24 -frames 1 - y structure.png
rem Test all modes of the "morpho" filter
ffmpeg -i rgb_text.png -i structure.png -lavfi morpho=erode -y erode.png
ffmpeg -i rgb_text.png -i structure.png -lavfi morpho=dilate \(-y\) dilate.png
ffmpeg -i rgb-text.png -i structure.png -lavfi morpho=open -y open.png
ffmpeg -i rgb_text.png -i structure.png -lavfi morpho=close -y close.png
ffmpeg -i rgb_text.png -i structure.png -lavfi morpho=gradient -y gradient.png
ffmpeg -i rgb_text.png -i structure.png -lavfi morpho=tophat -y tophat.png
ffmpeg -i rgb_text.png -i structure.png -lavfi morpho=blackhat -y blackhat.png
pause

\section*{These are the input and output images:}

If the structure is green instead of white, then the "morpho" filter is only applied to the green channel:
ffmpeg -f lavfi -i color=black:s=400x160,format=rgb24 -lavfi drawtext=text="Test":font="arial
black": fontcolor=white: fontsize=140: \(x=20: y=25\), rgbashift=gh=20:bh=10:bv=10 -frames 1 - \(y\) rgb_text.png
ffmpeg -f lavfi -i color=black:s=9x9,format=rgb24 -lavfi geq=g='255*lte(hypot(((2*X+1)/H-1),((2*Y+1)/H-1)),1)' -frames 1 -y structure.png
ffmpeg -i rgb_text.png -i structure.png -lavfi morpho=erode -y erode.png
pause

These are the input and output images:

\subsection*{2.95 Correct the radial distortion of (fisheye-) lenses}

This can be done with the "lenscorrection" filter, which has the following options:
\begin{tabular}{|l|l|}
\hline\(c x\) & Relative \(x\) coordinate of the center of distortion, in range [0...1], default is 0.5 \\
\hline cy & Relative \(y\) coordinate of the center of distortion, in range [0..1], default is 0.5 \\
\hline k1 & Coefficient of the quadratic correction term, in range [-1...1]. 0 means no correction, default is 0. \\
\hline k2 & Coefficient of the ^4 correction term, in range [-1...1]. 0 means no correction, default is 0. \\
\hline
\end{tabular}

The formula that generates the correction is:
\(r_{-} s r c=r_{-}\)tgt \({ }^{*}\left(1+k 1^{*}\left(r_{-} t g t / r_{-} 0\right)^{\wedge} 2+k 2\right.\) * \(\left.\left(r_{-} t g t / r_{-} 0\right)^{\wedge} 4\right)\)
where \(r_{-} 0\) is half of the image diagonal and \(r_{-} s r c\) and \(r_{-} t g t\) are the distances from the focal point in the source and target images, respectively.

For fisheye images, it's a little bit more complicated because the coefficients k1, k2 aren't given for half of the image diagonal.
Let \(w\) and \(h\) be the dimensions of the rectangular input image.
The square of the ratio of the diagonal of the rectangular image to the diagonal of the circular fisheye image is:
ratio \(=\left(w^{\wedge} \mathbf{2}+h^{\wedge} 2\right) / h^{\wedge} 2\)

Let \(\mathbf{c} 1\) and c 2 be the given coefficients for the fisheye lens. Then the coefficients k 1 and k 2 can be calculated as follows:
k1 = c1 * ratio
k2 \(=\) c2 * ratio^2

See also http://www.paulbourke.net/dome/fisheyecorrect/

This is an example for the Entaniya M12 \(280^{\circ}\) lens, from Paul Bourke's website:
\[
y=0.5229 x-0.043 x^{\wedge} 2+0.0253 x^{\wedge} 3-0.0109 x^{\wedge} 4
\]
\(y\) is the radial coordinate in the image plane in the [ \(0 \ldots 1\) ] range, and \(x\) is the field angle in radians. The maximum \(x\) value is \(\mathrm{FOV} * \mathrm{PI} / 360^{\circ}\).
Let's assume we have a perfect fisheye image and we want to simulate how this image would look like, if it was taken through the not-so-perfect fisheye lens.
```

set "IN=1200.png" :: Input image (fisheye test image)
set "S=1200" :: Size of input image
set "FOV=280"
set "A=0.5229"
: Field of view of fisheye lens in degrees
: First order coefficient, for a perfectly linear fisheye lens this is (360/FOV/PI)
: Second order coefficient
: Third order coefficient
set "C=0.0253"
set "D=-0.0109"
Fourth order coefficient
rem Step 1:
rem Apply the fisheye distortion Example for Entaniya M12 280
rem y = A * x + B * x^2 + C * x^3 + D * x^4
rem where x is in the [0...FOV*PI/360] range
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,geq='st(1,hypot(X-%S%/2,Y-%S%/2)/%S%*PI*%FOV

```

```

%S%/2*sin(ld(2))' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -i xmap.pgm -vf transpose -y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i %IN% -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap" -y out1.png
pause

```
Note: For all rotational-symmetric problems the ymap file can simply be generated by transposing the xmap file.

The inverse problem is much more complicated. Given is an image that was taken through a not-so-perfect fisheye lens, and we want to transform this image into an undistorted fisheye image, with other words: We want to linearize it.
In this case we need the inverse of the above \(4^{\text {th }}\) degree function, which is very complicated to derive.
The trick is to use the root(expr, max) function. But please be warned that this is an extremely slow solution, because it requires to find the root of an expression for each pixel.
```

set "IN=1200.png"
Input image (fisheye test image)
set "S=1200"
set "FOV=280"
set "A=0.5229"
set "B=-0.043"
set "C=0.0253"
set "D=-0.0109"
rem Step 2:
rem Apply the inverse function to out1.png, and then the result should be same as the original image
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,geq='st(1,hypot(X-%S%/2,Y-%S%/2)/%S

```

```

%/360*PI));%S%/2+0.5+ld(3)*%S%/PI/%FOV%*180*sin(ld(2))' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -i xmap.pgm -vf transpose -y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i out1.png -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap" -y out2.png
pause

```

This video filter converts equirectangular \(360^{\circ}\) panoramic videos between various formats, and it can also rotate them.
The default rotation order is yaw --> pitch --> roll, but can be changed by setting the "rorder" parameter. Positive yaw moves the line of sight towards the right, positive pitch moves the line of sight up, positive roll rotates the image clockwise (or rotates the observer's head counter-clockwise).

t_original.jpg

t_yaw90.jpg

t_pitch90.jpg

t_yaw90_pitch90.jpg

t_pitch90_roll90.jpg

t_yaw90_roll90.jpg

Parameters of the v360 filter:
\begin{tabular}{|c|c|c|}
\hline \multirow[t]{18}{*}{input, output} & e, equirect & Equirectangular projection, see https://en.wikipedia.org/wiki/Equirectangular_projection Warning: There is a small rounding error in v360 if the input is "e", but in most cases this error can be neglected. See https://trac.ffmpeg.org/ticket/9617 \\
\hline & c3x2 & \(3 \times 2\) cubemap projection \\
\hline & c6x1 & \(6 \times 1\) cubemap projection \\
\hline & c1x6 & 1x6 cubemap projection \\
\hline & eac & Equi-angular cubemap \\
\hline & flat, gnomonic, rectilinear & \begin{tabular}{l}
Regular video projection, see https://en.wikipedia.org/wiki/Gnomonic_projection \\
Warning: There is a small rounding error in v360 if the input is "flat", but in most cases this error can be neglected. See https://trac.ffmpeg.org/ticket/9617
\end{tabular} \\
\hline & dfisheye & Double fisheye projection \\
\hline & barrel, fb, barrelsplit & Facebook's 360 projection \\
\hline & sg & Stereographic projection, see https://en.wikipedia.org/wiki/Stereographic_map_projection \\
\hline & mercator & Mercator projection, see https://en.wikipedia.org/wiki/Mercator_projection \\
\hline & ball & \begin{tabular}{l}
Ball projection, this means the \(360^{\circ}\) content of the input video is shown as a reflection on a mirror sphere. Similar to single-fisheye with \(360^{\circ}\) field of view, but has a different mapping function: \\
With ball projection all points with \(90^{\circ}\) distance from the center point are mapped to the circle with \(70.7 \%\) radius, however with \(360^{\circ}\) single fisheye projection they are mapped to the circle with \(50 \%\) radius. In both cases the point with \(180^{\circ}\) distance from the center point is mapped to the edge of the circle.
\end{tabular} \\
\hline & hammer & Hammer-Aitoff map projection, see https://en.wikipedia.org/wiki/Hammer_projection \\
\hline & sinusoidal & Sinusoidal map projection projection, see https://en.wikipedia.org/wiki/Sinusoidal _projection \\
\hline & fisheye & Single fisheye projection \\
\hline & pannini & Pannini projection (output only), see https://en.wikipedia.org/wiki/lmage_stitching\#Pannini \\
\hline & cylindrical & \begin{tabular}{l}
Cylindrical projection \\
Warning: There is a small rounding error in v360 if the input is "cylindrical", but in most cases this error can be neglected. See https://trac.ffmpeg.org/ticket/9617
\end{tabular} \\
\hline & cylindricalea & Cylindrical equal area projection, see https://en.wikipedia.org/wiki/Cylindrical equal-area_projection \\
\hline & perspective & \begin{tabular}{l}
Perspective projection, this is like watching a sphere from large distance (output only). \\
Warning: Don't use the v360 filter's "perspective" projection if you need scientifically correct behaviour. The "perspective" projection depends somehow on the option "v_fov", but the exact meaning of this option in this context is unknown. Better use a workaround with "remap" filter. I did try to reverse-engineer the source
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline & & code to find out the meaning of the "v_fov" option, but this approach wasn't successful. \\
\hline & tetrahedron & Tetrahedron projection \\
\hline & octahedron & Octahedron projection \\
\hline & tsp & Truncated square pyramid projection \\
\hline & he, hequirect & Half equirectangular projection \\
\hline & equisolid & Equisolid projection, see https://en.wikipedia.org/wiki/Fisheye_lens\#Mapping_function \\
\hline & og & Orthographic projection, see https://en.wikipedia.org/wiki/Orthographic_map_projection \\
\hline interp & near, nearest & Nearest neighbour interpolation \\
\hline & line, linear & Bilinear interpolation, this is the default \\
\hline & cube, cubic & Bicubic interpolation \\
\hline & lanc, lanczos & Lanczos interpolation \\
\hline & sp16, spline16 & Spline16 interpolation \\
\hline & gauss, gaussian & Gaussian interpolation \\
\hline & mitchell & Mitchell interpolation \\
\hline w, h & in pixels & Width and height of the output video, default size depends on output format \\
\hline yaw, pitch, roll & in degrees & \begin{tabular}{l}
Rotation angles \\
Warning: In the command line these are absolute angles, however if they are sent via sendcmd, then they are interpreted as relative angles. That means you can't test the angles in the command line and then use the same values for sendemd. What a stupid idea!
\end{tabular} \\
\hline rorder & 'ypr', 'yrp', 'pyr', 'pry', 'ryp', 'rpy' & Set the rotation order, default is 'ypr' \\
\hline h_flip, v_flip & 0,1 & Flip the output horizontally or vertically \\
\hline d_flip & & Flip the output back / forward \\
\hline ih_flip, iv_flip & & Flip the input horizontally or vertically \\
\hline in_trans & & Transpose the input \\
\hline out_trans & & Transpose the output \\
\hline h_fov, v_fov, d_fov & in degrees & Set the horizontal, vertical or diagonal field of view for output \\
\hline ih_fov, iv_fov, id_fov & in degrees & Set the horizontal, vertical or diagonal field of view for input \\
\hline alpha_mask & 0, 1 & Make all unmapped pixels transparent \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l}
\hline h_offset, v_offset & \(-1 \ldots 1\) & \begin{tabular}{l} 
Output horizontal and vertical off-axis offset, the default values are 0 \\
The meaning of these options is unclear. If you can explain it, please let me know.
\end{tabular} \\
\hline
\end{tabular}

Undocumented feature of the v360 filter: The top left pixel of the input video is mapped to all those pixels in the output video, which get no input data. If you want to give the unused area a specific color, you can just fill the top left pixel of the input video with this color:
```

-vf drawbox=w=1:h=1:color=green,v360=...

```

Note: If the transformation is from "equirectangular" to "ball", you must use different coordinates for the filled pixel:
```

-vf drawbox=x=3*iw/4:y=ih/2:w=1:h=1:color=green,v360=input=e:output=ball..

```

Note: Even if the input pixel format is rgb24, the output format is gbrp which is a planar pixel format.

List of map projections: https://en.wikipedia.org/wiki/List_of_map_projections\#Cylindrical
Fisheye mapping functions: https://en.wikipedia.org/wiki/Fisheye lens\#Mapping function
Paul Bourke's classification of fisheye mappings: http://paulbourke.net/dome/fisheyetypes/

\subsection*{2.97 Equirectangular images of the night sky}

Equirectangular images of the night sky can be found here:
http://paulbourke.net/miscellaneous/astronomy/
http://paulbourke.net/dome/stellariumsphere/
http://paulbourke.net/dome/celestiasphere/
https://svs.gsfc.nasa.gov/vis/a000000/a003500/a003572/
https://sci.esa.int/web/gaia/-/60196-gaia-s-sky-in-colour-equirectangular-projection

If you want to undo spherical rotations, you must apply the same rotation angles with different sign, and you must apply the rotations in the reverse order. For example, this spherical rotation
v360=e : e : yaw=10:pitch=20 : roll=30
can be undone by this spherical rotation:
v360=e:e:yaw=-10:pitch=-20:roll=-30 : rorder=rpy

Note: It doesn't care in which order you write the angles in the command line. The rotation order is only determined by the "rorder" option. The default rotation order is yaw-pitch-roll.

Note: The order of the rotations is important. We are talking about a spherical coordinate system, like the geographical coordinates on earth.
Case 1: You walk 1 km north, then turn \(90^{\circ}\) left and walk 1 km to the west.
Case 2: You walk 1 km to the west, then turn \(90^{\circ}\) right and walk 1 km north.
You might think that in both cases you arrive at the same place. But that's wrong. It becomes clear when you walk longer distances:
Case 3: You start at the equator in Africa and walk north until you reach the north pole, then turn \(90^{\circ}\) left and walk the same distance. You will arrive somewhere in central America.
Case 4: You start at the equator in Africa and walk west until you are in central America, then turn \(90^{\circ}\) right and walk the same distance. You will arrive at the north pole.
That means the order of rotations is important. When you have made yaw and pitch rotations (in this order) and want to undo these rotations, you must undo them in reverse order. First pitch and then yaw.

\subsection*{2.99}

\section*{Remap a fisheye video to an equirectangular video}

In this example the xmap and ymap files for the remap filter are created by FFmpeg (no C\# code required).
The size of the equirectangular video is defined by the user and can be different from 2:1.
```

set "IN=110_0001.mp4"
Input video
set "SQ=2880"
: Size of square input video
set "SR=1440" :: Radius that is actually used from the source video, must be SQ/2 or smaller
set "PW=1920"
Width of panorama video
set "PH=550"
Width of panorama video
set "PH=550"
Height of pan
rem Create the xmap file

```

```

1 -y xmap.pgm
rem Create the ymap file

```

```

1 -y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i %IN% -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap" -c:v mpeg4 -q:v 2 -y %OUT%
pause

```

If the fisheye lens has more than \(180^{\circ}\) field of view, but you want only \(180^{\circ}\) visible in the panorama, set the SR variable to a value smaller than SQ/2.
A lot of informations about fisheye projections can be found on Paul Bourke's website: www.paulbourke.net/dome/
More informations about the remap filter can be found here: https://trac.ffmpeg.org/wiki/RemapFilter
The color of unmapped pixels can be specified with the "fill" option, the default color is black.

Fisheye input (from Kodak Pixpro SP360 camera):

\section*{Panorama output:}

The VLC player won't recognize the output video as a spherical equirectangular video, because some special metadata is missing. This metadata can't be inserted with FFmpeg, but it can be done with the "Spatial Media Metadata Injector":
https://github.com/google/spatial-media/releases/tag/v2.1

In this example the fisheye's field of view can be set to any value up to \(360^{\circ}\), and the width/height ratio of the equirectangular output video is always \(2: 1\). The lower part is filled with black if the fisheye has less than \(360^{\circ}\) field of view.
```

set "IN=IMG_077.jpg"
Fisheye input image or video, must be square
set "SQ=364\overline{8}
set "FOV=220"
set "Q=2"
set /a "H=%SQ%/%Q%"
set /a "W=2*%H%"
set /a "A=%H%*%FOV%/360"
set "OUT=out.jpg"
Size of square fisheye input image
Fisheye field of view in degrees
Size divider for output image, use 1 for best quality,
or a bigger value for faster computing
Height of equirectangular imag
Width of equirectangular image is always twice the height
Height of equirectangular image that is actually filled with data,
the lower part of the output image remains black
Equirectangular output image or video
rem Create the xmap file for remapping from fisheye to equirectangular
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=pix fmts=gray16le,^
geq='%SQ%/2*(1-Y/%A%*sin(X*2*PI/%W%))' -frames 1 -y xmap1.pgm
rem Create the ymap file for remapping from fisheye to equirectangular
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=pix_fmts=gray16le,^
geq='%SQ%/2*(1-Y/%A%*\operatorname{cos}(X*2*PI/%W%))' -frames 1 -y ymap1.pgm
rem Remap from fisheye to equirectangular
ffmpeg -i %IN% -i xmapl.pgm -i ymap1.pgm -filter_complex "format=pix_fmts=rgb24,remap" -y %OUT%
pause

```

For a square \(180^{\circ}\) single-fisheye video the conversion to an equirectangular video can also be done with the V360 filter. The second hemisphere is filled with a user-defined color. This example is obsolete, please use the next example.
```

set "IN=in.mp4" :: Fisheye input video (square, camera pointing upwards)
set "OUT=out.mp4" :: Equirectangular output video
ffmpeg -i %IN% -lavfi "pad=w=2*iw:color=darkgreen,v360=input=dfisheye:output=e:pitch=90" -y %OUT%

```
pause

Square single-fisheye images or videos with any field of view can be converted to equirectangular images or videos:
```

set "IN=1200.png"
:: Input field of view in degrees
set "C=green" :: Color for filling unused area
set "OUT=out.png" :: Equirectangular output image or video
ffmpeg -i %IN% -vf drawbox=w=1:h=1:color=%C%,v360=input=fisheye:ih_fov=%FOV%:iv_fov=%FOV%:output=equirect:pitch=-90 - y
%OUT%
pause

```

Note: For image output, add "-frames 1"
Note: If required, the lower part of the equirectangular output can be cut off with the crop filter.

\subsection*{2.100}

\section*{Remap an equirectangular video to a fisheye video}

The field of view can be set between 1 and 360 degrees. The sky is in the center of the fisheye video, and the ground is at the circular edge.
The input video must have \(2: 1\) width/height ratio.
```

set "IN=test1.mp4" :: Input video
set "H=960" :: Height of equirectangular input video
set "S=1080" :: Size of square fisheye output video
set "FOV=220" :: Set the field of view in degrees
set "OUT=fish.mp4" :: Output video
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(0.9999+atan2(X-%S%/2,Y-%S%/2)/PI)' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix fmts=gray16le,^
geq='%H%/360*%FOV%*(hypot ((2*X/%S%)-1,(2*Y/%S%)-1))' -f_frames 1 -y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i %IN% -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap" -q:v 2 -y %OUT%
pause

```

The same thing can also be done with the v360 filter:
```

set "IN=equirectangular.png" :: Input image
set "FOV=220" :: Output field of view in degrees
set "OUT=fish.png" :: Output image
ffmpeg -i %IN% -vf v360=input=e:fisheye:h_fov=%FOV%:v_fov=%FOV%:pitch=90 -y %OUT%
pause

```

Unfortunately the v360 filter with fisheye output fills not only the image circle with data, but instead the whole quadratic image. The workaround is to overlay a circular mask:
```

set "IN=equirectangular.png" :: Input image
set "SIZE=1200x1200" :: Size of the mask image
set "FOV=180" :: Output field of view in degrees
set "OUT=fish.png" :: Output image

```
ffmpeg -f lavfi -i color=black:s=\%SIZE\% -lavfi format=argb,geq=a='255*gt(hypot(( \(2 * X+1) / H-1),((2 * Y+1) / H-\)
1)), 1)': \(\mathrm{r}=0: \mathrm{g}=0: \mathrm{b}=0\)-frames 1 -y mask.png
ffmpeg -i \%IN\% -i mask.png -lavfi v360=e:fisheye:h_fov=\%FOV\%:v_fov=\%FOV\%:pitch=90,overlay \(-y \% O U T \%\)
pause

This example is for a computer with two or more monitors. That means the desktop is wider than the monitor. It's assumed that the main monitor contains an equirectangular content (for example SpaceEngine). This content is grabbed by the "gdigrab" input device, converted to \(180^{\circ}\) fisheye format and then shown in the center of the other monitor (or beamer).
```

ffmpeg -f gdigrab -video size 1920x1080 -offset x 0 -offset y 0 -i desktop -lavfi
v360=e:fisheye:ih_fov=36\overline{0}:iv_fov=180:h_fov=180:\overline{v_fov=180:w=1080:h=1080,format=bgra -window_borderless 1 -window_x 2340}
-window_y 0 -f sdll2 -
pause

```

Note: "-offset_x 0 -offset_y 0" can be omitted because the top left corner is the default, but "-video_size 1920x1080" is important because in a multi-monitor system the desktop is larger than the monitor, however we want to grab only the first screen.
Note: You can see the framerate at the bottom of the console window.
Note: The "format=bgra" conversion is probably required because that's the screen pixel format which is set in the operating system. "rgba" does also work. "rgb0" or "bgr0" can also be used. These are pixel formats without alpha channel, but they are a little bit slower than "bgra".

The above example is running on my computer with 20 fps and can be improved to 27 fps by grabbing only the square central part of the equirectangular input video:
```

ffmpeg -f gdigrab -video_size 1080x1080 -offset_x 420 -i desktop -lavfi
v360=e:fisheye:ih_fov=180:iv_fov=180:h_fov=180:v_fov=180:w=1080:h=1080,format=bgra -window_borderless 1 -window_x 2340
-window_y 0 -f sdl2 -
pause

```

Note: The v360 filter becomes faster if interpolation is deactivated by using "interp=near".

The remap filter is faster than the \(\mathbf{v} 360\) filter. This example runs with 30 fps (the mapping files are simple identity maps, but that shouldn't affect the speed):
```

rem Create the xmap file (this is a simple identity map only for testing)
ffmpeg -f lavfi -i nullsrc=size=1080x1080 -vf format=gray16,geq='X' -frames 1 -y xmap.pgm
rem Create the ymap file (this is a simple identity map only for testing)
ffmpeg -f lavfi -i nullsrc=size=1080x1080 -vf format=gray16,geq='Y' -frames 1 -y ymap.pgm
ffmpeg -f gdigrab -video_size 1080x1080 -offset_x 420 -i desktop -i xmap.pgm -i ymap.pgm -lavfi fps=30,remap
-window_borderless 1 -wiñdow_x 2340 -window_y 0--f sdl2 -
pause

```

Note: Before I inserted the "fps" filter, there were numerous errors "Application provided invalid, non-monotonically increasing dts to muxer". It wasn't possible to remove them with the bitstream filter -bsf:v setts=dts=DTS-STARTDTS. But with fps=30 it works fine. But now you can't see any more the maximum possible framerate in the console window.

This is an example with fisheye to equirectangular conversion (wrong direction...)
```

rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=1080x1080 -vf format=pix_fmts=gray16le,geq='st(0,PI/2*(X/539.5-1));st(1,PI/2*(Y/539.5-

```

```

pot(ld(6),ld(7)));st(9,atan(ld(8)/ld(5))/(PI/2));539.5+539.5*ld(6)/ld(8)*ld(9)' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=1080x1080 -vf format=pix_fmts=gray16le,geq='st(0,PI/2*(X/539.5-1));st(1,PI/2*(Y/539.5-

```

```

pot(ld(6),ld(7)));st(9,atan(ld(8)/ld(5))/(PI/2));539.5+539.5*ld(7)/ld(8)*ld(9)' -frames 1 -y ymap.pgm
rem Realtime remapping
ffmpeg -f gdigrab -video size 1080x1080 -offset x 420 -i desktop -i xmap.pgm -i ymap.pgm -lavfi fps=30,remap
-window_borderless 1 -wiñdow_x 2340 -window_y 0--f sdl2 -
pause

```

This is an example for half-equirectangular ( \(960 \times 1080\) ) to \(180^{\circ}\) fisheye ( \(1080 \times 1080\) ) conversion. The input is the \(1920 \times 1080\) screen from SpaceEngine. because the aspect ratio isn't 2:1, only the central \(960 \times 1080\) rectangle is grabbed. The output can be sent to a beamer with \(180^{\circ}\) fisheye lens. The framerate is about 30fps on my notebook.
```

rem From equirectangular to fisheye
set "IN_W=960" : : Input width in pixels
set "IN_H=1080" :: Input height in pixels
set "IN H FOV=180" :: Input horizontal field of view in degrees
set "IN_V_FOV=180" : : Input vertical field of view in degrees
set "OUT\}\overline{W}=1080" :: Output width in pixels
set "OUT_H=1080" :: Output height in pixels
set "OUT H FOV=180" : : Output horizontal field of view in degrees
set "OUT_V_FOV=180" : : Output vertical field of view in degrees
rem Create the xmap file

```

```

hypot(ld(0),ld(\overline{1}))));st(4,\operatorname{cos}(ld(3))*\operatorname{cos(ld(2)));(%IN_W%-1)/2*(1+atan2(ld(4),sin(ld(3)))/PI*360/%IN_H_FOV%)' -frames 1}
-y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%OUT W%x%OUT H% -vf format=pix fmts=gray16le,geq='st(0,%OUT H FOV%/180*(2*X/(%OUT W%-1)-
1)); st(1,%OUT_V_FOV%/180* (2*Y/(%OUT_H%-1)-1));st(2,atan2(ld(1),ld(0))) ;st(3,PI/2*(1-
hypot(ld(0),l\overline{d}(\overline{1}))));st(4,asin(\operatorname{cos}(\overline{ld}(3))*sin(ld(2))));(%IN_H%-1)/2*(1+ld(4)/PI*360/%IN_V_FOV%)' -frames 1 -y ymap.pgm
rem Apply the remap filter in realtime
ffmpeg -f gdigrab -video_size %IN_W%x%IN_H% -offset_x 480 -i desktop -i xmap.pgm -i ymap.pgm -lavfi fps=30,remap
-window_borderless 1 -window_x 24\overline{0}0 -window_y 0 -f \overline{sdl2 -}
pause

```

In some cases it's better to make spherical transformations with the "remap" filter instead of "v360" filter, for example if input or output formats or special effects are required that aren't available in "v360", or as a workaround for the errors in "v360". Also the "remap" filter is faster than "v360", however the improvement in speed is quite small if the \(\mathbf{v} 360\) filter is used with the "interp=near" option. The following formulae have been carefully tested for correct rounding and absence of +-1 errors.
\begin{tabular}{|c|c|c|}

\end{tabular}

Note: You can choose the order of the yaw, pitch and roll rotations as desired, or you can omit the rotations if you don't need them. But keep in mind that here in "remap" the order is reversed. You have the output at the beginning and the input at the end. As shown above, the rotation order is yaw, pitch, roll.

Note: For clarity, each equation is written here in a new line. However in the command line there are no line feeds allowed. Either it must all be written in one long line, or you must terminate each line with a suitable character, depending on your batch interpreter. For example ^ for Windows batch files, as shown here.

Note: For double fisheye, the parameters OUT_W and OUT_H refer to the size of the output image, but the parameters OUT_H_FOV and OUT_V_FOV describes the field of view of each of the fisheye images. Not the total horizontal angle of the output image.

\section*{Example:}

Let's assume input and output formats are fisheye. If the fisheye projector is shifted 0.5 to the side (halfway between the dome's center and edge), and if the optical axis of the projection lens is tilted \(26.565^{\circ}\) so that the optical axis is pointing to the dome's vertex, use these parameters to create the image:
\begin{tabular}{ll} 
set "YAW=26.565" & \(::\) Yaw angle in degrees \\
set "OFF_IN_X=0" & \(::\) Input \(X\) offset, normalized to the dome's radius \\
set "OFF_OUT_X=0.5" & \(:\) : Output \(X\) offset, normalized to the dome's radius
\end{tabular}

However if you have taken an image with a fisheye lens inside the dome, with the camera at the same place as above and also pointing to the dome's vertex, then this image can be converted back to a normal fisheye image with these parameters:
\begin{tabular}{ll} 
set "YAW=-26.565" & \(::\) Yaw angle in degrees \\
set "OFF_IN_X=0.5" & \(::\) Input \(X\) offset, normalized to the dome's radius \\
set "OFF_OUT_X=0" & \(:\) : Output \(X\) offset, normalized to the dome's radius
\end{tabular}

See also the next chapter for off-center fisheye projector.
\begin{tabular}{|c|c|}
\hline \begin{tabular}{l}
Convert from pixel coordinates [0 ... W-1] to angle in radians [-FOV/2 ... +FOV/2] \\
The angle is calculated for the center of the pixel.
\end{tabular} & ```
angle = FOV * PI / 360 * ((2 * X + 1) / W - 1)
with
    FOV = field of view in radians
    x = pixel coordinate
    W = image width in pixels
``` \\
\hline \begin{tabular}{l}
Convert from pixel coordinates [0 ... W-1] to normalized coordinates [-1 ... +1]: \\
Result for \(X=0\) is \((-1+1 / W)\) \\
Result for \(X=(W-1)\) is \((1-1 / W)\)
\end{tabular} & ```
XN = (2 * x + 1) / w - 1
with
    X = pixel coordinate
    W = image width in pixels
``` \\
\hline Convert from normalized coordinates [-1 ... +1] to angle in radians [-FOV/2 ... +FOV/2] & angle \(=\) FOV * PI / 360 * XN \\
\hline Convert from angle in radians [-FOV/2 ... + FOV/2] to pixel coordinates [0 ... W-1]: & ```
x = 0.5 * W * (1 + angle * 360 / PI / FOV)
with
    W = image width in pixels
    FOV = field of view in degrees
    angle = angle in degrees
``` \\
\hline
\end{tabular}

When writing the numbers to a *.pgm file, is it safe to assume that the numbers are always rounded down to the next integer? Yes it is, as can be shown with this simple test:
```

ffmpeg -f lavfi -i nullsrc=size=20x1 -vf format=pix_fmts=gray16le,geq='x/10' -frames 1 -y test.pgm
pause

```

This is the resulting file in a hex editor. It contains 10 pixels with 16 -bit value 0 followed by 10 pixels with 16-bit value 1:
```

0x00: 50 35 OA 32 30 20 31 OA 36 35 35 33 35 OA O0 00
0x10: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0x20: 00 00 00 01 00 01 00 01 00 01 00 01 00 01 00 01
0x30: 00 01 00 01 00 01

```

\subsection*{2.103}

\section*{Off-center fisheye projection}

See http://www.paulbourke.net/dome/
and especially http://paulbourke.net/dome/offaxisfisheyeprojection/ where unfortunately you can't find the formulas...

A similar effect can be realized with the "h_offset" and "v_offset" options of the v360 filter. But that's the inverse algorithm. It's usable if a fisheye image was taken off-center in a dome, and shall be corrected to the center of the dome.
```

set "IN=1200.png" :: Fisheye test pattern from http://www.paulbourke.net/dome/testpattern/1200.png
set "OUT=out.png" :: Fisheye output image
ffmpeg -i %IN% -lavfi v360=fisheye:fisheye:h_offset=0.5 -y %OUT%
pause

```

At first I thought that the offset correction for a off-center fisheye projector could be done very easy as follows:
```

st(4,ld(4)+%OFFSET_X%);^
st(5,1d(5)+%OFFSET_Y%) ;^
st(6,ld(6)+%OFFSET Z%) ;^
st(0,sqrt(ld(4)*ld(4)+ld(5)*ld(5)+ld(6)*ld(6)));^
st(4,ld(4)/ld(0));^
st(5,ld(5)/ld(0));^
st(6,ld(6)/ld(0));^

```

The above algorithm is the same as the " \(h\) _offset" and " \(v\) _offset" options of the v360 filter. But this approach doesn't work. It turned out that the inverse algorithm is required. The output is given and the input has to be found. First the normalization must be undone by a suitable unknown factor, so that after subtracting the offsets the result is already normalized. Undoing the normalization is possible, but complicated.
For details, see this discussion (in german): https://groups.google.com/g/de.sci.mathematik/c/Dyaif04tgzQ

Here the projection lens is at the dome's center. This is the 1.5 m dome in the Sankt Andreasberg Observatory in the Harz Mountains in Germany.

Here the projection lens it at the OFF_OUT_Y=0.5 position. It's clearly visible that the image gets brighter at the left side and darker at the right side.

This is an example for transformation from fisheye to off-center fisheye, where the lens is shifted half the dome's radius to the side and tilted \(\mathbf{2 6 . 5 6 5}{ }^{\circ}\), so that the optical axis is pointing to the dome's vertex:
```

set "IN_W=1200" :: Input width in pixels
set "IN_H=1200" :: Input height in pixels
set "IN_H_FOV=180" :: Input horizontal field of view in degrees
set "IN_V_FOV=180" :: Input vertical field of view in degrees
set "OUT_W=1200" :: Output width in pixels
set "OUT H=1200" :: Output height in pixels
set "OUT_H_FOV=180" : : Output horizontal field of view in degrees
set "OUT_V_FOV=180" : : Output vertical field of view in degrees
set "YAW=26.565" :: Yaw angle in degrees
set "PITCH=0" :: Pitch angle in degrees
set "ROLL=0" :: Roll angle in degrees
set "OFF_IN_X=0" :: Input X offset, normalized to the dome's radius
set "OFF'IN Y=0" :: Input Y offset, normalized to the dome's radius
set "OFF_IN_Z=0" :: Input Z offset, negative is closer to dome's vertex
set "OFF_OUT_X=0.5" : : Output X offset, normalized to the dome's radius
set "OFF_OUT_Y=0" :: Output Y offset, normalized to the dome's radius
set "OFF_OUT_Z=0" : : Output Z offset, negative is closer to dome's vertex

```

### 2.104

A DLP beamer does always throw an off-axis image. The optical axis of the beamer is below the image (or above the image, if the beamer is mounted upside down).
(I'm still working on this chapter)

```
ffmpeg -f lavfi -i color=red:s=320x180 -f lavfi -i color=yellow:s=320x220 -lavfi vstack -frames 1 -y test1.png
ffmpeg -f lavfi -i color=red:s=320x180 -frames 1 -y test2.png
pause
```

test1.png has size $320 \times 400$ and the optical axis of the beamer is in the center. The red part at the top is the visible part.
Field of view from 500 pixels distance: $35.49^{\circ}$ x $43.60^{\circ}$ (2 * $\operatorname{atan}(320 / 2 / 500)=35.49^{\circ}$
test2.png has size $320 \times 180$ (16:9) and is only the visible part.
Field of view from 500 pixels distance: $35.40^{\circ} \times 20.41^{\circ}$

This is the simple version with the $\mathbf{v} 360$ filter:

```
set "IN=equirectangular.png" :: Input image
set "FOV=180" :: Output field of view in degrees
set "OUT=double_fish.png" :: Output image
ffmpeg -i %IN% -lavfi v360=e:dfisheye:h_fov=%FOV%:v_fov=%FOV%:pitch=0 -y %OUT%
pause
```

Note: Pitch can be 0 or 90 , depending on your needs.

Unfortunately the v360 filter with dfisheye output fills not only the two image circles with data, but instead also the outer areas. The workaround is to overlay a double-circular mask:

```
set "IN=equirectangular.png" :: Input image
set "SIZE=1200x1200" :: Size of half mask
set "FOV=180" 
ffmpeg -f lavfi -i color=black:s=%SIZE% -lavfi format=argb,geq=a='255*gt(hypot(((2*X+1)/H-1),((2*Y+1)/H-
1)),1)':r=0:g=0:b=0,split,hstack -frames 1 -y mask.png
ffmpeg -i %IN% -i mask.png -lavfi v360=e:dfisheye:h_fov=%FOV%:v_fov=%FOV%:pitch=0,overlay -y %OUT%
pause
```

Note: Pitch can be 0 or 90, depending on your needs.

### 2.106 <br> Remap an equirectangular video to a "Little planet" video

Fisheye projection is used. The ground is in the center of the video, and the sky is at the circular edge. The input video must have $2: 1$ width/height ratio.

```
set "IN=test3.mp4" :: Equirectangular input video
set "H=960" :: Height of input video (width = 2 * height)
set "S=1080" :: Size of square little planet output video
set "OUT=out.mp4" :: Output video
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(0.9999+atan2(Y-%S%/2,X-%S%/2)/PI)' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(1-hypot ((2*X/%S%)-1,(2*Y/%S%)-1))' -frames 1-y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i %IN% -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap=fill=green" -q:v 2 -y %OUT%
pause
```

The values in the xmap and ymap files can't be negative. If a value is greater than the size of the input image, this pixel is painted with the color that's specified by the "fill" option.

If you want the sky in the center and the ground at the circular edge, use these remap functions instead:

```
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(0.9999-atan2(Y-%S%/2,X-%S%/2)/PI)' -frames 1-y xmap.pgm
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(hypot ((2*X/%S%)-1,(2*Y/%S%)-1))' -frames 1 - \ y ymap.pgm
```

The same thing can also be done with the $\mathbf{v} 360$ filter:

```
set "IN=test1.png" :: Input image or video
set "FOV=360" :: Output field of view in degrees
set "OUT=littleplanet.png" :: Output image or video
ffmpeg -i %IN% -vf v360=input=equirect:output=fisheye:h_fov=%FOV%:v_fov=%FOV%:pitch=-90 - y %OUT%
pause
```

Similar to "Little planet", but using a different projection. The $360^{\circ}$ world is shown as a reflection on a mirror sphere. The ground is in the center of the video, and the sky is at the circular edge. The input video must have $\mathbf{2 : 1}$ width/height ratio.

```
set "IN=equirectangular_test.png" 
set "OUT=mirror.png"
: Output video
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(0.9999+atan2(Y-%S%/2,X-%S%/2)/PI)' -frames 1-y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(1-2/PI*asin(hypot((2*X/%S%)-1,(2*Y/%S%)-1)))' -frames 1 -y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i %IN% -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap" -q:v 2 -y %OUT%
pause
```

If you want the sky in the center and the ground at the circular edge, use these remap functions instead:

```
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix fmts=gray16le,^
geq='%H%*(0.9999-atan2(Y-%S%/2,X-%S%/2)/PI)' -frames 1-y xmap.pgm
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(2/PI*asin(hypot((2*X/%S%)-1,(2*Y/%S%)-1)))' - frames 1 -y ymap.pgm
```

The same thing can also be done with the "ball" output format of the v360 filter:

| set "IN=testl.png" | $::$ Equirectangular input image or video |
| :--- | :--- |
| set "OUT=mirror.png" | $::$ Output image or video |
| ffmpeg -i \%IN\% -lavfi "v360=input=e: output=ball:pitch=90" -q:v 2 -y mirror.png |  |
| pause |  |

Pitch=90 is for the sky in the center, pitch=-90 is for the ground in the center.

This batch file converts a double-fisheye video from Ricoh Theta V to a "mirror sphere" video:

```
set "IN=R0010017.mp4"
set "H=1920"
set "C=11.5" :: Width of interpolation band in degrees, must be smaller or equal than (FOV-180}\mp@subsup{}{}{\circ}\mathrm{ )
set "T=20" :: Duration in seconds
set "S=1000" :: Output size
set "FPS=24" :: Output framerate
set "OUT=out.mp4" :: Output video
rem Create the mergemap file
ffmpeg -f lavfi -i nullsrc=size=%H%x%H% -vf "format=gray8,geq='clip(128-128/%C%* (180-%FOV%/(%H%/2)*hypot(X-%H%/2,Y-%H
%/2)) , 0, 255)',v360=fisheye:e:ih_fov=%FOV%:iv_fov=%FOV%" -frames 1 -y mergemap.png
rem Merge the two fisheye images from the double-fisheye input video and transform it to a mirror-sphere video
ffmpeg -i %IN% -i mergemap.png -lavfi "[0]format=rgb24,split[a][b];
[a] crop=ih:iw/2:0:0,v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV% [c] ;
[b] crop=ih:iw/2:iw/2:0,v360=fisheye:e:yaw=180:ih_fov=%FOV%:iv_fov=%FOV%[d];[1] format=gbrp[e];[c][d]
[e]maskedmerge,drawbox=x=3*iw/4:y=ih/2:w=1:h=1:color=black,v3\overline{60}=e:ball:roll=-90:w=%S%:h=%S%" -r %FPS% -t %T% -y %OUT%
pause
```

Note: For "equirectangular" to "ball" transformation, the color that's used for unmapped pixels is not located at position 0,0 (as with most other transformations), but instead at $3^{* i w} / 4$, ih/2.

This batch file does the same thing as the previous one, but uses another method for filling the unmapped pixels with a color (alpha_mask, scale2ref, overlay). Surprisingly this method is a little bit faster.

```
set "IN=R0010017.mp4" :: Input video
set "H=1920" :: Height of input video
set "FOV=191.5"
    Horizontal and vertical field of view of the fisheye lenses in degrees
    Width of interpolation band in degrees, must be smaller or equal than (FOV-180*)
    Duration in seconds
    Output size
    Output framerate
    Output video
set "C=11.5"
set "T=20"
set "S=1000"
set "FPS=24"
set "OUT=out17.mp4"
rem Create the mergemap file
ffmpeg -f lavfi -i nullsrc=size=%H%x%H% -vf "format=gray8,geq='clip(128-128/%C%* (180-%FOV%/(%H%/2)*hypot(X-%H%/2,Y-%H
%/2)) ,0,255)',v360=fisheye:e:ih_fov=%FOV%:iv fov=%FOV%" -frames 1 -y mergemap.png
rem Merge the two fisheye images from the double-fisheye input video and transform it to a mirror-sphere video
ffmpeg -i %IN% -i mergemap.png -f lavfi -i color=black:s=2x2 -lavfi "[0]format=rgb24,split[a][b];
[a]crop=ih:iw/2:0:0,v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV% [c] ;
[b] crop=ih:iw/2:iw/2:0,v360=fisheye:e:yaw=180:ih_fov=%FOV%:iv_fov=%FOV%[d];[1]format=gbrp[e];[c][d]
[e]maskedmerge,v360=e:ball:roll=-90:w=%S%:h=%S%:alpha mask=1[f],[2][f]scale2ref,overlay=shortest=1" -r %FPS% -t %T% -y
%OUT%
```

pause

## Note:

- First input of scale2ref: The video that shall be scaled
- Second input of scale2ref: The video which has the reference size
- First output of scale2ref: The scaled video
- Second output of scale2ref: A copy of the second input
- First input of overlay: The main (background) video
- Second input of overlay: The overlay (foreground) video

In this example scale2ref has no labels at its two output, which means overlay uses the same two streams in the same order as inputs.

This batch file does the same thing as the previous one, but uses the "geq" filter for filling the unmapped pixels with a color. This method is slower.

```
set "IN=R0010017.mp4"
set "H=1920"
Input video
Height of input video
set "FOV=191.5"
set "C=11.5"
set "T=20"
Width of interpolation band in degrees, must be smaller or equal than (FOV-180*)
Duration in seconds
set "S=1000"
set "FPS=24
Output size
Output framerate
set "OUT=out17.mp4"
Output video
rem Create the mergemap file
ffmpeg -f lavfi -i nullsrc=size=%H%x%H% -vf "format=gray8,geq='clip(128-128/%C%* (180-%FOV%/(%H%/2)*hypot(X-%H%/2,Y-%H
%/2)) ,0,255)',v360=fisheye:e:ih_fov=%FOV%:iv_fov=%FOV%" -frames 1 -y mergemap.png
rem Merge the two fisheye images from the double-fisheye input video and transform it to a mirror-sphere video
ffmpeg -i %IN% -i mergemap.png -lavfi "[0]format=rgb24,split[a][b];

[b] crop=ih:iw/2:iw/2:0,v360=fisheye:e :yaw=180:i
```

```
Y) ,O)'"-r %FPS% -t %T% - y %OUT%
```

pause

When you want to create a timelapse of many fisheye images, it may happen that one of the images isn't aligned correctly because the viewing direction of the camera was off. With normal (non-fisheye) images that isn't a big problem, because you can simply re-align the image by shifting it in $x$ and $y$ directions. However for fisheye images things are much more complicated. The required procedure is as follows:

1. Remap the fisheye image to an equirectangular $360^{\circ}$ image. The lower part of the image remains black.
2. Apply two rotations to this equirectangular image.
3. Remap the equirectangular image back to a fisheye image.
```
set "IN=IMG_077.jpg" :: Input image or video
set "S=3648" :: Size of square fisheye input image
set "FOV=180" :: Fisheye field of view in degrees
set "X=15" :: Rotation angle around X axis
set "Y=0"
set "Q=5"
set /a "H=%S%/%Q%"
set /a "W=2*%H%"
set /a "A=%H%*%FOV%/360"
set "OUT=out.jpg"
    Rotation angle around Y axis
    Size divider for the intermediate equirectangular image,
    use 1 for best quality, or a bigger value for faster computing
    Height of equirectangular image
    : Width of equirectangular image is always twice the height
    Height of equirectangular image that is actually filled with data, the rest remains black
    Output image or video
rem Create the xmap file for remapping from fisheye to equirectangular
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=pix_fmts=gray16le,^
geq='%S%/2*(1-Y/%A%*sin(X*2*PI/%W%))' -frames 1 - y xmap1.pgm
rem Create the ymap file for remapping from fisheye to equirectangular
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=pix_fmts=gray16le,^
geq='%S%/2*(1-Y/%A%* cos (X*2*PI/%W%))' -frames 1 -y ymap1.pgm
rem Create the xmap file for remapping from equirectangular to fisheye
```

```
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%* (0.9999+atan2(X-%S%/2,Y-%S%/2)/PI)' -frames 1- - y xmap2.pgm
rem Create the ymap file for remapping from equirectangular to fisheye
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%/360*%FOV%*(hypot((2*X/%S%)-1,(2*Y/%S%)-1))' -frames 1 -y ymap2.pgm
rem Remap from fisheye to equirectangular, apply the rotations, then remap back to fisheye
ffmpeg -i %IN% -i xmap1.pgm -i ymap1.pgm -i xmap2.pgm -i ymap2.pgm -filter_complex
"format=pix_fmts=rgb24,remap,v360=pitch=%Y%:roll=%X%:output=e[5] ; [5][3][4]remap" -y %OUT%
pause
```

The same thing can also be done with the $\mathbf{v} 360$ filter. In this example the top left pixel of the input image or video is set to a specific color with the "drawbox" filter. This color is used for all those pixels in the output file, that aren't mapped to a pixel in the input file. Please note that this is an undocumented feature of the v360 filter and it's not guaranteed that it works in all cases.

```
set "IN=1200.png"
set "FOV=180" :: Field of view in degrees
set "PITCH=0"
set "YAW=30"
set "C=green"
set "OUT=out.png" :: Output image or video
Input image or video
:: Rotation angle around X axis
ffmpeg -i %IN% -vf drawbox=w=1:h=1:color=%C%,v360=input=fisheye:ih_fov=%FOV%:iv_fov=%FOV%:output=fisheye:h_fov=%FOV
%:v_fov=%FOV%:yaw=%YAW%:pitch=%PITCH% -y %OUT%
pause
```

The v360 filter does have the "alpha_mask" option. If this option is set, all unused pixels in the output file are set to maximum transparency, so that the overlay filter can be used for filling this area with a color. This example does exactly the same thing as the previous example. Decide yourself which one is easier or faster:
set "IN=1200.png" :: Input image or video

```
set "FOV=180" :: Field of view in degrees
set "PITCH=0" :: Rotation angle around X axis
set "YAW=30"
Rotation angle around Y axis
set "C=green"
set "OUT=out.png"
Color for filling unused area
Output image or video
ffmpeg -i %IN% -f lavfi -i color=%C%:s=1200x1200 -filter_complex v360=input=fisheye:ih_fov=%FOV%:iv_fov=%FOV
%:output=fisheye:h_fov=%FOV%:v_fov=%FOV%:yaw=%YAW%:pitch=%PITCH%:alpha_mask=1[a],[1][a]overlay -frames 1 -y %OUT%
pause
```

Note: If the input is a video, remove the -frames 1 option.

See also www.paulbourke.net/dome/fishtilt/

### 2.109 How the "drawbox" filter works

```
ffmpeg -f lavfi -i color=gray:s=20x20 -vf format=rgb24,drawbox=x=4:y=4:width=6:height=6:thickness=1:color=red -frames 1
-y test.png
pause
```

## The top left pixel of the box is at coordinates $\mathbf{x}, \mathrm{y}$.

The bottom right pixel of the box is at coordinates ( $x+w i d t h-1$ ), $(y+h e i g h t-1)$.
The width and height of the box are exactly "width" and "height", independent of the thickness.
Setting the thickness greater than 1 doesn't change the outer dimensions of the box.
The number of pixels inside the box is (width-2*thickness), (height-2*thickness).
If you want a number of A pixels inside the box, you must set width or height to (A+2*thickness).
Note for "drawbox" filter: This filter doesn't support RGB formats!

The result is an equirectangular panorama video.

```
set "IN=double_fisheye.jpg" :: Input video or picture
set "X1=198" - : X coordinate of center of left fisheye image
set "Y1=210" :: Y coordinate of center of left fisheye image
set "X2=595" :: X coordinate of center of right fisheye image
set "Y2=210" :: Y coordinate of center of right fisheye image
set "SR=192" : : Radius that is actually used from the source video
set "PW=1920" :: Width of panorama video
set "PH=960"
Height of panorama video
set "PH=960"
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%PW%x%PH% -vf format=pix_fmts=gray16le,geq='if(lt(Y,%PH%/2),%X1%-Y*2*%SR%/%PH
%*sin(X*2*PI/%PW%),%X2%+(%PH%-Y)*2*%SR%/%PH%*sin(X*2*PI/%PW%))' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%PW%x%PH% -vf format=pix fmts=gray16le,geq='if(lt(Y,%PH%/2),%Y1%-Y*2*%SR%/%PH
%*\operatorname{cos}(X*2*PI/%PW%),%Y2%-(%PH%-Y)*2*%SR%/%PH%*\operatorname{cos}(X*2*PI/%PW%))' -frames 1 - Y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i %IN% -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap" -q:v 2 -y %OUT%
pause
```

The parameters X1, Y1, X2, Y2 and SR must be carefully adjusted (by try and error) to get a good stitching result. They depend on the size of the source video or picture. Use these values as a starting point: $\mathrm{X} 1=$ width/4, $\mathrm{Y} 1=$ height/2, $\mathrm{X} 2=$ width*3/4, $\mathrm{Y} 2=$ height/2, $\mathrm{SR}=$ height/2. the following table shows how the parameters affect the stitching.
Note: The same thing can also be done with the V360 filter, see the next chapter.

| Parameter | Result when decreasing the parameter | Result when increasing the parameter |
| :---: | :---: | :---: |
| X1 |  |  |
| Y1 |  |  |
| X2 |  |  |
| Y2 |  |  |
| SR |  |  |

When double-fisheye images are stitched together to an equirectangular image, it's possible that stitching artefacts are visible as two vertical lines where the luminance fron the two images doesn't fit together. These artefacts can be removed by applying a suitable luminance gradient at one or both sides of the border. This example applies the gradient to the left side of two vertical borders:

```
set "IN=fli0z.png" :: Input image
set "B1=250" :: Right side of first vertical border, left side is at B1-1
set "B2=750" :: Right side of second vertical border, left side is at B2-1
set "W=25" :: Width of interpolation area
ffmpeg -i %IN% -vf "geq=cb_expr='cb(X,Y)':cr_expr='cr(X,Y)':lum_expr='clip(lum(X,Y) +between(X,%B1%-1-%W%,%B1%-
1) *lerp (0,lum (%B1%,Y) - lum (%B1%-1,Y), (X-%B1%-1+%W%)/%W%) +between(X, %B2%-1-%W%,%B2%-1)
* lerp (0, lum (%B2%,Y) - lum (%B2%-1,Y), (X-%B2%-1+%W%)/%W%),0,255)',format=rgb24" -y out.png
```

pause

## How it works:

In the area of width $\mathbf{W}$ to the left side of the vertical border, a ramp is added to the luminance. The amplitude of this ramp equals the difference of the luminance values left and right of the border.
You have to know in advance where exactly the vertical borders are.

Same as previous example, but now applying the gradient to the left side of the first border and to the right side of the second border:

Same as previous examples, but now applying half of the gradient to the left side and the other half to the right side of both borders:

```
set "IN=fliOz.png" :: Input image
set "B1=250" :: Right side of first vertical border, left side is at B1-1
set "B2=750" :: Right side of second vertical border, left side is at B2-1
set "W=25" :: Half width of interpolation area
ffmpeg -i %IN% -vf "geq=cb expr='cb(X,Y)':cr expr='cr(X,Y)':lum expr='clip(lum(X,Y)+0.5*(
between (X,%B1%-1-%W%,%B1%-\overline{1})*lerp (0,lum(%B1%,Y)-lum(%B1%-1,Y),(\overline{X}-%B1%-1+%W%)/%W%)+
between (X, %B2%-1-%W% , %B2%-1) * lerp (0, lum (%B2%,Y) - lum (%B2%-1,Y), (X-%B2%-1+%W%)/%W%) +
between (X, %B1%,%B1%+%W%) * lerp (lum (%B1%-1,Y) - lum(%B1%,Y) , 0, (X-%B1%)/%W%) +
between (X, %B2%,%B2%+%W%)*lerp(lum (%B2%-1,Y) - lum(%B2%,Y),0,(X-%B2%)/%W%)),0,255)',format=rgb24" -y out.png
pause
```

Remove the line feeds from the command line, which were only inserted for clarity.
Please note that workarounds with geq filter are quite slow.

This is an example for merging two overlapping fisheye videos, realized with the "maskedmerge" filter:

```
set "IN=double fisheye.mp4" :: Input video
set "H=640" : : Height of input video
set "FOV=191.5" :: Horizontal and vertical field of view of the fisheye lenses in degrees
set "C=11.5"
set "T=10"
set "OUT=out.mp4" : : Output video
Width of interpolation band in degrees, must be smaller or equal than (FOV-180}\mp@subsup{}{}{\circ}\mathrm{ )
Duration in seconds
rem Create the mergemap file
ffmpeg -f lavfi -i nullsrc=size=%H%x%H% -vf "format=gray8,geq='clip(128-128/%C%* (180-%FOV%/(%H%/2)*hypot(X-%H%/2,Y-%H
%/2)) ,0,255)',v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV%" -frames 1 -y mergemap.png
rem Merge the two fisheye images from the double-fisheye input video
ffmpeg -i %IN% -i mergemap.png -lavfi "[0]format=rgb24,split[a][b];
[a]crop=ih:iw/2:0:0,v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV%[c];
[b] crop=ih:iw/2:iw/2:0,v360=input=fisheye:output=e:yaw=180:ih_fov=%FOV%:iv_fov=%FOV%[d];[1] format=gbrp[e];[c][d]
[e]maskedmerge" -t %T% -y %OUT%
```

pause

Tested with this input video, downloaded in $1280 \times 640$ size: https://www.youtube.com/watch?v=70Wd7Ex54jE
Note: The FOV variable must be set to the correct field of view of the fisheye lenses. The procedure for finding the best value for "FOV" is as follows: Set " C " to a very small value (for example 0.5 degrees), then find the best FOV value by try and error, then set " C " to a larger value, for example 10 degrees.

Note: The "maskedmerge" filter expects the mergemap in the same pixel format as it processes the first two inputs, and these are (in this case) automatically converted to the planar gbrp pixel format. This is hard to find out, because it's not well documented. That's why the mergemap must be converted to gbrp pixel format as well.
Note: Pixel formats can be checked in the filter chain by inserting the "showinfo" filter. Another method for checking where Ffmpeg did auto-insert format conversions is to use "-v verbose" or (for even more informations) "-v debug". But it's quite hard to find the relevant informations in the long listing.

For comparison, this is the same as the previous example, but it's just hard stitching the two fisheye videos together, without any merging. Tested with the same input video as the previous example.

| set "IN=double fisheye.mp4" | $:$ Input video <br> set "FOV=191.5" |
| :--- | :--- |
|  | : Field ov view of the fisheye lenses, over full image height, <br> $:$ |

```
set "T=10" :: Duration in seconds
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -vf "v360=input=dfisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV%" -t %T% -y %OUT%
pause
```

The following example is for converting a dual-fisheye video from a Ricoh Theta camera to an equirectangular video.
The problem with this input video is that the size is $1920 \times 1080$, which is not a $2: 1$ aspect ratio as it should be. The input video has a black border at the bottom which must be cropped away, so that the height is reduced to 960.

```
set "IN=theta.mp4" :: Input video
set "H=960"
Half of the image width = height of input image after cropping
set "FOV=204"
Horizontal and vertical field of view of the fisheye lenses in degrees
Width of interpolation band in degrees, must be smaller or equal than (FOV-180}\mp@subsup{}{}{\circ}\mathrm{ )
Output video
set "OUT=out.mp4"
rem Create the mergemap file
ffmpeg -f lavfi -i nullsrc=size=%H%x%H% -vf "format=gray8,geq='clip (128-128/%C%* (180-%FOV%/(%H%/2)*hypot(X-%H%/2,Y-%H
%/2)) ,0,255)',v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV%" -frames 1 -y mergemap.png
rem Merge the two fisheye images from the double-fisheye input video
ffmpeg -i %IN% -i mergemap.png -lavfi "[0]crop=h=%H%:y=0,format=rgb24,split[a][b];
[a] crop=ih:iw/2:0:0,v360=input=fisheye:output=e:ih fov=%FOV%:iv fov=%FOV% [c];
[b] crop=ih:iw/2:iw/2:0,v360=input=fisheye:output=e:yaw=180:ih_fov=%FOV%:iv_fov=%FOV%[d];[1] format=gbrp[e];[c][d]
[e]maskedmerge" -y %OUT%
pause
```

If you want to rotate another part of the video into the center, insert one more v360 filter after "maskedmerge" and use the rorder/yaw/pitch/roll rotation options:

```
... [1]maskedmerge,v360=input=e:output=e:rorder=rpy:roll=-95:pitch=-18" -y %OUT%
```

### 2.112 Stitch double-fisheye images with alignment errors

If the optical axes of the lenses of a $360^{\circ}$ camera aren't aligned to exactly opposite direction, the images don't fit together at the borders. We can assume that the first camera's axis is perfect and the second camera has three alignment errors: Yaw, pitch and roll. These errors can be corrected before stitching the images together.

Step 1: Make perfect double-fisheye and equirectangular test images (that means without alignment errors)
set "IN=1200.png"
set "OUT=double_fisheye.png"
ffmpeg -i \%IN\% -i \%IN\% -lavfi "[0]transpose=1[left];[1]transpose=2,negate[right];[left][right]hstack" -y \%OUT\%
set "IN=double_fisheye.png"
set "OUT=equirectangular.png"
ffmpeg -i \%IN\% -lavfi "v360=input=dfisheye:output=e:ih_fov=180:iv_fov=180" -y \%OUT\%
pause
These are the perfect double-fisheye and equirectangular test images:

Step 2: Make a double-fisheye test image with alignment errors

```
set "IN=equirectangular.png"
set "OUT=misaligned_double_fisheye.png
set "FOV=200" :: 午ield of
set "Y=-8" :: yaw error of right fisheye lens
set "P=5" :: pitch error of right fisheye lens
set "R=7" : : roll error of right fisheye lens
ffmpeg -i %IN% -lavfi split[a][b];[a]v360=e:fisheye:h_fov=%FOV%:v_fov=%FOV%[a];[b]v360=e:fisheye:h_fov=%FOV%:v_fov=%FOV
%:rorder=ypr:yaw='180+%Y%':pitch=%P% : roll=%R%[b];[a][\overline{b}]hstack -y %OUT%
pause
```

This is the double-fisheye test image with alignment errors in the right half. You can see that it's shifted to the right and bottom, and rotated counterclockwise:

Step 3: When you now stich the fisheye images together, you will see the alignment errors:

```
set "IN=misaligned_double_fisheye.png"
set "OUT=equirect_misaligned.png"
set "FOV=200" : : field of view
ffmpeg -i %IN% -lavfi "split[a][b];[a]crop=ih:ih:0:0,v360=fisheye:fisheye:ih_fov=%FOV%:iv_fov=%FOV
%:h_fov=180:v_fov=180[a];[b]crop=ih:ih:ih:0,v360=fisheye:fisheye:ih_fov=%FOV%:iv_fov=%FOV%:h_fov=180:v_fov=180[b];[b]
[a]hstack,v360=dfisheye:e:ih fov=180:iv fov=180" -y %OUT%
pause
```

This is the stitched equirectangular image, you can clearly see the alignment errors:

Step 4: Compensate the alignment errors before stitching the images together:

```
set "IN=misaligned_double_fisheye.png"
set "OUT=equirect_\overline{corrected.png"}
set "FOV=200" :: field of view
set "Y=8" :: yaw error of right fisheye lens
set "P=-5" :: pitch error of right fisheye lens
set "R=-7" : : roll error of right fisheye lens
ffmpeg -i %IN% -lavfi "split[a][b];[a]crop=ih:ih:0:0,v360=fisheye:fisheye:ih fov=%FOV%:iv fov=%FOV
%:h_fov=180:v_fov=180[a];[b]crop=ih:ih:ih:0,v360=fisheye:fisheye:ih_fov=%FOV%:iv_fov=%FOV
%:h_fov=180:v_fov=180:rorder=rpy:yaw=%Y%:pitch=%P%:roll=%R%[b] ; [b][a]hstack,v360=dfisheye:e:ih_fov=180:iv_fov=180" -y
%OUT%
pause
```

This is the corrected equirectangular output image:

The tricky part is to find the best values for FOC, Y, P and R by try and error. In this example I did already know the correct values, they are the same as in step 2 but with opposite sign. Please note that the rotation order must also be reversed.

If a flat video is to be shown in a fulldome planetarium with a fisheye projector, some preprocessing is required. The video is downscaled to a smaller size, padded with large black borders to equirectangular 2:1 format, rotated with the v360 filter, and then given out in $180^{\circ}$ fisheye output.

```
set "IN=pk14.mp4" 
set "W=480" : : Width of input video after downscaling, this is for 16:9 aspect ratio
set "H=270" : : Height of input video after downscaling, this is for 16:9 aspect ratio
set "S=1200" :: Size of square fisheye output video
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -lavfi "scale=%W%:%H%,pad='2*%S%':%S%:-1:-
1,format=pix_fmts=rgb24,v360=input=equirect:output=fisheye:h_fov=180:v_fov=180:pitch='90-%UP%'" -y %OUT%
pause
```

It's also possible to use the flat video directly as input for the v360 filter. This has the problem that the unused area is filled with a random color (coming from the top left pixel of the input video). As a workaround, this pixel is filled with black before using the v360 filter:

```
set "IN=pk14.mp4" :: Input video
set "UP=30" :: Up-looking angle in degrees (center of the rectangular video)
set "H=64" :: Horizontal field of view, this is for 16:9 aspect ratio
set "V=36" : : Vertical field of view, this is for 16:9 aspect ratio
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -vf drawbox=w=1:h=1:color=black,v360=input=flat:ih_fov=%H%:iv_fov=%V
%:output=fisheye:h_fov=180:v_fov=180:pitch='90-%UP%' -y %OUT%
pause
```

With sufficient computing power live processing is possible. Just drag and drop the input video over the icon of this batch file:

| set $" U P=30 "$ | $::$ Up-looking angle in degrees (center of the rectangular video) |
| :--- | :--- |
| set $\mathrm{H}=64 "$ | $:$ Horizontal field of view, this is for $16: 9$ aspect ratio |
| set $" V=36 "$ | $::$ Vertical field of view, this is for $16: 9$ aspect ratio |

```
ffmpeg -re -i %1 -vf drawbox=w=1:h=1:color=black,v360=input=flat:ih_fov=%H%:iv_fov=%V
%:output=fisheye:h_fov=180:v_fov=180:pitch='90-%UP%' -window_fullsc\overline{reen 1 -f s\overline{d}l2 -}
```

Please note that the sdl2 output doesn't play audio. The Windows taskbar remains visible in fullscreen mode. You can hide it as follows: Make a right click on the taskbar, click on "properties" and then select "automatically hide taskbar".

This is an example for live processing and passing the output to FFplay. Just drag and drop the input video over the icon of this batch file. FFplay has the advantage that it does also play audio, and the Windows taskbar is automatically hidden:

The -fs option means full screen, and -autoexit means that FFplay closes automatically when the end of the video has been reached.

In this example a $180^{\circ}$ fisheye image is used as the background and a flat image is overlaid above the horizon. This should also work for videos instead of images.

```
set "BG=fisheye.jpg" :: Fisheye background image (or video)
set "FG=flat.jpg" :: Flat foreground image (or video)
```

```
set "ID=45"
set "S=3648"
set "OUT=out.jpg" :: Output image (or video)
Size of the square fisheye input and output images (or videos)
ffmpeg -i %BG% -i %FG% -lavfi "[1]v360=input=flat:output=fisheye:id_fov=%ID%:h_fov=180:v_fov=180:w=%S%:h=%S%:pitch='90-
%UP%':alpha_mask=1[fg];[0][fg]overlay" -y %OUT%
pause
```

This is the same as before, but the flat image is duplicated, so that the same image is shown at the north and south horizon:

```
set "BG=fisheye.jpg" :: Fisheye background image (or video)
set "FG=flat.jpg" :: Flat foreground image (or video)
set "UP=15"
set "ID=45"
set "S=3648"
set "OUT=out.jpg" :: Output image (or video)
ffmpeg -i %BG% -i %FG% -lavfi "[1]v360=input=flat:output=fisheye:id fov=%ID%:h fov=180:v fov=180:w=%S%:h=%S%:pitch='90-
%UP%':alpha_mask=1,split[fg1][fg2];[fg2]rotate=PI[fg3];[0][fg1]over\overline{lay[a];[a][白g3]overlay" -y %OUT%}
pause
```

Some explanations for this example:
[0] and [1] are predefined labels for the input files.
[0] is the first input, in this case "in.png"
[1] is the second input, in this case "in.mp4"
[fg1] [fg2] [fg3] and [a] are just labels and you can change them if you want.
"alpha_mask" is an option of the $\mathbf{v} 360$ filter. In this case it's used to make the outer area of the rectangular video transparent.
https://www.ffmpeg.org/ffmpeg-all.html\#v360
"split" is a filter that has one input and two (or more) outputs. It is here used to duplicate the foreground video.
https://www.ffmpeg.org/ffmpeg-all.html\#split_002c-asplit
"rotate" is a filter that rotates the video. In this case it's used to rotate one of the foreground videos to the other side of the dome.
https://www.ffmpeg.org/ffmpeg-all.html\#rotate
"overlay" is a filter that has two inputs and one output. Because in this case we want to overlay two videos, we must use it two times. https://www.ffmpeg.org/ffmpeg-all.html\#overlay-1

If the surface of the planet is given as an equirectangular image, then things are quite simple:

This is the same as the previous example, but with day/night and twilight zone added:

```
set "IN=Earth_eq.jpg" :: Equirectangular image of earth or planet surface, for example from:
set "BG=Starfield.jpg"
set "SIZE=1024x512"
set "TW=20"
set "DEC=23.5"
set "DS=10"
set "S=-0.005"
set "Y=90"
set "P=50"
set "R=0"
set "D=400"
set "XP=800"
set "YP=400"
set "T=10"
    https://de.wikipedia.org/wiki/Datei:Nasa_land_ocean_ice_8192.jpg
    Background image
    Size for mergemap, must be the same as the equirectangular input video
    Width of twilight zone in degrees
Declination of light source (sun), 0}\mp@subsup{0}{}{\circ}\mathrm{ for spring equinox, +23.5
    0
    Brightness of the dark side, O for black, }255\mathrm{ for full brightness
    Rotation speed, 1.0 means one full revolution per frame
Yaw angle
Pitch angle
Roll angle
Diameter of planet
X position of planet
y position of planet
y position of planet
ffmpeg -f lavfi -i nullsrc=size=%SIZE% -vf "format=gray8,geq='clip((1+180*(Y-H/2)*128/(%TW%*(H/2))),%DS
%,255)',v360=e:e:pitch=%DEC%+90,format=rgb24" -frames 1 -y mergemap.png
ffmpeg -loop 1 -i %BG% -loop 1 -i %IN% -f lavfi -i color=black:size=%SIZE%,format=rgb24 -i mergemap.png -lavfi
"[1]scroll=h=%S%,format=rgb24[a]; [2] [a][3]maskedmerge,v360=e:perspective:yaw=%Y%:pitch=%P%:roll=%R%:alpha_mask=1,scale=
%D%:%D%[a],[0] [a] overlay=x=%XP%:y=%YP%" -t %T% -y out.mp4
```

pause

## Warning: Don't use the v360 filter's "perspective" projection if you need scientifically correct behaviour. The "perspective" projection depends somehow on the option " $v$ _fov", but the exact meaning of this option is unknown in this context. Better use a workaround with "remap" filter. I did try to reverseengineer the source code to find out the meaning of the "v_fov" option, but this approach wasn't successful.

If a normal perspective image of the planet is given, then things are more complicated. It's clear that the perspectice image contains only half of the planet's surface. The other half must be replaced by a color.

Another problem is that FFmpeg's "v360" filter allows perspective images only for output, but not for input. In this case a workaround with the "remap" filter is required. As described above, it's also recommended to use the "remap" workaround for "perspective" output.

Now l'd like to describe how to create an image of the moon, as it appears from the side. It's impossible to take such an image from the earth, because the moon is always facing (roughly) the same side towards the earth. The first step is to take an image of the moon with a telescope or a telephoto lens. The second step is to measure in this image the moon's center coordinates and its radius. In case of a full moon this is quite simple, but for other moon phases it's more difficult. One approach is to measure the coordinates of three points on the moon's edge. These points should have wide spacing from each other. From the coordinates of these three points it's possible to calculate the center coordinates and the radius.
Because it's time consuming to do this with a pocket calculator, I wrote a small C\# program for the job. The source code can be downloaded here: http://www.astro-electronic.de/source/FindCenterOfCircle.zip

Now the center coordinates and the radius are known and can be inserted in this batch file. In the output image the observer is rotated $61^{\circ}$ to the left:

| set "IN=moon.jpg" | $::$ Input image |
| :--- | :--- |
| set "XC=927.7" | $::$ X coordinate of center of planet in input image |
| set "YC=2310.3" | $::$ Y coordinate of center of planet in input image |
| set "R=2070.0" | $::$ Radius of planet in input image |
| set "W=4000" | $::$ Width of intermediate equirectangular image |
| set "H=2000" | $::$ Height of intermediate equirectangular image |
| set "FILL=blue" | $::$ Fill color for no-data area |
| set "YAW=61" | $::$ Rotation angle |
| set "B=250" | :: Width of added border |
| set "OUT=out.png" | : Output image |
| rem Create the xmap file, from "perspective" input image to intermediate equirectangular image |  |

 $\% \mathrm{XC} \%+\% \mathrm{R} \% * \sin (1 \mathrm{~d}(0)) * \cos ((Y-0.5 * \% H \%) * \mathrm{PI} / \% \mathrm{H} \%),-1)^{\prime}-\mathrm{frames} 1-y$ xmap.pgm
rem Create the ymap file, from "perspective" input image to intermediate equirectangular image
ffmpeg -f lavfi -i nullsrc=size= $\% W \% x \% H \%-v f$ format=gray16le, geq='st(0,(X-\%H\%)*PI/\%H\%);if(between(ld(0),-0.5*PI,0.5*PI), $\% \mathrm{YC} \%+\% \mathrm{R} \% * \sin ((\mathrm{Y}-0.5 * \% \mathrm{H} \%) * \mathrm{PI} / \% \mathrm{H} \%),-1)^{\prime}$-frames 1 - y ymap.pgm
rem Rotate the moon
ffmpeg -i \%IN\% -i xmap.pgm -i ymap.pgm -lavfi "format=rgb24,remap=fill=\%FILL\%,v360=e:perspective:yaw=\%YAW $\%:$ alpha_mask $=1$, pad=iw $+2 * \% B \%: i h+2 * \% B \%: \% B \%: \% B \%-y$ \%OUT $\%$
pause
Please note that the above batch file uses the incorrect "perspective" output of the v360 filter. The next batch file is better. It uses the "remap" workaround instead of the "perspective" projection of the "v360" filter:

Here are the input and output images. Input image taken by me 2018-05-20. You can see in the input image that Mare Crisium (at 2 o'clock) appears elongated in N -S direction, but when the point of view was moved $60^{\circ}$ to the right you realize that in fact it's elongated in E-W direction. The no-data area is shown blue:

The script does also work if the input image contains only a part of the moon. The only requirement is that a large enough part of the moon's edge is visible, for calculating the center coordinates and the radius. It's no problem if the moon's center is outside the image. In this image you see Mare Marginis and Mare Smythii, which are right of Mare Crisium:

Compare with a real map of the moon (select the projection "Lunar Globe 3D"): https://quickmap.Iroc.asu.edu/projections

### 2.115

## Live rotation of the moon

A live video of the moon is taken with the GH5S camera, connected to a telescope. The signal is captured with a HDMI to USB converter, and then processed in realtime so that the libration area becomes visible. The left half of the display shows the input video with a red frame. The telescope must be positioned so that the moon fits exactly in the frame. The right half of the display shows the rotated moon. Some variables must be set in the batch file before running: Moon radius, latitude and longitude rotation angles.

```
set "IW=1920"
set "R=512"
set "H=1700"
set "S=960"
set "R2=450"
set "FRAME=red"
set "FILL=blue"
set "LON=60"
set "LAT=0"
set /a "IH2=%IH%/2"
set /a "W=2*%H%"
set /a "S2=%S%/2"
rem Create the xmapl file, from "perspective" input image to intermediate equirectangular image
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=gray16le,geq='st(0,(X-%H%)*PI/%H%);if(between(ld(0) ,-0.5*PI,0.5*PI),
%IH2%+%R%*sin(ld (0))*\operatorname{cos}((Y-0.5*%H%)*PI/%H%),-1)' -frames 1 - y xmap1.pgm
rem Create the ymap1 file, from "perspective" input image to intermediate equirectangular image
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=gray16le,geq='st(0,(X-%H%)*PI/%H%);if(between(ld(0),-0.5*PI,0.5*PI),
%IH2%+%R%*\operatorname{sin}((Y-0.5*%H%)*PI/%H%),-1)' -frames 1 -y ymap1.pgm

pause
```

This is a live screenshot:

### 2.116 Insert a crosshair in a live video

A live video is captured with a HDMI to USB converter, and then a crosshair is inserted before the video is shown on the computer screen.
This can be used for checking if a telescope tracks the stars correctly.

```
set "IW=1920" :: Width
set "IH=1080" :: Height
set "C=white" :: Color of crosshair
set "G=10" :: Radius of clear area in the center
ffmpeg -f dshow -video_size %IW%x%IH% -framerate 5 -pixel_format yuyv422 -i video="USB Video" -lavfi
"format=rgb24,drawbox=x=iw/2:y=0:w=1:h=ih/2-%G%:color=%C%,drawbox=x=iw/2:y=ih/2+%G%:w=1:h=ih/2-%G%:color=%C
```

```
0 -window_y 0 -f sdl2 -
pause
```

This script enlarges the four corners of a live video by an adjustable factor. If you set the factor to 1 , then the video is shown unchanged. The live video is captured by a HDMI to USB converter. Can be used for adjusting telescope optics.

```
set "IW=1920" : : Width
set "IH=1080" :: Height
set "F=5" :: Enlarging factor
ffmpeg -f dshow -video_size %IW%x%IH% -framerate 5 -pixel_format yuyv422 -i video="USB Video" -lavfi
"format=rgb24,split=4 [a] [b] [c] [d]; [a] crop=iw/2/%F%:ih/2/%F%:0:0,scale=iw*%F%:ih*%F%[aa],[b]crop=iw/2/%F%:ih/2/%F%:iw-
iw/2/%F%:0,scale=iw*%F%:ih*%F%[bb],[c] crop=iw/2/%F%:ih/2/%F%:0:ih-ih/2/%F%,scale=iw*%F%:ih*%F%[cc], [d]crop=iw/2/%F
%:ih/2/%F%:iw-iw/2/%F%:ih-ih/2/%F%,scale=iw*%F%:ih*%F%[dd], [aa][bb][cc][dd]xstack=inputs=4:layout=0_0|w0_0|0_h0|
w0_h0,format=rgb24" -window_x 0 -window_y 0 -f sdl2 -
pause
```

This is the same as before, but the input video is grabbed from the first monitor and the result is shown on the second monitor. You can use this script with any software that uses the full screen of the first monitor.

```
set "IW=1920" :: Width of first monitor
set "IH=1080" :: Height of first monitor
set "F=5" :: Enlarging factor
ffmpeg -f gdigrab -video_size %IW%x%IH% -i desktop -lavfi "format=rgb24,split=4[a][b][c][d];[a]crop=iw/2/%F%:ih/2/%F
%:0:0,scale=iw*%F%:ih*%F% [aa],[b] crop=iw/2/%F%:ih/2/%F%:iw-iw/2/%F%:0,scale=iw*%F%:ih*%F% [bb],[c] crop=iw/2/%F%:ih/2/%F
%:0:ih-ih/2/%F%,scale=iw*%F%:ih*%F%[cc],[d]crop=iw/2/%F%:ih/2/%F%:iw-iw/2/%F%:ih-ih/2/%F%,scale=iw*%F%:ih*%F%[dd],[aa]
[bb][cc][dd]xstack=inputs=4:layout=0_0|w0_0|0_h0|w0_h0,format=rgb24" -window_x %IW% -window_y 0 -f sdl2 -
```

pause

Note: "-window_x 1920" near the end of the command line means that the output begins at $x=1920$, that's the left edge of the second monitor (if the width of the first monitor is 1920).

The idea is to horizontally stack many images together, so that we get a very wide image. In this image, connect the upper edge to the lower edge, so that we get a long cylindrical tube. Now fly through this tube with the camera.

```
set "IN=image%%3d.jpg" :: Input filenames
set "N=26" :: Number of images
set "T=3" :: Time in seconds for scrolling from one image to the next image
set /a "D=%T%*(%N%-2)" :: Duration (Warning: /a supports only integer arithmetic!)
set "IH=400"
set "PW=1200"
set "PH=800"
set "A=1200"
set "E=10"
set "FPS=30"
set "OUT=tunnel.mp4"
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%PW%x%PH% -vf format=pix_fmts=gray16le,geq='st(0,hypot(%PW%/2-X,%PH%/2-Y));%A%*(1-%E
%/ld(0))' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%PW%x%PH% -vf format=pix fmts=gray16le,geq='%IH%*(0.5-atan2(%PH%/2-Y,%PW%/2-X)/(2*PI))'
-frames 1 -y ymap.pgm
rem Create the tunnel video
ffmpeg -framerate 1/%T% -start_number 2 -i %IN% -framerate 1/%T% -start_number 1 -i %IN% -framerate 1/%T% -start_number
0 -i %IN% -i xmap.pgm -i ymap.pgm -filter_complex [0][1][2]hstack=inputs=3,fps=%FPS%,crop=w=2*iw/3:x='iw/3*(1-mod(t,%T
%)/%T%)',format=pix_fmts=rgb24[5] ; [5] [3] [4]remap -t %D% -y %OUT%
```

pause

An alternative approach is to project the images on a cone instead of a cylinder. Only the xmap file must be changed:

This is the tunnel effect with an additional spiral effect:

```
set "IN=image%%3d.jpg" :: Input filenames
set "N=6" :: Number of images
set "T=3" :: Time in seconds for scrolling from one image to the next image
set /a "D=%T%*(%N%-2)" :: Duration (Warning: /a supports only integer arithmetic!)
set "IH=400"
set "PW=1200"
set "PH=800"
set "A=1200"
set "E=10"
set "S=500"
set "FPS=30
set "OUT=tunnel.mp4" :: Output filename
    Height of input images
    Height of input images
    Height of output video
    Distance from viewing point to image plane
    :: Radius of central black dot
    :: Spiral effect, number of pixels in radial direction for a 360
    Output framerate
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%PW%x%PH% -vf format=pix_fmts=gray16le,geq='st(0,hypot(%PW%/2-X,%PH%/2-Y));%A%*(1-%E
%/ld(0))' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%PW%x%PH% -vf format=pix_fmts=gray16le,geq='%IH%*(mod (hypot(%PW%/2-X,%PH%/2-Y)/%S%+0.5-
atan2(%PH%/2-Y,%PW%/2-X)/(2*PI),1))' -frames 1 -y ymap.pgm
rem Create the tunnel video
ffmpeg -framerate 1/%T% -start number 2 -i %IN% -framerate 1/%T% -start number 1 -i %IN% -framerate 1/%T% -start number
0 -i %IN% -i xmap.pgm -i ymap.pgm -filter_complex [0][1][2]hstack=inputs=3,fps=%FPS%,crop=w=2*iw/3:x='iw/3*(1-mod}(t,%
%)/%T%)',format=pix_fmts=rgb24[5] ; [5] [3] [4]remap -t %D% -y %OUT%
pause
```

How the mathematics of this filter works:

A is the distance from the viewing point to the output image plane.
$E$ is the radius of the central area in the outpot image, which will remain black.
$R$ is the radial coordinate in the output image.
$X$ is the horizontal coordinate in the input image.
$\mathbf{C}$ is a parameter that defines how far the vanishing point is behind the output image plane.
In the special case of a cylindrical tube $(C \rightarrow \infty)$ the formula simplifies to: $X=A(1-E / R)$
You must make sure that for the maximum possible value of $R$ the resulting $X$ value doesn't exceed the width of the input image.

### 2.119

## Black hole simulation with remap filter

An introduction to Kerr black holes, including mathematics: http://www.madore.org/~david/math/kerr.html
An exact mathematical approach for the simulation of spinning black holes can be found here:
Oliver James, Eugenie von Tunzelmann, Paul Franklin, Kip S. Thorne: "Gravitational Lensing by Spinning Black Holes in Astrophysics, and in the Movie Interstellar https://arxiv.org/abs/1502.03808

There are many informations about black hole simulations on Simon Tyran's website: http://www.yukterez.net/

A black hole simulation by Ziri Younsi:

- Falling into a black hole (Realistic Ultra HD 360 VR movie) [8K] https://www.youtube.com/watch?v=S6qw5 YA8iE

A video from Alessandro Roussel about how to make an exact simulation of a black hole (in french language):

- https://www.youtube.com/watch?v=PjWjZFwz3rQ

FFmpeg's remap filter can be used to simulate the light deviation near black holes.
As an approximation, when a beam of light passes near a black hole, it will be deviated by angle alpha (in Radians):
alpha = 2 * rs / (r-rs)
where $r$ is the Schwarzschild radius of the black hole, and $r$ is the closest distance between the beam and the center of the black hole.
Assuming we have a $180^{\circ}$ fisheye image, we can express the light deviation in pixels: c = height / pi *2 * rs / (r-rs)

The values for the PGM files (which are required for the remap filter) can be calculated with these formulas:
$r=\operatorname{sqrt}\left((x-x c)^{\wedge} \mathbf{2}+(y-y c)^{\wedge} \mathbf{2}\right)$
$\mathrm{c}=$ shape $/(\mathrm{r}-\mathrm{rs}) \quad$ where shape is a constant that defines the "strength" of the distortion
if $r>r$ :
x_remap $=x-c$ * $(x-x c)$
$y \_$remap $=y-c^{*}(y-y c)$
if $r<r s$ :
x_remap $=0$
y_remap $=0$
where $\mathrm{xc}, \mathrm{yc}$ are the pixel coordinates of the center of the black hole, $\mathrm{x}, \mathrm{y}$ are the pixel coordinates in the source video and r is the distance between the source pixel and the center of the black hole.

This is the batch file for applying the black-hole-effect to a video:

```
set "IN=MVI_2562.mov" :: Input video
set "OUT=output.mp4" :: Output video
ffmpeg -i %IN% -i xmap.pgm -i ymap.pgm -lavfi "format=pix_fmts=rgb24,remap" -c:v mpeg4 -q:v 2 -y %OUT%
pause
```

It's also possible to simulate moving black holes. To do this you need many xmap and ymap files (one for each frame), and loop through them.

```
set "IN=MVI_2562.mov" :: Input video
set "OUT=oūtput.mp4" :: Output video
ffmpeg -i %IN% -framerate 30 -i xmap%%4d.pgm -framerate 30 -i ymap%%4d.pgm -lavfi "format=pix_fmts=rgb24,remap" -c:v
mpeg4 -q:v 2 -y %OUT%
pause
```

Calculate the xmap and ymap files for all frames. This is done by a C\# program, which can be downloaded here: http://www.astro-electronic.de/source/Moving_Black_Hole.zip

Example of a simulated black hole:

Black hole simulation with FFmpeg, no C\# code required:

```
set "W=2448" :: Width of image
set "H=2448" :: Height of image
set "CX=2000" :: X center of distortion
set "CY=1200" :: Y center of distortion
set "RS=50" :: Schwarzschild radius
set "SH=0.50" :: Shape parameter
rem Create the xmap file
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=pix fmts=gray16le,geq='st(0,X-%CX%);st(1,hypot(ld(0),%CY%-Y));st(2,X-
(ld(0)*%SH%*2*%RS%/(ld(1)-%RS%)));if(lt(%RS%,ld(1)),clip(ld(2),0,%W%),0)' -frames 1 -y xmap.pgm
rem Create the ymap file
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=pix_fmts=gray16le,geq='st(0,Y-%CY%);st(1,hypot(%CX%-X,ld(0)));st(2,Y-
(ld(0)*%SH%*2*%RS%/(ld(1)-%RS%)));if(lt(%RS%,ld(1)),clip(ld(2),0,%H%),0)' -frames 1 -y ymap.pgm
rem Apply the displace filter to the image
ffmpeg -i test3.mp4 -i xmap.pgm -i ymap.pgm -lavfi format=pix_fmts=rgb24,remap -frames 1 -y out.jpg
rem Alternatively it can all be written in one command line:
ffmpeg -i test3.mp4 -f lavfi -i nullsrc=size=%W%x%H% -f lavfi -i nullsrc=size=%W%x%H% -lavfi
[0] format=pix_fmts=rgb24[v]; [1] format=pix_fmts=gray16le,geq='st(0,X-%CX%);st(1,hypot(ld(0),%CY%-Y));st(2,X- (ld(0) *%SH
%*2*%RS%/(ld(1) -%RS%)));if(lt(%RS%,ld(1)),clip(ld(2),0,%W%),0)'[x];[2]format=pix_fmts=gray16le,geq='st(0,Y-%CY
%);st(1, hypot (%CX%-X,ld(0)));st(2,Y-(ld(0)*%SH%*2*%RS%/(ld(1)-%RS%)));if(lt(%RS%,ld(1)),clip(ld(2),0,%H%),0)'[y];[v][x]
[y]remap -frames 1 -y out.jpg
pause
```

This example is for a moving black hole, no C\# code required (but unfortunately this is extremely slow):

| set "IN=test3.mp4" | : : Input video |
| :---: | :---: |
| set "W=2448" | : : Width of video |
| set "H=2448" | : : Height of video |

st $(4, \mathrm{Y}-(\operatorname{ld}(2) * \% S H \% * 2 * \% \mathrm{RS} \% /(\operatorname{ld}(3)-\% \mathrm{RS} \%)))$;^
if (lt $(\% \mathrm{RS} \%, \operatorname{ld}(3)), \operatorname{clip}(\operatorname{ld}(4), 0, \% \mathrm{H} \%), 0) \cdot[y] ; \wedge$
[v][x][y]remap -t $3-y$ \%OUT\%
pause
" $\mathrm{T}+0.001$ " is a workaround to avoid the problem that at the segment borders two "between" expressions become simultaneously true.
This method is extremely slow because this expression must be evaluated four times for each pixel, although it would be sufficient to evaluate it only one time per frame:
st ( 1, between ( $T+0.001,0,1$ ) *lerp ( $\%$ CY $0 \%, \% C Y 1 \%, T$ ) +between ( $T+0.001,1,2$ ) *lerp ( $\%$ CY1 $\%, \% C Y 2 \%, T-1$ ) +between ( $T+0.001,2,3$ ) *lerp ( $\% C Y 2 \%, \% C Y 3 \%, T-2$ ) );
Recommended workaround: Calculate many xmap and ymap files in advance by C\# code.

A wormhole is a hypothetical window to another place in space or time, or even in another universe.
For more informations see https://en.wikipedia.org/wiki/Wormhole

Short story from Rudy Rucker:

- "The Last Einstein-Rosen Bridge" http://www.rudyrucker.com/transrealbooks/completestories/\# Toc14

An easy-level book, unfortunately without any mathematics:

- Kip Thorne: "The Science of Interstellar"

The exact mathematical approach can be found in this paper. Unfortunately the mathematics exceed my capabilities by far:

- Oliver James, Eugenie von Tunzelmann, Paul Franklin, Kip S. Thorne: "Visualizing Interstellar's Wormhole" https://arxiv.org/pdf/1502.03809.pdf
- The same paper is also available here: https://aapt.scitation.org/doi/10.1119/1.4916949

## Two very interesting videos by Scott Manley:

- What Would Travelling Through A Wormhole Look Like? (VR/360) https://www.youtube.com/watch?v=V7e-1bRpweo
- Wormholes Get Weirder - Watch Other Objects Near Wormholes \& Learn How I Created The Images https://www.youtube.com/watch?v=PVO8nvb1o2w The math is a little bit explained beginning at 7:40. Two pages of the code are visible at 12:40 (slow 3D version) and 12:44 (much faster 2D version). Somewhere in the comments he mentioned that he did use the "RK4" Runge-Kutta algorithm. I got his C code and will try to understand that later.

An article from Jason Biggs, Wolfram Alpha: (I'm not familiar with this programming language)

- Visualizing Interstellar's Wormhole: from article to programming https://community.wolfram.com/groups/-/m/t/852052 Please note that some characters got lost in the code.
- The same code (without missing characters) is also available here: https://mathematica.stackexchange.com/questions/110945/interstellar-imageeffects

Here are several wormhole simulations by Pierre-Jean Charpin:

- https://www.youtube.com/channel/UC51wkO4JFG-a018jIAOh9rA/videos

A wormhole simulation by Alessandro Roussel:

- $360^{\circ}$ Traversing a flat Worm Hole https://www.youtube.com/watch?v=Fqm_OG4dvKs

A wormhole simulation by Robert Szili:

- Walking around a wormhole https://www.youtube.com/watch?v=4Wm3F9s8ThE

## A simplified wormhole can be simulated in a video as follows:

- In the outer area the light rays are distorted in the same way as when passing near a black hole. This can be simulated with the remap filter.
- In the inner area, another video is inserted as a $360^{\circ}$ "little planet" video (or even better a mirror-sphere video).
- The drawback of this simplified simulation is that you can't let the camera or an object fly through the wormhole. You can only look a t it from a distance.

This is a batch file for wormhole simulation. The xmap0000 and ymap0000 files for the black hole are created in advance by C\# code.

```
set "IN=main.mov" :: Main input video
set "LP=test1.mp4" : : Equirectangular video for little planet
set "H=960" :: Height of equirectangular input video
set "S=1080" :: Size of square little planet output video
set "P=0"
Pitch angle
set "Y=90"
set "R=-90"
set "LPD=100"
set "LPX=1500"
set "LPY=1000"
set "T=8"
rem Step 1: Convert the equirectangular video to a little planet video
rem Create the xmap and ymap files
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(0.9999+atan2(Y-%S%/2,X-%S%/2)/PI)' -frames 1 -y xmap.pgm
ffmpeg -f lavfi -i nullsrc=size=%S%x%S% -vf format=pix_fmts=gray16le,^
geq='%H%*(1-hypot((2*X/%S%)-1,(2*Y/%S%)-1))' -frames 1 -y ymap.pgm
rem Apply the remap filter to the video
ffmpeg -i %LP% -i xmap.pgm -i ymap.pgm -lavfi "v360=output=e:pitch=%P%:yaw=%Y%:roll=%R%,format=pix_fmts=rgb24,remap"
-q:v 2 -t %T% -y lp.mp4
rem Step 2: Apply the black hole effect to the main video and then overlay the little planet video over the black hole
ffmpeg -i %IN% -i lp.mp4 -i xmap0000.pgm -i ymap0000.pgm -filter_complex "[0][2][3]remap[4];[1]scale=%LPD%:%LPD
%,format=argb,geq=a='255*lt(hypot ((2*X/W) -1, (2*Y/H)-1),1)':r='r(\overline{X},Y)':g='g(X,Y)':b='b(X,Y)'[5]; [4][5]overlay=x=%LPX%-
%LPD%/2:Y=%LPY%-%LPD%/2" -q:v 2 -t %T% -y out.mp4
```

pause

The same thing can de done much easier with the v360 filter and the alpha_mask option:

```
set "IN=main.mov" :: Main input video
set "LP=test1.mp4" :: Equirectangular video for mirror-sphere
set "H=960"
set "S=1080"
set "P=30" :: Pitch angle
set "Y=0"
set "R=0"
set "LPD=102"
set "LPX=1800"
set "LPY=1000"
set "T=8"
Equirectangular video for mirror-spher
:. Size of square mirror-sphere output vide
Pitch angle
Yaw angle
Roll angle
Mirror-sphere diameter
: X Position of center of mirror-sphere
Y Position of center of mirror-sphere
set "T=8" :: Length of output video
rem Make only the mirror-sphere video
rem ffmpeg -i %LP% -vf v360=output=ball:pitch=%P%:yaw=%Y%:roll=%R% -q:v 2 -t %T% -y lp.mp4
ffmpeg -i %IN% -i xmap0000.pgm -i ymap0000.pgm -i %LP% -filter_complex "[0][1][2]remap[4];[3]v360=output=ball:pitch=%P
%:yaw=%Y%:roll=%R%:alpha mask=1,scale=%LPD%:%LPD%[5];[4][5]overlay=x=%LPX%-%LPD%/2:y=%LPY%-%LPD%/2" -q:v 2 -t %T% -y
out.mp4
pause
```

### 2.121 <br> Simulation of a moving wormhole

If the wormhole shall move in the field of view, two things must move:

1. The black hole distortion must move. This requires many unique xmap and ymap files for each frame. These files are created by a $C=$ program.
2. The inserted mirror-sphere video must move. This can be realized with sendemd and overlay filters.

Step 1:
In the main video it's recommended to have a small object at that position in space where the wormhole shall later be inserted. This can for example be a small white ball (about 8 mm diameter) on an almost invisible tripod (which can be built with 0.3 mm diameter carbon fibers).
The $x, y$ coordinates of this object must be measured in each frame. There are two methods how to measure the $x$, $y$ coordinates: Either extract many images from the video and measure the coordinates manually (this is described in step 2), or preferably extract the coordinates automatically with FFprobe and find_rect filter. In this case continue with step 3.

## Step 2:

Extract a suitable number of frames from the main video:

```
set "IN=in.mp4" :: Input video
set "STEP=1" :: Step width (number of frames)
set "OUT=image%%4d.jpg" :: Output images filename
ffmpeg -i %IN% -vf framestep=%STEP% -start_number 0 -y %OUT%
pause
Measure the \(x, y\) coordinates of the small object in each frame and enter the positions in the "measured.csv" file. Set the "offset" variable in the C\# program to 0 . Continue with step 4.
```

Step 3:
Create a small $40 \times 40$ pixel grayscale image of the object and then automatically extract the $x, y$ coordinates from the main video:

Note: To speed up the algorithm, make the object image as small as possible (40x40 pixels) and specify a search window with the xmin, xmax, ymin, ymax options.
This is the resulting logfile. If no coordinates are written in a line, then no object was found for the specified threshold. In this case you can try a larger threshold value, or you have to enter the coordinates manually.

```
0.000000
0.040000
0.080000
0.120000,45,1
0.160000,45,1
0.200000,45,1
0.240000,45,1
```

Note: These coordinates are for the top left corner of the $40 \times 40$ pixels search window. Set the "offset" variable in the C\# program to 20 .

## Step 4:

Calculate the xmap and ymap files for all frames. This is done by a C\# program, which can be downloaded here: http://www.astro-electronic.de/source/Moving_Black Hole.zip

## Step 5:

The file positions.cmd was also automatically created by the C\# program (many lines omitted here):

```
0.00 overlay x 1665.00, overlay y 454.00, scale w 100.00, scale h 100.00
0.04 overlay x 1665.00, overlay y 454.00, scale w 100.00, scale h 100.00;
0.08 overlay x 1665.00, overlay y 454.00, scale w 100.00, scale h 100.00;
6.00 overlay x 939.00, overlay y 449.00, scale w 100.00, scale h 100.00;
6.04 overlay x 935.20, overlay y 448.20, scale w 101.60, scale h 101.60;
6.08 overlay x 932.40, overlay y 447.40, scale w 103.20, scale h 103.20;
6.12 overlay x 928.60, overlay y 446.60, scale w 104.80, scale h 104.80;
6.16 overlay x 925.80, overlay y 445.80, scale w 106.40, scale h 106.40;
6.20 overlay x 922.00, overlay y 445.00, scale w 108.00, scale h 108.00
```

Step 6: Run this batch file to create the final moving wormhole video:

```
set "IN=in.mp4"
Main input video
set "LP=WL4149.mp4
Equirectangular video for mirror-sphere
set "P=0'
set "Y=0"
set "R=60"
set "R1=0.00"
set "R2=0.00"
set "V=9"
set "LUT=lut2.cube"
set "T=12"
Pitch angle
Yaw angle
Roll angle
Rotation speed before v360 filter, 1.0 means one revolution per frame
Rotation speed after v360 filter, 1.0 means one revolution per second
Time when wormhole vanishes
Time when wor
: Length of output video
rem Make only the mirror-sphere video
rem ffmpeg -i %LP% -vf v360=output=ball:pitch=%P%:yaw=%Y%:roll=%R% -t %T% -y lp.mp4
ffmpeg -i %IN% -ss 9 -i %LP% -start number 0 -i xmap%%4d.pgm -start number 0 -i ymap%%4d.pgm -lavfi "[0]sendcmd='%V%
streamselect map 1',split[4][5]; [4][2][3]remap=fill=red,sendcmd=f=positions.cmd[6];[1]
fps=25,v360=e:e:pitch=0,scroll=h=%R1%,v360=output=ball:pitch=%P%:yaw=%Y%:roll=%R
%:alpha mask=1,rotate='%R2%*2*PI*t':c=black@0.0,scale=w=10:h=10:eval=frame,lut3d=%LUT%[7] ; [6] [7]
overlay=x=0:y=0 : format=rgb[8]; [8] [5] streamselect=map=0,format=yuv420p" -t %T% -y out.mp4
```

pause

Notes:
overlay=format=rgb is strongly required, because the default format yuv420 allows only to set the $\mathbf{x}, \mathrm{y}$ coordinates in multiples of 2.
"remap=fill=red" is used here only to make alignment errors visible, if the overlay isn't exactly at the same position as the black hole distortion. Normally there should no red pixels be visible. After this check you can replace it by "remap=fill=black".
"fps=25" is used here because the mirror-sphere video has a different framerate (30fps), which resulted in jerky scaling of this video.
It's also possible to let the inner area of the wormhole rotate as a function of time. Two different rotations are applied in this example. The first rotation is using the scroll filter (applied to an equirectangular video, before the v360 filter) and the other is using the rotate filter after the v360 filter.

Note for scroll filter: scroll=h=1.0 means one full horizontal revolution per frame. So you have to know the framerate to set the rotation speed.

In FFmpeg "commands" are a special case of options, which can be changed dynamically while FFmpeg is running. All commands are options, but not all options are commands. Commands can be changed either with "sendcmd" or with "zmq".

|  | sendcmd | zmq |
| :--- | :--- | :--- |
| Which options can be controlled? | All those that have support for commands. | All those that have support for commands. |
| When can an option be changed? | Options can be changed at exact times, but these <br> times must be known in advance, because they must <br> be written in the *.cmd file or in the command line. | Options can be changed in real time while FFmpeg is <br> running, but the timing is not as exact as with <br> sendcmd. |
| Timing accuracy | exact | about 100-200ms, as a rough estimate |
| Is it possible to decide in real time to <br> change or not to change an option? | no | yes |
| Possible sources where data comes from | *.cmd file <br> FFmpeg command line, as argument of <br> sendcmd filter | from a second console window via <br> "zmqsend" tool |
| from a batch file via "zmqsend" tool |  |  |
| zeromq library which is available for many |  |  |
| programming languages |  |  |
| for example NetMQ library for C\# |  |  |

[^1]- sendemd has many pitfalls and can drive you crazy!
- The sendcmd filter sends commands to another filter. For example in the previous chapter sendcmd was used to to send the $\mathbf{x}$ and $\mathbf{y}$ coordinates to the overlay filter. The commands are defined in a file (*.cmd is recommended), or could also be defined in the command line.
- To find out which filters support commands, use the ffmpeg -filters command, or look in the documentation of the filter.
- Normally the sendcmd filter is inserted in the filter chain somewhere before the target filter. A problem arises when the target filter has more than one input (for example overlay has two inputs). This doesn't work, because sendcmd accepts only one input. In this case sendemd must be inserted somewhere earlier in the filter chain, where only one input exists.
- It's important that sendemd is inserted at a position in the filter chain that has sufficient duration. For example, if the overlaid video is shorter than the main video, and if sendemd is inserted in the input of the shorter video, that would give unexpected behaviour, because when the shorter video has ended, sendcmd will get the wrong time (which stays then constant), and will send wrong commands to the other filters based on the wrong time. Always insert sendemd at the longest input.
- It's also possible to have more than one sendemd in the filter chain, for example at both inputs.
- It's also possible to insert sendcmd after the target filter, for example at the end of the filter chain. The drawback of this method is that the changes become effective with one frame delay.
- All arguments of the sendcmd target filter must be initialized with valid values, even if these values are never used because sendcmd does always overwrite them.
- It's also possible to evaluate an expression in sendcmd and send the result to the target filter. To enable expression evaluation the [expr] flag must be used instead of the default [enter] flag. Inside the expression the "TI" variable can be used, which runs from 0 to 1 in the interval.
- If a line in the *.cmd file begins with a "\#" character then it's a comment. Empty lines are allowed as well.
- The *.cmd file must contain at least one command. It's not allowed if it contains only comments.
- If the filter chain contains multiple filters of the same type, they must be given unique names, for example "v360@1", "v360@2".
- (I have not tested this with FFmpeg. It doesn't work with FFplay) There is another (undocumented) way how to send commands. In the same console window where FFmpeg is running, type " c " or " C " and immediately (without a space character) let the command follow, for example: Cdrawtext 15.3 reinit ' $x=752: y=480$ '<enter> In this example "15.3" is the time. You can use "all" instead of the filter/class instance if you want to send the command to all filters that can receive it. Instead of pressing <enter> you can also send " $\backslash \mathrm{n}$ ". Found here: https://stackoverflow.com/questions/56058909/ffmpeg-drawtext-and-live-coordinates-with-sendcmd-zmq
- FFmpeg accepts a few keys while it's running. This is undocumented and can only be found in the source code in ffmpeg.c in the function check_keyboard_interaction()

| $\boldsymbol{?}$ | show this help |
| :--- | :--- |
| + | increase verbosity |
| - | decrease verbosity |
| c | Send command to first matching filter supporting it |
| C | Send/Queue command to all matching filters |
| d D | cycle through available debug modes |
| h | dump packets/hex press to cycle through the 3 states |
| q | quit |
| s | Show QP histogram |

This is an example for cropping a square region out of a rectangular video, while changing the $\mathbf{x}, \mathrm{y}$ position of the cropped region as a function of time with linear interpolation:

```
ffmpeg -i in.mp4 -lavfi sendcmd=f=coord.cmd,crop@1=w=800:h=800:x=0:y=0 out.mp4
pause
```

The top left coordinates of the crop window are specified in the file "coord.cmd":

```
0.0-1.0 [expr] crop@1 x ' lerp (0,100,TI)'
0.0-1.0 [expr] crop@1 y 'lerp(0,100,TI)';
1.0-2.0 [expr] crop@1 x 'lerp(100,150,TI)';
1.0-2.0 [expr] crop@1 y 'lerp(100,220,TI)';
2.0-3.0 [expr] crop@1 x 'lerp(150,80,TI)';
2.0-3.0 [expr] crop@1 y 'lerp (220,220,TI)';
and so on...
```

Note: In this example "crop@1" can be replaced by "crop", because there is only one crop filter in the filter chain.
Note: The same effect could also be realized with the 'zoompan' filter, but that's more complicated because 'zoompan' doesn't support commands.

This is an example where the $x, y$ position of the cropped region changes at certain times, without any interpolation:

| ffmpeg <br> pause |  |  |  |
| :---: | :---: | :---: | :---: |
|  |  |  |  |

The top left coordinates of the crop window are specified in the file "coord.cmd":

```
9.50 crop x 30
9.50 crop y 60;
15.00 crop x 100;
15.00 crop y 100;
```

In most cases it's not possible to change the size of a video stream dynamically, but in some cases it does work, for example if "scale" is immediately followed by "overlay":

```
ffmpeg -f lavfi -i color=red:s=800x600 -f lavfi -i color=yellow:s=2x2 -lavfi [1]sendcmd="2.0 scale w
400", scale=w=200:h=200[a];[0][a]overlay=x=100:y=100 -t 5 -y out.mp4
pause
```

This is an example of a rotating earth, where the rotation axis rapidly changes (this is physically impossible) and the observer's viewing point changes:

```
set "IN=Earth_eq.jpg" :: Equirectangular input image of earth
set "BG=Starfield.jpg"
set "R1=0.005"
set "D=400"
    from https://de.wikipedia.org/wiki/Datei:Nasa_land_ocean_ice_8192.jpg
Background image 1920x1080
Rotation speed, 1.0 means one revolution per frame, 0.005 means 8s per rev. at 25fps
Diameter of earth
set "X=760"
X position of eart
set "Y=340"
y position of earth
set "T=30"
Length of output video
ffmpeg -loop 1 -i %BG% -loop 1 -i %IN% -lavfi
[1] sendcmd=f=sendcmd.cmd,v360@1=e:e:pitch=0:yaw=0:roll=0:reset_rot=1,scroll=h=
%R1%,v360@2=e:perspective:pitch=0:yaw=0 :roll=0:alpha mask=1:reset rot=1,scale=%D%:%D%[a],[0][a]
overlay=x=%X%:y=%Y% -t %T% -y out.mp4
pause
```

sendcmd.cmd

```
# set the initial conditions
0.00 v360@1 pitch 0;
0.00 v360@1 yaw 0;
0.00 v360@1 roll 0;
0.00 v360@2 pitch 50;
0.00 v360@2 yaw 0;
0.00 v360@2 roll 0;
# from t = 8s to 9s change the rotation axis of the earth by 60
# Latitude 30
8.00-9.001 [expr] v360@1 yaw 'lerp(0,30,TI)';
8.00-9.001 [expr] v360@1 pitch 'lerp(0,-60,TI)';
# from t = 14s to 15s change the viewing point, so that the observer is on the rotation axis:
14.00-15.001 [expr] v360@2 pitch 'lerp(50,90,TI)';
# from t = 18s to 21s change the rotation axis of the earth from Cairo to New York
# Latitude 41' north, Longitude 74' west
18.00-21.001 [expr] v360@1 yaw 'lerp(30,-74,TI)';
18.00-21.001 [expr] v360@1 pitch 'lerp(-60,-49,TI)';
```

Note: If specified in the command line, the v360 rotation angles are absolute angles. However if sent via sendcmd, they become relative angles. That's why the "reset_rot=1" option is used. It automatically resets the rotations to zero before a new relative rotation is applied.

In my optinion "relative rotations per frame" are the same thing as rotational velocity, and I don't understand why the same options (yaw, pitch and roll) are used for abslotue angles in the command line and rotational velocities in sendcmd. It would be much clearer if different options would be used for different things.
The "reset_rot" option can be set to 0,1 or -1 . The meaning of -1 is unclear. It's not documented.

A few examples for sendemd and single / double quotes:

| ```ffmpeg -i in1.mp4 -i in2.mp4 -lavfi "[0] sendcmd='3.0 streamselect map 1'[a];[a][1]streamselect=inputs=2:map=0" out.mp4``` | sendemd at the beginning of the filter chain, double quotes for whole filter chain. <br> Works fine, but would give enexpected results if the first input is shorter than the second input! |
| :---: | :---: |
| ffmpeg -i in1.mp4 -i in2.mp4 -lavfi <br> "[0][1]sendcmd='3.0 streamselect map 1', streamselect=inputs=2:map=0" out.mp4 | This doesn't work because sendemd accepts only one input |
| ffmpeg -i in1.mp4 -i in2.mp4 -lavfi <br> sendcmd='3.0 streamselect map 1 ', streamselect=inputs=2:map=0 out.mp4 | This is the example from the streamselect documentation, doesn't work under Windows. |
| ffmpeg -i in1.mp4 -i in2.mp4 -lavfi sendcmd="3.0 streamselect map 1", streamselect=inputs=2:map=0 out.mp4 | Single quotes replaced by double quotes, works under Windows. |
| ffmpeg -i in1.mp4 -i in2.mp4 -lavfi <br> "sendcmd='3.0 streamselect map 1',streamselect=inputs=2:map=0" out.mp4 | Double quotes added for the whole filter chain, single quotes for sendemd argument, works under Windows. |
| ```ffmpeg -i in1.mp4 -i in2.mp4 -lavfi "[0][1]streamselect@my=inputs=2:map=0,sendcmd='3.0 streamselect@my map 1'" out.mp4``` | [0][1] added, sendcmd at the end of the filter chain, commands become effective with one frame delay. Double quotes for filter chain, single quotes for sendcmd argument |
| ffmpeg -i in1.mp4 -i in2.mp4 -lavfi <br> [0][1]streamselect@my=inputs=2:map=0, sendcmd="3.0 streamselect@my map 1" out.mp4 | [0][1] added, sendcmd at the end of the filter chain, commands become effective with one frame delay. No quotes for filter chain, double quotes for sendcmd argument |

Note about double quotes around the filter chain:
In Windows it's not required to put the whole filter chain in double quotes, but it seems these double quotes are required on a Mac. Not tested myself.
If a filter chain contains the " $\mid$ " character, it must be encapsulated in "" double quotes.
A note from Moritz Barsnick in the FFmpeg user list, April 5, 2020:
"Under Windows, " ' " is not a command line quotation character. If parts of the command line need to be quoted in order to be collated, you need to use the double quotation mark ' "'. The single quotation mark is passed directly to ffmpeg on Windows, making the filter argument unparsable. [...] I believe a large part of ffmpeg's examples in doc and wiki are "wrong" in this matter, and could or should be changed to also work on Windows, where possible."

### 2.124

## Sending commands with ZMQ

This is an example of a command line with the " zmq " filter, which receives messages that were sent from somewhere else. It's possible to send messages to all filters and all options that accept commands (as indicated in the documentation of the filter). These are the same options as for the "sendcmd" filter.

```
ffplay -dumpgraph 1 -f lavfi "color=s=200x200:c=red[l];color=s=200x200:c=blue[r];nullsrc=s=400x200,zmq[bg];[bg]
[l] overlay[bg+l]; [bg+l] [r]overlay@my=x=200"
pause
```

Note: "-dumpgraph" is not required in this example. This option is only available in FFplay and not in FFmpeg. It draws a graphical representation of the filtergraph in the console output.

Note: This example is copied from the documentation of the $\mathbf{z m q}$ filter, but the sizes were changed because it didn't work with the original smaller sizes. Seems to be a bug in FFplay.
Note: the zmq filter has the option "bind_address" or "b" which is by default set to "tcp://*:5555". You can change this value to your needs, but don't forget to escape any ' $\because$ ' signs.
Note: Don't send messages to those options that don't support commands. This could lead to malfunction.

For details about ZMQ (or ZeroMQ), see https://zeromq.org/

The commands can be sent from a command line in another console window by using the zmqsend.exe tool.
Copy the files zmqsend.exe and avutil-56.dIl in the same directory where you have ffmpeg.exe (In this example l'm using the folder c:Iffmpeg). Open a second console window and type this command:
echo overlay@my x 150 |c:\ffmpeg zmqsend
Question: What can be done if this error message appears?

```
[Parsed_zmq_3 @ 000001d92beb4180] Could not bind ZMQ socket to address 'tcp://*:5555': Address in use
```

[lavfi @ O00001d92beabb80] Error initializing filter 'zmq

## It's also possible to send ZMQ commands from a C\# program with the NetMQ library, as in this short example:

```
using NetMQ;
using NetMQ.Sockets
using System;
using System.Windows.Forms
namespace netmq
nam
    public partial class Form1 : Form
    {
        public Form1()
        {
            InitializeComponent();
        }
    i pr
        using (var client = new RequestSocket())
            { client.Connect("tcp://localhost:5555")
                // this works, but I don't understand it:
                    // what does "tcp://" mean?
                    // what does "localhost:" mean?
                    // what does "localhost:"
                    // what does "5555" mean?
                    // If you can explain it, please let me know
            client.SendFrame("overlay@my x 150");
            var message = client. ReceiveFrameString();
            Console.WriteLine("Received {0}", message);
        }
        }
    }
}
```

Note: Use Nuget to add the NetMQ package, and add the two using directives at the beginning.

```
Please note that not everything that's possible is also useful. For example, a message can be sent to the "width" option of the "scale" filter for changing the size of a video stream. But changing the size mid-stream isn't supported by many other filters (for example "eq", "colorkey" and "despill"). In some cases it works (for example "scale" immediately followed by "overlay"), but in most other cases it fails.
```

### 2.125

Let's assume you want to change an input image while FFmpeg is running. As a simple example, we want to show the image on the screen.
The trick is not to use the image as input, but instead a symbolic link (symlink) which is pointing to the image:

```
ffmpeg -framerate 1 -stream_loop -1 -f image2 -i symlink.lnk -window_x 0 -window_y 0 -f sdl2 -
pause
```

The complicated part is how to create and change the symlink. You need administrator permission to do this. Type "cmd" in the Windows search window, then click on "Run as administrator". Go to your working directory by typing (for example)

```
cd C:\Users\astro\Desktop\test
```

Before you can start FFmpeg, you must create the symlink which is pointing to the first image:

```
mklink symlink.lnk image1.png
```

Then FFmpeg can be started and it should show the first image.
As the next step, we want to change the symlink to the second image, while FFmpeg is running. To do this, type the following three commands:

```
mklink temp.lnk image2.png
copy /l /y temp.lnk symlink.lnk
del temp.lnk
```

In the first command line a temporary symlink to the new image is created.
In the second command line the symlink is changed to the new target and FFmpeg should immediately show the new image.
In the third command line the temporary symlink is deleted. That must be done because a new symlink can't be created if one with the same name does already exist.

See also: https://stackoverflow.com/questions/11296491/change-target-for-symbolic-link-in-windows
Note: You can also create links by right-clicking in a folder (New --> Shortcut), but those links don't work for this purpose. They are somehow different from the symlinks which are used here.
Note: It was also suggested to use -readrate 1 (which is the same as -re). This did't work when I tested it, but it might be useful in other cases.

Start a FFplay process with console window and video window:

```
Process p;
ProcessStartInfo startInfo = new ProcessStartInfo()
startInfo.FileName = "ffplay";
startInfo.Arguments = "-f lavfi testsrc2=s=vga";
p = Process.Start(startInfo);
```

Note: This assumes that you have set the PATH environment variable accordingly, so that FFplay is found. Otherwise you can use startInfo.WorkingDirectory = ...

## Start a FFplay process without console window:

```
Process p;
ProcessStartInfo startInfo = new ProcessStartInfo();
startInfo.UseShellExecute = false;
startInfo.CreateNoWindow = true;
startInfo.FileName = "ffplay";
startInfo.Arguments = "-f lavfi testsrc2=s=vga";
p = Process.Start(startInfo)
```

See also: https://stackoverflow.com/questions/19756860/executing-an-external-program-via-c-sharp-without-showing-the-console

## Stop the FFplay process:

p.kill();

Get a filename from a command line argument, this works also if you start the C\# program by dropping a file on the program's icon:

```
private void Form1_Shown(object sender, EventArgs e)
i
    string[] arguments = Environment.GetCommandLineArgs(); // get the filename by command line argument,
    if (arguments.Length == 2)
        myFilename = arguments[1];
}
```

## C\# Sample program for real-time zmq adjustment of brightness and contrast with scrollbars:

```
using NetMQ;
sing NetMQ.Sockets
using System;
using System.Diagnostics;
using System.Globalization
using System.Globalization
namespace netmq
{
    public partial class Form1 : Form
    {
Process p;
RequestSocket client;
public Form1()
InitializeComponent();
}
private void button2 Click(object sender, EventArgs e) // Start the FFplay process
{
    if (p == null)
        ProcessStartInfo startInfo = new ProcessStartInfo()
            startInfo.UseShellExecute = false
            startInfo.CreateNoWindow = true;
            startInfo.FileName = "ffplay";
            startInfo.Arguments = "-top 0 -left 0 -f lavfi \"testsrc2=s=960x540,zmq,eq@my\"";
            richTextBox1.AppendText(startInfo.Arguments);
            p = Process.Start(startInfo)
        }
}
private void button3_Click(object sender, EventArgs e) // Stop the FFplay process
{
    if ((p != null) && !p.HasExited)
    {
        p.Kill();
        p = null;
            }
}
private void Form1_Shown(object sender, EventArgs e) // Create and connect the client for zmq
{
client = new RequestSocket();
    client.Connect("tcp://localhost:5555"); // This works, but I don't understand it:
```

```
// What does "tcp://" mean?
// What does "localhost:" mean?
// Why 5555?
// If you can explain it, please let me know
}
private void hScrollBar1_Scroll(object sender, ScrollEventArgs e) // Scrollbar for brightness adjustment
    {
        client.SendFrame("eq@my brightness " + ((double)hScrollBar1.Value * 0.02).ToString(CultureInfo.InvariantCulture))
        var message = client.ReceiveFrameString();
        Console.WriteLine("Received {0}", message);
    }
    private void hScrollBar2_Scroll(object sender, ScrollEventArgs e) // Scrollbar for contrast adjustment
    {
        client.SendFrame("eq@my contrast " + ((double)hScrollBar2.Value * 0.1).ToString(CultureInfo.InvariantCulture));
        var message = client.ReceiveFrameString();
    Console.WriteLine("Received {0}", message);
    }
    private void Form1_FormClosing(object sender, FormClosingEventArgs e) // Cleanup
    if ((p != null) && !p.HasExited)
        p.Kill();
    }
}
```

\}

Note: In the command line for FFplay it's not necessary to specify any values for contrast and brightness. Just writing "eq" or "eq@my" is sufficient.

## It might be a problem that the code is blocking if the zmq message can't be sent. In this case it's better to specify a 500 ms timeout for receiving the reply:

```
private void vScrollBar1_Scroll (object sender, ScrollEventArgs e)
{
    if ((p != null) && !p.HasExited)
    if
        string message;
        client.SendFrame("overlay@my y " + y);
    client.TryReceiveFrameString(TimeSpan.FromMilliseconds(500), out message);
    }
}
```

## See also my example in chapter "Real-time bluescreening".

### 2.127 Video stabilization

Videos can be stabilized in a one-pass process with "deshake" filter or in a two-pass process with "vidstabdetect" and "vidstabtransform" filters.
set "IN=C1000650.MOV"
set "OUT=C0650_stab.MOV" : Input video
rem Stabilize the video
ffmpeg -i \%IN\% -vf vidstabdetect -y dummy.mov
del dummy.mov
ffmpeg -i \%IN\% -vf vidstabtransform -y \%OUT\%
pause

This is the same thing, but with 10-bit DNxHD (Digital Nonlinear Extensible High Definition) codec for importing in the free DaVinci Resolve version:

```
set "IN=C1000645.MOV" :: Input video
set "OUT=C0645_stab.MOV" :: Output video
rem Stabilize the video
ffmpeg -i %IN% -vf vidstabdetect - y dummy.mov
del dummy.mov
ffmpeg -i %IN% -vf vidstabtransform -map_metadata 0 -pix_fmt yuv422p10le -c:v dnxhd -profile:v 4 -c:a pcm_s24le
-color_range pc -movflags write_colr -y %OUT%
```

pause

## Two notes from Andrei B.:

- The "vidstab" filter has the drawback that it gets confused by rolling shutter from CMOS sensors.
- A very good (and free) tool that can do much better is VirtualDub with Deshaker 3.0 filter. This filter has a rolling shutter factor input and can greatly improve on reducing the wabbliness of a stabilized video. It's documentation includes instructions on how to measure your camera's rolling shutter factor.

This is a test for comparing the "deshake" filter with the "vidstabdetect/vidstabtransform" filters:

```
rem deshake
ffmpeg -i test.mov -lavfi split[a][b];[a]deshake=rx=64:ry=64:edge=0 [c];[b][c]hstack -y deshake.mov
rem vidstabdetect
ffmpeg -i test.mov -lavfi vidstabdetect=shakiness=10:show=1 -y dummy.mov
rem vidstabtransform with optzoom=0 (which means no zoom, so that borders are visible)
ffmpeg -i test.mov -lavfi split[a][b];[a]vidstabtransform=smoothing=50:crop=black:optzoom=0[c];[b][c]hstack -y
vidstab.mov
rem vidstabtransform with optzoom=1 (which means optimized zoom, so that no borders are visible)
ffmpeg -i test.mov -lavfi split[a][b];[a]vidstabtransform=smoothing=50:crop=black:optzoom=1[c];[b][c]hstack -y
vidstab_zoom.mov
pause
```

By comparing the results, I found that the two-stage solution with "vidstabdetect/vidstabtransform" gives much better results than the one-stage "deshake" solution.
In "vidstabtransform" it's possible to set the "smoothing" parameter which defines the number of frames (2*smoothing +1) for low-pass filtering of the camera movements. The default "smoothing" value is 10 (which means 21 frames), but $i$ found it useful to use higher values between 20 and 50.
"vidstabtransform" does correct $x, y$ translations and also rotations.
The option "optzoom=1" does automatically choose a suitable zoom factor, so that there are no no-data areas at the borders visible.
Note: I think there is a bug in vidstabtransform, the option crop=black doesn't work as described. The no-data borders are filled with the colors of the edge of the image. Black borders appear only when the image shift becomes very large. But that doesn't matter, because with "optzoom=1" (which is the default) the no-data borders are anyway cropped away.

See also: http://oioiiooixiii.blogspot.com/2016/09/ffmpeg-video-stabilisation-using.html

This is an example for removing a linear drift from a video. The first and the last image is extracted and the $x, y$ coordinates of an object is measured in these two images. The diffence between the coordinates is the motion vector. Then the "crop" filter is used for cropping a window out of the input video, where the top left coordinates of the crop window are a function of time. The input size was $2048 \times 2048$, and the output size is reduced to $1856 \times 1856$ (which is the input size minus the larger of the two motion vectors).

```
rem Extract the first frame
ffmpeg -i M31-STATT-2020.mov -frames 1 -y first_frame.jpg
rem Extract the last frame
ffmpeg -sseof -0.2 -i M31-STATT-2020.mov -update 1 -y last_frame.jpg
rem Coordinates of object in first frame: 1026, 1091
rem Coordinates of object in lastframe: 1131, 1282
rem Motion vector: +105, +191
rem Duration: 17.23s
ffmpeg -i M31-STATT-2020.mov -lavfi crop=x='105/17.23*t':y='191/17.23*t':w=1856:h=1856 -y out1.mp4
pause
```

## Note: This stabilization method does no longer work because the behaviour of the v360 filter was changed 25-Oct-2020. The yaw, pitch and roll rotation angles are now interpreted as relative angles, if they are sent via sendcmd. See also ticket 9447 . There was a new option "reset_rot" added which resets the rotation angles, so that absolute rotations can be simulated. I'm not sure if it could be used in this example. Recommended workaround: Use the spherical stabilizer in DaVinci Resolve.

$360^{\circ}$ videos can't be stabilized the same way as normal (flat) videos. A normal video can be stabilized by following one point and applying $x$ and y shifts. In a $360^{\circ}$ video, two points must be followed and rotations in three axes (yaw, pitch, roll) must be applied.

Let's begin by making a nice $360^{\circ}$ test video. First get a fulldome test pattern and create an equirectangular test image:

```
set "IN=1200.png"
    :: Test pattern from http://www.paulbourke.net/dome/testpattern/1200.png
ffmpeg -i %IN% -i %IN% -lavfi "[0]transpose=1[left];[1]transpose=2,negate[right];[left]
[right]hstack,v360=input=dfisheye:output=e:pitch=90" -y equirectangular_test.png
pause
```

Now use this image for creating a test video with rotations around different axes:

| set " |
| :---: |
| ffimpeg text |
| pause |

The rotations are defined is the file "sendcmd.cmd": I don't really understand what reset_rot=-1 is doing.
0.0-9.0 [expr] v360 reset_rot '-1';
0.0-1.0 drawtext reinit 'text=';
$0.0-1.0$ [expr] v360 yaw '0';
$0.0-1.0$ [expr] v360 pitch '0';
0.0-1.0 [expr] v360 roll '0';

```
1.0-2.0 drawtext reinit 'text=PITCH';
1.0-2.0 [expr] v360 yaw '0';
1.0-2.0 [expr] v360 pitch 'lerp (0,45,TI)';
1.0-2.0 [expr] v360 roll '0';
2.0-3.0 drawtext reinit 'text=YAW';
2.0-3.0 [expr] v360 yaw 'lerp(0,45,TI)';
2.0-3.0 [expr] v360 pitch '45';
2.0-3.0 [expr] v360 roll '0';
3.0-4.0 drawtext reinit 'text=PITCH + YAW';
3.0-4.0 [expr] v360 yaw 'lerp(45,90,TI)';
3.0-4.0 [expr] v360 pitch 'lerp(45,90,TI)';
3.0-4.0 [expr] v360 roll '0';
4.0-5.0 drawtext reinit 'text=ROLL';
4.0-5.0 [expr] v360 yaw '90';
4.0-5.0 [expr] v360 pitch '90';
4.0-5.0 [expr] v360 roll 'lerp(0,45,TI)';
5.0-6.0 drawtext reinit 'text=PITCH + ROLL';
5.0-6.0 [expr] v360 yaw '90';
5.0-6.0 [expr] v360 pitch 'lerp(90,135,TI)';
5.0-6.0 [expr] v360 roll 'lerp(45,90,TI)';
6.0-7.0 drawtext reinit 'text=YAW + ROLL';
6.0-7.0 [expr] v360 yaw 'lerp(90,135,TI)';
6.0-7.0 [expr] v360 pitch '135';
6.0-7.0 [expr] v360 roll 'lerp(90,135,TI)';
7.0-8.0 drawtext reinit 'text=PITCH + YAW + ROLL';
7.0-8.0 [expr] v360 yaw 'lerp(135,180,TI)';
7.0-8.0 [expr] v360 pitch 'lerp(135,180,TI)';
7.0-8.0 [expr] v360 roll 'lerp(135,180,TI)';
8.0-9.0 drawtext reinit 'text=';
8.0-9.0 [expr] v360 yaw '180';
8.0-9.0 [expr] v360 pitch '180';
8.0-9.0 [expr] v360 roll '180';
```

How large is the image shift in this test video, from one image to the next? The image height is 1200 pixels and that's 180 degrees. So the image scale is $0.15^{\circ}$ per pixel. The rotation speed is $45^{\circ}$ per second. So the image shift at the default $25 f$ fps framerate is $1.8^{\circ}$ per frame or 12 pixel per frame.
Let's check this and extract small grayscale images from the center of the test video (images Axxx.png), and also from a point $90^{\circ}$ right of the center (images Bxxxx.png):

Note: The duration must only be specified if you want to analyze only the beginning of the video, for fast testing. If you want to analyze the whole video, just set the " T " variable to a value longer than the video.

Let's have a look which movements we can see in the small images:

| Time <br> [s] | Frames | Rotation | Movement in image A <br> (center of equirectangular video) | Movement in image B <br> $\left(90^{\circ}\right.$ right of center of equirectangular video) |
| :--- | :--- | :--- | :--- | :--- |
| $0-1$ | $0-25$ | -- | -- | -- |
| $1-2$ | $25-50$ | pitch | down | counter-clockwise rotation |
| $2-3$ | $50-75$ | yaw | left | down and left |
| $3-4$ | $75-100$ | pitch + yaw | down and left | first down and left, then down |
| $4-5$ | $100-125$ | roll | counter-clockwise rotation | up |
| $5-6$ | $125-150$ | pitch + roll | first down and right, then right | up and right |
| $6-7$ | $150-175$ | yaw + roll | first up, then up and left | first up, then up and left |
| $7-8$ | $175-200$ | pitch + yaw + roll | first up, then up and left | first up, then up and left |
| $8-9$ | $200-224$ | -- | -- |  |
|  |  |  |  |  |

That means we can measure the image shift in the small images in $\mathbf{x}$ and y direction and then calculate the rotation angles as follows:
Yaw_angle_in_radians = -c * horizontal_shift_in_image_A
Pitch_angle_in_radians $=\mathbf{c}$ * vertical_shift_in_image_A
Roll_angle_in_radians $=\mathbf{- c}$ * vertical_shift_in_image_B
where c is a constant, $\mathrm{c}=\mathrm{Pi} /$ equirectangular_image_height

Before the A and B images can be analyzed for movement, you should make sure that they contain useful details. For example, they should not contain the blue sky which has no fine details. Also, when you have for example a video of a mountainbiker, make sure that the images contain only the background and not the bike or the driver (under the assumption that you want to stabilize on the background).

This batch file draws two red rectangles around the small windows, so that you can check if these windows contain useful details:

```
set "IN=test.mp4" :: Equirectangular input video
set "B=100" :: Box size in pixels
ffmpeg -i %IN% -vf drawbox=x=iw/2-%B%/2:y=ih/2-%B%/2:w=%B%:h=%B%:color=red:thickness=5,drawbox=x=3/4*iw-%B%/2:y=ih/2-%B
%/2:w=%B%:h=%B%:color=red: thickness=5 -y dummy.mp4
pause
```

If you find that the small windows contain unsuitable content, then use the V360 filter to rotate the video and then repeat the process.

The image shifts in $x$ and $y$ direction in the A and B images are now analyzed by a C\# program, which produces a file "stabilize.cmd" which can later be used as input for FFmpeg's sendcmd filter.
(See the C\# source code of the improved version in the next chapter)

You can see that the accumulated angle error is only a few degees at the end of the video. In the input video the angles were $\mathbf{1 8 0}^{\circ}, \mathbf{1 8 0}^{\circ}, 180^{\circ}$ at the end of the video, which is equivalent to $0^{\circ}, 0^{\circ}, 0^{\circ}$.

Finally apply the corrections to the test video:

```
set "IN=test.mp4" :: Equirectangular input video
set "T=10" :: Duration in seconds
ffmpeg -i %IN% -lavfi sendcmd=f=stabilize.cmd,v360=e:e:pitch=0:yaw=0:roll=0 -t %T% -y out.mp4
pause
```

When you play this video, you see that most of the rotations are removed. Now I must produce a real $360^{\circ}$ video on my mountainbike :-)

Of course, there is room for improvements:

- Use more than two windows for detecting the image shifts. For example 6 windows front, rear, left, right, up, down.
- This would add redundancy and make the algorithm more robust.
- Automatically detect if a window contains no useful details and don't use this data
- Automatically detect if one window contains details that don't move in the same direction as the other windows. Some kind of median filtering.
- Use all R, G and B channels for detecting the image shifts.

## Note: This stabilization method does no longer work because the behaviour of the v360 filter was changed 25-Oct-2020. The yaw, pitch and roll rotation angles are now interpreted as relative angles, if they are sent via sendcmd. See also ticket 9447 . There was a new option "reset_rot" added which resets the rotation angles, so that absolute rotations can be simulated. I'm not sure if it could be used in this example. Recommended workaround: Use the <br> spherical stabilizer in DaVinci Resolve

This version has the following improvements:

- Extract color images and use $R, G$ and $B$ channels for image shift detection, all colors can be individually enabled or disabled
- Use 6 images from each frame for rotation detection: front (XA), right (XB), back (XC), left (XD), up (XE) and down (XF), all 6 images can be individually enabled or disabled
- Offset angles can be applied to the output file as well
- Use median filtering for the rotation angles
- Faster algorithm for finding the minimum of the sum of absolute differences
- Set the time values in the *.cmd file in the middle between the time stamps of the frames

These are the movements in the 6 image sequences:

| Movement in images |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Rotation | XA | XB | XC | XD | XE | XF |
| pitch | down |  | up |  | down | down |
| yaw | left | left | left | left |  |  |
| roll |  | up |  | down | left | right |

There is a lot of redundancy: 12 independent ways to calculate pitch (4 for each color channel), and the same for yaw and roll as well.
This is the batch file for extracting the 6 image sequences from the input video:
set "IN=test.mp4" : : Equirectangular input video

```
set "B=100" :: Image size in pixels
ffmpeg -i %IN% -vf crop=w=%B%:h=%B% -start number 0 -t %T% - y XA%%04d.png
ffmpeg -i %IN% -vf v360=input=e:output=e:yaw=90,crop=w=%B%:h=%B% -start_number 0 -t %T% -y xB%%04d.png
ffmpeg -i %IN% -vf v360=input=e:output=e:yaw=180,crop=w=%B%:h=%B% -start_number 0 - t % T% -y xC%%04d.png
ffmpeg -i %IN% -vf v360=input=e:output=e:yaw=-90,crop=w=%B%:h=%B% -start number 0 -t %T% -y XD%%O4d.png
ffmpeg -i %IN% -vf v360=input=e:output=e:pitch=90,crop=w=%B%:h=%B% -start number 0 -t %T% -y XE%%04d.png
ffmpeg -i %IN% -vf v360=input=e:output=e:pitch=-90,crop=w=%B%:h=%B% -start_number 0 -t %T% -y XF%%04d.png
pause
```

My C\# source code can be downloaded here: http://www.astro-electronic.de/source/v360stabilizer.zip
This is the batch file for applying the rotations to the input video:

```
set "IN=test.mp4" :: Equirectangular input image
set "T=9" :: Duration in seconds
ffmpeg -i %IN% -lavfi sendcmd=f=stabilize.cmd,v360=e:e:pitch=0:yaw=0:roll=0 -t %T% -y out.mp4
pause
```

Note: There is a very good spherical stabilizer in DaVinci Resolve, highly recommended.

Suppose you have a video in which a TV or computer screen is visible, and in postprocessing you want another video to be shown on that screen.
Or you have a video in which a beamer projects an image on a wall, which is almost impossible to capture flicker-free in a video. It's better to overlay the projected image in postprocessing.
The perspective filter can be used to remap a rectangular video into the distorted screen (which is an irregular quadrangle).
The coordinates of the corners of the screen are $\mathrm{x} 0, \mathrm{y} 0$ (top left), $\mathrm{x} 1, \mathrm{y} 1$ (top right), $\mathrm{x} 2, \mathrm{y} 2$ (bottom left) and $\mathrm{x} 3, \mathrm{y} 3$ (bottom right) and must me measured in the original video.

```
set "X0=500"
set "YO=250"
set "X1=1250"
set "Y1=150"
set "X2=400" : : Bottom left corner
set "Y2=750"
set "X3=1150" :: Bottom right corner
set "Y3=850"
rem Make a color test video
ffmpeg -f lavfi -i testsrc2=s=hd1080 -t 5 -y video1.mp4
rem Make a black and white test video
ffmpeg -f lavfi -i testsrc2=s=hd1080 -vf eq=saturation=0 -t 5 -y video2.mp4
rem Embed the black and white video into the color video
ffmpeg -i video1.mp4 -i video2.mp4 -lavfi "[1]format=argb,pad=w=iw+2:h=ih+2:x=1:y=1:color=black@0.0,perspective=x0=
%X0%:y0=%Y0%:x1=%X1%:y1=%Y1%:x2=%X2%:y2=%Y2%:x3=%X3%:y3=%Y3%:sense=1[2];[0][2]overlay" -q:v 2 -y out.mp4
```

pause

Before I discovered the perspective filter, I thought that I had to use the remap filter for this purpose, and I figured out the formulas myself. Here they are:

The coordinates of the point to be remapped are $x, y$.
We draw a vertical line through point $x, y$ and calculate the intersection points with the upper and lower edge of the quadrangle:
$a=(x-x 0) /(x 1-x 0) \quad$ The parameter a describes where the line intersects the upper edge. For $a=0$ it's at the top left corner, for a=1 it's at the top right corner. For $0<a<1$ the intersection point is somewhere between these two corners. But there are also cases possible $a<0$ or $a>1$ where the intersection point is outside the finite line segment.

The intersection point is $\mathrm{x} 4, \mathrm{y} 4$
$\mathrm{x} 4=\mathrm{x}$
$y 4=y 0+a *(y 1-y 0)$
We do the same thing for the lower edge:
$b=(x-x 2) /(x 3-x 2)$
$\mathrm{x} 5=\mathrm{x}$
$\mathrm{y} 5=\mathrm{y} \mathbf{2}+\mathrm{b}$ * $(\mathrm{y} 3-\mathrm{y} 2)$
Parameter $c$ describes where the point $x, y$ lies on the line segment between pints 4 and 5:
$c=(y-y 4) /(y 5-y 4)$
Now we remap these points into a unit quadrat with the top left corner at 0,0:
Point 4 is at coordinates $a, 0$ and point 5 is at coordinates $b, 1$
Point $x, y$ is remapped to coordinates
xmap $=(a+c *(b-a))$
ymap $=c$

```

pause
```

Here is the input image and the two output images:

It might be dangerous to use this kind of processing for images of women without prior asking them for permission :-)
The "displace" filter expects mapping files with relative values in the range [ $0 . .255$ ], where 128 is the neutral value for no displacement. Larger displacements than 127 pixels aren't possible.

I recommend to set the format to rgb24 before using the displace filter.
The displace filter isn't fully compatible with 10-bit data. Dithering is introduced.

This is an example for enlarging the eyes:

```
set "W=751" :: Width of image
set "H=853" :: Height of image
set "LX=256" :: left eye x
set "LY=362" :: left eye y
set "RX=445" :: right eye x
set "RY=325" :: right eye Y
set "A=10" :: Maximum amplitude of displacement, positive displaces outwards and negative inwards,
    allowed range is [0..127], best values are below 20

%D%*%D%)) ; st (1, 2*%A%*%D%/(pow ((%RX%-X),2) +pow ((%RY%-Y), 2) +%D%*%D%));128-ld
(0)* (X-%LX%) -ld(1)* (X-%RX%)' -frames 1 -y displace_x.pgm
rem Create the displace_y file
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=pix fmts=gray8,geq='st(0, 2*%A%*%D%/(pow((%LX%-X),2) +pow((%LY%-Y),2)+
%D%*%D%)) ; st (1, 2*%A%*%D%/(pow ((%RX%-X),2) +pow((%RY%-Y), 2) +%D%*%D%)) ; 128-1d
(0)* (Y-%LY%)-ld(1)* (Y-%RY%)' -frames 1 -y displace_y.pgm
rem Apply the displace filter to the image or video
ffmpeg -i me.jpg -i displace_x.pgm -i displace_y.pgm -lavfi format=pix_fmts=rgb24,displace -frames 1 -y big_eyes.jpg
pause
```

If the output is a video, remove "-frames 1 " in the last command line.

Here are the input and output images:

## Mathematics for this distortion:

$$
d=\frac{2 A D r}{r^{2}+D^{2}} \quad r=\sqrt{(x-c x)^{2}+(y-c y)^{2}} \quad \frac{d}{r}=\frac{2 A D}{(x-c x)^{2}+(y-c y)^{2}+D^{2}} \quad d x=(x-c x) \frac{d}{r} \quad d y=(y-c y) \frac{d}{r}
$$

with $\mathbf{d}=$ displacement distance
$A=$ maximum amplitude of displacement
$r=$ distance from pixel $x, y$ to center of distortion cx,cy
D = distance where the largest displacement occurs
cx,cy = coordinates of center of the distortion
$\mathrm{dx}, \mathrm{dy}=$ displacement values

FFmpeg has several filters for video noise reduction (denoising):

| Filter | Description | Notes and Examples |
| :--- | :--- | :--- |
| atadenoise | Apply an Adaptive Temporal Averaging Denoiser to the video <br> input | very fast, temporal only with no motion compensation; LGPL <br> Example: atadenoise $=0 a=0.2: 1 \mathrm{a}=0.2: 2 \mathrm{a}=0.2: 0 \mathrm{b=0.3:1b=0.3:2b=0.3}$ |
| bm3d | Denoise frames using Block-Matching 3D algorithm | very very slow, currently implemented as spatial only, algorithm considered as one of the <br> state of art denoisers; LGPL |
| chromanr | Reduce chrominance noise | This filter calculates the absolute difference of the Y components (contrary to the official <br> documentation! ) of the current pixel and a neighbour pixel from a rectangular <br> neighbourhood. Absolute differences are also calculated for the U and V components. A <br> neighbour pixel is used for averaging, if the sum of all three absolute differences is lower <br> than the threshold. Only the U and V components are averaged. The Y component <br> remains unchanged. With the "stepw" and "steph" options it's possible to use only a <br> subset of the neighbour pixels for averaging. |
| dctdnoiz | Denoise frames using 2D DCT (frequency domain filtering) | very very slow: spatial only, blurs too much; LGPL |
| fftdenoiz | Denoise frames using 3D FFT (frequency domain filtering) | slow, spatial and limited temporal, using Fast Fourier Transform, may have introduce <br> ringing with bad settings; LGPL |
| hqdn3d | This is a high precision/quality 3d denoise filter. It aims to <br> reduce image noise, producing smooth images and making <br> still images really still. It should enhance compressibility. | fast, both spatial and temporal, does basically lowpass by destroying high frequencies, <br> blurs with extreme settings; GPL <br> Example: hqdn3d=4:4:9:9 |
| nlmeans | Denoise frames using Non-Local means algorithm | very slow, currently implemented as spatial only, algorithm considered as one of the <br> state of art denoisers; LGPL |
| owdenoise | Apply Overcomplete Wavelet denoiser | very very very slow, spatial only, wavelet; GPL <br> Example: owdenoise=ls=25 |
| removegrain | Spatial denoiser for progressive video | fast, spatial only, limited usecase |
| vaguedenoiser | Apply a wavelet based denoiser | slow, spatial only, pretty good, wavelet; LGPL |
| tmix | Noise reduction by averaging up to 1024 successive frames | Not suitable for moving objects. Example: tmix=frames=20 |
| tmedian | Noise reduction by calculating the median out of up to 127 <br> successive frames | Example: tmedian=radius=20 |

Special thanks to Paul B Mahol who posted most of these notes in the FFmpeg-user list on October 27, 2019
2.133

The complex filtergraph can be loaded from an external script file.
Line feeds and empty lines are allowed in the script file. This makes the script much more readable.
The drawback is that you can't use variables as in a batch file.

### 2.134 Time delay within a filter chain

This is an example for a time delay within a filter chain:

```
ffmpeg -f lavfi -i testsrc=duration=10:size=vga -filter_complex split[a][b];[a]setpts=PTS-5/TB[c];[b]
[c]hstack=shortest=1 -y out.mp4
pause
```

Hint: Subtracting a constant from PTS works fine. However if you try to add a constant to PTS (e.g. setpts=PTS+5/TB), this may lead to the problem that the true length of the output video isn't equal to the length in the metadata.

In this example the same thing is done with tpad and trim filters:

```
ffmpeg -f lavfi -i testsrc=duration=10:size=vga -filter complex split[a][b];[a]tpad=start duration=5[c];[b]
[c]hstack=shortest=1, trim=start=5, setpts=PTS-5/TB -y out.mp4
pause
```

### 2.135 Recording one-time events with pre-trigger

Let's assume you want to record a video of a one-time event and you don't know when this event will happen. You get a trigger signal when the event starts, but in the video you also want to see 10 seconds before the trigger signal. This can be realized by capturing the camera signal continuously, delaying it by 10 seconds and then streaming it to a UDP adress. This is the first process which is running continuously:

```
set "SIZE=640x480" :: Size of camera frames
set "FR=30" :: Framerate of camera
set "DELAY=10" :: Delay time in seconds
ffmpeg -f dshow -video size %SIZE% -vcodec mjpeg -framerate %FR% -i video="BisonCam,NB Pro":audio="Mikrofon (Realtek(R)
Audio)" -lavfi "[0:0]tpad=%FR%*%DELAY%,format=yuv420p;[0:1]adelay=%DELAY%s" -q:v 2 -f mpegts udp://127.0.0.1:1234
```

Note: This doesn't work if you omit the audio channel.
Note: The argument of the "adelay" filter is normally in milliseconds, but you can also specify seconds if you add "s", as in this example.
For informations about UDP (User Datagram Protocol) see https://en.wikipedia.org/wiki/User_Datagram_Protocol

The first process should be running for at least 10 seconds. Then the second process is started when the event occurs. It saves a 20 second video, which consists of 10 seconds before and 10 seconds after the trigger signal:
set $" T=20 " \quad:$ Duration in seconds
ffmpeg -f mpegts -i udp://127.0.0.1:1234 -t \%T\% -y out.mp4

For testing the stream you can use this batch file:

```
ffmpeg -f mpegts -i udp://127.0.0.1:1234 -f sdl2 -
```

or alternatively this batch file:

```
ffplay -f mpegts -i udp://127.0.0.1:1234
```

See also https://trac.ffmpeg.org/wiki/Capture/Lightning (that's a complicated solution with external software)

### 2.136

When you make a video from many JPG images, all images must have the same pixel format. But sometimes they are different. For example I has many images that came from the camera with 4:2:2 pixel format. But I had to edit one of the images with IrfanView, it then it was saved with pixel format 4:2:0.
This example changes the pixel format of an image from 4:2:0 to 4:2:2

```
ffmpeg -i IMG_044x.jpg -pix_fmt yuvj422p -q 0 IMG_044.jpg
pause
```

Set the pixel format of a video to $4: 4: 4$ and scale the video to $1920 \times 1080$
ffmpeg -i input.MOV -pix_fmt yuv444p -s $1920 \times 1080$ out.mov
pause

In a filter chain the format can be set as follows:

```
ffmpeg -i input.MOV -lavfi "format=pix_fmts=rgb24" -y out.mp4
pause
```

Which is the same as:

```
ffmpeg -i input.MOV -lavfi "format=rgb24" -y out.mp4
pause
```

See also: https://trac.ffmpeg.org/wiki/Chroma\ Subsampling

| Chroma <br> subsampling | 8-bit <br> format | 10-bit format | Notes |
| :--- | :--- | :--- | :--- |
| $4: 4: 4$ | yuv444p | yuv444p101e | Each of the three Y'CbCr components have the same sample rate, thus there is no chroma subsampling. This <br> scheme is sometimes used in high-end film scanners and cinematic post production. <br> Note that "4:4:4" may instead be referring to R'G'B' color space, which implicitly also does not have any <br> chroma subsampling. |
| $4: 2: 2$ | yuv422p | yuv422p10le | The two chroma components are sampled at half the sample rate of luma: the horizontal chroma resolution is <br> halved. This reduces the bandwidth of an uncompressed video signal by one-third with little to no visual <br> difference. |
| $4: 2: 0$ | yuv420p | yuv420p10le | In 4:2:0, the horizontal sampling is doubled compared to 4:1:1, but as the Cb and Cr channels are only <br> sampled on each alternate line in this scheme, the vertical resolution is halved. The data rate is thus the same. <br> Cb and Cr are each subsampled at a factor of 2 both horizontally and vertically. |

RGB and gray pixel formats (this is only a subset of the available formats):

|  | NB_COMPONENTS | BITS_PER_PIXEL | Notes |
| :--- | :--- | :--- | :--- |
| rgb24, bgr24 | 3 | 24 | packed |
| gbrp | 3 | 24 | planar |
| gray | 1 | 8 |  |
| argb, rgba, abgr, bgra | 4 | 32 | packed |
| gray16be, gray16le | 1 | 16 |  |
| rgb48be, rgb48le, bgr48be, bgr48le | 3 | 48 | packed |
| brgp16be, brgp16le | 3 | 48 | planar |
| gray14be, gray14le | 1 | 14 |  |

All pixel formats are described in the source code in the folder libavutil in file pixfmt.h.

You can also print out the list of all pixel formats with this command:
ffmpeg -pix_fmts
pause

Automatic format conversions can be disabled by the option "-noauto_conversion_filters".
Use "-v verbose" for checking where FFmpeg did auto-insert format conversions. Search for the green lines in the console listing.
You can also add "graphmonitor=f=format". This output is shown as text overlaid to the video.

If you are using the "-noauto_conversion_filters" option, you must manually insert the required conversions in the filter chain.
Example without "-noauto_conversion_filters":

```
ffmpeg -v verbose -f lavfi -i testsrc2=s=svga:d=5,format=yuv422p10le -vf
lut3d="VLog_to_V709.cube" -pix_fmt yuv422p10le -c:v h264 -y out.mov
pause
```

In this example you can see in the console listing that Ffmpeg did auto-insert two format conversions: Before the lut3d filter from yuv422p10le to rgb48le, and after the lut3d filter from rgb48le to yuv422p10le.

The same example with "-noauto_conversion_filters":

```
ffmpeg -v verbose -f lavfi -i testsrc2=s=svga:d=5,format=yuv422p10le -vf
scale,format=rgb48le,lut3d="VLog_to_V709.cube",scale -noauto_conversion_filters -pix_fmt yuv422p10le -c:v h264 -y
out.mov
pause
```

As you can see, there are also two "scale" filters required. It's hard to understand why. In this case the second format conversion can be omitted because it's redundant with the following "-pix_fmt" option.
The following explanation was written by Gyan Doshi in the ffmpeg user list on September 14, 2020 :
"Each filter presents a list of input formats they can work with and a list of output formats they can directly generate. The framework inspects adjacent filters and sets a compatible common format for the outputs and inputs when possible. If not, it sets one of the available output formats for the preceding filter and one from input formats for the following filter and inserts a scale filter to convert between those. This process is format negotiation. The format filter doesn't carry out the conversion itself - it inserts scale which in turn invokes libswscale. scale without any args defaults to the source W and H. But for pixel formats, its output format is constrained by the following format filter. That triggers a format conversion by libswscale."

For more details about the scale filter see also: https://trac.ffmpeg.org/wiki/Scaling
Some important notes from the above website:

- When going from BGR (not RGB) to yuv420p the conversion is broken (off-by-one). Use -vf scale=flags=accurate_rnd to fix that.
- yuvjxxxp pixel formats are deprecated. Yet for $\mathbf{x} 265$ the workaround was implemented, but not for jpeg2000 and AV1. For those -vf scale=out_range=pc should be used.
- Converion from YCbCr limited to RGB 16 bit is broken, use zscale instead of swscale
- Limited range RGB is not supported at all.
- Dither can be turned off using -vf scale=sws_dither=none
- One should always remember that YCbCr 4:4:4 8 bit is not enough to preserve RGB 8 bit, YCbCr 4:4:4 10 bit is required.
- The default for matrix in untagged input and output is always limited BT. 601

This is the RGB color cube:

0 = black, $R=$ red, $G=$ green, $B=$ blue, $Y=$ yellow, $C=$ cyan, $M=$ magenta, $W=$ white

The cube has 6 faces:

There are several ways how to connect the faces to a net. Here are two examples:

The cube does also contain 6 internal diagonal planes:

It's not possible to connect these 6 diagonal planes to a net, because they don't have any common edges.

But it's possible to find nets which contain all 6 faces and all 6 diagonal planes:

If you find a more compact net than the middle or right one, please let me know.

If you want to show all 6 sides and all 6 diagonal planes in a single image, it's more efficient to split the net in $\mathbf{3}$ parts:

This is an example for creating an image which contains all 6 faces and all 6 diagonal planes of the RGB cube:

```
ffmpeg -f lavfi -i color=black:size=256x256 -lavfi split=4[a][b][c][d];^
[a]geq=r=' lerp (255,0,Y/W)':g='0':b='lerp (0,255,X/W)'[aa];^
[b] geq=r=' lerp (255,0,Y/W)'':g=' lerp (0,255,X/W)':b=' lerp (255,0,X/W)' [bb] ;^
[c]geq=r=' lerp (255,0,Y/W)':g='255':b=' lerp (0,255,X/W)' [cc] ;^
[d]geq=r=' lerp (255,0,Y/W)':g=' lerp (255,0,X/W)':b=' lerp (255,0,X/W)'[dd] ;^
[aa][bb][cc][dd]hstack=4,split=3[e1][e2][e3];^
[e2] colorchannelmixer=0:0:1:0:1:0:0:0:0:1:0:0[f2] ;^
[e3] colorchannelmixer=0:1:0:0:0:0:1:0:1:0:0:0[f3];^
[e1][f2][f3]vstack=3 -frames 1 -y out.png
```

pause

This is the output image:

& \text { if MAX }!=0 \text { and MIN }!=0 \\
& \text { Please note that this formula } \\
& \text { works only if the RGB values } \\
& \text { are in the [0..1] range. For } \\
& \text { the [0..255] range, replace } \\
& \text { "1" by " } 255 " .
\end{aligned}
$$

## Color table:

| Color | HUE | R | G | B |
| :--- | :--- | :--- | :--- | :--- |
| red | $\mathbf{0}^{\circ}$ | 255 | 0 | 0 |
| orange | $30^{\circ}$ | 255 | 128 | 0 |
| yellow | $\mathbf{6 0}^{\circ}$ | 255 | 255 | 0 |
| green-yellow | ${90^{\circ}}^{\circ}$ | 128 | 255 | 0 |
| green | $120^{\circ}$ | 0 | 255 | 0 |
| blue-green | $150^{\circ}$ | 0 | 255 | 128 |
| cyan | $180^{\circ}$ | 0 | 255 | 255 |
| green-blue | $210^{\circ}$ | 0 | 128 | 255 |
| blue | $240^{\circ}$ | 0 | 0 | 255 |
| violet | $270^{\circ}$ | 128 | 0 | 255 |
| magenta | $300^{\circ}$ | 255 | 0 | 255 |
| blue-red | $330^{\circ}$ | 255 | 0 | 128 |
| white |  | 255 | 255 | 255 |
| black |  | 0 | 0 | 0 |

L := (MAX + MIN) / 2

This is a different method for calculating hue and chroma:
HUE : $=\operatorname{atan} 2(\operatorname{sqrt}(3) *(G-B), 2 * R-G-B)$
CHROMA : $=\operatorname{sqrt}(3 *(G-B) \wedge 2+(2 * R-G-B) \wedge 2)$

### 2.140

Convert HSV to RGB

Given is HUE [0..360 ${ }^{\circ}$ ] and $\mathrm{S}, \mathrm{V}$ [0..1]
$h_{i}:=\mid$ HUE $/ 60^{\circ}$ ।
$\mathrm{f}:=$ HUE $/ 60^{\circ}-\mathrm{h}_{\mathrm{i}}$
p := V * (1 - S)
$\mathrm{q}:=\mathrm{V}$ * (1-S *f)
$\mathrm{t}:=\mathrm{V}$ * (1-S*(1-f))

| $(R, G, B):=(V, t, p)$ | if $h_{i}=0$ | (from red to yellow) |
| :--- | :--- | :--- |
| $(R, G, B):=(q, V, p)$ | if $h_{i}=1$ | (from yellow to green) |
| $(R, G, B):=(p, V, t)$ | if $h_{i}=2$ | (from green to cyan) |
| $(R, G, B):=(p, q, V)$ | if $h_{i}=3$ | (from cyan to blue) |
| $(R, G, B):=(t, p, V)$ | if $h_{i}=4$ | (from blue to magenta) |
| $(R, G, B):=(V, p, q)$ | if $h_{i}=5$ | (from magenta to red) |

Note: HSV = Hue-Saturation-Value

| -c:v mpeg4 | This is the older MP4 codec, which is poorly documented. See also https://trac.ffmpeg.org/wiki/Encode/MPEG-4 |
| :---: | :---: |
| -c:v libxvid | This MP4 codec is using the external library "libxvid". Search for "libxvid" in the documentation. See also http://www.ffmpeg.org/ffmpeg-codecs.html\#libxvid |
| -c:v libx264 | Newer H264 codec with better compression than mpeg4, but it's possible that the videos don't play on older computers. It's also possible to create lossless videos, as described in the next link: <br> See also https://trac.ffmpeg.org/wiki/Encode/H. 264 <br> See also http://www.ffmpeg.org/ffmpeg-codecs.html\#libx264_002c-libx264rgb |
| -c:v libx265 | H265 is newer than H264, it has better compression than H264 and about the same quality. It's possible that the videos don't play on older computers. <br> See also https://trac.ffmpeg.org/wiki/Encode/H. 265 <br> See also http://www.ffmpeg.org/ffmpeg-codecs.html\#libx265 |
| -c:v prores_ks | Apple ProRes encoder, example: <br> ffmpeg -i input.MOV -vcodec prores_ks -pix_fmt yuva444p10le -profile:v 4444 -bits_per_mb 8000 -s $1920 \times 1080$ out.mov <br> See also http://www.ffmpeg.org/ffmpeg-codecs.html\#ProRes <br> See also https://trac.ffmpeg.org/wiki/Encode/VFX |
| -c:v dnxhd | This codec is suitable for converting 10-bit videos from GH5S camera into a format that's readable by the free DaVoince Resolve software. There isn't much documentation available for this codec and its options. Example: <br> ffmpeg -i input.mov -map_metadata 0 -pix_fmt yuv422p10le -c:v dnxhd -profile:v 4 -c:a pcm_s24le -color_range pc -movflags write_colr out.mov |
| -c:v rawvideo | This means the output format is uncompressed raw video. It's good for lossless intermediate video files. Example: <br> ffmpeg -i in.mp4 -c:v rawvideo -f rawvideo -an -y out.raw (This file can't contain audio) <br> The drawback of this format is that you have to know the framerate, size and pixel format when you read such a file. This problem can be avoided by using the *.nut file format. This format can also contain audio. Example: <br> ffmpeg -i in.mp4 -c:v rawvideo -y out. nut |
| $\begin{aligned} & \text {-c:v ffv1 } \\ & \text {-c:v ffv1 -level } 3 \end{aligned}$ | FFV1 is a lossless video codec which comes in two versions, 1 and 3. See also https://trac.ffmpeg.org/wiki/Encode/FFV1 |

For the "mpeg4" and "libxvid" codecs you can select a video quality level with $-\mathrm{q}: \mathrm{v} \mathrm{n}$, where $n$ is a number from 1-31, with 1 being highest
quality/largest filesize and 31 being the lowest quality/smallest filesize. This is a variable bit rate mode.
The constant rate factor (CRF) can be set with the -crf parameter. Use this mode if you want to keep the best quality and don't care about the file size. The CRF range 0-51 for 8-bit x264 and 0-63 for 10-bit. 0 is lossless (for 8 -bit, but not for $\mathbf{1 0 - b i t}$ ), 23 is the default, and 51 is worst quality possible. For lossless 10 bit -qp 0 is required.
This is in more detail explained here: https://www.pixeltools.com/rate_control_paper.html
Use a preset with the -preset parameter. Possible options are ultrafast, superfast, veryfast, faster, fast, medium (this is the default), slow, slower and veryslow. A preset is a collection of options that will provide a certain encoding speed to compression ratio. A slower preset will provide better compression. Use the slowest preset that you have patience for.

The -tune parameter can be set to these options:

| film | use for high quality movie content; lowers deblocking |
| :---: | :---: |
| animation | good for cartoons; uses higher deblocking and more reference frames |
| grain | preserves the grain structure in old, grainy film material |
| stillimage | good for slideshow-like content |
| fastdecode | allows faster decoding by disabling certain filters |
| zerolatency | good for fast encoding and low-latency streaming |

List all possible internal presets and tunes:

```
ffmpeg -hide_banner -f lavfi -i nullsrc -c:v libx264 -preset help -f mp4 -
pause
```

### 2.142 Keyframes

-g 1 Use every frame as a keyframe
2.143 Open GOP and closed GOP

The difference betweeb open and closed GOP (Group of Pictures) is explained here:
https://streaminglearningcenter.com/blogs/open-and-closed-gops-all-you-need-to-know.html

### 2.144 Video codecs with alpha channel

These are a few examples for exporting videos with alpha channel:

```
rem PNG images (lossless compression, output pixel format is rgba)
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=0.2 -pix_fmt rgba -y test_png_8bit_%%5d.png
rem PNG images (lossless compression, output pixel format is rgba64be)
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=0.2 -pix_fmt rgba64be -y test_png_16bit_o%5d.png
rem Apple ProRes (in all four cases the output pixel format is yuva444p12le)
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix_fmt rgba -c:v prores_ks -y test_prores1.mov
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix_fmt rgba64le -c:v prores_ks -y test_prores2.mov
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix_fmt yuva444p10le -c:v prores_ks -y test_prores3.mov
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix fmt yuva444p12le -c:v prores ks -y test prores4.mov
rem Rawvideo (uncompressed, output pixel format is yuva444p10le)
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix_fmt yuva444p10le -c:v rawvideo -y test_rawvideo1.nut
rem Rawvideo (uncompressed, output pixel format is yuva444p12le)
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix_fmt yuva444p12le -c:v rawvideo -y test_rawvideo2.nut
rem Rawvideo (uncompressed, output pixel format is rgba)
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix_fmt rgba -c:v rawvideo -y test_rawvideo3.nut
rem Rawvideo (uncompressed, output pixel format is rgba64le)
ffmpeg -f lavfi -i testsrc2=s=1920x1080:d=4 -pix_fmt rgba64le -c:v rawvideo -y test_rawvideo4.nut
pause
```

## Note: The *.nut format is unique for FFmpeg.

Note: alpha=0 means transparent, alpha=255 means opaque
See also https://www.digitalrebellion.com/blog/posts/list_of_video formats_supporting_alpha_channels

### 2.145 Metadata

Global metadata can be saved in a text file as follows:

```
ffmpeg -i input.mp4 -f ffmetadata metadata.txt
pause
```

If you also need the metadata from the video and audio streams (which may contain more informations), use this command line:

```
ffmpeg -i input.mp4 -c copy -map_metadata 0 -map_metadata:s:v 0:s:v -map_metadata:s:a 0:s:a -f ffmetadata metadata.txt
pause
```

## The metadata can be re-inserted into a video as follows:

```
ffmpeg -i input.mp4 -i metadata.txt -map_metadata 1 -codec copy output.mp4
pause
```

Write metadata "title" to mp4 video without re-encoding:

```
ffmpeg -i input.mp4 -metadata title="This is the Title" -acodec copy -codec copy -copyts output.mp4
pause
```

Unfortunately FFmpeg can't insert the metadata that is required for a spherical $360^{\circ}$ video.
This website describes which metadata tags are actually written to the output files: https://wiki.multimedia.cx/index.php/FFmpeg_Metadata There is also a list on this page: https://trac.ffmpeg.org/wiki/FilteringGuide

FFmpeg can't write EXIF metadata to *.jpg images (February 2021).

Note: By default, "-filter_complex" or "-lavfi" don't copy the metadata from the input to the output.
Also it's not possible to copy the metadata from the input to the output with "-map_metadata 0 ".
The metadata map must be explicitly specified. For example, this would be -map_metadata:s:v:0 0:s:v:0. For videos with multiple streams however, all output streams (regardless of whether or not they are filtered) would have to be specified this way to preserve all stream metadata (since a single map disables all mappings). (Source: https://trac.ffmpeg.org/ticket/9649)

### 2.146 Video filters "copy" and "null"

These filters are only for testing, for example when you want to disable part of a filter chain.
The "null" filter does really nothing, the output is the same as the input.
The "copy" filter copies the old frame and deletes the old one. The output is the same as with the "null" filter.
For more details about "null" filter see also: https://trac.ffmpeg.org/wiki/Null

### 2.147 Re-numbering images

Cameras do normally create images with 4-digit numbers. When the counter (in Canon cameras) overflows, the number changes from 9999 to 0001 . That means the number 0000 is missing and the numbers aren's continuously increasing, as it's expected by FFmpeg. This problem can be solved with this sequence of console commands:

```
ren IMG 1*.* IMG 2*.*
ren IMG-0*.* IMG-1*.*
ren IMG 9*.* IMG 0*.*
```

The first two commands add 1000 to those numbers that begin with 0 or 1 . The last command subtracts 9000 from those numbers that begin with 9 .
Now the images are in increasing order, but one image is still missing between images 0999 and 1001. This isn't a problem for FFmpeg because is does automatically search the next image. That means small gaps are allowed in the numbering. The maximum gap size is 5 by default. This can be changed with the parameter -start_number_range.

### 2.148

Filenames for images

Image filenames can contain variables. Please note that in a Windows batch file the \% character must be replaced by two \%\% characters.

| Variable | Description | Notes |
| :---: | :---: | :---: |
| \%nd | A sequential n -digit number | The start number can be specified with the -start_number option. The default value is 1. |
| \%Ond | A sequential number that is 0 -padded to n digits |  |
| \%Y | Year | Only available if the "-strftime 1" option is used. Example for embedding date and time in the filename: Screenshot-\%Y-\%m-\%d-\%H-\%M-\%S.jpg |
| \%m | Month |  |
| \%d | Day |  |
| \%H | Hours |  |
| \%M | Minutes |  |
| \%S | Seconds |  |
| \%d | PTS of the frame (Presentation time stamp) | Only available if the "-frame_pts 1 " option is used. Example for embedding the PTS in the filename: Screenshot-\%d.jpg |

### 2.149

## Create two-dimensional gradients

This is an example for making a two-dimensional gradient by defining the colors in the four corners:

```
set "SIZE=256x256" :: Size
set "R1=255" :: Red
set "G1=0" :: Green top left corner
set "B1=0" :: Blue /
set "R2=255" :: R Red \
set "G2=255" :: Green top right corner
set "B2=0" :: Blue y
set "R3=0" : : Red \
set "G3=0" :: Green bottom left corner
set "B3=255" :: Blue /
set "R4=255" :. Red 
set "G4=0" :: Green bottom right corner
set "B4=255" :: Blue /
ffmpeg -f lavfi -i color=black:size=%SIZE% -lavfi geq=r='lerp(lerp(%R1%,%R2%,X/W),lerp(%R3%,
%R4%,X/W),Y/W)':g=' lerp (lerp (%G1%,%G2%,X/W), lerp (%G3%,%G4%,X/W),Y/W)':b='lerp (lerp (%B1%,%B2%,X/W) ,lerp (%B3%,
%B4%,X/W),Y/W)' -frames 1 -y out.png
pause
```

This is the output image:

### 2.150 Make spectrum images

This command line creates an image with a spectrum red - green - blue - red. In the middle between red and green is 50\% red and 50\% green, which is not a bright yellow.
ffmpeg -f lavfi -i nullsrc=s=768x256 -vf geq=r='lt(X,256)*clip(256-X,0,255)+clip(X-
$512,0,255) ': g=' \operatorname{lt}(x, 256) * \operatorname{clip}(x, 0,255)+g t e(x, 256) * c l i p(512-x, 0,255) ': b=1 \operatorname{lt}(x, 512) * c l i p(X-256,0,255)+g t e(X, 512) * c l i p(768-$ $\mathrm{X}, 0,255$ )',oscilloscope=tw=1:s=1 -frames 1 - y spectrum. png
pause

This is the output image:

The same thing can also be done with the "gradients" video source:
ffmpeg -f lavfi -i gradients=s=768x256:c0=red:c1=lime:c2=blue:c3=red:nb_colors=4:x0=0:y0=0:x1=767:y1=0 -vf oscilloscope=tw=1:s=1 -frames $1-y$ spectrum.png
pause
Note: "green" is $0 \times 008000$, "lime" is 0x00FF00

This command line creates an image with a spectrum yellow - cyan - magenta - yellow:
ffmpeg -f lavfi -i gradients=s=768x256:c0=yellow:c1=cyan:c2=magenta:c3=yellow:nb_colors=4:x0=0:y0=0:x1=767:y1=0-vf oscilloscope=tw=1:s=1 -frames 1 -y spectrum1.png
pause
This is the output image:

This command line creates an image with a spectrum red - yellow - green - cyan - blue - magenta. Because this is an optical spectrum, the last part from magenta to red is omitted. In the middle between red and green is $100 \%$ red and $100 \%$ green, which is bright yellow.
ffmpeg -f lavfi -i nullsrc=s=1280x256 -vf geq=r='clip(512-X,0,255)+clip(X-
$1024,0,255$ ) ': $g=' \operatorname{lt}(X, 512) * \operatorname{clip}(x, 0,255)+g t e(X, 512) * c l i p(1024-x, 0,255) ': b=' l t(X, 1024) * c l i p(X-$
$512,0,255)+$ gte $(X, 1024) * \operatorname{clip}(1536-X, 0,255)^{\prime}$,oscilloscope=tw=1:s=1 -frames 1 - $y$ spectrum2.png
pause

This is the output image:

The same thing can also be done with the "gradients" video source:
ffmpeg -f lavfi -i
gradients=s=1280x256:c0=red:c1=yellow: $c 2=1$ ime: $c 3=c y a n: c 4=b l u e: c 5=m a g e n t a: n b \_c o l o r s=6: x 0=0: y 0=0: x 1=1279: y 1=0-v f$ oscilloscope=tw=1:s=1 -frames 1 -y spectrum2.png
pause
Note: "green" is $0 \times 008000$, "lime" is $0 \times 00 F F 00$

This command line creates an image with a spectrum red - yellow - green - cyan-blue - magenta - red. In the middle between red and green is $100 \%$ red and $100 \%$ green, which is bright yellow.
ffmpeg -f lavfi -i nullsrc=s=1536x256 -vf geq=r='clip(512-X,0,255)+clip(X-
$1024,0,255$ ) ': g='lt (X,512)*clip (X,0,255) +gte (X,512) *clip (1024-X,0,255)':b='lt(X,1024)
${ }^{*}$ clip $(X-512,0,255)+g t e(X, 1024) * \operatorname{clip}(1536-X, 0,255)$, oscilloscope=tw=1:s=1 -frames 1 - $y$ spectrum3.png
pause

This is the output image:

The same spectrum can also be created with the "gradients" video source:

## ffmpeg -f lavfi -i

gradients=s=1536x256:c0=red:c1=yellow:c2=1ime:c3=cyan:c4=blue:c5=magenta:c6=red:nb_colors=7:x0=0:y0=0:x1=1535:y1=0-vf oscilloscope=tw=1:s=1 -frames 1 -y spectrum3.png
pause

A similar spectrum can be created with the "colorspectrum" video source. The difference is that the RGB channels have sine shapes, giving a better

## result:

ffmpeg -f lavfi -i colorspectrum=size=1000x2 -vf format=rgb24,crop=iw:1,scale=iw:50 -frames 1 -y out.png pause

This is the output image:

Create a full saturation spectrum at the bottom with a gradient to black at the top:

```
ffmpeg -f lavfi -i nullsrc=s=1536x256 -vf geq=r='st(0,clip(512-X,0,255) +clip(X
1024,0,255));Y*ld(0)/255':g='st(0,lt(X,512)*clip (X,0,255)+gte (X,512)*clip(1024-
X,0,255));Y*ld(0)/255':b='st(0,lt(X,1024)*clip(X-512,0,255)+gte(X,1024)*clip(1536-X,0,255));Y*ld(0)/255' -frames 1 -y
spectrum4.png
```

pause

This is the output image:

Create a full saturation spectrum at the top with a gradient to black at the bottom:
ffmpeg -f lavfi -i nullsrc=s=1536x256-vf geq=r='st(0, clip(512-X,0,255)+clip(X-1024,0,255));(255-
$\mathrm{Y}) * \operatorname{ld}(0) / 255$ ': g='st $(0,1 \mathrm{t}(\mathrm{X}, 512) * \operatorname{clip}(\mathrm{X}, 0,255)+\mathrm{gte}(\mathrm{X}, 512) * \operatorname{clip}(1024-\mathrm{X}, 0,255))$; (255-
Y) *ld(0) /255': b='st(0,lt(X,1024)*clip (X-512,0,255) +gte (X,1024)*clip(1536-X,0,255));(255-Y)*ld(0)/255', oscilloscope=tw=1:y=0:s=1 -frames $1-y$ spectrum5.png
pause

This is the output image:

A similar spectrum can be created with the "colorspectrum" source. The difference is that the RGB channels have sine shapes, giving a better result: ffmpeg -f lavfi -i colorspectrum=size=1536x256:type=black -vf oscilloscope=tw=1:y=0:s=1 -frames 1 -y spectrum5a.png

This is the output image:

Create a full saturation spectrum at the top with a gradient to white at the bottom:

```
ffmpeg -f lavfi -i nullsrc=s=1536x256 -vf geq=r='st(0, clip(512-X,0,255)+clip (X-1024,0,255));Y+ld(0)*(1-
Y/255)':g='st(0,lt(X,512)*clip (X,0,255) +gte (X,512)*clip (1024-X,0,255));Y+ld
(0)*(1-Y/255)':b='st(0,lt(X,1024)*clip (X-512,0,255) +gte(X,1024)*clip(1536-X,0,255));Y+ld(0)*(1-Y/255)' -frames 1 
spectrum6.png
```

pause

This is the output image:

Create a full saturation spectrum at the bottom with a gradient to white at the top:
ffmpeg -f lavfi -i nullsrc=s=1536x256-vf geq=r='st(0, clip(512-X,0,255)+clip(X-1024,0,255));255+Y*(ld(0)/255-
1)' $: g=\operatorname{st}(0,1 t(X, 512) * \operatorname{clip}(X, 0,255)+g t e(X, 512) * \operatorname{clip}(1024-X, 0,255)) ; 255+Y *(1 d(0) / 255-1) ': b=1 \operatorname{st}(0,1 t(X, 1024) * c l i p(X-$
$512,0,255)+$ gte $(\mathrm{X}, 1024) * \operatorname{clip}(1536-\mathrm{X}, 0,255)$ );255+Y*(1d(0)/255-1)' -frames 1 -y spectrum7.png
pause
This is the output image:

A similar spectrum can be created with the "colorspectrum" source. The difference is that the RGB channels have sine shapes, giving a better result: ffmpeg -f lavfi -i colorspectrum=size=1536x256:type=white -frames 1 -y spectrum7a.png

This is the output image:

Create a full saturation spectrum in the middle with a gradient to white at the top and a gradient to black at the bottom:
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0, clip(512-X, 0,255) +clip (X-
$1024,0,255)$ ) ;if(lt $(Y, 256), 255+Y *(\operatorname{ld}(0) / 255-1),(511-Y) * l d(0) / 255) ': g=' \operatorname{st}(0,1 t(X, 512) * c l i p(X, 0,255)+g t e(X, 512) * c l i p(1024-$ $\mathrm{X}, 0,255)$ ) ;if(lt $(\mathrm{Y}, 256), 255+\mathrm{Y} *(\mathrm{ld}(0) / 255-1),(511-\mathrm{Y}) * \operatorname{ld}(0) / 255)$ ':b='st(0,lt(X,1024) *clip (X-
$512,0,255)+g \operatorname{te}(X, 1024) * \operatorname{clip}(1536-X, 0,255)$ ) ;if(lt $(Y, 256), 255+Y *(1 d(0) / 255-1),(511-Y) * l d(0) / 255) '$-frames $1-y$ spectrum8.png
pause

This is the output image:

A similar spectrum can be created with the "colorspectrum" source. The difference is that the RGB channels have sine shapes, giving a better result: ffmpeg -f lavfi -i colorspectrum=size=1536x512:type=all -frames 1 -y spectrum8a.png

This is the output image:

### 2.151 Radial Gradients

## Example:

2.152 Make an additive color mixing image
ffmpeg -f lavfi -i color=black:s=400x400 -lavfi geq=r='255*lt(hypot(X-148,Y-230),100)':g='255*lt(hypot(X-252,Y230) , 100) ': $b=' 255 * \operatorname{lt}(\operatorname{hypot}(\mathrm{X}-200, \mathrm{y}-140), 100)^{\prime}$-frames $1-\mathrm{y}$ test.png
pause

## This is the output image:

ffmpeg -f lavfi -i color=black:s=400x160,format=rgb24 -lavfi drawtext=text="Test":font="arial
black": fontcolor=white:fontsize=140:x=20:y=25,rgbashift=gh=20:bh=10:bv=10 -frames 1 - y rgb_text.png
pause

This is the output image:

### 2.154 Make a 8-color test image

This test image can be used for spherical transformations of equirectangular images.

```
ffmpeg -f lavfi -i color=black:s=200x100 -lavfi
geq=r='255*mod(trunc(4*X/W),2)':g='255*trunc (2*X/W)':b='255*trunc(2*Y/H)' -frames 1 -y test.png
pause
```

This is the output image:

### 2.155 Redshift

It's possible to simulate a relativistic redshift, like in astronomy when a galaxy is moving away from the observer at a high speed.
In this case the colors must be modified as follows:

- black will remain black
- red is shifted towards black
- yellow is shifted towards red
- green is shifted towards yellow
- cyan is shifted towards green
- blue is shifted towards cyan
- magenta is shifted towards blue
- white is shifted towards yellow

This can't be realized by a hue rotation, because hue would rotate red towards magenta and blue (which phsyically makes no sense).
But this can be realized by a simple 3D look-up table which contains only 8 colors, which are the corners of the RGB cube. The table is saved in *.cube format. The order of the components in the *.cube file is red, green, blue.
redshift.cube

```
LUT_3D_SIZE 2
# blac\overline{k}}\mathrm{ remains black
0 0 0
* 0 0
# red becomes black
O 0
# green becomes yellow
1 1 0
# yellow becomes red
1 0 0
# blue becomes cyan
0 1 1
# magenta becomes blue
0 0 1
# cyan becomes green
1 0
# white becomes yellow
1 1 0
```

## This batch file will create a test spectrum (including black and white) and apply the above look-up table:

```
rem Create a test spectrum (including black and white):
ffmpeg -f lavfi -i nullsrc=s=1536x512 -vf geq=r='st(0,clip (512-X,0,255) +clip(X-
1024,0,255));if(lt(Y,256) ,255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':g='st(0,lt(X,512)*clip(X,0,255) +gte(X,512)*clip(1024-
X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)':b='st(0,lt(X,1024)*clip(X-
512,0,255) +gte (X,1024)*clip(1536-X,0,255));if(lt(Y,256),255+Y*(ld(0)/255-1),(511-Y)*ld(0)/255)' -frames 1 -Y
spectrum.png
rem Apply the look-up table and use vstack to show the output below the input:
ffmpeg -i spectrum.png -filter_complex split[a][b],[a]lut3d="redshift.cube"[c],[b][c]vstack -y out.png
pause
```

This is the output image:

Some notes for redshift in astronomy:
delta lambda = lambda * v/c $\quad z=$ (lambda_obs / lambda_emission) - $1 \quad z=v / c$ (approximation for $v \ll c$ )

### 2.156 SMPTE Color Bars

Example:

```
ffmpeg -f lavfi -i smptebars=duration=10 -frames 1 -y out.png
pause
```

See also: https://en.wikipedia.org/wiki/SMPTE_color_bars

### 2.157 Make many JPG test images

```
set "N=6" :: Number of frames
set "S=400\times300" :: Size
ffmpeg -f lavfi -i testsrc2=size=%S%:duration=%N%:rate=1 -y test%%3d.jpg
pause
Note: The default start number is 1 . If you want to begin the filenames with "test000.jpg", add "-start_number 0" before the output filename.
```

```
set "G=10" :: Grid size
set "T=9" :: Grid thickness
set "C=white"
set "B=black"
set "S=800x600"
set "D=10"
Background color
    Video size
    Duration in seconds
rem Make a grid video
ffmpeg -f lavfi -i color=%B%:s=%S% -vf drawgrid=w=%G%:h=%G%:t=%T%:C=%C% -t %D% - y grid.mp4
pause
Note: If thickness is almost as large as grid size, the result becomes a grid of dots.
```

### 2.159 Make a chessboard video

```
ffmpeg -f lavfi -i color=black:s=vga -vf geq=lum='255*mod(floor(X/40)+floor(Y/40),2):cr=128' -t 5 -y out.mp4
pause
```

### 2.160 Make a test video with audio

```
rem Make a 6 seconds video with 1kHz tone
ffmpeg -f lavfi -i testsrc2=size=vga -f lavfi -i sine=1000 -t 6 -y video.mp4
pause
```

This is an example for a noise generator:

```
ffmpeg -f lavfi -i color=gray:size=vga -vf noise=c0s=100:allf=t+u -t 10 -y out.mp4
pause
```

### 2.162 Make a grayscale test image

## rem Make an image with 16x16=256 gray levels:

ffmpeg -f lavfi -i nullsrc -vf geq=lum='X/W*16+16*floor(Y/H*16)':cr=128:cb=128-frames 1 - y grayscale.png
pause

This filter can be used for colorizing of black and white images or videos. It has $\mathbf{1 5}$ default palettes:

```
ffmpeg -f lavfi -i color=black:s=256x20 -lavfi geq=lum=X:cr=128,split=15[a][b][c][d][e][f][g][h][i][j][k][l][m][n][o];
[b]pseudocolor=p=magma [B] ; [c]pseudocolor=p=inferno[C]; [d]pseudocolor=p=plasma[D]; [e]pseudocolor=p=viridis[E];
[f]pseudocolor=p=turbo[F]; [g]pseudocolor=p=cividis[G];[h]pseudocolor=p=range1[H];[i]pseudocolor=p=range2[I];
[j]pseudocolor=p=shadows[J];[k]pseudocolor=p=highlights[K];[l]pseudocolor=p=solar[L];[m]pseudocolor=p=nominal[M];
[n]pseudocolor=p=preferred[N];[O]pseudocolor=p=total[O];[a][B][C][D][E][F][G][H][I][J][K][L][M][N][O]vstack=15 -frames 1
-y out.png
pause
```

This is the output image:

|  | Input grayscale |
| :--- | :--- |
|  | magma |
| inferno |  |
| plasma |  |
| viridis |  |
|  | turbo |
|  | cividis |
|  | range1 |
|  |  |
|  | range2 |
|  | shadows |
| highlights |  |
| solar |  |
| nominal |  |
|  | preferred |
| total |  |

### 2.164

Sometimes it's important to know if a filtergraph has 10-bit accuracy, or if there is a hidden 8-bit conversion somewhere in the filtergraph.
This can be tested with an image which contains 1024 levels of gray in a $32 \times 32$ grid:

```
rem Step 1: Make a 10-bit image with 32*32=1024 levels of gray:
ffmpeg -f lavfi -i nullsrc=s=svga,format=yuv444p10le -vf geq=lum='X/W* 32+32*floor(Y/H* 32)':cr=512:cb=512,format=rgb48be
-frames 1 -y 10bit.png
rem Step 2: Apply the filter under test (replace "null" by the filtergraph that you want to test):
ffmpeg -i 10bit.png -lavfi null -y test.png
rem Step 3: Use strong contrast enhancement by a factor 32 to make the least significant bits visible:
ffmpeg -i test.png -vf format=yuv444p10le,geq=lum='clip(32*(lum(X,Y) -512),0,1023)':cr='cr(X,Y)':cb='cb(X,Y)' -y 32x.png
pause
```

Now check if the output image has 32 levels of gray in $X$ direction. If there was a hidden 8 -bit conversion, then only $\mathbf{8}$ levels of gray are visible. Note: The strong contrast enhancement in the $3^{\text {rd }}$ step is done with the "geq" filter, because the "eq" filter isn't 10-bit compatible.

If you want to do the same test with a video instead of an image, use this batch file:

Here are the results of the 10-bit compatibility test (tested 2022-01-01, sorted alphabetically):

| Filter | Is it 10-bit compatible? |
| :--- | :--- |
| atadenoise | yes |
| blend | yes |
| bm3d | yes |
| chromahold | yes |
| chromakey | yes |
| chromanr | yes |

### 2.165 Make a 10-bit test video with audio

```
rem Make a 6 seconds 10-bit video with 1kHz tone
ffmpeg -f lavfi -i testsrc2=size=hd1080,format=yuv422p10le -f lavfi -i sine=1000 -c:v h264 -t 6 -y out.mov
pause
```

### 2.166 Find an object in a video and hide it

The find_rect function can find a rectangular object in an image or video, and cover_rect can then replace it by another image or by interpolating the neightbor pixels.

```
ffmpeg -i test1.png -vf find_rect=test2.pgm,cover_rect out.png
pause
```

Note: find_rect will find only one instance of the object in a frame.

If you already know the coordinates and size of the rectangular object to be covered, then instead of "find_rect" and "cover_rect" it's better to use these alternatives:

- If you want to interpolate the surrounding pixels, use the "delogo" filter.
- If you want to draw a rectangle with a uniform color, use the "drawbox" filter
- If you want to replace the region by another image, use the "overlay" filter.

The find_rect filter can also be used for searching an object in a video and write the $\mathbf{x}, \mathrm{y}$ coordinates and the score to a file. This works only with FFprobe and not with FFmpeg:

| set "IN=in.mp4" | $::$ Input video |
| :--- | :--- |
| set "OBJ=needle.pgm" | $::$ Image of the object, must be gray8 |
| set "TH=0.04" | $::$ Threshold, $0.01=$ only exact matches, $0.99=$ almost everything matches |
| set "XMIN=900" | $::$ Minimum $x$ position of the object's top left corner |
| set "XMAX=1900" | $::$ Maximum x position of the object's top left corner |
| set "YMIN=490" | $::$ Minimum y position of the object's top left corner |
| set "YMAX=510" | $::$ Maximum y position of the object's top left corner |

ffprobe -f lavfi movie= $\%$ IN $\%$,find_rect=object= $=0 B J \%:$ threshold= $\% T H \%: x m i n=\% X M I N \%: x m a x=\% X M A X \%: y m i n=\% Y M I N \%: Y m a x=\% Y M A X \%$ -show_entries frame=pkt_pts_time:frame_tags=lavfi.rect.x,lavfi.rect.y,lavfi.rect.score -of csv 1> log.csv
pause
Note: To speed up the algorithm, make the object image as small as possible and use a search window with the xmin, xmax, ymin, ymax options.
This is the resulting logfile. The coordinates are for the top left corner of the object image. If no object was found for the specified threshold, no coordinates are written:

```
frame,0.000000
frame,0.041667,1633,1000,0.032153
frame,0.083333,1634,1000,0.033357
frame,0.125000
frame,0.166667,1634,1000,0.035687
frame,0.208333,1634,1000,0.038733
frame,0.250000
frame,0.291667,1634,1000,0.019203
frame,0.333333,1634,1000,0.007542
```

-••

If you want to omit the word "frame," in the log file, replace "csv" by "csv=p=0"

```
ffprobe -f lavfi movie=%IN%,find_rect=object=%OBJ%:threshold=%TH% -show_entries
frame=pkt_pts_time:frame_tags=lav̄fi.rect.x,lavfi.rect.y -of csv=p=0 1> log.csv
```

Note: A list of variables that can be printed with "-show_entries" can be found in the file "ffprobe.xsd" which is in the source tree under doc/ffprobe.xsd

Note: Tracking of objects works better in DaVinci resolve.

### 2.168 Detect black frames and replace them by previous frame

See https://video.stackexchange.com/q/23589/
See "blackframe" and "blackdetect" filters.

FFmpeg supports these image formats. This list is incomplete, a longer (but also incomplete) list can be found at http://www.ffmpeg.org/general.html

| Image <br> Format | compressed? | lossless? | 16-Bit? | Notes |
| :--- | :--- | :--- | :--- | :--- |
| BMP | no | yes | no | very big filesize |
| DNG | yes | yes | yes | "Adobe Digital Negative" format, recommended for saving RAW images from cameras. Use Adobe <br> DNG converter to make these files. <br> Warning: FFmpeg's DNG decoder doesn't work correctly with most images. |
| FITS | yes | yes | yes | Flexible Image Transport System, a popular image format in astronomy |
| GIF | yes | yes | no | this is obsolete, use PNG instead |
| JPG | yes | no | no | recommended for 8-bit images if small file size is required |
| PAM | no | $?$ | $?$ | "Portable Arbitrary Map" |
| PGM | no | yes | yes | "Portable Graymap", these files are required for the remap filter. FFmpeg can read binary PGM (P5) <br> files and ASCII PGM (P2) files, but for output only binary PGM (P5) is supported. PGM files contain <br> values in the range [0..65535]. Negative values aren't possible, but FFmpeg gives no warning if a <br> negative number is found in a P2 file. |
| PGMYUV | no | $?$ | $?$ | This is a FFmpeg variant of the binary PGM format |
| PNG | yes | yes | yes | recommended for lossless saving of 8-bit or 16-bit images |
| PPM | no | yes | yes | "Portable Pixmap" |
| TGA | yes | yes | no | this is obsolete, use PNG instead |
| TIFF | no | yes | yes |  |

## Show all supported pixel formats of the PNG encoder:

```
ffmpeg -h encoder=png
pause
```

In FFmpeg the image size is limited to ((Width * 8) + 1024) * (Height + 128) < INT_MAX = 2147483647
That means $16384 \times 16384$ is allowed but $32768 \times 16384$ is not.
See also https://video.stackexchange.com/questions/28408/how-to-fix-ffmpeg-picture-size-32768x16384-is-invalid

### 2.171 CR2 and DNG Images

FFmpeg's DNG decoder has many problems and fails with most DNG images. Also FFmpeg can't import CR2 (Canon RAW) images.
This is the best workaround I could find so far, for FFmpeg DNG to JPG conversion. The DNG image comes from a Canon 6D via Adobe DNG converter V12.4: Update December 2021: This command line doesn't work any more.

```
ffmpeg -i IMG_3459.dng -vf
colorchannelmixer=rr=1.0:gg=0.5:bb=1.0,tonemap=linear:param=1000,tonemap=gamma:param=1.3,crop=x=96:y=60:w=iw-96:h=ih-60
-y out.jpg
```

pause

Note: I think "colorchannelmixer=gg=0.5" is a dirty workaround for decoding the bayer_rggb16le pixel format. There are two green pixels in a macropixel, that's why the image appears too green and thus the green channel must be divided by 2.

Note: A problem of FFmpeg's DNG decoder is that the size of the image may be a little bit too large. If there are black borders at the top and left, you can remove them with the "crop" filter. In this example the size is for an image from a Canon 6D (5472x3648).
Note: Depending on the color temperature at which the picture was taken, the "rr" and "bb" parameters may have to be adjusted. If the image appears too reddish, make "rr" smaller than 1.0 and "bb" bigger than 1.0 , and if is's too bluish, then the other way round. It should be possible to automatize this process using the metadata from the DNG image, but I don't know how to do this.
Note: This workaround doesn't work with DNG images that were exported from Adobe Lightroom.

## Recommended workarounds for importing DNG images in FFmpeg:

- If 8-bit is sufficient, use IrfanView to convert the DNG images to PNG or JPG. Batch processing is possible for groups of images.
- If 16-bit is required, use GIMP with Darktable plugin to convert DNG images to 16-bit PNG. Unfortunately batch processing for groups of images isn't possible, because the BIMP plugin doesn't allow DNG as import format.
- To convert groups of CR2 or DNG images to 16 -bit PNG, you can use Darktable (as a stand-alone program without GIMP).
- Don't try to import DNG images in FFmpeg. It might theoretically be possible, however there are too many problems and it's not worth the trouble.

```
Highly recommended workaround for importing CR2 or DNG images (or groups of numbered images) into a video
    - It's very easy to do this with DaVinci Resolve 17
```

It was claimed that FFmpeg can correctly decode DNG images (from Adobe DNG converter V12.4). But l've never seen a working example. Some hints were given in the FFmpeg user list:

- "Use zscale filter."

Sources:
http://ffmpeg.org/pipermail/ffmpeg-user/2020-October/050340.html
http://ffmpeg.org/pipermail/ffmpeg-user/2020-October/050415.html
http://ffmpeg.org/pipermail/ffmpeg-user/2020-November/050701.html
It's unclear how zscale must be used. Which options, with which other filters and/or format conversions, in which order? Unfortunately the documentation of FFmpeg's zscale filter is a useless mess.
The "zimg" (zscale) library can be found here, but don't expect any useful documenatation: https://github.com/sekrit-twc/zimg
An example for zscale can be found here: https://stackoverflow.com/questions/69251960/how-can-i-encode-rgb-images-into-hdr10-videos-in-fmpeg-command-line

- "Use the right input pixel format prior to calling zscale as it does not support bayer formats."

Source: http://ffmpeg.org/pipermail/ffmpeg-user/2020-October/050428.html
It's unclear which is the right input pixel format. According to FFprobe, the input pixel format is bayer_rggb16le. How can the pixel format be set? With "-pix_fmt" before the input? Or after the input? Or with "-pixel_format"? Or with "format=" at the beginning of the filter chain? None of these four methods works.

- "Set output trc."

Source: http://ffmpeg.org/pipermail/ffmpeg-user/2020-October/050428.htm
"trc" means "transformation characteristics". At which point in the filter chain must it be set? Before the zscale filter or in the zscale filter or after the zscale filter? To which value must it be set? How can it be specified that the input color space is sRGB?

- The following threads in the ffmpeg-user list are about importing DNG images in FFmpeg, but none of them contains a working example:
http:///fmpeg.org/pipermail/ffmpeg-user/2013-February/013312.html
http://ffmpeg.org/pipermail/fmpeg-user/2020-August/049681.html
http://ffmpeg.org/pipermail/ffmpeg-user/2020-October/050323.htmI
http://ffmpeg.org/pipermail/ffmpeg-user/2020-October/050412.htmI
- http://ffmpeg.org/pipermail/ffmpeg-user/2020-November/050700.html
- http://ffmpeg.org/pipermail/ffmpeg-user/2021-February/051999.html

I gave up at this point, because without proper documentation it's impossible to find a working example in reasonable time. There are too many open questions and the try-and-error approach is frustrating. If anybody has found a working example, please let me know.

I used these DNG images for testing:
http://www.astro-electronic.de/IMG_3459.dng This image was taken with a Canon 6D camera and converted to DNG by Adobe DNG converter V12.4 http://www.astro-electronic.de/Canon_5D.dng This image was taken with a Canon 5D-MK4 camera and converted to DNG by Adobe DNG converter V12.4 http://www.astro-electronic.de/Pentax_K5.DNG This image was directly generated by a Pentax K5 camera.

Some other DNG images can be found here: http://ffmpeg.org/pipermail/ffmpeg-user/2020-August/049681.html
A DNG test image can be downloaded near the bottom of this website: https://www.rawdigger.com/howtouse/rawdigger-histograms-display-modes

### 2.172 Colorspace

For more infos about colorspace, colormatrix and zscale see https://trac.ffmpeg.org/wiki/colorspace

This is copied from the above wiki page:
FFmpeg stores all these properties in the AVFrame struct:

- The format (type and bit-depth), in AVFrame->format
- The signal range, in AVFrame->color_range
- The YUV/RGB transformation matrix, in AVFrame->colorspace
- The linearization function (a.k.a. transformation characteristics), in AVFrame->color_trc
- The RGB/XYZ matrix, in AVFrame->color_primaries

## See also https://stackoverflow.com/questions/61834623/how-to-use-ffmpeg-colorspace-options

See also https://medium.com/invideo-io/talking-about-colorspaces-and-ffmpeg-f6d0b037cc2f

### 2.173 Video sizes

This list contains only the most important video sizes. The full list is in the FFmpeg documentation.

|  | Size | Aspect ratio | Notes |
| :--- | :--- | :--- | :--- |
| ntsc | $720 \times 480$ | $3: 2$ |  |
| pal | $720 \times 576$ | $5: 4$ |  |
| vga | $640 \times 480$ | $4: 3$ |  |
| svga | $800 \times 600$ | $4: 3$ |  |
| xga | $1024 \times 768$ | $4: 3$ |  |
| hd720 | $1280 \times 720$ | $16: 9$ |  |
| uxga | $1600 \times 1200$ | $4: 3$ |  |
| hd1080 | $1920 \times 1080$ | $16: 9$ | Beamer in the planetarium in the St. Andreasberg observatory |
| wuxga | $1920 \times 1200$ | $8: 5$ | Cinema advertising |
| 2kflat | $1998 \times 1080$ | $37: 20=16.65: 9$ |  |
| 2k, 2kdci | $2048 \times 1080$ | $256: 135=17.066: 9$ |  |
| uhd2160 | $3840 \times 2160$ | $16: 9$ |  |
| 4kflat | $3996 \times 2160$ | $37: 20=16.65: 9$ |  |
| 4k, 4kdci | $4096 \times 2160$ | $256: 135=17.066: 9$ |  |

|  | 128 | 160 | 176 | 240 | 320 | 352 | 400 | 432 | 480 | 640 | 704 | 720 | 768 | 800 | 852 | 960 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 96 | sqcif |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 120 |  | qqvga |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 144 |  |  | qcif |  |  |  |  |  |  |  |  |  |  |  |  |  |

```

```
%:1a=%D%:2a=%D%:0b=%D%:1b=%D%:2b=%D%[d];[c]tmix=%TMIX%[e];[d][e]blend=all_mode=lighten:shortest=1" -map 2:a -q:v 1 -c:v
mpeg4 %AUD% -y %OUT%
pause
```

This batch file does the same postprocessing with a loop over all CUT*.MOV files in the current folder:

```
set "BP R=0.02"
Black point red, positive value makes background darker
set "BP_G=0.00"
set "BP_B=0.02"
set "WP=0.2"
set "SAT=1.0"
set "GAM=1.0"
set "D=0.3"
set "TMIX=25"
set "CUT=15"
set "AUDIO=no"
set AUD=""
if %AUDIO%==no (set AUD=-an)
for %%f in (CUT*.MOV) do call :for body %%f
goto : the_end
: for_body
ffmpeg -i %1 -i dark.png -filter complex "crop=2824:ih,pad=iw:2824:-1:-1,scale=1200:1200,format=rgb48[a];[a]
[1]blend=all_mode=subtract,colorlevels=rimin=%BP_R%:gimin=%BP_G%:bimin=%BP_B%:rimax=%WP%:gimax=%WP%:bimax=%WP
```

```
%[d];[c]tmix=%TMIX%[e];[d][e]blend=all_mode=lighten:shortest=1" -q:v 1 -c:v mpeg4 %AUD% -y %~n1.mp4
exit /b
    : the_end
pause
```

Workflow for videos from the starry sky with Panasonic GH5S and Nippon Kogaku 8mm Fisheye:
Step 1, apply gradation curve and then extract an image and insert the CLUT:

```
set "IN=P1000128.mov"
    : Input video
set "T=1" :: Time where image is extracted
ffmpeg -ss %T% -i %IN% -f lavfi -i haldclutsrc=8 -filter complex "[0]format=pix fmts=rgb48be[a];
[1] format=pix_fmts=rgb48be[b]; [b][a]xstack=inputs=2:layoüt=0_0|w0_0" -frames 1 -y image_with_clut.png
pause
```

Step 2, after editing with GIMP, the CLUT is extracted and applied to the video:

```
set "IN=P1000128.mov" :: Input video
set "BR=0.04" :: Small brightness adjustment before applying the CLUT
set "OUT=128.mp4" :: Output video
ffmpeg -i processed_image_with_clut.png -vf crop=512:512:0:0 -y clut.png
ffmpeg -i %IN% -i clut.png -filter_complex "[0]format=pix_fmts=rgb48be,crop=2824:ih,pad=iw:2824:-1:-1,eq=brightness=%BR
%,scale=1200:1200[a],[a][1]haldclut" -an -y %OUT%
del clut.png
pause
```

### 2.178

## Combine many options and filters

Of course, you can also combine any number of options and filters in a single batch file, as in this example.
With this batch file you can cut a temporal part out of a video, change width and height, adjust the frame rate, change the speed (slow motion or time lapse), if necessary crop to square format, if necessary remove the original sound, and change contrast, brightness, saturation and gamma.

```
set "INPUT=PanoView.mp4" :: Input video
set "OUTPUT=out.mp4" : : Output video
set "SIZE=800x800"
set "RATE=30"
set "START=1.0"
set "LENGTH=3"
set "SPEED=3.0"
set "QUAD=no"
set "AUDIO=no"
set "CONTRAST=1.0"
set "BRIGHT=0.0"
set "SATUR=1.0"
set "GAMMA=1.0"
set "QU=3"
set CROP=iw:ih
if %QUAD%==yes (set CROP=ih:ih)
set SOUND=
if %AUDIO%==no (set SOUND=-an)
ffmpeg -ss %START% -t %LENGTH% -i %INPUT% %SOUND% ^
-vf crop=%CROP%,setpts=%SPEED%*PTS,eq=contrast=%CONTRAST%:brightness=%BRIGHT%:saturation=%SATUR%:gamma=%GAMMA% ^
-s %SIZE% -r %RATE% -q:v %QU% -codec:v mpeg4 %OUTPUT%
pause
```

### 2.179 Timelapse example with masking, deflicker, rotation, fading

This batch file creates a time lapse from many images, with masking and deflicker filter, with slow rotation of the image, fade in and fade out at the beginning and end:

```
set "IN=IMG_%%4d.jpg"
set "SN=3551"
set "SIZE=1200"
set "QU=3"
set "FPS=30"
set "FADE=3"
set "FADEOUT=11.5"
set "CONTRAST=1.0"
set "BRIGHT=0"
set "SATUR=1.2"
set "GAMMA=1.1"
set "ROT=0.0+n*0.002"
set "ROT=0.0
set "AUDIO=birds.mp3"
set "VOL=1.5"
set "OUT=out.mp4"
: Input pictures
Number of first picture

pause
```

### 2.180

Set "Rec Format" to "MOV" and "Rec Quality" to one of these:

Set "Variable Frame Rate" to "On" and set the desired framerate.
The video can be played as-is with VLC player and is already a timelapse. The speed factor can be calculated as follows:
Speed_Factor = Framerate / Base_Framerate where Base_Framerate is either 24, 25, 30, 50 or 60 as specified in "Rec Quality".
If you want a higher speed factor, you have to use the setpts filter:

```
set "IN=P1000128.mov" :: Input video
set "S=5.0" :: Slow motion factor
ffmpeg -i %IN% -vf setpts=5*PTS -y out.mp4
pause
```

## Example:

The video was taken in [FHD/8bit/100M/50p] mode at 240fps. It has already a 4.8 x speed factor if played as-is.
Output from FFprobe: FrameRate $=50 p$, VFRRatio $=50 / 240$
With the additional factor 5 the total speed factor becomes $24 x$, with other words one second in reality is shown as 24 seconds in playback. The output framerate can be set with the -r option if required; this doesn't affect the speed factor.

Table for setpts value (for videos taken at 240fps):

|  | Desired Slow Motion Factor |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Base <br> Framerate | 2x | 2.4x | 2.5x | 3 x | 4x | 4.8x | 5x | 6x | 8x | 9.6x | 10x | 12x | 16x | 19.2x |
| 24 | 0.2 | 0.24 | 0.25 | 0.3 | 0.4 | 0.48 | 0.5 | 0.6 | 0.8 | 0.96 | 1 | 1.2 | 1.6 | 1.92 |

```

pause

Please note that for better readability the command line is shown here with line feeds. These must be removed in the real batch file.

## Important note for the drawgraph filter:

The colors of the curves must be specified in the non-standard format 0xAABBGGRR, however the background color must be specified in FFmpeg's normal color format 0xRRGGBBAA, for which many predefined colors are available.

This is the light curve of the star TYC1932-00469-1 which was occulted by the asteroid (87) Sylvia on October 30, 2019. The video was taken with a Canon EF 400 mm f/2.8 lens, SpeedBooster 0.64x and Panasonic GH5S camera at 25600 ISO, FHD 25fps and [Ex. Tele Conv.] = 2.1x.

This is a batch file for drawing light curves of two stars simultaneously:

```
set "IN=P1000479.mov"
set "OUT=occultation.mp4"
set "BP_R=0.015"
set "BP-G=0.005"
set "BP_B=0.015"
set "WP=0.26"
set "S=300"
set "T=40"
set "X1=926"
set "Y1=475"
set "C1=0xfffffffff"
set "X2=1054"
set "Y2=267"
set "C2=0xffff00ff"
set "BG=0x00000000"
set "B=10"
set "MIN=60"
set "MAX=90
set "FONT=arial.ttf"
set "COLOR=white"
set "BCOLOR=black"
set "SIZE=30"
set "POS_X=0"
set "POS Y=(h-th)"
set "OFFSET=2340"
```

```
%: x=%POS_X%:y=%POS_Y%'
rem Extract the first frame:
rem ffmpeg -ss %S% -i %IN% -vf "colorlevels=rimin=%BP R%:gimin=%BP G%:bimin=%BP B%:rimax=%WP%:gimax=%WP%:bimax=%WP%"
-frames 1 -y framel.png
rem Find the coordinates of the star (with IrfanView) and set them to the variables X1,Y1 and X2,Y2.
```

```
rem Then create a video with light curves and markers at the stars. The light curve can be YAVG for average over the
box or YMAX for maximum in the box:
ffmpeg -ss %S% -i %IN% -lavfi "[0]crop=2*%B%:2*%B%:%X1%-% B%:%Y1%-%B%,signalstats,
drawgraph=m1=lavfi.signalstats.YAVG:mode=line:slide=scroll:min=%MIN%:max=%MAX%:size=1920x270:fg1=%C1%:bg=%BG%[1];
[0] crop =2*%B%:2*%B%:%X2%-%B%:%Y2%-%B%,signalstats,
drawgraph=m1=lavfi.signalstats.YAVG:mode=line:slide=scroll:min=%MIN%:max=%MAX%:size=1920x270:fg1=%C2%:bg=%BG%[2];
[2][1]overlay[3];
[0] colorlevels=rimin=%BP_R%:gimin=%BP_G%:bimin=%BP_B%:rimax=%WP%:gimax=%WP%:bimax=%WP%,
drawbox=x=%X1%+2*%B%:y=%\overline{Y}1%:c=White: t=1 : w=2*%B%:h=\overline{1}
drawbox=x=%X1%:y=%Y1%+2*%B%:c=White : t=1 : w=1 : h=2*%B%
drawbox=x=%X2%+2*%B%:y=%Y2%:c=Violet:t=1:w=2*%B%:h=1,
drawbox=x=%X2%: y=%Y2%+2*%B%:c=Violet: t=1:w=1:h=2*%B% [4];
[4][3] overlay=y=810,%CLOCK%" -pix fmt yuv420p -t %T% -y %OUT%
pause
```

This is a batch file for drawing the light curve and the audio level simultaneously. But it has the problem that the two graphs aren't running exactly synchronously. I don't know why.

```
set "IN=P1000479.mov" 
Input video
set "IN=P1000479.mov"
set "BP_R=0.015"
set "BP_G=0.005"
set "BP-B=0.015"
set "WP=0.26"
set "S=300"
set "T=40"
set "X=926"
set "Y=475"
set "C1=0xffffffff"
set "C2=0xffff00ff"
set "BG=0x00000000"
set "B=10"
set "MAX=90
set "MIN=70"
Output video
Black point red, positive value makes background darker

set CLOCK=drawtext='fontfile=%FONT%:text=%%{pts\:hms\:%OFFSET%}:fontcolor=%COLOR%:boxcolor=%BCOLOR%:box=1:fontsize=%SIZE
%: x=%POS_X%:y=%POS_Y%'
rem Extract the first frame:
rem ffmpeg -ss %S% -i %IN% -vf "colorlevels=rimin=%BP_R%:gimin=%BP_G%:bimin=%BP_B%:rimax=%WP%:gimax=%WP%:bimax=%WP%"
-frames 1 -y framel.png
rem Find the coordinates of the star (with IrfanView) and set them to the variables X and Y.
rem Then create a video with light curve and audio level curve. The light curve can be YAVG for average over the box or
YMAX for maximum in the box
ffmpeg -ss %S% -i %IN% -lavfi [0:v] crop=2*%B%:2*%B%:%X%-%B%:%Y%-%B
%,signalstats,drawgraph=m1=lavfi.signalstats.YAVG:mode=line:slide=scroll:min=%MIN%:max=%MAX%:size=1920x200:fg1=%C1%:bg=
%BG%[1];
[0:a] asetnsamples=n=1920,astats=metadata=1:reset=1,adrawgraph=m1=lavfi.astats.1.RMS_level:mode=bar:slide=scroll:min=
%AMIN%:max=%AMAX%:size=1920x100:fg1=%C2%:bg=%BG%[2]; [1][2]vstack[3];[0]colorlevels=rimin=%BP_R%:gimin=%BP_G%:bimin=%BP_B
% :rimax =%WP% : gimax =%WP%:bimax =%WP%, drawbox=x=%X%+2*%B%:y=%Y%:c=White:t=1:w=2*%B%:h=1,drawbox=x=%X%:y=% Y%+2*%B
%:c=White : t=1:w=1:h=2*%B%[4]; [4][3] overlay=y=750,%CLOCK% -pix_fmt yuv420p -t %T% -y %OUT%
pause
```

The value 1920 for asetnsamples is the number of audio samples per video frame, in this case $48000 / 25=1920$.

### 2.182 Oscilloscope

The oscilloscope filter can show the brightness of a video line:

```
set "IN=P1000479.mov" :: Input video
set "OUT=out.mp4" :: Output video
set "LINE=495" :: The shown line
set "H=1080" :: Height of the video
ffmpeg -i %IN% -lavfi "oscilloscope=x=0.5:y=%LINE%/%H%:C=1" -t 10 -y %OUT%
pause
```

c=1 means show only the first component, in this case the luma component.
c=7 means show the first three components.
If you want to show the RGB components, add "format=rgb24," before the oscilloscope filter.
Note: It seems oscilloscope doesn't work with 10-bit videos.

### 2.183 Vectorscope

```
set "IN=test.mp4" :: Input video
ffplay %IN% -vf "split[a] [b],[b]vectorscope=g=green[c],[a] [c]overlay=x=W-w:y=H-h"
```

### 2.184 Capture a video from a webcam

List all supported, connected capture devices:

```
ffmpeg -list_devices 1 -f dshow -i dummy
pause
```

List the possible video sizes, frame rates ans pixel formats for one capture device:

```
ffmpeg -list_options 1 -f dshow -i video="HD WebCam"
pause
```

## Capture video from the webcam:

```
ffmpeg -y -f dshow -video_size 1280x720 -framerate 10 -pixel_format yuyv422 -i video="HD WebCam" -t 5 out.mp4
pause
```

See also: https://trac.ffmpeg.org/wiki/Capture/Webcam See also: https://trac.ffmpeg.org/wiki/DirectShow

Built-in help for "dshow" input device:

```
ffmpeg -h demuxer=dshow
pause
```

Capture the entire desktop without audio:
set "FR=10" $::$ Framerate
ffmpeg -f gdigrab -framerate \%FR\% -i desktop -y out.mp4
pause

## Capture the entire desktop with audio:

Go th the windows device manager and choose "Audio Devices". Select the "Recording" tab. Enable the "Stereomix" device. Click on "Properties". Under the "Listen" tab, ckeck the box "Listen to this device". Under the "Levels" tab, disable the speaker.
Then run this command to find out the name of the "Stereomix" device:
ffmpeg -list_devices true -f dshow -i dummy
pause

Enter the name in the following command line, in this case "Stereomix (Realtek(R)Audio)". If the audio volume is too low, you can increase it with the "volume" filter.

```
ffmpeg -f gdigrab -i desktop -f dshow -i audio="Stereomix (Realtek(R) Audio)" -af volume=3 -y grabbed_video.mp4
pause
```

## Or alternatively with Nvidia driver:

```
ffmpeg -f gdigrab -i desktop -f dshow -i audio="Stereomix (Realtek(R) Audio)" -af volume=3 -c:v h264_nvenc -y
grabbed_video.mp4
pause
```

## Capture a region of the desktop:

```
set "SHOW=1" :: 0 = do not show the border
set "FR=10" :: 1 = show the border of the region on the desktop
Set :: Size of the region
set "X=20" :: Left edge of region
set "Y=50" :: Top edge of region
ffmpeg -f gdigrab -show_region %SHOW% -framerate %FR% -video_size %SIZE% -offset_x %X% -offset_y %Y% -i desktop -y
out.mp4
pause
```

## Capture a window:

```
set "TITLE=*new 1 - Notepad++" :: Name of the window
set "FR=10" : : Framerate
ffmpeg -f gdigrab -framerate %FR% -i title="%TITLE%" -y out.mp4
pause
The title is the text in the title line of the window. It's not the name of the process in the task manager. A problem is that the title may change dynamically. For example, the title of an editor changes as soon as you begin to enter something ( \(\mathbf{a}\) * is inserted at the beginning).
```

It's also possible use a cheap HDMI to USB converter and capture the HDMI output from a camera, including audio (tested with GH5S).

The available options (pixel formats and video sizes) of the HDMI to USB converter can be shown with this command:

```
ffmpeg -list_options 1 -f dshow -i video="USB Video"
pause
```

This is the output:

```
[dshow @ 0000000000184800] DirectShow video device options (from video devices)
[dshow @ 0000000000184800] Pin "Capture" (alternative pin name "0")
[dshow @ 0000000000184800] vcodec=mjpeg min s=1920\times1080 fps=5 max s=1920\times1080 fps=30
[dshow @ 0000000000184800] vcodec=mjpeg min s=1600\times1200 fps=5 max s=1600\times1200 fps=30
[dshow @ 0000000000184800] vcodec=mjpeg min s=1360x768 fps=5 max s=1360x768 fps=30
[dshow @ 0000000000184800] vcodec=mjpeg min s=1280\times1024 fps=5 max s=1280\times1024 fps=30
[dshow @ 0000000000184800] vcodec=mjpeg min s=1280\times960 fps=5 max s=1280x960 fps=50
[dshow @ 0000000000184800] vcodec=mjpeg min s=1280x720 fps=10 max s=1280x720 fps=60.0002
```

#### Abstract

[dshow @ 0000000000184800] vcodec=mjpeg min s=1024x768 fps=10 max s=1024x768 fps=60.0002 [dshow @ 0000000000184800] vcodec=mjpeg min s=800x600 fps=10 max s=800x600 fps=60.0002 [dshow @ 0000000000184800] vcodec=mjpeg min s=720x576 fps=10 max s=720x576 fps=60.0002 [dshow @ 0000000000184800] vcodec=mjpeg min s=720x480 fps=10 max s=720x480 fps=60.0002 [dshow @ 0000000000184800] vcodec=mjpeg min s=640x480 fps=10 max s=640x480 fps=60.0002 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=1280x720 fps=10 max s=1280x720 fps=10 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=1920×1080 fps=5 max s=1920x1080 fps=5 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=1600x1200 fps=5 max s=1600x1200 fps=5 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=1360x768 fps=8 max s=1360x768 fps=8 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=1280x1024 fps=8 max s=1280x1024 fps=8 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=1280x960 fps=8 max s=1280x960 fps=8 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=1024x768 fps=10 max s=1024x768 fps=10 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=800x600 fps=5 max s=800x600 fps=20 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=720x576 fps=5 max s=720x576 fps=25 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=720x480 fps=5 max s=720x480 fps=30 [dshow @ 0000000000184800] pixel_format=yuyv422 min s=640x480 fps=5 max s=640x480 fps=30

Note: Actually all these options are listed twice. I don't know why.

The available audio options of the HDMI to USB converter can be shown with this command:
ffmpeg -list_options 1 -f dshow -i audio="Digitale Audioschnittstelle (US"
pause

This is the output:
[dshow @ 00000000003c48c0] DirectShow audio only device options (from audio devices)
[dshow @ $00000000003 c 48 c 0$ ] Pin "Capture" (alternative pin name "Capture")
[dshow @ $00000000003 c 48 c 0$ ] min ch=1 bits=8 rate= 11025 max ch=2 bits=16 rate=44100

This is the batch file for capturing video and audio from the HDMI to USB converter, using yuyv pixel format (no compression) but with low framerate (tested with GH5S):

```
ffmpeg -f dshow -video_size 1920x1080 -framerate 5 -pixel_format yuyv422 -i video="USB Video":audio="Digitale
Audioschnittstelle (US" -q:v 2 -c:v mpeg4 -t 10 -y out.mp
pause
```

Note: On my (old) computer I use "-c:v mpeg4", because libx264 or libx265 are too slow for real time processing. In such cases "-rtbufsize" with a large buffer size can be used, for example " 500 M ".
If the size is set to $1600 \times 1200$, the sample aspect ratio (that's the aspect ratio of the pixels) must be set to $4: 3$ with the setsar filter:

```
ffmpeg -f dshow -video_size 1600x1200 -framerate 5 -pixel_format yuyv422 -i video="USB Video":audio="Digitale
Audioschnittstelle (US" -vf setsar=4/3 -q:v 2 -c:v mpeg4 -t 10 -y out.mp4
pause
```

The same can also be done without filtering, by using the "-sar" option:

```
ffmpeg -f dshow -video_size 1600x1200 -framerate 5 -pixel_format yuyv422 -i video="USB Video":audio="Digitale
Audioschnittstelle (US" -sar 4/3 -q:v 2 -c:v mpeg4 -t 5 -y out.mp4
pause
```

Note: If the size $1600 \times 1200$ is used, the sample aspect ratio is $4 / 3$. That means the pixels are wider than high and the input size is $16: 9$.
Case study: We want to capture a square $1: 1$ region from the center of the field (for example a fisheye), coming from GH5S camera. Is it better to set the camera to FHD (16:9) or anamorphic (4:3) format?

| FHD or 4K (16:9) | Anamorphic (4:3) |
| :---: | :---: |
| Output pixels have $1: 1$ aspect ratio: <br> ffmpeg -f dshow -video_size $1920 \times 1080$-framerate 5 <br> -pixel_format yuyv422 -i video="USB Video" -lavfi <br> "crop=1200:1200,format=rgb24" -f sdl2 - | Output pixels have $1: 1$ aspect ratio: <br> ffmpeg -f dshow -video_size $1600 \times 1200$-framerate 5 -pixel_format yuyv422 -i video="USB Video" -lavfi "crop $=\overline{9} 00: 1200$, format=rgb24,scale=1200:1200" -f sdl2 - <br> Output pixels have 4:3 aspect ratio: <br> ffmpeg -f dshow -video_size $1600 \times 1200$-framerate 5 -pixel_format yuyv422 -i video="USB Video" -lavfi "setsar=4/3,format=rgb24, crop=900:1200" -f sdl2 - |
| Horizontal resolution: 1080 | Horizontal resolution: 900 |
| Vertical resolution: 1080 | Vertical resolution: 1200 |

This is the batch file for capturing video and audio from the HDMI to USB converter, using mjpeg compression which allows higher framerates (tested with GH5S):

```
ffmpeg -f dshow -rtbufsize 500M -video_size 1920x1080 -framerate 30 -vcodec mjpeg -i video="uSB Video":audio="Digitale
Audioschnittstelle (US" -q:v 2 -c:v mpeg4 -t 10 -y out.mp4
pause
```

Note: In this example "-vcodec" selects a decoder, because it's written before the input file. In most cases "-c" or "-codec" or "-vcodec" is an output option, but it can also be an input option either to tell FFmpeg which codec an input has, or (as in this case) to tell the input device which codec to emit.
This is the same for size $1600 \times 1200$ with anamorphic video from the GH5S:

```
ffmpeg -f dshow -rtbufsize 500M -video_size 1600x1200 -framerate 30 -vcodec mjpeg -i video="USB Video":audio="Digitale
Audioschnittstelle (US" -vf setsar=4/3 -q:v 2 -c:v mpeg4 -t 10 -y out.mp4
pause
```

This is the same without filtering, with "-sar" option instead:

```
ffmpeg -f dshow -rtbufsize 500M -video_size 1600x1200 -framerate 30 -vcodec mjpeg -i video="USB Video":audio="Digitale
Audioschnittstelle (US" -sar 4/3 -q:v 2 -c:v mpeg4 -t 10 -y out.mp4
pause
```

If mjpeg compression is used, it's possible to avoid re-encoding by using the "-c:v copy" option:

```
ffmpeg -f dshow -video_size 1920x1080 -framerate 30 -vcodec mjpeg -i video="USB Video":audio="Digitale
Audioschnittstelle (US" -c:v copy -t 10 -y out.mp4
pause
```

Note: Unfortunately it's impossible to use "setsar" or "-sar" and "-c:v copy" at the same time.
The HDMI to USB converter has a built-in test image which shows 8 vertical color bars.
Warning: The test image is not generated if the converter is already plugged in when the computer is started. You must first start the computer and then
plug in the converter.

### 2.187

Create a "SubRip" *.srt subtitle file. The format is as follows and the text must begin in the first line:

```
1
00:00:00,000 --> 00:00:02,000
This is the title text
2
00:00:02,500 --> 00:00:04,000
<b>This is bold text</b>
3
00:00:04,500 --> 00:00:06,000 X1:100 X2:100 Y1:100 Y2:100
<u>This is underlined at position 100,100</u>
4
00:00:06,500 --> 00:00:08,000
<i>italic</i>
5
00:00:08,500 --> 00:00:10,000
<font color="#fffff00">The End (yellow text)</font>
```

Note: I didn't fully understand how the text coordinates are defined (third subtitle in the above example). What's the difference bwetween X1 and X2? It's unclear to which frame size the coordinates are referring to.

For more info about the SubRip file format, see also: https://en.wikipedia.org/wiki/SubRip

Method 1, burning the subtitles directly into the video frames:

```
ffmpeg -i subtitle.srt -y subtitle.ass
ffmpeg -i test.mp4 -vf ass=subtitle.ass -y out.mp4
pause
```

Method 2, the output seems to be the same as with method 1:

```
ffmpeg -i test.mp4 -vf subtitles=subtitle.srt -y out.mp4
pause
```

Same thing with specifying the fontsize and yellow color:

```
ffmpeg -i test.mp4 -vf subtitles=subtitle.srt:force_style='Fontsize=26,PrimaryColour=&HOOffff&' -y out.mp4
pause
```

Method 3, creating a subtitle stream that can be switched on/off in the player. Works fine with VLC player, but not with FFplay:

```
ffmpeg -i test.mp4 -i subtitle.srt -c:v copy -c:a copy -c:s mov_text -metadata:s:s:0 language=ger -y out.mp4
pause
```

Note: MP4 containers support subtitles only in "MPEG-4 Timed Text" (MP4TT) format. You can force FFmpeg to write this format with the -c: s mov_text option.
See also https://jacknorthrup.com/Multiple-Program-Languages-Documentation/FFMPEG.html

## See also these Wiki pages:

https://trac.ffmpeg.org/wiki/HowToBurnSubtitlesIntoVideo
https://trac.ffmpeg.org/wiki/HowToConvertSubtitleToASS
Convert YouTube SBV to SRT: https://trac.ffmpeg.org/wiki/HowToConvertYouTubeSBVtoSRT

If you want to create many subtitles, consider using a subtitler , for example "aegisub": http://www.aegisub.org/

### 2.188

Create a*.ass subtitle file with this content:

```
[Script Info]
ScriptType: v4.00+
Collisions: Normal
PlayResX: }192
PlayResY: 1080
Timer: 100.0000
[V4+ Styles]
Format: Name, Fontname, Fontsize, PrimaryColour, SecondaryColour, OutlineColour, BackColour, Bold, Italic, Underline, StrikeOut,
ScaleX, ScaleY, Spacing, Angle, BorderStyle, Outline, Shadow, Alignment,
MarginL, MarginR, MarginV, Encoding
Style: testStyle,Verdana, 96, &HOOAOAOAO,&HOOOOOOOO,&Hc0000000,&H00000000,-1,0,0,0,100,100,0,0.00,1,1,0,2,0,0,0,0
[Events]
Format: Layer, Start, End, Style, Actor, MarginL, MarginR, MarginV, Effect, Text
Dialogue: 0,0:00:02.00,0:00:12.00,testStyle,,0000,0000,0000,,{\move(960,800,960,100)}{\fad(1000,1000)}This is the first line of this
Dialogue: 0,0:00:04.00,0:00:14.00,testStyle, 0000,0000,0000, ,{\move (960,800,960,100)}{\fad(1000,1000)}test
Dialogue: 0,0:00:06.00,0:00:16.00,testStyle,,0000,0000,0000,,{\move(960,800,960,100)}{\fad(1000,1000)}This is a shorter line
Dialogue: 0,0:00:08.00,0:00:18.00,testStyle, ,0000,0000,0000, ,{\move (960,800,960,100)}{\fad(1000,1000)}Last line
```

Some hints about the *.ass file format:

- PlayResX and PlayResY are the dimensions of the screen where the texts are drawn on.
- "PrimaryColour" is the color of the text. The colors are in format \&HAABBGGRR, where AA = 00 means opaque and $A A=F F$ means transparent
- Alignment: 1 = left, 2 = centered, 3 = right. Add 4 for a "Toptitle" and add 8 for a "Midtitle".
- The Imove commands contain the $x, y$ corrdinates where the text appears and disappears. In this case the text is scrolling up.
- The lfad commands contain the fade-in and fade-out durations in milliseconds.

The example was found here: http://forum.doom9.org/showthread.php?t=82025
The *.ass file format is explained in detail here: https://fileformats.fandom.com/wiki/SubStation_Alpha

Applying the texts to a video is very simple:

| set "IN=blue.mov" | $:$ : Input video |
| :--- | :--- |
| set "T=20" | $:$ : Duration |
| set "OUT=out.mp4" | $:$ : Output video |

:: Output video

```
ffmpeg -i %IN% -vf subtitles=credits.ass -t %T% -y %OUT%
```

pause

### 2.189 Removing subtitles

Subtitles can be removed with the -sn option, for inputs or for outputs.
2.190 freiOr

This seems to be an external library for video effects.
"FreiOr is mostly adopted on GNU/Linux and OSX platforms, counts more than 100 plugins and is used by several video software applications ..." See also https://freiOr.dyne.org/

See also https://en.wikipedia.org/wiki/FreiOr
Some documentation can be found here: https://mltframework.github.io/mlt_web/plugins/PluginsFilters/

### 2.191 Mapping streams to the output (-map)

For details about the "-map" option, see also: https://trac.ffmpeg.org/wiki/Map

### 2.192 Creating multiple outputs

This is described on this Wiki page: https://trac.ffmpeg.org/wiki/Creating\ multiple\ outputs

### 2.193 Attaching a preview image to a video

```
set "IN=test.mp4" :: Input video
set "T=3" 
ffmpeg -ss %T% -i %IN% -vf scale=320:-1 -frames 1 -y image.png
ffmpeg -i %IN% -i image.png -map 0 -map 1 -c:0 copy -c:v:1 png -disposition:v:1 attached_pic -y %OUT%
pause
```

Note: The codec for the previev image can be "png" or "mjpeg".

## I did use a video from a Canon 5D-MK4 and got this error message:

"Could not find tag for codec none in stream \#2, codec not currently supported in container. Could not write header for output file \#0 (incorrect codec parameters ?): Invalid argument"

This is probably because the video has an additional timecode stream, in this case replace "-map 0" by "-map 0:0 -map 0:1":

```
set "IN=test.mp4" :: Input video
set "T=3" :: Time of previev image
set "OUT=out.mp4" :: Output video
ffmpeg -ss %T% -i %IN% -vf scale=320:-1 -frames 1 -y image.png
ffmpeg -i %IN% -i image.png -map 0:0 -map 0:1 -map 1 -c:0 copy -c:v:1 png -disposition:v:1 attached_pic -y %OUT%
pause
```

It's also possible to write all in one command line:

```
set "IN=test.mp4"
set "T=3"
set "OUT=out.mp4" :: Output video
ffmpeg -i %IN% -ss %T% -i %IN% -map 1:v:0 -map 0 -filter:v:0 scale=320:-1,trim=end_frame=1 -c copy -c:v:0 png
-disposition:0 attached_pic -y %OUT%
pause
```

Or use this command line if your video has a timecode stream:

Note: When you upload a video with embedeed preview image to a Wordpress website, then you have two files in the media pool: The video and the preview image. But the preview image isn't automatically used when you insert a "video" block. You have to edit the properties of the video block and select the preview image. In this case it makes sense to give tghe preview image the same size as the video (don't reduce it to width 320).

### 2.194 Attach Cover Art to a Video

## Example:

```
ffmpeg -i "input.mkv" -attach "cover.jpg" -map 0 -c copy -metadata:s:t mimetype="image/jpg" -metadata:s:t:0
filename="cover.jpg" "output_cover.mkv"
```

Source: http://ffmpeg.org/pipermail/ffmpeg-user/2022-March/054398.html

Some filters have timeline support, which means they can be enabled with the "enable=" option.

## Example:

delogo=200:100:100:50:enable='between (t, 10, 20) '

It's missing in the documentation. You have to use this command to see which filters have timeline support:

| ffmpeg -filters pause |  |
| :---: | :---: |

Here is the result:

| T.C aexciter | A $->\mathrm{A}$ | Enhance high frequency part of audio. |
| :---: | :---: | :---: |
| T.C afade | A $->\mathrm{A}$ | Fade in/out input audio. |
| TSC afftdn | $\mathrm{A}->\mathrm{A}$ | Denoise audio samples using FFT. |
| . . afftfilt | A $->$ A | Apply arbitrary expressions to samples in frequency domain. |
| . SC afir | $\mathrm{N}->\mathrm{N}$ | Apply Finite Impulse Response filter with supplied coefficients in additional stream(s). |
| . . aformat | A $->$ A | Convert the input audio to one of the specified formats. |
| TSC afreqshift | $\mathrm{A}->\mathrm{A}$ | Apply frequency shifting to input audio. |
| T.C agate | $\mathrm{A}->\mathrm{A}$ | Audio gate. |
| .S. aiir | $\mathrm{A}->\mathrm{N}$ | Apply Infinite Impulse Response filter with supplied coefficients. |
| . . . aintegral | $\mathrm{A}->\mathrm{A}$ | Compute integral of input audio. |
| ... ainterleave | $\mathrm{N}->\mathrm{A}$ | Temporally interleave audio inputs. |
| . alimiter | $\mathrm{A}->\mathrm{A}$ | Audio lookahead limiter. |
| TSC allpass | $\mathrm{A}->\mathrm{A}$ | Apply a two-pole all-pass filter. |
| ... aloop | A $->\boldsymbol{A}$ | Loop audio samples. |
| . . . amerge | $\mathrm{N}->\mathrm{A}$ | Merge two or more audio streams into a single multi-channel stream. |
| T.. ametadata | A $->$ A | Manipulate audio frame metadata. |
| . . C amix | $\mathrm{N}->\mathrm{A}$ | Audio mixing. |
| ... amultiply | AA->A | Multiply two audio streams. |
| TSC anequalizer | $\mathrm{A}->\mathrm{N}$ | Apply high-order audio parametric multi band equalizer. |
| TSC anlmdn | $\mathrm{A}->\mathrm{A}$ | Reduce broadband noise from stream using Non-Local Means. |
| . SC anlms | AA->A | Apply Normalized Least-Mean-Squares algorithm to first audio stream. |
| ... anull | $\mathrm{A}->\mathrm{A}$ | Pass the source unchanged to the output. |
| T.. apad | $\mathrm{A}->\mathrm{A}$ | Pad audio with silence. |
| T.. aperms | $A->A$ | Set permissions for the output audio frame. |
| ... aphaser | $\mathbf{A}->\mathrm{A}$ | Add a phasing effect to the audio. |
| TSC aphaseshift | A $->\boldsymbol{A}$ | Apply phase shifting to input audio. |
| ... apulsator | $\mathbf{A}->\mathrm{A}$ | Audio pulsator. |
| ... arealtime | $\boldsymbol{A}->\boldsymbol{A}$ | Slow down filtering to match realtime. |
| ... aresample | $\mathrm{A}->\mathrm{A}$ | Resample audio data. |
| ... areverse | $\mathrm{A}->\mathrm{A}$ | Reverse an audio clip. |
| TSC arnndn | A $->\boldsymbol{A}$ | Reduce noise from speech using Recurrent Neural Networks. |
| ... aselect | $\mathbf{A}->\mathrm{N}$ | Select audio frames to pass in output. |
| ... asendcmd | $\mathrm{A}->\mathrm{A}$ | Send commands to filters. |
| ... asetnsamples | A $->\boldsymbol{A}$ | Set the number of samples for each output audio frames. |
| ... asetpts | $\mathrm{A}->\mathrm{A}$ | Set PTS for the output audio frame. |
| ... asetrate | $\mathrm{A}->\mathrm{A}$ | Change the sample rate without altering the data. |
| ... asettb | $\mathrm{A}->\mathrm{A}$ | Set timebase for the audio output link. |
| ... ashowinfo | $\mathrm{A}->\mathrm{A}$ | Show textual information for each audio frame. |
| T.. asidedata | A $->\boldsymbol{A}$ | Manipulate audio frame side data. |
| TSC asoftclip | $\mathbf{A}->\boldsymbol{A}$ | Audio Soft Clipper. |
| ... asplit | $\mathrm{A}->\mathrm{N}$ | Pass on the audio input to N audio outputs. |
| .S. astats | $\boldsymbol{A}->\mathrm{A}$ | Show time domain statistics about audio frames. |
| ..C astreamselect | $\mathrm{N}->\mathrm{N}$ | Select audio streams |
| TSC asubboost | A->A | Boost subwoofer frequencies. |

| TSC asubcut | $\mathrm{A}->\mathrm{A}$ | Cut subwoofer frequencies. |
| :---: | :---: | :---: |
| TSC asupercut | $A->A$ | Cut super frequencies. |
| TSC asuperpass | $\mathrm{A}->\mathrm{A}$ | Apply high order Butterworth band-pass filter. |
| TSC asuperstop | A $->\boldsymbol{A}$ | Apply high order Butterworth band-stop filter. |
| ..C atempo | A $->\mathrm{A}$ | Adjust audio tempo. |
| . . . atrim | $\mathrm{A}->\mathrm{A}$ | Pick one continuous section from the input, drop the rest. |
| ... axcorrelate | $\mathrm{A} A->\mathrm{A}$ | Cross-correlate two audio streams. |
| . . . azmq | $\mathrm{A}->\mathrm{A}$ | Receive commands through ZMQ and broker them to filters. |
| TSC bandpass | A $->\boldsymbol{A}$ | Apply a two-pole Butterworth band-pass filter. |
| TSC bandreject | $\boldsymbol{A}->\mathrm{A}$ | Apply a two-pole Butterworth band-reject filter. |
| TSC bass | $\mathrm{A}->\mathrm{A}$ | Boost or cut lower frequencies. |
| TSC biquad | $\mathrm{A}->\mathrm{A}$ | Apply a biquad IIR filter with the given coefficients. |
| . . . channelmap | A $->\boldsymbol{A}$ | Remap audio channels. |
| ... channelsplit | $\mathrm{A}->\mathrm{N}$ | Split audio into per-channel streams. |
| . .. chorus | A $->$ A | Add a chorus effect to the audio. |
| . . . compand | A $->\boldsymbol{A}$ | Compress or expand audio dynamic range. |
| ... compensationdelay | $A->A$ | Audio Compensation Delay Line. |
| T.C crossfeed | $\mathrm{A}->\mathrm{A}$ | Apply headphone crossfeed filter. |
| TSC crystalizer | A $->\boldsymbol{A}$ | Simple audio noise sharpening filter. |
| T.. dcshift | $\mathrm{A}->\mathrm{A}$ | Apply a DC shift to the audio. |
| T.. deesser | $\boldsymbol{A}->\boldsymbol{A}$ | Apply de-essing to the audio. |
| . drmeter | A $->\mathrm{A}$ | Measure audio dynamic range. |
| T.C dynaudnorm | $\boldsymbol{A}->\mathrm{A}$ | Dynamic Audio Normalizer. |
| . earwax | A $->$ A | Widen the stereo image. |
| ... ebur128 | $\mathrm{A}->\mathrm{N}$ | EBU R128 scanner. |
| TSC equalizer | $\mathrm{A}->\mathrm{A}$ | Apply two-pole peaking equalization (EQ) filter. |
| T.C extrastereo | $\mathrm{A}->\mathrm{A}$ | Increase difference between stereo audio channels. |
| ..C firequalizer | $\mathrm{A}->\mathrm{A}$ | Finite Impulse Response Equalizer. |
| ... flanger | $\mathrm{A}->\mathrm{A}$ | Apply a flanging effect to the audio. |
| . . haas | $\mathrm{A}->\mathrm{A}$ | Apply Haas Stereo Enhancer. |
| . . . hdcd | A $->$ A | Apply High Definition Compatible Digital (HDCD) decoding. |
| .S. headphone | $\mathrm{N}->\mathrm{A}$ | Apply headphone binaural spatialization with HRTFs in additional streams. |
| TSC highpass | $\mathrm{A}->\mathrm{A}$ | Apply a high-pass filter with 3dB point frequency. |
| TSC highshelf | A $->\mathrm{A}$ | Apply a high shelf filter. |
| ... join | N->A | Join multiple audio streams into multi-channel output. |
| ... loudnorm | A $->\mathrm{A}$ | EBU R128 loudness normalization |
| TSC lowpass | $\mathrm{A}->\mathrm{A}$ | Apply a low-pass filter with 3dB point frequency. |
| TSC lowshelf | A $->$ A | Apply a low shelf filter. |
| . . . mcompand | $A->A$ | Multiband Compress or expand audio dynamic range. |
| ... pan | $\mathrm{A}->\mathrm{A}$ | Remix channels with coefficients (panning). |
| ... replaygain | A $->\boldsymbol{A}$ | ReplayGain scanner. |
| ..C rubberband | $\mathrm{A}->\mathrm{A}$ | Apply time-stretching and pitch-shifting. |
| . . ${ }^{\text {c sidechaincompress }}$ | $A A->A$ | Sidechain compressor. |
| T.C sidechaingate | $A A->A$ | Audio sidechain gate. |

| ... silencedetect | A->A | Detect silence. |
| :---: | :---: | :---: |
| . . . silenceremove | A $->$ A | Remove silence. |
| . . C speechnorm | A $->\boldsymbol{A}$ | Speech Normalizer. |
| T.C stereotools | $\boldsymbol{A}->\mathrm{A}$ | Apply various stereo tools. |
| T.C stereowiden | A $->\boldsymbol{A}$ | Apply stereo widening effect. |
| ... superequalizer | A $->\mathrm{A}$ | Apply 18 band equalization filter. |
| .S. surround | A $->$ A | Apply audio surround upmix filter. |
| TSC treble | A $->A$ | Boost or cut upper frequencies. |
| ... tremolo | $\mathbf{A}->\mathrm{A}$ | Apply tremolo effect. |
| ... vibrato | A->A | Apply vibrato effect. |
| T.C volume | A $->\mathrm{A}$ | Change input volume. |
| ... volumedetect | A $->$ A | Detect audio volume. |
| ... aevalsrc | $1->A$ | Generate an audio signal generated by an expression. |
| ... afirsrc | $1->A$ | Generate a FIR coefficients audio stream. |
| ... anoisesrc | $1->A$ | Generate a noise audio signal. |
| ... anullsrc | $1->A$ | Null audio source, return empty audio frames. |
| ... hilbert | $1->A$ | Generate a Hilbert transform FIR coefficients. |
| ... sinc | $1->A$ | Generate a sinc kaiser-windowed low-pass, high-pass, band-pass, or band-reject FIR coefficients. |
| ... sine | $1->A$ | Generate sine wave audio signal. |
| ... anullsink | A->1 | Do absolutely nothing with the input audio. |
| . . . addroi | V->V | Add region of interest to frame. |
| ... alphaextract | $\mathrm{V}->\mathrm{N}$ | Extract an alpha channel as a grayscale image component. |
| T.. alphamerge | VV->V | Copy the luma value of the second input into the alpha channel of the first input. |
| TSC amplify | $\mathrm{V}->\mathrm{V}$ | Amplify changes between successive video frames. |
| ... ass | $\mathrm{V}->\mathrm{V}$ | Render ASS subtitles onto input video using the libass library. |
| TSC atadenoise | $\mathrm{V}->\mathrm{V}$ | Apply an Adaptive Temporal Averaging Denoiser. |
| TSC avgblur | $\mathrm{V}->\mathrm{V}$ | Apply Average Blur filter. |
| T.C bbox | $\mathrm{V}->\mathrm{V}$ | Compute bounding box for each frame. |
| ... bench | $\mathrm{V}->\mathrm{V}$ | Benchmark part of a filtergraph. |
| T.C bilateral | $\mathrm{V}->\mathrm{V}$ | Apply Bilateral filter. |
| T.. bitplanenoise | $\mathrm{V}->\mathrm{V}$ | Measure bit plane noise. |
| .S. blackdetect | $\mathrm{V}->\mathrm{V}$ | Detect video intervals that are (almost) black. |
| ... blackframe | $\mathrm{V}->\mathrm{V}$ | Detect frames that are (almost) black. |
| TSC blend | VV->V | Blend two video frames into each other. |
| TS. bm3d | $\mathrm{N}->\mathrm{V}$ | Block-Matching 3D denoiser. |
| T.. boxblur | $\mathrm{V}->\mathrm{V}$ | Blur the input. |
| TS. bwdif | $\mathrm{V}->\mathrm{V}$ | Deinterlace the input image. |
| TSC cas | $\mathrm{V}->\mathrm{V}$ | Contrast Adaptive Sharpen. |
| TSC chromahold | $\mathrm{V}->\mathrm{V}$ | Turns a certain color range into gray. |
| TSC chromakey | $\mathrm{V}->\mathrm{V}$ | Turns a certain color into transparency. Operates on YUV colors. |
| TSC chromanr | $\mathrm{V}->\mathrm{V}$ | Reduce chrominance noise. |
| TSC chromashift | $\mathrm{V}->\mathrm{V}$ | Shift chroma. |
| ... ciescope | $\mathrm{V}->\mathrm{V}$ | Video CIE scope. |
| T.. codecview | $\mathrm{V}->\mathrm{V}$ | Visualize information about some codecs. |

| TSC colorbalance | $\mathrm{V}->\mathrm{V}$ | Adjust the color balance. |
| :---: | :---: | :---: |
| TSC colorchannelmixer | $V->V$ | Adjust colors by mixing color channels. |
| TSC colorcontrast | $\mathrm{V}->\mathrm{V}$ | Adjust color contrast between RGB components. |
| TSC colorcorrect | $\mathrm{V}->\mathrm{V}$ | Adjust color white balance selectively for blacks and whites. |
| TSC colorize | $\mathrm{V}->\mathrm{V}$ | Overlay a solid color on the video stream. |
| TSC colorkey | $\mathrm{V}->\mathrm{V}$ | Turns a certain color into transparency. Operates on RGB colors. |
| TSC colorhold | $\mathrm{V}->\mathrm{V}$ | Turns a certain color range into gray. Operates on RGB colors. |
| TSC colorlevels | $\mathrm{V}->\mathrm{V}$ | Adjust the color levels. |
| TS. colormatrix | $V->V$ | Convert color matrix. |
| TS. colorspace | $\mathrm{V}->\mathrm{V}$ | Convert between colorspaces. |
| TSC colortemperature | $\mathrm{V}->\mathrm{V}$ | Adjust color temperature of video. |
| TSC convolution | $\mathrm{V}->\mathrm{V}$ | Apply convolution filter. |
| TS. convolve | $\mathrm{VV}->\mathrm{V}$ | Convolve first video stream with second video stream. |
| . . . copy | $\mathrm{V}->\mathrm{V}$ | Copy the input video unchanged to the output. |
| ... cover_rect | $\mathrm{V}->\mathrm{V}$ | Find and cover a user specified object. |
| ..C crop | $\mathrm{V}->\mathrm{V}$ | Crop the input video. |
| T.. cropdetect | $\mathrm{V}->\mathrm{V}$ | Auto-detect crop size. |
| . . . cue | $\mathrm{V}->\mathrm{V}$ | Delay filtering to match a cue. |
| TSC curves | $\mathrm{V}->\mathrm{V}$ | Adjust components curves. |
| . SC datascope | $\mathrm{V}->\mathrm{V}$ | Video data analysis. |
| T.C dblur | $\mathrm{V}->\mathrm{V}$ | Apply Directional Blur filter. |
| TS. dctdnoiz | $\mathrm{V}->\mathrm{V}$ | Denoise frames using 2D DCT. |
| TSC deband | $\mathrm{V}->\mathrm{V}$ | Debands video. |
| T.C deblock | $\mathrm{V}->\mathrm{V}$ | Deblock video. |
| ... decimate | $\mathrm{N}->\mathrm{V}$ | Decimate frames (post field matching filter) |
| TS. deconvolve | $\mathrm{VV}->\mathrm{V}$ | Deconvolve first video stream with second video stream. |
| TS. dedot | $\mathrm{V}->\mathrm{V}$ | Reduce cross-luminance and cross-color. |
| TSC deflate | $\mathrm{V}->\mathrm{V}$ | Apply deflate effect. |
| ... deflicker | $\mathrm{V}->\mathrm{V}$ | Remove temporal frame luminance variations. |
| ... deinterlace_qsv | $\mathrm{V}->\mathrm{V}$ | QuickSync video deinterlacing |
| ... dejudder | $\mathrm{V}->\mathrm{V}$ | Remove judder produced by pullup. |
| T.. delogo | $\mathrm{V}->\mathrm{V}$ | Remove logo from input video. |
| T.. derain | $\mathrm{V}->\mathrm{V}$ | Apply derain filter to the input. |
| ... deshake | $\mathrm{V}->\mathrm{V}$ | Stabilize shaky video. |
| TSC despill | $\mathrm{V}->\mathrm{V}$ | Despill video. |
| ... detelecine | $\mathrm{V}->\mathrm{V}$ | Apply an inverse telecine pattern. |
| TSC dilation | $\mathrm{V}->\mathrm{V}$ | Apply dilation effect. |
| T.. displace | VVV->V | Displace pixels. |
| ... dnn_processing | $\mathrm{V}->\mathrm{V}$ | Apply DNN processing filter to the input. |
| .S. doubleweave | $\mathrm{V}->\mathrm{V}$ | Weave input video fields into double number of frames. |
| T.C drawbox | $\mathrm{V}->\mathrm{V}$ | Draw a colored box on the input video. |
| ... drawgraph | $\mathrm{V}->\mathrm{V}$ | Draw a graph using input video metadata. |
| T.C drawgrid | $\mathrm{V}->\mathrm{V}$ | Draw a colored grid on the input video. |
| T.C drawtext | $\mathrm{V}->\mathrm{V}$ | Draw text on top of video frames using libfreetype library. |

| T.. hysteresis | VV->V | Grow first stream into second stream by connecting components. |
| :---: | :---: | :---: |
| TS. identity | VV->V | Calculate the Identity between two video streams. |
| . . . idet | $\mathrm{V}->\mathrm{V}$ | Interlace detect Filter. |
| T.C il | $\mathrm{V}->\mathrm{V}$ | Deinterleave or interleave fields. |
| TSC inflate | $\mathrm{V}->\mathrm{V}$ | Apply inflate effect. |
| ... interlace | $\mathrm{V}->\mathrm{V}$ | Convert progressive video into interlaced. |
| ... interleave | $\mathrm{N}->\mathrm{V}$ | Temporally interleave video inputs. |
| . . . kerndeint | $\mathrm{V}->\mathrm{V}$ | Apply kernel deinterlacing to the input. |
| TSC kirsch | $V->V$ | Apply kirsch operator. |
| TSC lagfun | $\mathrm{V}->\mathrm{V}$ | Slowly update darker pixels. |
| TSC lenscorrection | $\mathrm{V}->\mathrm{V}$ | Rectify the image by correcting for lens distortion. |
| ... libvmaf | VV->V | Calculate the VMAF between two video streams. |
| TSC limiter | $\mathrm{V}->\mathrm{V}$ | Limit pixels components to the specified range. |
| ... loop | $\mathrm{V}->\mathrm{V}$ | Loop video frames. |
| TSC lumakey | $\mathrm{V}->\mathrm{V}$ | Turns a certain luma into transparency. |
| TSC lut | $\mathrm{V}->\mathrm{V}$ | Compute and apply a lookup table to the RGB/YUV input video. |
| TSC lut1d | $\mathrm{V}->\mathrm{V}$ | Adjust colors using a 1D LUT. |
| TSC lut2 | $\mathrm{VV}->\mathrm{V}$ | Compute and apply a lookup table from two video inputs. |
| TSC lut3d | $\mathrm{V}->\mathrm{V}$ | Adjust colors using a 3D LUT. |
| TSC lutrgb | $\mathrm{V}->\mathrm{V}$ | Compute and apply a lookup table to the RGB input video. |
| TSC lutyuv | $\mathrm{V}->\mathrm{V}$ | Compute and apply a lookup table to the YUV input video. |
| TSC maskedclamp | VVV->V | Clamp first stream with second stream and third stream. |
| TSC maskedmax | VVV->V | Apply filtering with maximum difference of two streams. |
| TSC maskedmerge | VVV->V | Merge first stream with second stream using third stream as mask. |
| TSC maskedmin | VVV->V | Apply filtering with minimum difference of two streams. |
| TSC maskedthreshold | VV->V | Pick pixels comparing absolute difference of two streams with threshold. |
| TSC maskfun | $\mathrm{V}->\mathrm{V}$ | Create Mask. |
| ... mcdeint | $\mathrm{V}->\mathrm{V}$ | Apply motion compensating deinterlacing. |
| TSC median | $\mathrm{V}->\mathrm{V}$ | Apply Median filter. |
| . . . mergeplanes | $\mathrm{N}->\mathrm{V}$ | Merge planes. |
| ... mestimate | $\mathrm{V}->\mathrm{V}$ | Generate motion vectors. |
| T.. metadata | $\mathrm{V}->\mathrm{V}$ | Manipulate video frame metadata. |
| T.. midequalizer | $\mathrm{VV}->\mathrm{V}$ | Apply Midway Equalization. |
| ... minterpolate | $\mathrm{V}->\mathrm{V}$ | Frame rate conversion using Motion Interpolation. |
| TSC mix | $\mathrm{N}->\mathrm{V}$ | Mix video inputs. |
| TSC monochrome | $\mathrm{V}->\mathrm{V}$ | Convert video to gray using custom color filter. |
| ... mpdecimate | $\mathrm{V}->\mathrm{V}$ | Remove near-duplicate frames. |
| TS. msad | $\mathrm{VV}->\mathrm{V}$ | Calculate the MSAD between two video streams. |
| TSC negate | $\mathrm{V}->\mathrm{V}$ | Negate input video. |
| TS. nlmeans | $\mathrm{V}->\mathrm{V}$ | Non-local means denoiser. |
| TSC nnedi | $\mathrm{V}->\mathrm{V}$ | Apply neural network edge directed interpolation intra-only deinterlacer. |
| ... noformat | $\mathrm{V}->\mathrm{V}$ | Force libavfilter not to use any of the specified pixel formats for the input to the next filter. |
| TS. noise | $\mathrm{V}->\mathrm{V}$ | Add noise. |
| T.C normalize | $\mathrm{V}->\mathrm{V}$ | Normalize RGB video. |

| . . null | $\mathrm{V}->\mathrm{V}$ | Pass the source unchanged to the output. |
| :---: | :---: | :---: |
| T.C oscilloscope | $\mathrm{V}->\mathrm{V}$ | 2D Video Oscilloscope. |
| TSC overlay | VV->V | Overlay a video source on top of the input. |
| . . . overlay_qsv | VV->V | Quick Sync Video overlay. |
| ... overlay_cuda | VV->V | Overlay one video on top of another using CUDA |
| T.. owdenoise | $\mathrm{V}->\mathrm{V}$ | Denoise using wavelets. |
| . . . pad | $\mathrm{V}->\mathrm{V}$ | Pad the input video. |
| ... palettegen | $\mathrm{V}->\mathrm{V}$ | Find the optimal palette for a given stream. |
| ... paletteuse | VV->V | Use a palette to downsample an input video stream. |
| T.. perms | $\mathrm{V}->\mathrm{V}$ | Set permissions for the output video frame. |
| TS. perspective | $\mathrm{V}->\mathrm{V}$ | Correct the perspective of video. |
| T.C phase | $\mathrm{V}->\mathrm{V}$ | Phase shift fields. |
| ... photosensitivity | $\mathrm{V}->\mathrm{V}$ | Filter out photosensitive epilepsy seizure-inducing flashes. |
| ... pixdesctest | $\mathrm{V}->\mathrm{V}$ | Test pixel format definitions. |
| T.C pixscope | $\mathrm{V}->\mathrm{V}$ | Pixel data analysis. |
| T.C pp | $\mathrm{V}->\mathrm{V}$ | Filter video using libpostproc. |
| T.. pp7 | $\mathrm{V}->\mathrm{V}$ | Apply Postprocessing 7 filter. |
| TS. premultiply | $\mathrm{N}->\mathrm{V}$ | PreMultiply first stream with first plane of second stream. |
| TSC prewitt | $\mathrm{V}->\mathrm{V}$ | Apply prewitt operator. |
| TSC pseudocolor | $\mathrm{V}->\mathrm{V}$ | Make pseudocolored video frames. |
| TS. psnr | $\mathrm{VV}->\mathrm{V}$ | Calculate the PSNR between two video streams. |
| . . . pullup | $\mathrm{V}->\mathrm{V}$ | Pullup from field sequence to frames. |
| T. . qP | $\mathrm{V}->\mathrm{V}$ | Change video quantization parameters. |
| . . . random | $\mathrm{V}->\mathrm{V}$ | Return random frames. |
| TSC readeia608 | $\mathrm{V}->\mathrm{V}$ | Read EIA-608 Closed Caption codes from input video and write them to frame metadata. |
| . . . readvitc | $\mathrm{V}->\mathrm{V}$ | Read vertical interval timecode and write it to frame metadata. |
| ... realtime | $\mathrm{V}->\mathrm{V}$ | Slow down filtering to match realtime. |
| TS. remap | VVV->V | Remap pixels. |
| TS. removegrain | $\mathrm{V}->\mathrm{V}$ | Remove grain. |
| T. . removelogo | $\mathrm{V}->\mathrm{V}$ | Remove a TV logo based on a mask image. |
| ... repeatfields | $\mathrm{V}->\mathrm{V}$ | Hard repeat fields based on MPEG repeat field flag. |
| ... reverse | $\mathrm{V}->\mathrm{V}$ | Reverse a clip. |
| TSC rgbashift | $\mathrm{V}->\mathrm{V}$ | Shift RGBA. |
| TSC roberts | $\mathrm{V}->\mathrm{V}$ | Apply roberts cross operator. |
| TSC rotate | $\mathrm{V}->\mathrm{V}$ | Rotate the input image. |
| T.. sab | $\mathrm{V}->\mathrm{V}$ | Apply shape adaptive blur. |
| ..C scale | $\mathrm{V}->\mathrm{V}$ | Scale the input video size and/or convert the image format. |
| ... scale_cuda | $\mathrm{V}->\mathrm{V}$ | GPU accelerated video resizer |
| . . . scale_qsv | $\mathrm{V}->\mathrm{V}$ | QuickSync video scaling and format conversion |
| . C scale2ref | VV->VV | Scale the input video size and/or convert the image format to the given reference. |
| ... scdet | $\mathrm{V}->\mathrm{V}$ | Detect video scene change |
| TSC scroll | $\mathrm{V}->\mathrm{V}$ | Scroll input video. |
| . . . select | $\mathrm{V}->\mathrm{N}$ | Select video frames to pass in output. |
| TS. selectivecolor | $\mathrm{V}->\mathrm{V}$ | Apply CMYK adjustments to specific color ranges. |

| . sendcmd | $\mathrm{V}->\mathrm{V}$ | Send commands to filters. |
| :---: | :---: | :---: |
| . . separatefields | $\mathrm{V}->\mathrm{V}$ | Split input video frames into fields. |
| . setdar | $\mathrm{V}->\mathrm{V}$ | Set the frame display aspect ratio. |
| ... setfield | $\mathrm{V}->\mathrm{V}$ | Force field for the output video frame. |
| ... setparams | $\mathrm{V}->\mathrm{V}$ | Force field, or color property for the output video frame. |
| ... setpts | $\mathrm{V}->\mathrm{V}$ | Set PTS for the output video frame. |
| . . setrange | $\mathrm{V}->\mathrm{V}$ | Force color range for the output video frame. |
| . setsar | $\mathrm{V}->\mathrm{V}$ | Set the pixel sample aspect ratio. |
| . settb | $\mathrm{V}->\mathrm{V}$ | Set timebase for the video output link. |
| TSC shear | $\mathrm{V}->\mathrm{V}$ | Shear transform the input image. |
| ... showinfo | $\mathrm{V}->\mathrm{V}$ | Show textual information for each video frame. |
| ... showpalette | $\mathrm{V}->\mathrm{V}$ | Display frame palette. |
| T.. shuffleframes | $\mathrm{V}->\mathrm{V}$ | Shuffle video frames. |
| TS. shufflepixels | $\mathrm{V}->\mathrm{V}$ | Shuffle video pixels. |
| T.. shuffleplanes | $\mathrm{V}->\mathrm{V}$ | Shuffle video planes. |
| T.. sidedata | $\mathrm{V}->\mathrm{V}$ | Manipulate video frame side data. |
| .S. signalstats | $\mathrm{V}->\mathrm{V}$ | Generate statistics from video analysis. |
| ... signature | $\mathrm{N}->\mathrm{V}$ | Calculate the MPEG-7 video signature |
| T.. smartblur | $\mathrm{V}->\mathrm{V}$ | Blur the input video without impacting the outlines. |
| TSC sobel | $\mathrm{V}->\mathrm{V}$ | Apply sobel operator. |
| ... split | $\mathrm{V}->\mathrm{N}$ | Pass on the input to N video outputs. |
| T.C spp | $\mathrm{V}->\mathrm{V}$ | Apply a simple post processing filter. |
| . sr | $\mathrm{V}->\mathrm{V}$ | Apply DNN-based image super resolution to the input. |
| TS. ssim | $\mathrm{VV}->\mathrm{V}$ | Calculate the SSIM between two video streams. |
| .S. stereo3d | $\mathrm{V}->\mathrm{V}$ | Convert video stereoscopic 3D view. |
| ..C streamselect | $\mathrm{N}->\mathrm{N}$ | Select video streams |
| ... subtitles | $\mathrm{V}->\mathrm{V}$ | Render text subtitles onto input video using the libass library. |
| .S. super2xsai | $\mathrm{V}->\mathrm{V}$ | Scale the input by 2 x using the Super2xSaI pixel art algorithm. |
| T.C swaprect | $\mathrm{V}->\mathrm{V}$ | Swap 2 rectangular objects in video. |
| T.. swapuv | $\mathrm{V}->\mathrm{V}$ | Swap U and V components. |
| TSC tblend | $\mathrm{V}->\mathrm{V}$ | Blend successive frames. |
| ... telecine | $\mathrm{V}->\mathrm{V}$ | Apply a telecine pattern. |
| ... thistogram | $\mathrm{V}->\mathrm{V}$ | Compute and draw a temporal histogram. |
| TS. threshold | VVVV->V | Threshold first video stream using other video streams. |
| T.. thumbnail | $\mathrm{V}->\mathrm{V}$ | Select the most representative frame in a given sequence of consecutive frames. |
| . .. thumbnail_cuda | $\mathrm{V}->\mathrm{V}$ | Select the most representative frame in a given sequence of consecutive frames. |
| ... tile | $\mathrm{V}->\mathrm{V}$ | Tile several successive frames together. |
| ... tinterlace | $\mathrm{V}->\mathrm{V}$ | Perform temporal field interlacing. |
| TSC tlut2 | $\mathrm{V}->\mathrm{V}$ | Compute and apply a lookup table from two successive frames. |
| TSC tmedian | $\mathrm{V}->\mathrm{V}$ | Pick median pixels from successive frames. |
| T.. tmidequalizer | $\mathrm{V}->\mathrm{V}$ | Apply Temporal Midway Equalization. |
| TSC tmix | $\mathrm{V}->\mathrm{V}$ | Mix successive video frames. |
| .S. tonemap | $\mathrm{V}->\mathrm{V}$ | Conversion to/from different dynamic ranges. |
| ... tpad | $\mathrm{V}->\mathrm{V}$ | Temporarily pad video frames. |

Buffer video frames, and make them available to the end of the filter graph.``` |
| :---: | :---: | :---: |

### 2.196

Expression evaluation

This is a subset of the available expressions:

| abs (x) | Return absolute value of x . |
| :---: | :---: |
| $\operatorname{acos}(x)$ | Return arccosine of $x$. |
| $\operatorname{asin}(x)$ | Return arcsine of $x$. |
| $\operatorname{atan}(x)$ | Return arctangent of $\boldsymbol{x}$. |
| $\operatorname{atan} 2(x, y)$ | Return the arc tangent of $\mathrm{y} / \mathrm{x}$ in the range -PI to PI. |
| between ( $\mathrm{x}, \mathrm{min}, \mathrm{max}$ ) | Return 1 if $x$ is greater than or equal to min and less than or equal to max, 0 otherwise. |
| bitand ( $\mathrm{x}, \mathrm{y}$ ) | Compute bitwise and operation on $x$ and $y$. |
| bitor (x,y) | Compute bitwise or operation on $x$ and $y$. |
| ceil (expr) | Round the value of expression expr upwards to the nearest integer. For example, "ceil(1.5)" is "2.0". |
| clip (x,min, max) | Return the value of $x$ clipped between min and max. |
| $\cos (\mathrm{x})$ | Compute cosine of $x$. |
| eq ( $x, y$ ) | Return 1 if $x$ and $y$ are equivalent, 0 otherwise. |
| $\exp (\mathrm{x})$ | Compute exponential of $x$. |
| floor (expr) | Round the value of expression expr downwards to the nearest integer. For example, "floor(-1.5)" is "-2.0". |
| gt ( $\mathrm{x}, \mathrm{y}$ ) | Return 1 if $\boldsymbol{x}$ is greater than $\boldsymbol{y}, 0$ otherwise. |
| gte ( $x, y$ ) | Return 1 if $x$ is greater than or equal to $y, 0$ otherwise. |
| hypot (x,y) | Return sqrt( $x^{*} x+y^{*} y$ ) |
| if (x,y) | Evaluate $x$, and if the result is non-zero return the result of the evaluation of $y$, return 0 otherwise. |
| if (x,y,z) | Evaluate $x$, and if the result is non-zero return the evaluation result of $y$, otherwise the evaluation result of $z$. |
| ld(var) | Load the value of the internal variable with number var, which was previously stored with st(var, expr). The function returns the loaded value. Please note that variables are currently not shared between expressions. But the variable keeps its value from one frame to the next. All variables are inititalized with 0 at the beginning. Warning: The random(x) function uses the same variables! |

| $\operatorname{lerp}(\mathrm{x}, \mathrm{y}, \mathrm{z})$ | Return $x$ if $z=0, y$ if $z=1$ and a linear interpolation for any value of $z$. There is no clipping for $z<0$ or $z>1$. The return value is: $x+z$ * $(y-x)$ |
| :---: | :---: |
| $\log (x)$ | Compute natural logarithm of $x$. |
| lt ( $\mathrm{x}, \mathrm{y}$ ) | Return 1 if $\boldsymbol{x}$ is less than $\boldsymbol{y}, 0$ otherwise. |
| lte ( $\mathrm{x}, \mathrm{y}$ ) | Return 1 if $x$ is less than or equal to $y$, 0 otherwise. |
| $\max (\mathrm{x}, \mathrm{y})$ | Return the maximum between $x$ and $y$. |
| $\min (\mathrm{x}, \mathrm{y})$ | Return the minimum between $x$ and $y$. |
| $\bmod (x, y)$ | Return the remainder of division of $\boldsymbol{x}$ by $\boldsymbol{y}$. |
| pow (x,y) | Return the power of $x$ elevated $y$, it is equivalent to "(x)^$(y)$ ". |
| print (t) | Print the value of expression $t$ and returns the value of the expression printed. |
| random (x) | Return a pseudo random value between 0.0 and 1.0. $x$ is the index of the internal variable which will be used to save the seed/state. Warning: The Id(var) and st(var, expr) functions use the same variables! <br> Note: random(0) uses the variable 0 as a seed value. If you want to set the seed value, you must use the st(0, expr) function. |
| root (expr, max) | Find an input value for which the function represented by expr with argument $I d(0)$ is 0 . The input value must be in the interval [ $0 .$. max]. The expression in expr must denote a continuous function or the result is undefined. <br> $I d(0)$ is used to represent the function input value, which means that the given expression will be evaluated multiple times with various input values that the expression can access through Id(0). When the expression evaluates to 0 then the corresponding input value will be returned. <br> Warning: If there is no input value in the [0..max] interval for which the result of the expression becomes 0 , then the root() function returns a wrong result! |
| round (expr) | Round the value of expression expr to the nearest integer. For example, "round(1.5)" is "2.0". |
| $\operatorname{sgn}(x)$ | Return the sign of $\mathrm{x}(-1,0$ or +1 ) |
| $\sin (x)$ | Return sine of $x$. |
| sqrt (x) | Return the square root ix x . |
| squish (x) | Compute expression $1 /\left(1+\exp \left(4^{*} x\right)\right) \quad \operatorname{squish}(-1)=0.982$, $\operatorname{squish}(0)=0.5$, $\operatorname{squish}(1)=0.0179$ |
| st (var, expr) | Store the value of the expression expr in an internal variable. var specifies the number of the variable where to store the value, and it is a value ranging from 0 to 9 . The function returns the value stored in the internal variable. <br> Please note that variables are currently not shared between expressions. But the variable keeps its value from one frame to the next. All variables are inititalized with 0 at the beginning. Warning: The random( x ) function uses the same variables! |
| $\tan (\mathrm{x})$ | Compute tangent of $\boldsymbol{x}$. |

| trunc (expr) | Round the value of expression expr towards zero to the nearest integer. For example, "trunc(-1.5)" is "-1.0". |
| :--- | :--- |
| while (cond, expr) | Evaluate expression expr while the expression cond is non-zero, and returns the value of the last expr evaluation, or NAN if <br> cond was always false. |
| PI | approximately 3.1415 |

Two expressions expr1 and expr2 can be combined to form another expression "expr1;expr2". expr1 and expr2 are evaluated in turn, and the new expression evaluates to the value of expr2.

Workaround for segment-wise linear interpolation, one segment per second:
between $(t, 0,1) * \operatorname{lerp}(v 0, v 1, t)+\operatorname{between}(t, 1,2) * \operatorname{lerp}(v 1, v 2, t-1)+\operatorname{between}(t, 2,3) * \operatorname{lerp}(v 2, v 3, t-2)+\ldots$

```
Workaround for segment-wise linear interpolation, two segments per second:
between(t,0,0.5) * lerp(v00,v05,2*t) + between(t,0.5,1.0) * lerp(v05,v10,2*(t-0.5)) + between(t,1.0,1.5) *
lerp(v10,v15,2*(t-1.0)) + ...
```

The above two workarounds have a problem: If $t$ is exactly at the border of two segments, then both "between" expressions are true. As a workaround, you can add 0.0001 to $t$.

If used inside the geq filter, the variable ' $t$ ' must be written as a capital ' T '.
Please note that for most parameters expressions can't be used. They are only allowed for those parameters which are described as "expr" in the documentation. If in doubt, use ffmpeg -h filter=name_of _filter to get the types of the parameters.

This is a trick for the "geq" filter if you want to use the same expression for the R, G and B channels. Of course it's a bad idea to use the same expression three times, because that's slow. The trick is to set the format to gray8, then apply the geq filter with only one expression, and then set the format to rgb24, as in this example:
format=gray 8 , geq=' $128+64 * \sin (0.2 * X)$ ',format=rgb24

Downloading a video from Facebook is possible, but a little bit complicated.
In Facebook, click on the three dots and then select "copy link". Now go to https://www.fbdown.net/, paste the link and click on "Download". Now click on "Download Video in Normal Quality" or "Download Video in HD Quality". This will open the video in a browser, where you can make a right click and save the video.

See also (german) https://www.heise.de/tipps-tricks/Facebook-Videos-herunterladen-so-geht-s-3904709.htmI

### 2.198 Uploading spherical 360 images to Facebook

A spherical 360 image is basically a normal equirectangular *.jpg image, but additionally a few properties must be set:
The property "make" must be set to "Ricoh" and "model" must be set to "Ricoh THETA S". These two changes are sufficient so that Facebook recognizes the image as spherical 360 image. Please note that width:height must be $2: 1$ and the image size must not exceed $6000 \times 3000$ pixels.
You can edit these properties in the Windows Explorer, or you can make the changes with "Exiftool" as in the following example:

```
set "INPUT=in.jpg" :: Input and output image
exiftool -overwrite_original -make="Ricoh" -model="Ricoh THETA S" %INPUT%
pause
```

See also (in german): https://www.allerstorfer.at/photosphere-xmp-metadaten-zu-360-panorama-hinzufuegen/ See also: https://evanwill.github.io/_drafts/notes/photosphere.html

### 2.199 Uploading videos to Facebook

It's possible to upload 10-bit videos to Facebook, but there may be a problem with the previev image, which is shown corrupted.
Use an 8-bit pixel format to avoid this problem, for example -pix_fmt yuv420p
If all videos don't play in Facebook, re-starting the browser may help.
See also https://trac.ffmpeg.org/wiki/Encode/YouTube

### 2.200 Downloading videos from Youtube

Downloading a video from Youtube is possible with the help of external websites:
Go to Youtube and copy the URL of the video. Now go (for example) to https://www.downvids.net/, paste the URL, select the file type and video quality, then click on "DOWNLOAD".

See also (german) https://www.heise.de/tipps-tricks/Youtube-Video-herunterladen-am-Computer-so-geht-s-3931676.html
2K and 4K video downloads are easy with the free "4K Video Downloader". Use the mkv format for high resolution videos: https://www.4kdownload.com/de/

## Notes from Andrei B.:

You can also use some browser extensions:
Firefox - addon "YouTube Video and Audio Downloader (Dev Edt.)" (uses ffmpeg as companion, plus a native companion for assembling streams)
Chrome - addon "YouTube Video and MP3 Downloader" https://addoncrop.com/youtube-video-downloader/

```
ffmpeg \
# Calling the binary
-i input.mp4 \ # Input video file
-r 30000/1001 \
# Set the frame rate - optional
-vf scale="1920:1080" \ # Resize video - optional
-codec:v libx264 \ # x264 Video Codec
-crf 21 \
-bf 2\
-flags +cgop \
-pix_fmt yuv420p \
-c:a aac
-b:a 128k
-ac 2 \
-r:a 44100 \
-map 0:v:0
-map 0:a:0 \
-movflags faststart \
output.mp4
pause
```

Found on Rodrigo Polo's github site: https://github.com/rodrigopolo/cheatsheets/blob/master/ffmpeg.md

See also (in german): https://support.google.com/youtube/answer/1722171

See also: How to encode Videos for YouTube, Facebook, Vimeo, twitch, and other Video Sharing Sites https://trac.ffmpeg.org/wiki/Encode/YouTube See also: Encoding for streaming sites https://trac.ffmpeg.org/wiki/EncodingForStreamingSites
See also: Streaming guide https://trac.ffmpeg.org/wiki/StreamingGuide
The following hints were posted by Moritz Barsnick on the FFmpeg user list on April 18, 2020 (edited by me):

- In my experience, an audio stream is a *must* for YouTube live streaming. You can help yourself with silent audio with minimal bandwidth. I believe I have succeeded with 8 and $16 \mathrm{~kb} / \mathrm{s}$ AAC. (I used to believe it needs to be two-channel audio, but my notes say I succeeded with mono.)
- You can add silence by adding a second input: -f lavfi -i anullsrc and encoding it with low bandwidth AAC: -c:a aac -b:a 8 k
- The framerate must be $\mathbf{2 4}, \mathbf{2 5}, 30$ or 60 fps (or those divided by 1.001).
- Don't forget to check your YouTube live stream console. It gives some (hazy) indications about your stream's health.
- YouTube has some codec recommendations, but I believe you can deviate from them with little harm: https://support.google.com/youtube/answer/2853702?hl=en

### 2.203 Limiting FFmpeg's encoding speed to realtime

## There are two possible methods:

- Use the "-re" option (not possible with all input strean types)
- Use the "realtime" filter at the beginning of the filter chain

### 2.204

## Streaming a video to a multicast address

See also https://trac.ffmpeg.org/wiki/StreamingGuide (But that guide isn't useful, as none of the examples did work when I tested them)

This is an example for sending the udp stream:
ffmpeg -re -f lavfi -i testsrc2=s=vga -b:v 2M -f mpegts udp://239.0.0.1:1234

Note: the -re flag is important and means that the stream is slowed down to realtime.

Alternatively you can use this test source which contains a horizontal bar that's scrolling vertically. This is good for checking if two receivers are running exactly synchroneously:

```
ffmpeg -re -f lavfi -i color=white:s=vga -lavfi drawbox=h=20:c=red:t=fill,scroll=v=1/25 -b:v 2M -f mpegts
udp://239.0.0.1:1234
```

This is an example for receiving the stream with FFplay:
ffplay udp://239.0.0.1:1234

Alternatively you can also receive the stream with FFmpeg:

```
ffmpeg -i udp://239.0.0.1:1234 -f sdl2 -
```

Note: In both cases it's possible to run multiple instances of the receiver.

Note: The full range of multicast addresses is from 224.0.0.0 to $\mathbf{2 3 9 . 2 5 5 . 2 5 5 . 2 5 5}$, but a lot of that range is restricted. If you want to use multicast for something private, better use 239.0.0.0 to 239.255.255.255.

See also: https://superuser.com/questions/307130/ffmpeg-command-to-stream-video-to-a-multicast-address

This is an example for starting two instances of FFplay:

```
start ffplay -noborder -x 640 -y 480 -left 0 -top 200 udp://239.0.0.1:1234
start ffplay -noborder -x 640-y 480 -left 640 -top 200 udp://239.0.0.1:1234
pause
```

This is an example for starting two instances of FFmpeg:
start ffmpeg -i udp://239.0.0.1:1234 -window_borderless 1 -window_x 0 -window_y 200 -f sdl2 -
start ffmpeg -i udp://239.0.0.1:1234 -window_borderless 1 -window_x 640 -window_y $200-f$ sdl2 -
pause
pause
Note: If two or more monitors are connected to the computer, it's possible to show the videos on different monitors. For example if both monitors are 1920x1080, set -window_x to 1920 for showing the video at the left edge of the second monitor.

Example for multicast streaming with rtp protocol:
ffmpeg -re -f lavfi -i testsrc2=s=vga -b:v 2M -c:v h264 -f rtp -sdp_file video.sdp "rtp://239.0.0.1:1234"

Note: The *.sdp file contains important informations about the stream, which the receiver wants to know.
Note: The rtp protocol can only be used for one stream. Not for audio and video simultaneously.

Example for receiving the rtp stream with two instances of FFplay:

```
start ffplay -protocol_whitelist file,rtp,udp -noborder -x 640 -y 480 -left 0 -top 200 video.sdp
start ffplay -protocol_whitelist file,rtp,udp -noborder -x 640 -y 480 -left 640 -top 200 video.sdp
```

Example for receiving the rtp stream with two instances of FFmpeg:

```
start ffmpeg -protocol_whitelist file,rtp,udp -i video.sdp -window_borderless 1 -window_x 0 -window_y 600 -f sdl2 -
start ffmpeg -protocol_whitelist file,rtp,udp -i video.sdp -window_borderless 1 -window_x 640 -window_y 600 -f sdl2 -
```

Example for receiving the stream with VLC Player:
"C:\Program Files\VideoLAN\VLC\vlc.exe" video.sdp

Note: The VLC path must be written in "" because it contains a space character.
Note: It takes about 10 seconds until the video appears.
Note: It seems to be impossible to specify the position and size of the VLC window. If you have a working example, please let me know.
See also this website where I found a lot of useful infos about rtp: https://www.kurento.org/blog/rtp-ii-streaming-ffmpeg

### 2.205

## Hardware acceleration

This command lists all hardware acceleration methods supported in this build of FFmpeg, regardless if the hardware is really available in this computer:

```
ffmpeg -hwaccels
pause
```

See also: https://trac.ffmpeg.org/wiki/HWAccellntro

Hardware accelerated h. 264 encoding on machines with Nvidia GPUs:

```
ffmpeg -i in.mp4 -c:v h264_nvenc out.mp4
pause
```

Note: If you get the error message "Driver does not support the required nvenc API version. Required: 11.1 Found: 11.0" then you should update your Nvidia driver to the latest version.

Hardware accelerated h.265/HEVC encoding on machines with Nvidia GPUs:

```
ffmpeg -i in.mp4 -c:v hevc_nvenc out.mp4
pause
```

Note: Not all pixel formats are supported.
Note: It's possible that you get an error message "Driver does not support the required nvenc API version. Required: 10.0 Found: 9.1" In this case go to the Windows Device Manager and update the Nvidia driver.

|  | Explanation: |
| :--- | :--- |
| SAR | Sample Aspect Ratio |
| DAR | Display Aspect Ratio |
| fps | frames per second |
| tbr | This is guessed from the video stream and is the value users want to see when they look for the video frame rate, except sometimes it is <br> twice what one would expect because of field rate versus frame rate. |
| tbn | The time base in AVStream that has come from the container. It is used for all AVStream time stamps. (time base number?) |
| tbc | The time base in AVCodecContext for the codec used for a particular stream. It is used for all AVCodecContext and related time stamps. |

### 2.207 FFmpeg source code

Many FFmpeg features have incomplete documentation. In these cases it may help to have a look at the source code as follows:

- Go to the main FFmpeg website http://www.ffmpeg.org/
- Click on "Source Code" and download the file "ffmpeg-snapshot.tar.bz2"
- After unpackung, you see all the source code.
- The filters are in the folder "libavfilter"
- Most audio filters begin with "af_" and most video filters begin with "vf_"

Listed in alphabetic order:
"adecorrelate" filter:
-- Documentation: More info required about what's the purpose of this filter, with examples. I thought it could be used for echo cancelling, but this doesn't seem to be the case. I did try this:
ffmpeg -f lavfi -i "sine=500:b=2,channelmap=0|0" -lavfi asplit[a][b];[a]adelay=500[c];[b][c]amix=weights="1 0.2" -t 10 -y echo.wav
ffmpeg -i echo.wav -lavfi adecorrelate=seed=22050 -y out.wav
"afftfilt" filter:
-- Documentation: For the overlap parameter, what are the default values if set to 1 ?

All filters:
-- Documentation: Add which filters support "enable=" timeline support. Currently it's only available via "ffmpeg -filters".
-- Documentation: There are a few pairs of video filters which share a common description: lut2/tlut2, setdar/setsar and weave/doubleweave.
The problem is that the second filter is difficult to find if you search by alphabet. I suggest to list these filters in correct alphabetic order, and the description of the second one contains only a link to the other filter.
Same problem also for "afifo", "agraphmonitor" and "astreamselect" which are listed only in chapter "Video filters". They should be listed in "Audio filters". A link to the corresponding video filter would be sufficient.

## All video sources:

-- Harmonize the default size of all video sources to the same value. At the moment some sources are $320 \times 240$ and some are $640 \times 480$. For example, if you need a "color" and a "testsrc2" source in the same command line, you have to specify the size for at least one of them, because the default sizes are different.
"amix" filter:
-- Documentation: What are the default weights? Are they 1 or $1 / \mathrm{n}$ or $1 /$ sqrt(n)?
"amplify" filter:
-- Many parameters are in the [0..65535] range. It's unclear how these parameters must be set for 8 -bit videos. Is it [0..255] in this case, or is it always [0..65535]? Which range for a 10-bit video, [0..1023] or [0..65535]? Please add this info to the documentation.
-- Documentation for "threshold" parameter: "Any difference greater or equal to this value..." I'm not sure if this is correct, or if it should read "Any absolute difference greater or equal to this value...". Same question also for "tolerance" parameter.
-- Documentation: Does this filter have a built-in limiter?
"asubboost" filter:
-- The documentation of this filter is a total mess. After reverse engineering from the filter's output signal, I found that the block diagram looks like this:

The "feedback" option has a very misleading name. This isn't a feedback, however it's going straight forward to the output. It should be renamed "wet". What's now "wet" could be renamed "gain", or it could be removed because it's unnecessary. The explanations of the "wet" and "feedback" options are clearly wrong. The explanation of the "slope" option is unclear (I think the attenuation per octave is meant). The "delay" option is missing the information that the unit is milliseconds.
"atilt" audio filter:
Documentation: I didn't understand what this filter is supposed to do.
"blend" filter:
-- Documentation: Please add documentation what all the modes do. A few modes are self-explaining, but most are not. A link to the wiki page would be helpful: https://trac.ffmpeg.org/wiki/Blend
-- Documentation: It's written that the "opacity" options are "Only used in combination with pixel component blend modes." But it's unclear what a "pixel component blend mode" is. It seems the "opacity" options aren't used if a user-defined expression is used. They are only used used if one of the "mode" options is used. The default is "all_opacity=1", which means the full blend effect is applied. A smaller opacity value means the output is mixed with the first input stream. "all_opacity=0" means the effect is disabled and the first input stream is returned. But there is one exception from this rule: If the mode is "normal", then "all_opacity=1" returns the first stream and "all_opacity=0" returns the second stream.
"chromanr" filter:
-- Documentation of the threshold option is unclear.
This is how I think it works:
Foreach neighbour pixel
\{
$A=$ absolute difference of $Y$ components of current pixel and neighbour pixel
$B=$ absolute difference of $U$ components of current pixel and neighbour pixel
$C=$ absolute difference of $V$ components of current pixel and neighbour pixel
if ( $A+B+C$ <threshold) then
use this neighbour pixel for averaging

## \}

If the above is correct, I suggest to change the description as follows:
"The algorithm calculates the absolute difference of the Y components of the current pixel and a neighbour pixel. The same is also calculated for the $U$ and $V$ components. A neighbour pixel is used for averaging, if the sum of all three absolute differences is lower than the threshold. Only the $U$ and V components are averaged. The $Y$ component remains unchanged."
-- Also the meaning of "stepw" and "steph" options is unclear. Do these options refer to the pixels? If stepw=2 and steph=2 then only a quarter of the pixels is analyzed, and the same $U$ and $V$ components are used for 4 pixels? Or do they refer to the selection of the neighbour pixels? If stepw=2 and steph=2 then only a quarter of the neighbour pixels is analyzed? After looking in the source, it seems the latter is the case.
"colorchannelmixer" filter:
-- Documentation: This filter isn't listed in the correct alphabetic order (should be before colorcontrast).
"colorcorrect" filter:
-- Documentation: I didn't understand the "analyze" option. Better description and examples required.
"colorhold" filter:
-- Documentation: This filter isn't listed in the correct alphabetic order (should be before colorkey).

## "colorlevels" filter:

-- Feature request: Add two new options "imin" and "imax" which set all three color channels simultaneously. Example:
colorlevels=rimin=0.1:gimin=0.1:bimin=0.1:rimax=0.3:gimax=0.3:bimax=0.3
could be written as:
colorlevels=imin=0.1:imax=0.3
"colorspectrum" video source:
-- Documentation: type=black is the default
-- Feature request: type=none for disabling both black and white
"convolve" filter:
-- Documentation: I know what a convolution is, but I don't understand what this filter is doing. Example required.

## Cross correlation

-- Feature request: Cross correlation for audio. For comparing two audio channels from the same sound source, which were recorded with two microphones at different places, or with two different recorders that weren't started simultaneously. Automatically find the best-fit delay time between two audio channels, and delay one of them by this amount. Can be used for synchronizing in-camera audio with sound from external recorder.
"cue" filter:
-- please add some examples to the documentation
"curves" filter:
-- In the documentation for "preset", please add the coordinates of the points for all presets. For example, what does "strong_contrast" mean? How strong is it? It would really help to know the coordinates of the points. This would also be usable as a starting point for defining your own curves.
-- Documentation of "master" option: I didn't understand it, please add an example and explain it.
-- Feature request: Allow import of curves files from GIMP.
-- Feature request: Make an option for using straight lines instead of smooth curves. This would be a nice workaround for strong linear contrast enhancement, by using only four points: $0 / 0 \mathrm{~b} / 0 \mathrm{w} / 11 / 1$ where $b$ is the black point and $w$ is the white point.
"deband" filter:
-- Documentation: Missing examples. I don't understand the description of this filter. The unit of the threshold values is unclear.

## "deflicker" filter:

-- Documentation: Which is the default mode?
-- Documentation: It's unclear how this filter corrects the brightness of the images. Does it add a constant, or does it multiply by a constant? With other words: Does it change the brightness or the contrast? I think it's contrast (multiplicative), but I'm not 100\% sure.
-- Feature request: Please allow to choose wetween additive and multiplicative deflicker. An example for additive deflicker is when you make a timelapse with a flash, and you know that the intensity of the flash is always the same. But you may have additive flicker if the setup isn't shielded from ambient light.
-- Feature request: Allow to deflicker the RGB channels separately, because fluorescent light does also have color flicker.
-- Feature request: Allow to split the video into many horizontal stripes and deflicker all stripes separately. Useful for flourescent light and rolling shutter flicker. See my workaround in this book.
"derain" filter:
-- Documentation: Please add examples.
"despill" filter:
-- Documentation is incomplete. Possible options are not explained. Missing examples. "Mix" and "Expand" parameters need more explanation how they work.

## "DNG" Decoder:

-- Missing documentation. Searching for "DNG" in ffmpeg-all.html finds nothing.
-- Problem: FFmpeg's DNG decoder doesn't work with RAW images from Canon 6D or Canon 5D-MK4 which were converted to DNG with Adobe DNG converter 12.4, and it also doesn't work with DNG images from Pentax K5 (see the download links in chapter "CR2 and DNG images"), and it also doesn't work correctly with the DNG images that were posted here: http://ffmpeg.org/pipermail/ffmpeg-user/2020-August/049681.html
So far, I didn't find any DNG image that could be decoded correctly. The "zscale" filter may be required, but I haven't figured out how the parameters must be set. If anybody has a working example for DNG to JPG or PNG conversion with FFmpeg, please let me know.
-- Feature request: Use LibRaw for importing RAW or DNG images, and throw away the DNG import stuff that doesn't work.

## "drawbox" filter:

-- Documentation: Using a thickness greater than 1 doesn't increase the outer dimensions of the box. The number of pixels inside the box is (width2*thickness) or (height-2*thickness).
-- Documentation: This filter doesn't support RGB formats.
"drawellipse" filter:
-- Suggestion for a new filter: For drawing circles or ellipses with or without filling.
"drawgraph" filter:
-- Make clear in the documentation that the color format for the graphs is 0xAABBGGRR, however the color format for the background is 0xRRGGBBAA. Or even better: Correct this bug. But that would break existing command lines.

Encoder and decoder for *.ser files
It's an uncompressed video format for astronomical videos. For infos about the SER video file format, see https://github.com/cgarry/ser-player and https://sites.google.com/site/astropipp/ser-player
"eq" filter:
-- Documentation: Please add "Do note that what contrast does is scale the distance of a pixel's value from the median value i.e. 128 for a 8 -bit input. So, if a pixel channel has a value of 100, then a contrast of 3 results in a value of $128+3^{*}(100-128)=44$."
-- Documentation: Please also add that the order is always contrast $->$ brightness $->$ gamma, regardless of the order in the command line. Also fill in where saturation fits in the order (I don't know).
-- Documentation: Please add this example for brightness before contrast: eq=brightness=0.3,eq=contrast=5, and explain that eq=brightness=0.3:contrast=5 will be executed in the order contrast before brightness.
-- Feature request: Add an option for specifying in which order the corrections are made.
-- Documentation: It might be helpful to point out that this filter includes a limiter, if the result is out of range.
-- Feature request:
If we assume the video data is in the [0..1] range, the transfer function (before applying gamma) is: out = brightness + 0.5 + contrast * (in - 0.5)
This works fine for images where most pixels are in the center of the histogram. But it fails for images which consist mainly of a dark background, with only a few bright details. To amplify contrast in such images, both brightness and contrast must be adjusted, which is complicated.

I suggest to add a new parameter "pivot" in the range [0..1] which is 0.5 by default (so that it's compatible with old command lines).
out = brightness + pivot + contrast * (in - pivot)
With the $p$ value properly set, the contrast can be adjusted without changing the brightness. This feature is already implemented in 3D_LUT_Creator.

Equirectangular $360^{\circ}$ spherical videos:
-- Feature request: Inserting the required metadata so that VLC (and other players) recognize these videos as spherical. The same thing that the "Spatial Media Metadata Injector" does.
"exposure" filter:
-- Documentation: The order is first "black level" and then "exposure", which means first add then multiply. It works internally with floats and has no built-in limiter.

Expression evaluation:
-- 'between(x, min, max)' Suggestion for improvement: Create an additional non-overlapping 'between2' function, with a slightly different definition: Return 1 if $x$ is greater than or equal to min and less than max, 0 otherwise. This is useful for segment-wise linear interpolation, as in this example: between $(t, 0,1) * \operatorname{lerp}(2,5, t)+b e t w e e n(t, 1,2) * \operatorname{lerp}(5,6, t-1)+b e t w e e n(t, 2,3) * \operatorname{lerp}(6,9, t-2)+\ldots$
The problem in this example is that at the ends of the intervals both 'between' functions become true simultaneously.
$--\quad$ 'lerp( $x, y, z$ )' Documentation, better explanation: $\operatorname{lerp}(x, y, z)$ returns $x$ if $z=0, y$ if $z=1$ and interpolates if $0<z<1$. The return value is $x+z *(y-x)$. There is no clipping for $z<0$ or $z>1$.
-- 'print(expr)' Suggestion for improvement: Optionally allow to add a string before the expression, so that during debugging it's easier to identify multiple print outputs in the log file. print(string, expr)
-- 'root(expr, max)' Problem: This function returns a wrong result if there is no root in the [0...max] interval. In such cases it should either throw an error message or return NAN.
-- 'taylor(expr, x)' 'taylor(expr, x, id)' Documentation: Better explanation and example required. I know what a taylor series is, but I don't understand how to use this FFmpeg function.
-- Feature request: A new function getval(x, y, filename) which reads a text file (or CSV file) and returns x-th value from the y-th line. Usable for many purposes where you have a parameter that can't be expressed by a simple formula, so that reading from an external file is easier. For example if you want to overlay a small video over the main video, at a variable position which is an arbitrary function of time.
-- Feature request: Share variables between expressions. This is especially required if inside the geq filter a variable is calculated by a long and complicated expression which depends only on $T$ (with other words: a function of time). This expression will be evaluated for each pixel again and again, making the filter extemely slow. It would be much better to calculate the variable only one time per frame, and then make this variable readable inside the geq filter.
-- Feature request: Allow to set variables by reading from an input text or CSV file.
-- Feature request: A function for segment-wise linear or spline interpolation of a curve through a set of given points. Similar to this workaround for segment-wise linear interpolation: between(T+0.001,0,1)*lerp(200,400,T)+between(T+0.001,1,2)*lerp(400,500,T-1)+between(T+0.001,2,3)*lerp(500,550,T-2)
"-f image2pipe":
-- Documentation is missing in ffmpeg-all.html

## "fade" filter:

-- Feature request: Please allow a fade-out at the end of the video, where the start time is defined relative to the end of the video. With other words it should work without knowing the length of the video.

## "ffplay-all.htm"

-- Documentation: Why are the values of the options "-left" and "-top" called "title"? That should be integers.
-- Documentation: Please make clear that -video_size is used to manually tell ffplay the size for videos that do not contain a header (such as raw video), however it's not used to resize videos.

## "ffmpeg-all.html"

-- Please add more details to chapter 34 "Changing options at runtime with a command", as was already described here: https://stackoverflow.com/questions/56058909/ffmpeg-drawtext-and-live-coordinates-with-sendemd-zmq
It should also be mentioned that two other methods exist: "sendcmd" and "zmq".
-- Add a chapter for accepted keys while FFmpeg is running, see function check_keyboard_interaction() in ffmpeg.c
-- Chapter 5.2 generic options: -h muxer=muxer_name Please add that this isn't only for muxers, but also for output devices. For example ffmpeg -h muxer=sdl

## "fftfilt" filter:

-- Documentation: If the weight_U and weight_V expressions aren't set, they are by default copied from weight_Y. In most cases this doesn't make sense and produces a greenish tint in the output image. To solve this problem, you should always set weight_U and weight_V to 1.
-- All four examples: Add :weight_U=1:weight_V=1
-- Documentation: "Adjust the dc value (gain) of the ... plane of the image." This is a very misleading formulation, because dc value and gain are two completely different things. A dc value is an additive offset. However gain is a factor for multiplication. It should be made clear what's meant.
"fillborders" filter:
-- Documentation: Please add that the width of the borders is limited to half of the image width or height.
"filter_complex_script"
-- Documentation: Please add that line feeds and empty lines are allowed in the script file, which makes the content much better readable.
-- Feature request: Allow to set variables, like in a batch file. (This is the main reason why I don't use filter_complex_script)
-- Feature request: Allow comments in the script file. (This is another reason why I don't use filter_complex_script)
"find_rect" video filter:
-- The following things should be added to the documentation:
-- The meaning of the 'xmin, ymin, xmax, ymax' options is unclear. It should be mentioned in the documentation that these coordinates refer to the top left corner of the object image. It's not the center of the object image! In the special case if the result is near the bottom right corner of the specified range, the object image would lie almost completely outside of the specified range. To get the center coordinates, half the size of the object image has to be added.
-- If the input video contains multiple instances of the object, find_rect will find only one of them.
-- threshold $\mathbf{= 0 . 0 1}$ means only exact matches, threshold $\mathbf{= 0 . 9 9}$ means almost everything matches (I'm not sure if this is correct)
-- The parameter "mipmaps" must be in the range [1...5]. The meaning of "mipmaps" is unclear in this context.
-- If the threshold value is met, find_rect writes the result to these internal variables: lavfi.rect.w (width of object), lavfi.rect.h (height of object), lavfi.rect.x (x position of object), lavfi.rect.y (y position of object). However it seems that cover_rect does always cover an area, totally independent of the threshold. That makes no sense.
-- It is possible to write these variables to a file with ffprobe and -show_entries
-- Examples section: Find the position of an object in each frame and write it to a log file:
ffprobe -f lavfi movie=test.mp4,find_rect=object=object.pgm:threshold=0.3 -show_entries
frame=pkt_pts_time:frame_tags=lavfi.rect.x,lavfi.rect.y,lavfi.rect.score -of csv $1>$ log.csv
-- Feature request: Add an option for using the result from the last frame as the starting point (plus or minus a specified range) for the current frame. For example, if the last result was ( $x=700, y=500$ ) let the search range for the current frame be from ( $700-R, 500-R$ ) to ( $700+R, 500+R$ ), where $R$ is is useddefined parameter. This could significantly speed up the algorithm, under the assumption that the object doesn't move far from one frame to the next.
"firequalizer" audio filter:
Documentation: Many things are unclear.

## "floodfill" filter:

-- Documentation: I don't understand what this filter is doing. Especially the "source" and "destination" options are unclear.
"gblur" filter:

## "gdigrab"

-- Suggestion for improvement: When capturing a window with the "title" option, it's sometimes difficult to specify the title, because that may be a very long string and copy-and-paste doesn't work in the window's title line. Another problem may the that the window title changes dynamically. I suggest that the title mustn't be an exact match, however it should be sufficent if the window title contains the specified sub-string.
"geq" filter:
-- Documentation: "If one of the lum_expr, cb_expr, or cr_expr options is specified, the filter will automatically select a YCbCr colorspace."
I think this sentence isn't fully correct because there is one exception. If the input format is gray8 and if geq=lum_expr is used, the output format is still gray8, which isn't a YCbCr colorspace.
-- Feature request: Allow commands, especially it should be possible to set a variable sd() inside the geq argument.
-- Feature request: Make it possible to access not only the current frame, but also the previous frames. For designing filters which require several frames.
-- Feature request: Alternatively allow to specify a pixel in HSV (Hue-Saturation-Value) range.
-- Feature request: I often have the case where the $R, G$ and $B$ channels must be set to the same value, but the expression is long and complicated. It's slow to calculate the same expression three times. Please add a mode which calculates the expression only one time and then sets the $R$, $G$ and $B$ channels to this value. A possible workaround is to calculate only the $\mathbf{R}$ channel with geq, and then use the colorchannelmixer filter to copy the $R$ channel to the $G$ and $B$ channels.
-- Please add to the documentation that this filter has no built-in limiter for overflow handling if the result is out of range, and that the functions must be different for 8 -bit or 10 -bit videos. This filter doesn't interpret video data in the [0..1] range, but instead [0..255] for 8-bit video and [0..1023] for 10-bit video. This isn't clear in the documentation.

## "gradients" video source:

-- Documentation: Typo in the line "x0, y0, y0, y1", correct is "x0,y0, x1, y1"
-- Feature request: Create two-dimensional gradients by defining the colors in the four corners of a rectangle. See also my workaround in this book.

## "hsvhold" filter:

-- Feature request: Please add three "similarity" parameters, one for hue, one for saturation and one for value. For example if a small hue range is required, but with a large range in saturation and value.
"hsvkey" filter:
-- Feature request: Same as for hsvhold.
"hue" filter:
-- Documentation: The range for the " h " and " H " options should be specified.
-- Documentation: The "b" option isn't described correctly. It doesn't set the brightness, but instead the change of the brightness. Setting this option to 0 doesn't make the output dark. It leaves the brightness as it is.
"hysteresis" filter:
-- Documentation: It's totally unclear what this filter is doing. Better explanation and examples required.

## "lagfun" filter:

-- Please add to the documentation that it doesn't work with RGB24 pixel format, and throw an error message if the input is RGB24.

## "maskfun" filter:

-- Documentation: I don't understand what this filter is doing. Better explanation and examples required.
"mix" filter:
-- Documentation: Replace "If number of weights is smaller than number of frames ..." by "If number of weights is smaller than number of inputs ..." . The same error is also in the "tmix" filter.
-- Documentation: The last sentence is misleading and should be changed to "By default scale is set to (1/sum_of_weights)". The same error is also in the "tmix" filter.

## "monochrome" filter:

-- Documentation: Better explanation and examples required.
"mpeg4" video encoder:
-- Missing documentation. There is some information in the wiki, but it's missing in the official documentation.
https://trac.ffmpeg.org/wiki/Encode/MPEG-4

## New filters:

-- Feature request: A video filter that replaces transparent pixels by a non-transparent color. Usable for example after v360 filter with alpha_mask=1 option. The workaround is to overlay a second stream which contains a uniform color. This is complicated because when creating the uniform color stream, you must know the correct size in advance.
"nullsrc" video source:
-- Feature request: Please allow expressions for "size" option.
"overlay" filter
Documentation: Make clear that the variable " n " begins at $1 .$,

## "perspective" filter:

-- When the "sense=destination" option is used, the output size is smaller than the input size and the outer area is filled with the colors of the pixels at the edge of the video. It would be better to define a uniform color, with black as default. As a workaround I used the "pad" filter to create a black border around the video, before using the perspective filter. Please see my example in the "Video-in-Video" chapter.

## "PGM files":

-- Feature request: PGM files (required for example for "remap" filter) should contain only values in the [0..65535] range. In the case of ASCII PGM (P2) files, it's theoretically possible that the file contains negative values. FFmpeg should give a warning if a negative value is found when reading such a file.
"scale" filter:
-- Feature request: An option for strongly reducing the size of an image, which calculates the brightness of the destination pixel not by averaging the
source pixels, but instead by choosing the brightest (or darkest) of the source pixels. Usable for shrinking images of the starry night sky, without loosing faint stars.
"scale2ref" filter:
-- Documentation: The first example is incomplete because the input labels are missing. Should be '[b][a]scale2ref[b][a];[a][b]overlay'
"scale_qsv" filter:
-- Documentation is missing
"sdl2" output device:
-- Documentation: The "-window_borderless" option is missing.
"selectivecolor" filter:
-- Documentation: I don't understand the difference between "absolute" and "relative" in this context. Please add a better explanation and an example to the documentation.
-- Documentation: Obviously there is no difference between absolute and relative modes, if the correction value is negative.
"sendcmd" filter:
-- Documentation: Please add an example for sendcmd, if the target filter has more than one input. In this case the sendcmd filter can't be inserted directly before the target filter. When choosing a suitable position for sendemd in the filter chain, make sure that at this position the duration is sufficient. If you have signal sources of different lengths, always choose the longest one for sendcmd.
-- Documentation: All arguments of the target filter must be initialized with valid values, even if these values are never used because sendcmd does always overwrite them.
-- Feature request: Allow that the sendemd filter accepts any number of inputs, and just pass the inputs to the next filter. This would simplify things if you need a sendcmd before a target filter which has more than one input.
"showspectrum" filter:
-- Documentation: It's unclear what an "intensity color value" is.
"showwaves" filter:
-- Documentation: If all channels shall have the same color, it's sufficient to specify the color for the first channel.
-- Documentation: I suggest the following better documentation for the "draw" option:
Set the draw mode.
Available values are:
'scale' Use blending, that means the samples are drawn darker where the slope is larger. This is the default.
'full' Draw all samples with full intensity. This is useful for higher values of $\boldsymbol{n}$.
"showwavespic" filter:
-- Feature request: Add a mode where for each audio sample only a pixel is drawn, instead of a line from +level to -level. So that the output looks like in an oscilloscope. Like the "point" and "p2p" values of the "mode" option in the "showwaves" filter.
"shufflepixels" filter:
-- Documentation: I tested this filter, but don't understand for what purpose it might be useful. Example required.

## "shuffleplanes" filter:

-- Documentation: Please add that the input must have a planar pixel format. If a non-planar pixel format is used (for example rgb24), a format conversion to gbrp will be inserted automatically, which means the colors are in a different order and you would get an unexpected result.
"speechnorm" filter
-- Documentation: I didn't understand how this filter works. A clear definition for "local half cycle" is required. An example with a graphical waveform would be helpful.
"streamselect" filter
-- Documentation: The examples are misleading. In the general case it's impossible to write sendcmd directly before streamselect, because streamselect requires at least two inputs but sendcmd accepts only one input.
-- Feature request: Please allow expressions for "map". That's easier than the workaround with "sendcmd".
"superequalizer" audio filter:
-- Documentation: The unit of the options is unclear. Example missing.

## "testsrc2" video source:

-- Documentation: "The testsrc2 source is similar to testsrc, but supports more pixel formats instead of just rgb24. This allows using it as an input for other tests without requiring a format conversion." Please explain how a different pixel format can be selected. The only way I know is to add
",format=yuv422p10le" for example. But isn't that a format conversion?

## "tmix" filter:

-- Undocumented feature missing in documentation: If not specified, all weights are 1 by default.
-- Undocumented feature missing in documentation: "tmix=frames=1" works and is a bypass mode.
-- Documentation: Replace "If number of weights is smaller than number of frames ..." by "If number of weights is smaller than number of inputs ..." . The same error is also in the "mix" filter.
-- Documentation: The last sentence is misleading and should be changed to "By default scale is set to (1/sum_of_weights)". The same error is also in the "mix" filter.
"trim" filter:
-- Feature request: Please allow expressions for the times.
-- Feature request: Please allow to spectify the end time relative to the end of the video, so that it's possible to trim 5 seconds from the end of the video, without having to know the video length.

## "v360" filter:

-- Revert request: After this patch http://ffmpeg.org/pipermail/ffmpeg-cvslog/2020-October/124887.html the yaw, pitch and roll angles are interpreted as relative angles if they are sent via sendemd. This should be reverted, because it breaks previously correct behaviour. It's now impossible to send angles
to the v360 filter with sendemd and lerp. See also ticket 9447 . It's very bad practice that the yaw, pitch and roll parameters have different meanings in the command line / if sent via sendemd. Also this behaviour is undocumented. In my opinion "relative angle per frame" is the same as "rotational velovity" and it would be better not to re-use the same options (yaw, pitch and roll) for two different things.
-- The implementation of " $h$ _offset" and " $v$ _offset" options is wrong. Simply adding the offsets in $x, y, z$ space, followed by a normalization doesn't give the correct result. The inverse algorithm is required. The output is given and the input has to be found. First the normalization must be undone by a suitable unknown factor, so that after subtracting the offsets the result is already normalized. I have successfully tested it with a remap simulation, see chapter "How to replace the v360 filter by the remap filter".
-- There are some small rounding errors in v360 if the input is "e", "flat" or "cylindrical". In most cases these errors can be neglected. See https://trac.ffmpeg.org/ticket/9617
-- Documentation: If specified in the command line, the v360 rotation angles are absolute angles. However if sent via sendcmd, they become relative angles. The "reset_rot" option can be used to reset the rotations to zero before new relative rotations are applied via sendcmd. "reset_rot=-1" is unclear and undocumented.
-- Documentation: For "perspective" projection, please describe the exact meaning of the option "v_fov".
-- Documentation: For most options the default values aren't documented.
-- Feature request: Support 4th order polynomial fisheye projection, as described on Paul Bourke's website: http://paulbourke.net/dome/fisheyecorrect/
-- Feature request: "perspective" projection also for input. Could be used for making "impossible" images of the moon, as it looks from the side.
-- Feature request: For fisheye and dfisheye output, there should be an option to make the output circular and fill the outer area transparent. In most cases the outer area of the circle is not required, and it might become faster. The workaround is to overlay a circular mask, but it's uneffective to calculate the outer area and then mask it away.

## "vibrance" filter:

-- Documentation: The purpose of the rbal, gbal, bbal, rlum, glum and blum options is unclear. The rlum, glum and blum values must be in the [0..1] range, this info is missing. Better explanation and/or examples required.
"vidstabtransform" filter:
-- The option "crop=black" doesn't work. See ticket 9410.
"vignette" filter:
-- Feature request: Automatically set the "aspect" option to the SAR of the input stream, if "aspect" is set to -1.
-- Feature request: Allow different functions, for example quadratic, cubic, or a user-defined exponent.
-- Documentation: Please describe which methematical function is used fir the vigentte effect (is it quadratic or cubic, or something else?)

## "xfade" filter:

-- Feature request: It would be nice if it could be used similar as "acrossfade", where the crossfade is always at the end of the first video, so that you don't have to know the length of the first video. Could be used as a workaround for fade-out at the end of a video, by crossfading with a black video. I know that this requires a lot of memory, but this is acceptable as in most cases crossfadings aren't longer than 1-2 seconds.
-- Documentation: Please add an example for the "expr" option.
-- Documentation: It's unclear if the second input stream is shifted towards the end or not. Example: Both input streams have duration 10, and offset is 5 Which frame from the second stream is used at $t=7$ ? Is it 2 or $\mathbf{7 ?}$
-- Documentation: What's the range of the "P" variable? Form 0 to 1?

## "zmq" filter:

Please add this to the documentation:
"It's possible to send zmq messages to all those filters and options that support commands. Don't send messages to other options, as this may lead to malfunction. However, not everything that's possible is also useful. For example, a message can be sent to the "width" option of the "scale" filter for changing the size of a video stream. But changing the size mid-stream isn't supported by many other filters (for example "eq", "colorkey" and "despill"). In some cases it works (for example the output of "scale" can be used as the second input of "overlay"), but in most other cases it fails."

Suggestion for improvement: The zmq filter has the same problem as the sendcmd filter. Sometimes it's difficult to find a suitable location in the filter chain, where zmq can be inserted. It must be a location where exactly _one_ video stream exists. Not zero and not more than one. As the zmq filter doesn't really need any input, it should just pass all input streams unchanged to the output, so that it could be placed anywhere in the filter chain.
"zoompan" filter:
-- Suggestion for improvement: Please allow expressions (especially "iw" and "ih") for the "s" option. In many cases it would make sense to set the output size to a fraction of the input size.
-- Suggestion for improvement: Please allow zoom values smaller than 1, and use a color to fill the unused area.
-- Documentation: Please add that the constant "in" begins with 1 (and not with 0 ).

## "zscale" video filter:

-- Documentation: Much better description is required for almost all options. Examples are required. This filter sems to be required for decoding DNG images, but I wasn't able to find out how it works. This filter is almost unusable because of missing documentation.

## 3 Audio processing with FFmpeg

### 3.1 Combine multiple audio files with crossfadings

```
rem Combine multiple audio files with crossfadings
set "FILE1=Sound_Day.wav" :: First audio filename
set "V1=1.0" - : Volume
set "S1=0" :: Start time
set "L1=14" :: Length
set "FILE2=Sound Night.wav" :: Second audio filename
set "V2=0.2" :: Volume
set "S2=20" :: Start time
set "L2=55" :: Length
set "FILE3=Sound_Day.wav" :: Third audio filename
set "V3=1.0" : : Volume
set "S3=20" :: Start time
set "L3=30" :: Length
set "DUR=5" :: Crossfade duration
set "OUT=sound.mp3" :: Output audio filename
ffmpeg -ss %S1% -i %FILE1% -t %L1% -af volume=%V1% -y s1.wav
ffmpeg -ss %S2% -i %FILE2% -t %L2% -af volume=%V2% -y s2.wav
ffmpeg -ss %S3% -i %FILE3% -t %L3% -af volume=%V3% -y s3.wav
ffmpeg -i s1.wav -i s2.wav -filter_complex acrossfade=d=%DUR% -y s12.wav
ffmpeg -i s12.wav -i s3.wav -filter_complex acrossfade=d=%DUR% -y %OUT%
pause
```

In this example three audio files are concatenated with crossfadings. For each file the volume, start time and length can be specified. At first three temporary files are created, then the first two are combined, and in the last step the third file is added. There is no quality loss because *.wav is an uncompressed audio format.

### 3.2 Change audio volume

See https://trac.ffmpeg.org/wiki/AudioVolume

### 3.3 Change audio sample rate and number of audio channels

```
rem Change the audio sample rate and the number of audio channels
set "IN=PanoView.mp4" :: Input video
set "START=5" :: Start time
set "LEN=5" :: Length
set "OUT=out.mp4" :: Output video
ffmpeg -ss %START% -t %LEN% -i %IN% -ac 2 -af aresample=44100 -y %OUT%
pause
```

- -ac 2 sets the number of audio channels to 2 . If you want to copy a mono channel to both stereo channels, use aeval=val(0)|val(0)
- -af aresample=44100 changes the audio sample rate to 44100 Hz

### 3.4 Change audio length, sample rate and/or pitch

| Command line | Length | SR | Pitch | What has changed? |
| :---: | :---: | :---: | :---: | :---: |
| ffmpeg -f lavfi -i sine=f=1000:r=48000:d=5 s.wav | 5 s | 48000 | 1000 Hz | (This is the input file) |
| ffmpeg -i s.wav -af asetrate=24000,atempo=2.0,aresample=48000 t1.wav | 5 s | 48000 | 500 Hz | Pitch |
| ffmpeg -i s.wav -af aresample=24000 t2.wav | 5 s | 24000 | 1000 Hz | SR |
| ffmpeg -i s.wav -af asetrate=24000,atempo=2.0 t3.wav | 5 s | 24000 | 500 Hz | SR and Pitch |
| ffmpeg -i s.wav -af atempo=2.0 t4.wav | 2.5 s | 48000 | 1000 Hz | Length |
| ffmpeg -i s.wav -af asetrate=24000,aresample=48000 t5.wav | 10 s | 48000 | 500 Hz | Length and Pitch |
| ffmpeg -i s.wav -af atempo=2.0,aresample=24000 t6.wav | 2.5 s | 24000 | 1000 Hz | Length and SR |
| ffmpeg -i s.wav -af asetrate=24000 t7.wav | 10 s | 24000 | 500 Hz | Length, SR and Pitch |
| Change the length by factor $L$ and pitch by factor $P$ : <br> set "L=1.2" <br> set " $\mathrm{P}=1.5$ " <br> ffmpeg -i s.wav -af atempo $=1 / \% \mathrm{~L} \% / \% \mathrm{P} \%$, asetrate $=48000 * \% \mathrm{P} \%$, aresample $=48000$ t8.wav | 6 s | 48000 | 1500 Hz | Length and Pitch |

Please note that the argument of the atempo filter must be in the [0.5 ... 2.0] range.
See also the rubberband filter.

### 3.5 Replace a segment of the audio stream by silence

```
set "B=10" :: Time where silence begins
set "E=10" :: Time where silence ends
ffmpeg -i in.mp4 -c:v copy -af "volume=enable='between(t,%B%,%E%)':volume=0" out.mp4
pause
```

### 3.6 Add an audio stream to a video, if no audio stream exists

In this example a silent stereo audio stream is added to a video, if (and only if) the video has no audio stream. Otherwise the audio stream remains unchanged:

```
rem Make a test video without audio stream:
ffmpeg -f lavfi -i testsrc2=size=vga -t 6 -y none.mp4
rem Make a test video with mono audio stream:
ffmpeg -f lavfi -i testsrc2=size=vga -f lavfi -i sine=1000 -t 6 -y mono.mp4
rem Make a test video with stereo audio stream:
ffmpeg -f lavfi -i testsrc2=size=vga -f lavfi -i sine=1000 -t 6 -ac 2 -y stereo.mp4
ffmpeg -i none.mp4 -f lavfi -i anullsrc=cl=stereo -shortest -y test1.mp4
ffmpeg -i mono.mp4 -f lavfi -i anullsrc=cl=stereo -shortest -y test2.mp4
ffmpeg -i stereo.mp4 -f lavfi -i anullsrc=cl=stereo -shortest -y test3.mp4
pause
```

 stereo audio stream.

This example is similar, but the output audio stream is forced to be mono in all three cases:

```
ffmpeg -i none.mp4 -f lavfi -i anullsrc -shortest -ac 1 -y test1.mp4
ffmpeg -i mono.mp4 -f lavfi -i anullsrc -shortest -ac 1 -y test2.mp4
ffmpeg -i stereo.mp4 -f lavfi -i anullsrc -shortest -ac 1 -y test3.mp4
```

This example is similar, but the output audio stream is forced to be stereo in all three cases:
ffmpeg -i none.mp4 -f lavfi -i anullsrc -shortest -ac 2 - -y test1.mp4
ffmpeg -i mono.mp4 -f lavfi -i anullsrc -shortest -ac 2 -y test2.mp4
ffmpeg -i stereo.mp4 -f lavfi -i anullsrc -shortest -ac 2 - $y$ test3.mp4

## How does it work?

If "map" is not specified, FFmpeg selects a single audio stream from among the inputs with the highest channel count. If there are two or more streams with same number of channels, it selects the stream with the lowest index. anullsrc here has one channel, so it will be passed over except when the source video has an audio stream.

See also: https://stackoverflow.com/questions/37862432/ffmpeg-output-silent-audio-track-if-source-has-no-audio-or-audio-is-shorter-th

### 3.7 Stereo --> mix into one mono channel

Both channels of the stereo stream will be downmixed into the stream:

```
ffmpeg -i stereo.wav -ac 1 mono.wav
pause
```

In this example the difference between the left and right stereo channel is calculated and written to a mono file. If the result is silence, then both input channels are equal. The input can be a video or an audio file.

```
ffmpeg -i input.mp4 -af "aeval=val(0)-val(1)" mono.wav
pause
```

### 3.9 Check if two mono inputs are equal

In this example the difference between the two mono audio channels is calculated and written to a mono file. If the result is silence, then both input channels are equal.

```
ffmpeg -i input1.wav -i input2.wav -lavfi [0][1]amerge,aeval=val(0)-val(1) -y mono.wav
pause
```

### 3.10 Extract one mono channel from stereo

```
ffmpeg -i stereo.wav -filter_complex "[0:a]channelsplit=channel_layout=stereo:channels=FR[right]" -map "[right]"
front right.wav
pause
```

If you only want the left channel use FL instead of FR.
See ffmpeg -layouts for a list of channel names.
If you are working with a video file, you can use `-map 0:0 -c:v copy` to preserve the video stream.

### 3.11 Stereo --> two mono channels

```
ffmpeg -i stereo.wav -filter complex "[0:a]channelsplit=channel layout=stereo[left][right]" -map "[left]" left.wav -map
"[right]" right.wav
pause
```

This command line does the same thing:

```
ffmpeg -i stereo.wav -map_channel 0.0.0 left.wav -map_channel 0.0.1 right.wav
pause
```

### 3.12 Mono --> stereo

## Of course both stereo channels will be identical.

```
ffmpeg -i input.wav -ac 2 output.wav
pause
```

## Other method for the same thing:

```
ffmpeg -i input.wav -af "channelmap=0|0" output.wav
pause
```

### 3.13 Two mono channels --> stereo

ffmpeg -i left.mp3 -i right.mp3 -filter_complex "[0:a][1:a]join=inputs=2:channel_layout=stereo[a]" -map "[a]" output.mp3 pause

### 3.14 Mix two stereo channels to one stereo channel

```
ffmpeg -i input1.wav -i input2.wav -filter complex "[0:a][1:a]amerge=inputs=2,pan=stereo|c0<c0+c2|c1<c1+c3[a]" -map
"[a]" output.mp3
pause
```

Or use this command line, the output may be different:

```
ffmpeg -i input1.wav -i input2.wav -filter complex "[0:a][1:a]amerge=inputs=2[a]" -map "[a]" -ac 2 output.mp3
pause
```

### 3.15

 Create a file with multiple audio streamsIn this example one video stream and two audio streams are mapped to the output file. The first is the unchanged input stream "-map 1:a" and the second is the modified stream with higher volume "-map[a]".

```
ffmpeg -f lavfi -i testsrc2 -f lavfi -i "sine=1k:b=2,channelmap=0|0" -lavfi "[1]volume=3[a]" -map 0:v -map 1:a -map [a]
-t 20 -y out.mkv
pause
```

In FFplay you can toggle between the streams with "a" button.
In VLC player you can toggle between the streams with "b" button.

### 3.16 How to choose the correct audio volume level

Normally music is normalized to the maximum value (+-32676 for 16-bit). That means the loudest part uses the maximum possible values, just without clipping. You can use the music for your video as-is, or you can make it quieter. If you make it louder, then it may be clipped.

Things are totally different when you make your own sound records, for example nature sounds.
As the first step, I recommend to calibrate the volume knob of your amplifier. To do this, show several videos from different sources (not your own selfmade videos), and adjust the volume knob so that all videos sound just right, with other words: Adjust the volume knob so, as you would like to hear these videos in the planetarium. To make sure that the frequency response is acceptable, use good 3-way boxes. Leave the volume knob in this position and don't change it.
Now you can adjust the volume of your own video, so that it also sounds great in the planetarium. This ensures that you can play all videos (your own and other videos) one after the other. You don't want to touch the volume knob during a presentation!

### 3.17 Remove low frequencies (wind noise) from an audio track

```
rem Audio hign pass filtering and volume adjustment
set "IN=sound.wav" :: Input soundtrack
set "AS=20" :: Start time
set "LEN=60" :: Length
set "HP=500" :: Cut-off frequency of the high pass filter
set "VOL=10" :: Volume factor
set "OUT=out.mp3" :: Output soundtrack
ffmpeg -ss %AS% -i %IN% -af highpass=f=%HP%,highpass=f=%HP%,highpass=f=%HP%,volume=%VOL% -t %LEN% - % %OUT%
pause
```

The high pass filter attenuates low frequencies by 12 dB per octave. At the specified cut-off frequency, the filter has 3dB attenuation. In this example, the same filter is used three times in a row, resulting in 36 dB per octave.

### 3.18 Remove silence from an audio stream

See also: http://ffmpeg.org/pipermail/ffmpeg-user/2021-September/053520.html
See also: https://medium.com/@jud.dagnall/dynamic-range-compression-for-audio-with-ffmpeg-and-compand-621fe2b1a892

### 3.19 Make a video from an audio file

Suppose an audio file is to be shown on Facebook. However, this is not possible because only pictures or videos can be shown there. Solution: The audio file is extended with a monochrome picture to a video.

```
ffmpeg -f lavfi -i color=c=black -i audio.mp3 -shortest out.mp4
pause
```

Do the same thing with a picture:
ffmpeg -loop 1 -i picture.jpg -i audio.mp3 -shortest out.mp4
pause

Do the same thing and use only a time segment from the audio file:

```
set "IN=IMG_1313.jpg" :: Input image
set "SOUND=190923_0019_12.wav" : : Sound file
set "SS=110" :: Start time in the sound file
set "SIZE=1600x1200" :: Size of output video
set "T=10" :: Duration
set "OUT=out.mp4" :: Output video
ffmpeg -loop 1 -i %IN% -sS %SS% -i %SOUND% -s %SIZE% -t %T% -y %OUT%
pause
```

### 3.20 Convert ultrasound to the audible range, e.g. to hear bats

There are two fundamentally different methods of converting a high frequency to a lower frequency. The first method is to divide the frequency by a constant (for example 2), in this case the frequency range from 0 to 25 kHz is converted to the range from 0 to 12.5 kHz .

```
rem Make 2 seconds 1kHz sinewave, followed by 2 seconds silence:
ffmpeg -f lavfi -i "sine=frequency=1000:sample_rate=48000:duration=2" -af apad -t 4 sine.wav
rem Halving the sampling rate doubles the duration and halves the pitch
ffmpeg -i sine.wav -af asetrate=24000 out1.mp3
rem The atempo=2 filter causes the duration to be halved and the pitch to remain unchanged
rem (The factor must be in the range [0.5 .. 2.0], if necessary you can use the filter several times in a row)
ffmpeg -i sine.wav -af atempo=2.0 out2.mp3
rem A combination of these two effects causes the duration to remain unchanged and the pitch to be halved:
ffmpeg -i sine.wav -af asetrate=24000,atempo=2.0 out3.mp3
pause
```

The second method is to subtract a constant frequency. In this case, for example, the frequency range [ 15 kHz ... 25 kHz ] is converted to the range [ 0 kHz ... 10 kHz . The advantage is that the frequency range from 0 to 15 kHz is completely suppressed.

```
rem Ultrasound converter by mixing (subtraction of the mixing frequency)
set "IN=Fledermaus_44100.wav" :: Input soundtrack (containing ultrasound)
set "SR=44100" : : Sample rate of the input soundtrack
set "MF=15000" :: Mixing frequency (this is the frequency to be subtracted)
set "BB=10000" :: Bandwidth
set "VOL=3"
set "OUT=out.wav" :: Output soundtrack
ffmpeg -ss 100 -i %IN% -f lavfi -i aevalsrc="sin(%MF%*2*PI*t):c=stereo:s=%SR%" ^
-filter complex "[0]volume=%VOL%,highpass=f=%MF%,highpass=f=%MF%,highpass=f=%MF%,highpass=f=%MF%[sound];
[sound][1] amultiply,lowpass=f=%BB%,lowpass=f=%BB%,lowpass=f=%BB%,lowpass=f=%BB%" - = % % OUT%
```

pause

The amultiply filter in the above example does multiply the input signal by a sine wave. Both inputs and the output are in the [-1...+1] range.

In this example, the ultrasound from a video is mixed to the audible range and the video is copied as-is:

If the output audio sample rate is specified with -ar, it must be a sane sample rate such as 44.1k or 48k.

The same thing can also be made much easier with the "afreqshift" filter:

| set "IN=s.wav" | $:$ Input file |
| :--- | :--- |
| set "FS=-13000" | $:$ Frequency shift |
| rem Make a ultrasonic 15 kHz test tone |  |
| ffmpeg -f lavfi -i sine=f=15000:r=48000:d=5 -y \%IN\% |  |
| rem Shift the frequency into the audible range |  |
| ffmpeg -i \%IN\% -af afreqshift $=\% F S \%-y$ test.wav |  |

pause

In this example I did add the "showspectrum" filter for visualizing the spectrum:
set "FS=14000" $\quad:$ Frequency shift
rem Make a video with a 15 kHz test tone:

```
ffmpeg -f lavfi -i sine=f=15000:r=48000:d=5 -f lavfi -i color=black -lavfi showspectrum=legend=1 -y test.mp4
rem Shift the frequency down:
ffmpeg -i test.mp4 -lavfi highpass=%FS%,highpass=%FS%,highpass=%FS%,afreqshift=-%FS%,asplit[a][b];
[b]showspectrum=legend=1 -map [a] -y out.mp4
```

pause

Note: "showspectrum" is a audio to video filter. That's why the audio signal must be duplicated with the "asplit" filter.
Note: The multiple "highpass" filters are used to strongly attenuate the frequencies below the shift frequency, so that these frequencies can't be heard when they are mirrored into the negative frequency range.

Note: The "afreqshift" filzter doesn't operate in the frequency domain. It uses two groups of allpass sections of biquad IIR filters to do most of the work.

### 3.21 Record sound with the computer's built-in microphone

With this batch file you can see which microphones are available:

```
ffmpeg -list_devices 1 -f dshow -i dummy
pause
```

With this batch file you can display the properties of a specific microphone:

```
ffmpeg -list_options 1 -£ dshow -i "audio=Mikrofon (Realtek High Definiti"
pause
```

With this batch file you can record sound with the internal microphone:

```
ffmpeg -f dshow -channels 2 -i audio="Mikrofon (Realtek High Definiti" -t 5 -f mp3 -y out.mp3
pause
```

With this batch file you can record sound with a cheap chinese USB soundcard (Model "3D SOUND"):

```
rem ffmpeg -list_devices 1 -f dshow -i dummy
rem ffmpeg -list_options 1 -f dshow -i "audio=Mikrofon (USB Audio Device)"
ffmpeg -f dshow -sample_rate 44100 -sample_size 16 -channels 2 -i audio="Mikrofon (USB Audio Device)" -t 5 -f
mp3 -y out.mp3
pause
```

A "Voice-Over" track is an audio track that's recorded while simultaneously a video is played. Useful also for making sound effects that fit to the video.
Note: Later I found out that it's much easier to record a Voice-Over track with Davinci Resolve. But for completeness I'm also showing here how it can be done with FFmpeg.

```
set "IN=test.mp4" :: Input video
set "AUDIO=audio.wav" :: Output audio
ffmpeg -re -i %IN% -f dshow -audio_buffer_size 100 -channels 2 -i audio="Mikrofon (Realtek High Definiti" -y -map 1:a
%AUDIO% -map 0:v -f sdl2 -
```

Please note that this command line has several problems:

1. It doesn't stop when the end of the video has been reached. The audio file gets longer than the video. But you can manually close the console window. 2. Video and audio are not perfectly synchrone. This depends also on the "audio_buffer_size" value.
2. If audio_buffer_size is large (or if the large default value is used), FFmpeg doesn't play the video continously. It's stop-and-go.
3. I found no documentation for -f sdl2

Alternatively it's also possible to pipe the video output to FFplay. In this case the scale filter is required to make the FFplay window smaller, so that you can still see the console window and close it manually when the video has ended.

```
set "IN=test.mp4" :: Input video
set "AUDIO=audio.wav" :: Output audio
ffmpeg -an -i %IN% -f dshow -audio_buffer_size 100 -channels 2 -i audio="Mikrofon (Realtek High Definiti" -y -map 1:a
%AUDIO% -map 0:v -vf scale=iw/2:-1 -f nut - | ffplay -
```

This example that was proposed by Gyan Doshi in the FFmpeg user list on January 17th, 2020. It uses the mpegts format instead. It works, but unfortunately it takes about 5 seconds until the FFplay window appears. The -autoexit option should close FFplay when EOF is detected, but in this example it doesn't work.

```
ffmpeg -an -i test.mp4 -f dshow -audio_buffer_size 100 -channels 2 -i audio="Mikrofon (Realtek High Definiti" -y -map
1:a audio.wav -map 0:v -vf scale=iw/2:=1 -f mpegts - | ffplay -f mpegts -autoexit -
```

The original video (with original audio) and the new recorded audio can now be mixed with this command line. The best value for "offset" has to be found by try and error.

```
set "IN=test.mp4" :: Input video (with audio)
set "AUDIO=audio.wav" :: Input audio
set "OFFSET=0 35"
set "W1=0.2"
set "W2=2.5"
    :: Offset time in seconds, a positive value means audio is shifted towards the beginning
    :: Weight of original sound from the video
set "W2=2.5" :: Weight of sound from audio file
ffmpeg -i %IN% -i %AUDIO% -filter_complex "[1:a]atrim=%OFFSET%[2],[0:a][2]amix=weights='%W1% %W2%'" -y -shortest -q:v 2
-c:v mpeg4 out.mp4
pause
```

### 3.23 Passing the FFmpeg output to FFplay

This batch file passes the video and audio output of FFmpeg to FFplay

```
ffmpeg -i in.mp4 (insert some filters here) -f nut - | ffplay -
pause
```

### 3.24 Record sound and pass the output to FFplay

This batch file records sound from the computer's microphone (or audio input) and passes the output to FFplay

```
ffmpeg -f dshow -sample rate 44100 -sample size 16 -channels 2 -i "audio=Microphone (SoundMAX Integrated" (insert some
filters here) -f wav - T ffplay -
pause
```

### 3.25 Live ultrasound conversion

It's possible to make ultrasound conversion in almost real time. You can input the ultrasound via the computer's microphone (or 3.5mm input jack), and play the converted sound via the computer's speakers (or 3.5 mm headphone output to an audio amplifier). The conversion has about $1-2$ seconds delay. Make sure that in the Windows control panel, in the microphone properties under "Microphone Extensions", no filter should be used.

```
rem ffmpeg -list_devices 1 -f dshow -i dummy
rem ffmpeg -list_options 1 -f dshow -i "audio=Mikrofon (Realtek High Definiti"
rem Live ultrasound converter by mixing (subtraction of the mixing frequency)
set "SR=44100" :: Sample rate of the input soundtrack
set "MF=10000" :: Mixing frequency (this is the frequency to be subtracted)
set "BB=10000" :: Bandwidth
set "VOL=30" 
ffmpeg -f dshow -channels 2 -i audio="Mikrofon (Realtek High Definiti" -f lavfi -i aevalsrc="sin
(%MF%*2*PI*t):c=stereo:s=%SR%" -filter_complex "[0]volume=%VOL%,highpass=f=%MF%,highpass=f=%MF%,highpass=f=
%MF%,highpass=f=%MF%[sound] ; [sound] [1]]amultiply,lowpass=f=%BB%,lowpass=f=%BB%,lowpass=f=%BB%,lowpass=f=%BB%"
-f nut - | ffplay -
```

Pinout of 3.5 mm stereo connectors: Tip contact is left channel, middle contact is right channel, outer contact is ground.

This is another method for live ultrasound conversion. It's faster and uses the FFT filter:

```
rem ffmpeg -list_devices 1 -f dshow -i dummy
rem ffmpeg -list_options 1 -f dshow -i "audio=Mikrofon (Realtek High Definiti"
rem Live ultrasound converter by mixing (subtraction of the mixing frequency)
set "SR=44100" :: Input sample rate
set "F=4000"
set "VOL=30"
    Subtracted frequency in Hz
    : Volume factor
set /a "N=4096*%F%/%SR%" :: N = 4096 * F / SR
set "AB=10" :: Audio buffer in milliseconds
```

ffmpeg -f dshow -audio buffer size \%AB\% -sample_rate \%SR\% -sample_size 16 -channels 2 -i audio="Mikrofon (Realtek High
 nut - $\mid f f p l a y ~-~$

In this example the delay time between input and output can be minimized by setting the -audio_buffer_size to a small value, for example with 10 ms buffer size the delay is about 0.5 seconds.
See also: https://trac.ffmpeg.org/wiki/DirectShow\#BufferingLatency

### 3.26 Extract the audio from a video

## ffmpeg -i video.mp4 -vn audio.mp3

### 3.27 Split a video into audio-only and video-only

Audio and video are saved if individual files.

```
ffmpeg -i input.mp4 -vcodec mpeg2video output_video.m2v -acodec copy output_audio.mp3
```

### 3.28 Synchronize audio with video

If you have a video with out-of-sync audio, you can synchronize it as follows. In this example a 0.5 seconds delay is added to the audio stream:

```
ffmpeg -i input.mp4 -itsoffset 0.5 -i input.mp4 -map 0:0 -map 1:1 -acodec copy -cvodec copy output.mp4
```

For more infos about "-itsoffset", see also: https://trac.ffmpeg.org/wiki/Understandingltsoffset
See also the "compensationdelay" filter for delaying audio.
Note: Synchronizing audio with video is very easy with DaVinci Resolve.

### 3.29 Sources for royalty-free music

http://opsound.org
Eric Matyas: http://soundimage.org/
https://artlist.io/
https://filmmusic.io
https://www.soundstripe.com/
https://freesound.org/

Please note that "royalty-free" doesn't mean you can do what you want with the music. You should read the licence carefully. For example it may be required to give the artist a proper credit, and show a link to the licence in the video.

These sources are not free:
https://audiio.com/
https://www.premiumbeat.com/de

### 3.30 Sound effects, from frequency domain to time domain

| Frequency domain | Time domain | Notes |
| :--- | :--- | :--- |
| $f(t)$ | $y(t)=\sin (2 * p i * f(t) * t)$ | This formula is wrong. It doesn't work this way. |
| $f(t)$ | $y(t)=\sin \left(2 * p i * \int_{0} f(t) d t\right)$ | This is the correct way to calculate the signal in the time <br> domain. |
| $f(t)=f 0$ | $y(t)=\sin (2 * p i * t * f 0)$ | Sine tone with constant frequency |
| $f(t)=f 0+(f 1-f 0) * t / p$ | $y(t)=\sin (2 * p i * t *(f 0+t *(f 1-f 0) /(2 * p)))$ | Linear chirp from f0 to $f 1$ in $p$ seconds |
| $f(t)=f 0 * \exp (t / b * \ln (2))$ | $y(t)=\sin (2 * p i * f 0 * b / \ln (2) * e x p(t * \ln (2) / b))$ | Logarithmic chirp from f0, frequency doubles in $b \operatorname{seconds}$ |
| $f(t)=f 0+f 1 * \sin (2 * p i * t)$ | $y(t)=\sin (2 * p i * t * f 0-f 1 * \cos (2 * p i * t))$ | Sinusoidally rising and falling tone from f0-f1 to f0+f1 with a <br> period of one second |
| $f(t)=f 0+f 1 * \sin (2 * p i * t / p)$ | $y(t)=\sin (2 * p i * t * f 0-f 1 * p * \cos (2 * p i * t / p))$ | Sinusoidally rising and falling tone with a period of $p$ seconds |

Here are a few examples:

```
rem Create a sine tone

```
rem Logarithmic chirp from 20Hz to 20480Hz in 20 seconds
set "D=20" :: Duration in seconds
set "FO=20" :: Start frequency in Hz
set "A=2" :: Frequency doubling time in seconds
    If the stop frequency F1 and the duration D are known, A can be calculated as follows:
    A = D * log(2) / log(F1/F0)
set "VOL=0.1" :: Volume
set "OUT=out.wav" :: Output filename
ffmpeg -f lavfi -i aevalsrc='%VOL%*sin(2*PI*%F0%*%A%/log(2)*exp(t*log(2)/%A%)):c=stereo:s=44100' -t %D% -y %OUT%
pause
```

### 3.31 Gravitational waves from binary black hole mergers

See also (in german): Frank Ohme, "Schwarze Löcher und andere Mysterien" https://onlinelibrary.wiley.com/doi/epdf/10.1002/piuz.202101618

Frequency of the gravitational wave (this is an approximation that fails near the end of the merger): (Source: see above) $f(t)=1 /(8 * \mathrm{pi}) *\left(\mathrm{c}^{3} /\left(\mathrm{G} * \mathrm{M}_{\mathrm{c}}\right)\right)^{5 / 8} *(5 / \mathrm{dt})^{3 / 8}$
with $\mathbf{c}=$ Speed of light, $\quad \mathbf{G}=$ Gravity constant, $\quad \mathbf{d t}=$ Time until merger
Note: The frequency of the gravitational wave is twice the revolution frequency of the black holes.
$M_{c}$ is the "Chirp mass": $\quad M_{c}=\left(m_{1} * m_{2}\right)^{3 / 5} /\left(m_{1}+m_{2}\right)^{1 / 5}$
Table for chirp mass (in solar masses):

| $\mathrm{m}_{1}$ | $\mathrm{m}_{2}$ |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2 | 3 | 4 | 5 | 6 | 8 | 10 | 12 | 15 | 20 | 30 | 50 |
| 2 | 1.74 |  |  |  |  |  |  |  |  |  |  |  |
| 3 | 2.12 | 2.61 |  |  |  |  |  |  |  |  |  |  |
| 4 | 2.42 | 3.01 | 3.48 |  |  |  |  |  |  |  |  |  |
| 5 | 2.70 | 3.35 | 3.89 | 4.35 |  |  |  |  |  |  |  |  |
| 6 | 2.93 | 3.65 | 4.25 | 4.76 | 5.22 |  |  |  |  |  |  |  |
| 8 | 3.33 | 4.17 | 4.87 | 5.48 | 6.02 | 6.96 |  |  |  |  |  |  |
| 10 | 3.67 | 4.61 | 5.40 | 6.08 | 6.79 | 7.78 | 8.71 |  |  |  |  |  |
| 12 | 3.97 | 5.00 | 5.86 | 6.62 | 7.30 | 8.49 | 9.53 | 10.45 |  |  |  |  |
| 15 | 4.37 | 5.51 | 6.47 | 7.33 | 8.09 | 9.44 | 10.62 | 11.67 | 13.06 |  |  |  |
| 20 | 4.93 | 6.23 | 7.34 | 8.33 | 9.22 | 10.79 | 12.17 | 13.40 | 15.05 | 17.41 |  |  |
| 30 | 5.83 | 7.39 | 8.73 | 9.93 | 11.01 | 12.95 | 14.65 | 16.19 | 18.25 | 21.24 | 26.12 |  |
| 50 | 7.19 | 9.14 | 10.82 | 12.32 | 13.70 | 16.16 | 18.35 | 20.34 | 23.04 | 26.98 | 33.50 | 43.53 |

Amplitude of the gravitational wave (this is an approximation):
$A(t)=4 * G^{5 / 3} * m_{1} * m_{2} *(p i * f(t))^{2 / 3} *\left(m_{1}+m_{2}\right)^{-1 / 3} /\left(d * c^{4}\right)$
with $d=$ Distance from source to observer

The distance between the two black holes can be calculated from Kepler's $3^{\text {rd }}$ law (this is an approximation):

```
r
```

Rate of orbital decay: (Source: https://en.wikipedia.org/wiki/Gravitational_wave\#Binaries )
$\mathrm{dr} / \mathrm{dt}=-64 / 5 * \mathrm{G}^{3} / \mathrm{c}^{5} *\left(\mathrm{~m}_{1} * \mathrm{~m}_{2}\right)\left(\mathrm{m}_{1}+\mathrm{m}_{2}\right) / \mathrm{r}^{3}$

Time until merger: (Source: https://en.wikipedia.org/wiki/Gravitational_wave\#Binaries )

```
t = 5 / 256 * c 
```

Let's try an example with two stellar black holes of 10 and 15 solar masses: (solar mass = $\mathbf{2 e} \mathbf{3 0} \mathbf{k g}$ )

```
m
m}\mp@subsup{m}{2}{\prime}15 * 2e30 kg = 3e31 k
```

```
f(t) = 1 / (8 * pi) * (c ( / (G * Mc) ) 5/8 * (5 / dt) 3/8
with c = 3e8 m/s
    G = 6.67e-11 m
    K = 1 / (8 * pi) * (c / / (G * M M ) ) 5/8 * 5 %/8}=34.4
f(t) = 34.47* dt -3/8
```

| dt | $\mathrm{f}(\mathrm{dt})$ | $\mathrm{A}(\mathrm{t}) \sim \mathrm{dt}^{-1 / 4}$ |
| :--- | :--- | :--- |
| 0.05 s | 106.0 Hz | 2.11 |
| 0.1 s | 81.7 Hz | 1.78 |
| 0.2 s | 63.0 Hz | 1.50 |
| 0.5 s | $44,7 \mathrm{~Hz}$ | 1.19 |
| 1 s | 34.5 Hz | 1.00 |
| 2 s | 26.6 Hz | 0.84 |
| 5 s | 18.9 Hz | 0.67 |
| 10 s | 14.5 Hz | 0.56 |
| 20 s | 11.2 Hz | 0.47 |
| $60 \mathrm{~s}=1 \mathrm{~min}$ | 7.4 Hz | 0.36 |
| $600 \mathrm{~s}=10 \mathrm{~min}$ | 3.1 Hz | 0.20 |
| $3600 \mathrm{~s}=1 \mathrm{~h}$ | 1.6 Hz | 0.13 |

Note: The frequency is proportional to $\mathrm{dt}^{-3 / 8}$, the amplitude is proportional to $\mathrm{f}^{2 / 3}$ and proportional to $\mathrm{dt}^{-1 / 4}$ (because $-3 / 8 * 2 / 3=-1 / 4$ ).
Note: The smallest stellar black holes have about 2 solar masses. For two such objects, $M_{c}=3.48 \mathrm{e} 30 \mathrm{~kg}$ and $K=58.29$, so that $f(1 \mathrm{~s})=58.29 \mathrm{~Hz}$
The time until merger is $d t$. When creating a sound where the merger takes place at $t=t_{m}$, we can calculate dt as follows:
$\mathrm{dt}=\mathrm{t}_{\mathrm{m}}-\mathrm{t}$
$f(t)=K *\left(t_{m}-t\right)^{-3 / 8}$
$\int f(t) d t=K *-8 / 5 *\left(t_{m}-t\right)^{5 / 8}$

This is the waveform as a function of time $t$ :
$y(t)=\sin \left(2 * p i * K * 8 / 5 *\left(t_{m}-t\right)^{5 / 8}\right)$

```
rem Binary black hole merger
set "K=34.47" :: K constant
set "S=1" :: Frequency upscaling factor, use S=1 for realistic output
set "TM=20" :: Time of merger
set "D=21" :: Duration in seconds
set "VOL=0.065" :: Volume one second before merger (before equalizer)
set "OUT=gw.wav" :: Output filename
```

t), $5 / 8$ )) ) : c=stereo:s=44100' -lavfi

)' -t \%D\% -y \%OUT\%
ffmpeg -i \%OUT\% -lavfi showwaves=s=1800x500:n=294:mode=p2p:draw=full -frames 1 -y waveform.png
pause

Note: The "firequalizer" filter is used to correct the frequency response of the LD IOCA SUB18A subwoofer below 50Hz:

| Frequency: | 20 Hz | 25 Hz | $\mathbf{3 0 ~ H z}$ | 35 Hz | $\mathbf{4 0 ~ H z}$ | $\mathbf{4 5 ~ H z}$ | 50 Hz |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Gain: | $\mathbf{+ 2 8 ~ d B}$ | +19 dB | +17 dB | +6 dB | +3 dB | +4 dB | +0 dB |

For measuring the frequency response of the subwoofer, it's helpful to use a tone generator software, for example Audio SweepGen: http://www.softsea.com/review/SweepGen.html

```
rem Create band-limited noise from f0 to f1
set "FO=2000" :: Lower frequency in Hz
set "F1=4000" :: Upper frequency in Hz
set "SR=44100" :: Sample rate in Hz
set "WS=65536" :: Window size for FFT filter, bigger size reduces click noise
set "T=5"
set "VOL=.5"
    Duration in seconds
    :: Volume
set "OUT=out.wav" :: Output filename
```

ffmpeg -f lavfi -i anoisesrc=r=\%SR\%:a=\%VOL\%:d=\%T\% -af afftfilt='win size=\%WS\%:real=re*between(0.5*sr*b/nb, \%F0\%,
$\% \mathrm{~F} 1 \%$ ) : imag=im*between ( $0.5 * \mathrm{sr} * \mathrm{~b} / \mathrm{nb}, \% \mathrm{~F} 0 \%, \% \mathrm{~F} 1 \%$ ) ' - $\mathrm{y} \%$ OUT $\%$
pause

## This example sends the sound directly to FFplay:

```
rem Create band-limited noise for two bands from f0 to f1 and from f2 to f3
set "F0=500" :: Lower band start frequency in Hz
set "F1=600" :: Lower band stop frequency in Hz
set "F2=1000" :: Upper band start frequency in Hz
set "F3=1200" :: Upper band stop frequency in Hz
set "SR=44100" :: Sample rate in Hz
set "T=5" :: Duration in seconds
set "VOL=1" :: Volume
ffmpeg -f lavfi -i anoisesrc=r=%SR%:a=%VOL%:d=%T% -af afftfilt='win_size=65536:real=re*bitor(between(0.5*Sr*b/nb,%F0%,
%F1%),between(0.5*sr*b/nb,%F2%,%F3%)) :imag=im*bitor(between(0.5*sr*b/nb,%F0%,%F1%),between(0.5*sr*b/nb,%F2%,%F3%))' -f
nut - | c:\ffmpeg\ffplay -autoexit -
pause
```

rem Create band-limited noise for three bands from f0 to $f 1$, from $f 2$ to $f 3$ and from $f 4$ to $f 5$

```
set "FO=500" :: Lower band start frequency in Hz
set "F1=550" :: Lower band stop frequency in Hz
set "F2=1000"
set "F1=550" :: Lower band stop frequency in Hz
: Mid band start frequency in Hz
set "F3=1100"
Mid band stop frequency in Hz
set "F4=1500"
:: Upper band start frequency in Hz
set "F5=1650"
Upper band stop frequency in Hz
set "SR=44100"
:: Sample rate in Hz
set "T=5"
Duration in seconds
:: Volume
set "VOL=1"
:: Volume
set "OUT=out.wav"
set "F0=500" :: Lower band start frequency in Hz
ffmpeg -f lavfi -i anoisesrc=r=%SR%:a=%VOL%:d=%T% -af afftfilt='win_size=65536:real=re*bitor(bitor(between(0.5*sr*b/nb,
%F0%,%F1%),between (0.5*sr*b/nb, %F2%,%F3%)),between (0.5*sr*b/nb, %F4%,%F5%)) : imag=im*bitor (bitor (between (0.5*sr*b/nb, %F0%,
%F1%),between (0.5*sr*b/nb,%F2%, %F3%)),between (0.5*sr*b/nb,%F4%,%F5%))' - y %OUT%
```

pause

### 3.33 Show the frequency response of a filter

```
ffmpeg -f lavfi -i aevalsrc='0.1*32767*eq(0,mod(n,32768))':d=10 -lavfi
lowpass=1k,showfreqs=overlap=0:win_size=32768:win_func=rect:ascale=log -y out.mp4
pause
```

## How does it work?

The "aevalsrc" source creates needle impulses with a very low frequency, in this case (sample_rate / 32768). With the default sample rate 44100 Hz the impulse frequency is 1.34 Hz . These needle impulses have a continuous spectrum (this can easily be shown if you remove the lowpass filter).

### 3.34 Make an audio file with a short test tone

```
rem Make a 10 seconds audio file with a short 3kHz tone at t=3s
ffmpeg -f lavfi -i sine=3000:duration=0.1 -af adelay=3000,apad -t 10 -y audio.wav
pause
```

### 3.35 Measuring the audio volume

The audio volume can be measured with the "volumedetect" filter, which doesn't change the input signal. The volume is written to the log output.
For example, this is useful if you have an unknown audio filter and want to know how much the volume is attenuated at a given frequency. In this case you would analyze the volume before and after applying the filter.

```
rem Create a 5 seconds 2kHz audio file:
ffmpeg -f lavfi -i sine=2000 -t 5 -y test.wav
rem Analyze the volume of this file:
ffmpeg -i test.wav -af volumedetect -f null NUL
pause
```

In this example the output format is "null" because no output file is required. It's also possible to replace "NUL" by "-" and this has the advantage that it runs under Linux and Windows:
ffmpeg -i test.wav -af volumedetect -f null -

Note: "NUL" in Windows can be replaced by "/dev/null" in Unix.

### 3.36 Convert an audio waveform to a picture

The audio waveform can be done with either of two filters: "showwaves" or "showwavespic". They both have some problems.

The straightforward solution is "showwavespic". The default image size is $\mathbf{6 0 0 \times 2 4 0}$, but there is an option for other sizes:

```
rem Create a sample waveform:
ffmpeg -f lavfi -i sine=250:b=2 -t 0.2 -y sine.wav
rem Convert the waveform to an image:
ffmpeg -i sine.wav -lavfi "showwavespic=filter=peak" -y waveform.png
pause
```

The drawback is that "showwavespic" doesn't have a mode for drawing only samples or lines between samples. It does always draw vertical lines from +level to -level, so that the output looks as if the frequency is doubled. I recommend to use the "showwaves" filter instead.

See also https://trac.ffmpeg.org/wiki/Waveform
$\square$

If you want to see the waveform as a line (like in an oscilloscope), you must use the showwaves filter:

```
rem Create a sample waveform:
ffmpeg -f lavfi -i sine=250:b=2 -t 0.2 -y sine.wav
rem Convert the waveform to an image:
ffmpeg -i sine.wav -lavfi showwaves=n=15:mode=p2p:draw=full -frames 1 -y waveform.png
pause
```

This is the output:

The drawback of this filter is that you have to know the sample rate and length of the audio file in advance and do some calculation. In this example we have 44100 * $0.2=8820$ audio samples and the default width of the image is 600 pixels. This means we have $8820 / 600=14.7$ audio samples per pixel. This value must be rounded to an integer (in this case 15) and used for the " $n$ " option.

Note: The "draw" option isn't well documented. Available values are:

- 'scale' Use blending, that means the samples are drawn darker where the slope is larger. This is the default.
- 'full' Draw all samples with full intensity. This is useful for higher values of $\mathbf{n}$.

Alternatively you can calculate the width of the output image as follows, and then use the"size" option to set the window size:
WIDTH $=\mathbf{S R}$ * $\mathbf{T} / \mathbf{N}$
with $S R=$ Sample rate, for example 44100
T = Duration in seconds
$\mathrm{N}=$ the " n " option in showwaves, audio samples per video pixel
This table lists the width of the image (for 44.1 kHz sample rate, only integer values between 100 and 10000 are shown):

|  | Nyquist | Duration [s] |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| n | Frequency $[\mathrm{Hz}]$ | 0.1 | 0.2 | 0.5 | 1 | 2 | 5 | 10 | 20 | 30 | 40 | 50 | 60 |

| 480 | 50 |  |  |  | 100 | 200 | 500 | 1000 | 2000 | 3000 | 4000 | 5000 | 6000 |

This batch file converts an audio file into a video with optical sound effect, like in the intro of Russ Meyer's film "Faster, Pussycat! Kill! Kill!": https://www.youtube.com/watch?v=LmeGKP5Bb20

The two stereo channels are duplicated to a total of 8 channels.

```
ffmpeg -i blueflowers.mp3 -lavfi
"showwaves=mode=cline:split_channels=true:s=1080x480:colors=white,transpose,split=4,hstack=4" -y out.mp4
```

pause

In this improved version the optical sound tracks appear one after the other and have individual delay times:

```
ffmpeg -i blueflowers.mp3 -lavfi "asplit=4[a0][a1][a2][a3];
[a0] asplit[b0][c0] ;
[a1] adelay=0.05:all=1,volume='gt(t,5)':eval=frame, asplit[b1][c1];
[a2] adelay=0.10:all=1,volume='gt(t,10)':eval=frame,asplit[b2][c2];
[a3] adelay=0.15:all=1,volume='gt(t,15)' : eval=frame,asplit[b3] [c3] ;
[b0] showwaves=mode=cline:split_channels=true:s=1080x480:colors=white[v0];
[b1] showwaves=mode=cline:split channels=true:s=1080x480:colors=white[v1];
[b2] showwaves=mode=cline:split channels=true:s=1080x480:colors=white[v2];
[b3] showwaves=mode=cline:split_channels=true:s=1080x480:colors=white[v3];
[v0][v1][v2][v3]vstack=4,transpose;[c0][c1][c2][c3]amix=4" -y out.mp4
pause
```

Note: The linefeeds were inserted only for clarity. Of coures everything must be written in one line.

### 3.38 Which equipment is useful for making sound records?

I use the following equipment:

- TASCAM DR-70D recorder, has 4 input channels, sample rate $44100,48000,96000 \mathrm{~Hz}, 16$ or 24 Bit
- The successor DR-701D has some improvements: The input amplifiers are somewhat less noisy, the four level controls can be electronically coupled, and the sampling rate can be up to 192 kHz .
- Rode NT1 microphones with fur windshields (deadcats), very low-noise and excellent for quiet nature sounds
- Microphone cable in 5 m length, so that you can stand a few meters away from the microphone when recording. If you stand too close to the microphone, you will have your own noise in the recording. You would hear every movement, every swallowing, every stomach growl...
- HAMA Joy Powerbank 10400mAh, as additional power supply for the recorder, because the built-in batteries only allow a very short recording time when the phantom power for the microphones is activated.

This batch file creates a sound file with this sequence:
Frequency F1 on left channel and silence on right channel for duration P/2, then silence on left channel and frequency F2 on right channel for duration $P / 2$, then repeat.

```
set "P=0.5" :: Duration of one cycle in seconds
set "F1=1000" :: Frequency for left channel
set "F2=2000" :: Frequency for right channel
set "T=10" :: Duration in seconds
ffmpeg -f lavfi -i sine=%F1% -f lavfi -i sine=%F2% -filter complex "[0]volume='lt(mod(t,op%),%P%/2)':eval=frame[a];
[1]volume='gte (mod (t,%P%) ,%P%/2)':eval=frame[b];[a][b]join=inputs=2:channel_layout=stereo" -t %T% -y out.wav
rem Alternatively you can also use this command line:
ffmpeg -f lavfi -i sine=%F1% -f lavfi -i sine=%F2% -filter_complex "[0]volume=0:enable='lt(mod(t,%P%),%P%/2)'[a];
[1]volume=0:enable='gte(mod (t,%P%) ,%P%/2)'[b]; [a][b]join=inputs=2:channel_layout=stereo' -t %T% -y out.wav
pause
```

I did compare these microphones with a quite silent 1 kHz sine source at about 2.5 m distance. The NTG2 microphone was connected to the left channel and the NT1 microphone to the right channel of the TASCAM DR-701D recorder. Phantom power was set to 48 V for both microphones. Sensitivity was set to " $\mathrm{HI}+\mathrm{C}$ and the level control was turned fully clockwise. No fur windshields (deadcats) were used for this test. In a second measurement the sine source was switched off and the microphones were covered under a pillow in a silent room. The measured noise level is a combination of microphone noise and amplifier noise in the recorder.

| Microphone | Measured level of $\mathbf{1 k H z}$ sine | Measured noise level | Sensitivity in manufacturer's data sheet | Noise level in manufacturer's data sheet |
| :--- | :--- | :--- | :--- | :--- |
| Rode NTG2 | RMS level dB: -22.4 | RMS level dB: -40.4 | $\mathbf{- 3 6 . 0} \mathbf{d B}$ re 1 Volt/Pascal +-2dB @ 1kHz | 18 dBA |
| Rode NT1 | RMS level dB: -12.1 | RMS level dB: -41.3 | $\mathbf{- 2 9 . 0 ~ d B ~ r e ~ 1 ~ V o l t / P a s c a l ~ + - 2 d B ~ @ ~ 1 k H z ~}$ | 4 dBA |

Result: The NT1 gives about 10dB more signal than the NTG2, at about the same noise level. For recording of quiet nature sounds the NT1 is clearly the superior microphone.

This batch file was used for the analysis:

```
ffmpeg -ss 5 -i 1kHz.wav -map_channel 0.0.0 -t 10 NTG2_1kHz.wav -map_channel 0.0.1 -t 3 -y NT1_1kHz.wav
ffmpeg -ss 5 -i silence.wav -map_channel 0.0.0 -t 10 NTG2_silence.wav -map_channel 0.0.1 -t 3 -y NT1_silence.wav
ffmpeg -i NTG2 1kHz.wav -af astats=metadata=1 -y out NTG2_1kHz.wav
ffmpeg -i NT1_\1kHz.wav -af astats=metadata=1 -y out_\overline{NT1_1र्kHz.wav}
ffmpeg -i NTG2_silence.wav -af astats=metadata=1 -y out_NTG2_silence.wav
ffmpeg -i NT1_silence.wav -af astats=metadata=1 -y out_\overline{NT1_silence.wav}
pause
```

$44100=2^{\wedge} 2 * 3^{\wedge} 2 * 5^{\wedge} 2 * 7^{\wedge} 2 \quad 48000=2^{\wedge} 7 * 3^{\wedge} 1 * 5^{\wedge} 3 \quad$ The greatest common divisor of 44100 and 48000 is 300.

## Divisors of 48000:

$1,2,3,4,5,6,8,10,12,15,16,20,24,25,30,32,40,48,50,60,64,75,80,96,100,120,125,128,150,160,192,200,240,250,300,320,375,384,400,480$, $500,600,640,750,800,960,1000,1200,1500,1600,1920,2000,2400,3000,3200,4000,4800,6000,8000,9600,12000,16000,24000,48000$

Divisors of 44100:
$1,2,3,4,5,6,7,9,10,12,14,15,18,20,21,25,28,30,35,36,42,45,49,50,60,63,70,75,84,90,98,100,105,126,140,147,150,175,180,196,210,225$, $245,252,294,300,315,350,420,441,450,490,525,588,630,700,735,882,900,980,1050,1225,1260,1470,1575,1764,2100,2205,2450,2940,3150,3675$, 4410, 4900, 6300, 7350, 8820, 11025, 14700, 22050, 44100

Divisors of 9600:
$1,2,3,4,5,6,8,10,12,15,16,20,24,25,30,32,40,48,50,60,64,75,80,96,100,120,128,150,160,192,200,240,300,320,384,400,480,600,640,800$, 960, 1200, 1600, 1920, 2400, 3200, 4800, 9600

Divisors of 8820:
$1,2,3,4,5,6,7,9,10,12,14,15,18,20,21,28,30,35,36,42,45,49,60,63,70,84,90,98,105,126,140,147,180,196,210,245,252,294,315,420,441,490$, 588, 630, 735, 882, 980, 1260, 1470, 1764, 2205, 2940, 4410, 8820

Divisors of 4800 :
$1,2,3,4,5,6,8,10,12,15,16,20,24,25,30,32,40,48,50,60,64,75,80,96,100,120,150,160,192,200,240,300,320,400,480,600,800,960,1200,1600$, 2400, 4800

Divisors of 4410:
$1,2,3,5,6,7,9,10,14,15,18,21,30,35,42,45,49,63,70,90,98,105,126,147,210,245,294,315,441,490,630,735,882,1470,2205,4410$
Divisors of 300 (Common divisors of 48000 and 44100):
1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 25, 30, 50, 60, 75, 100, 150, 300

| Framerate | Ticks of 1/90000s clock per frame <br> (Mpeg TS system clock timebase) | Audio samples per frame <br> @44.1 kHz | Audio samples per <br> frame @48 kHz |
| :--- | :--- | :--- | :--- |
| $23.976 \mathrm{fps}=24000 / 1001$ | 3753.75 | 1839.3375 | 2002 |
| 24 fps | 3750 | 1837.5 | 2000 |
| 25 fps | 3600 | 1764 | 1920 |
| $29.97 \mathrm{fps}=30000 / 1001$ | 3003 | 1471.47 | 1601.6 |
| 50 fps | 1800 | 882 | 960 |
| $59.94 \mathrm{fps}=60000 / 1001$ | 1501.5 | 735.735 | 800.8 |

Speed of sound in air at $20^{\circ} \mathrm{C}$ : $343.2 \mathrm{~m} / \mathrm{s}$

| Time [ms] | Distance [m] | Samples @ 44100Hz | Samples @ 48000Hz | Notes |
| :--- | :--- | :--- | :--- | :--- |
| 0.022675 | 0.00778 | 1 |  |  |
| 0.020833 | 0.00715 |  | 1 |  |
| 1 | 0.3432 | 44.1 | 48 |  |
| 2 | 0.6864 | 88.2 | 96 |  |
| 2.2675 | 0.7782 | 100 | 139.860 | This is the smallest possible time interval where the number of samples is an <br> integer at sample rate 44100 Hz and also at 48000 Hz |
| 2.9138 | 1 | 128.497 | 147 |  |
| 3.3333 | 1.144 | 220.5 | 279.720 |  |
| 5 | 1.716 | 256.699 | 699.301 | Both sample numbers are integers |
| 5.8275 | 2 | 441 | 1398.60 |  |
| 10 | 3.432 | 642.483 | 4800 | Both sample numbers are integers |
| 14.569 | 5 | 4284.97 | 48000 |  |
| 29.138 | 10 | 4410 |  |  |
| 100 | 34.32 |  |  |  |
| 1000 | 343.2 |  |  |  |
|  |  |  |  |  |

300 Hz is the largest frequency where one cycle consists of an integer number of samples at 44100 Hz and also at 48000 Hz sample rate.

## 4 FFprobe

How to examine a video file with FFprobe without having to write the name of the video into a batch file each time?
It's very simple, just create this batch file once and put it on your desktop:

```
ffprobe %1
```

pause

Now you can simply drag the video you want to examine with the mouse onto the icon of this batch file, and you will immediately see the result without having pressed a single key. The parameter \%1 causes the file name to be passed to FFprobe.

See also: https://trac.ffmpeg.org/wiki/FFprobeTips

By the way, it's also possible to let FFmpeg examine a file.
To see whether FFmpeg recognizes the file as something:

```
ffmpeg -i myfile.xxx
```

pause

## To see whether FFmpeg can decode the file:

```
ffmpeg -i myfile.xxx -f null -
pause
```

This is an example for writing the "noise floor count" of an audio file to a CSV log file:

```
ffprobe -f lavfi -i amovie=in.mp3,astats=metadata=1 -show_entries tags=lavfi.astats.Overall.Noise_floor_count -of
csv=p=0 1> log.csv
pause
```

### 4.1 Count the number of frames

```
ffprobe -v error -count_frames -select_streams v:0 -show_entries stream=nb_read_frames -of
default=nokey=1:noprint wrappers=1 input.mp4
pause
```

Get the total number of frames of a video: https://stackoverflow.com/questions/2017843/fetch-frame-count-with-ffmpeg

### 4.2 Find the keyframe timestamps

```
ffprobe -select_streams v:0 -show_frames -skip_frame nokey -show_entries frame=best_effort_timestamp_time input.mp4
pause
```

## 5 FFplay

Keyboard commands while playing:

| Key | Notes |
| :---: | :---: |
| q, ESC | Quit |
| f, left mouse double-click | Toggle full screen |
| p, SPACE | Pause |
| $s$ | Step to the next frame. Pause if the stream is not already paused, step to the next video frame, and pause. |
| m | Toggle mute. |
| 9, 0 | Decrease and increase volume respectively. |
| /, * | Decrease and increase volume respectively. |
| a | Cycle audio channel in the current program. |
| v | Cycle video channel. |
| t | Cycle subtitle channel in the current program. |
| C | Cycle program. |
| w | Cycle video filters or show modes. |
| left/right | Seek backward/forward 10 seconds. |
| down/up | Seek backward/forward 1 minute. |
| page down/page up | Seek to the previous/next chapter, or if there are no chapters seek backward/forward 10 minutes. |
| right mouse click | Seek to percentage in file corresponding to fraction of width. |

This is a batch file that you can put on your desktop, and then play a video simply by drag-and-drop:

```
ffplay %1 -autoexit
Note: Contrary to FFmpeg, FFplay doesn't need "-i" before the input.
```

List of the most important FFplay options:

| -video_size | Set frame size (WxH or abbreviation) Note: This is different from FFmpeg, where the option is -s The "-video_size" option is used to manually tell ffplay the size for videos that do not contain a header (such as raw video). It is not used to resize videos. For resizing use either the $-x$ and $-y$ options or the "scale" filter. |
| :---: | :---: |
| -fs | Start in fullscreen mode |
| -x | Force displayed width |
| -y | Force displayed height |
| -left | Set the x position for the left of the window (default is a centered window). |
| -top | Set the y position for the top of the window (default is a centered window). |
| -an | Disable audio |
| -vn | Disable video |
| -ss pos | Seek to pos |
| -nodisp | Disable graphical display |
| -noborder | Borderless window |
| -alwaysontop | Window always on top |
| -f fmt | Force format |
| -loop number | Loops movie playback <number> times. 0 means forever |
| -vf filtergraph | Create the filtergraph specified by filtergraph and use it to filter the video stream Note: FFplay doesn't allow -filter_complex |
| -af filtergraph | filtergraph is a description of the filtergraph to apply to the input audio |
| -autoexit | Exit when video is done playing |
| -exitonkeydown | Exit if any key is pressed |
| -exitonmousedown | Exit if any mouse button is pressed |

Note: FFplay supports only one input. It doesn't support "filter_complex".
This is a batch file for playing audio files by drag-and-drop (without video output):

```
ffplay %1 -nodisp -autoexit
```

## 6 DaVinci Resolve 15 / 16 / 17

Why DaVinci Resolve and not FFmpeg? FFmpeg has no graphical user interface. For film cutting you have to see what you are doing. These are two programs for different tasks, and they complement each other very well.
DaVinci Resolve is a very complex program with so many functions that you don't know where to begin.
https://www.blackmagicdesign.com/de/products/davinciresolve/
Note: The Downloads are described as "Updates", which is misleading. In fact all available downloads are complete versions and don't require any other version installed before.

I got this book: Paul Saccone, Dion Scoppettuolo: "Der ultimative Leitfaden zu DaVinci Resolve 15" (I got the german translation, but it's also available in english).
Please note that this book is for version 15. Version 16 seems to have a different user interface, so for learning with this book it's better to use the older version 15. The official manuals for versions 16 and 17 are extremely long, more than 3000 pages.

DaVinci Resolve Project Server: This is a tool for working on a project with multiple persons. If you are the only person working on your project, then you don't need it and the icon can be deleted from the desktop.

DaVinci Resolve 16 manual: https://documents.blackmagicdesign.com/UserManuals/DaVinci_Resolve_16_Reference_Manual.pdf
DaVinci Resolve 17 new features guide: https://documents.blackmagicdesign.com/SupportNotes/DaVinci_Resolve_17_New_Features_Guide.pdf
Fusion 9 user manual: https://documents.blackmagicdesign.com/UserManuals/Fusion9_Tool_Reference.pdf
Fusion 16 user manual: It's included as a PDF when you download the latest version of Fusion 17 here:

### 6.2 Mouse buttons and keyboard shortcuts

| Icons | Keyboard or mouse | Description |
| :---: | :---: | :---: |
|  | Middle mouse button | Move the whole timeline to the left or right |
| < - > |  | (seems to be the same as moving the position with the mouse) |
| L4 |  | Jump to the start |
| 4 | J | Play backward |
|  | J+K | Play backward with half speed |
|  | Hold $K$ and press $J$ once, or press ARROW LEFT | One frame backward |
| ■ | K | Stop |
|  | Hold $K$ and press $L$ once, or press ARROW RIGHT | One frame forward |
|  | K+L | Play forward with half speed |
| - | L | Play forward |
|  | press L twice | Play with double speed |
| W |  | Jump to the end |
| $\rightleftarrows$ |  | Endless loop mode |
|  | Numpad / | Play around selection |
|  | Space | Play / Pause |
| - | 1 | Set the "In" marker |
| 14 | 0 | Set the "Out" marker |
|  | - | Fine adjustment, one frame to the right |
|  | , | Fine adjustment, one frame to the left |
|  | F9 | Insert |

|  | F10 | Overwrite |
| :--- | :--- | :--- |
|  | F11 | Replace |
|  | F12 | Place on top |
|  | SHIFT+F10 | Ripple Overwrite |
|  | SHIFT+F12 | Fit to Fill |
|  | A | Append at End |
|  | D | Selection Mode |
|  | M | Blade Edit Mode |
|  | N | In "Edit" page: Toggle the selected clip on/off |
|  | Q | If a clip is selected: Set a marker inside the clip If no clip is selected: Set a marker in the timeline |
|  | W | Toggle "Snapping" tool (that's the magnet symbol) |
|  | X | Toggle between source and timeline viewer $\quad$ View $\rightarrow$ Source/Timeline Viewer |
|  | Trim Edit Mode |  |
|  | SHIFT+SPACE | Toggle "Dynamic Trim Mode" |
|  | CTRL+F | Select a clip (or gap) under the playhead and add In and Out points to the timeline. If the wrong track is selected, deactivate the |
|  | "Auto track selector" in one or more tracks. |  |
|  | In "Color" page: Zoom to fit window $\quad$ In "Fusion" page: View depth channel |  |
|  | In "Fusion" page, opens a search window for adding new tools |  |
|  | CTRL+W | Toggle fullscreen mode, this works only in "Edit" and "Color" page. |
|  | Toggle a node on/off in "Fusion" page |  |
|  | If DEL key deletes too much, use undo and then try the backspace key |  |
|  | Toggle wipe mode on/off |  |
|  | Undo Warning: You can't undo things from a prior session. |  |
|  |  |  |

Note: The symbols were taken from the "Segoe UI Symbol" character set.
Note: You can define your own keyboard shortcuts with DaVinci_Resolve --> Keyboard_Customization

See also this keyboard shortcut sheet from Bernd Klimm: https://vfxstudy.com/wp-content/uploads/2020/02/Fusion-Keyboard-Shortcuts-v1.pdf
6.3 GUI Controls

| (1) | Here you can control the volume and mute the speakers. It doesn't change the volume of the output video. |
| :--- | :--- |
|  |  |
|  |  |
|  |  |
|  |  |

### 6.4 Preferences

Preferences can be set in DaVinci Resolve --> Preferences:

- System --> Memory and GPU Leave 4GB for other applications
- System --> Media Storage Use the fastest drive that you have on your computer
- User --> Project Save and Load Use "Live Save" and "Project Backups"
- User --> Project Save and Load Select the "Project backup location"
- User --> Editing --> New Timeline Settings --> Start Timecode $=$ 00:00:00:00
- User --> Editing Set the "Standard Still Duration"

You can also reset all user preferences to the factory default by clicking on the $\bullet \bullet$ symbol in the top right corner and then use "Reset User Preferences..."

If Playback --> Render Cache is set to "User", you can right-click on a clip and use "Render Cache Color Output".

### 6.5 Project settings

The timeline framerate in the project settings must be set before any media are imported. The timeline resolution can be changed later.

The project settings are in File --> Project Settings, or click on the symbol in the lower right corner.

- Set the timeline resolution, timeline framerate and playback framerate
- Master Settings: scroll down to "Optimized Media and Render Cache":
- Set the "Optimized media resolution" to half or quarter, that's the proxy resolution that's used for editing
- Tick "Enable background caching after 7 seconds"
- Tick "Automatically cache transitions in user mode"
- Tick "Automatically cache composites in user mode"
- Tick "Automatically cache Fusion Effects in user mode"
- Color Management --> Color Space \& Transforms
- Color science: "DaVinci YRGB" or "DaVinci YRGB Color Managed"
- Color Processing Mode: "SDR" or "HDR"
- Timeline Color Space: Rec.709 Gamma 2.4
- In this menue it's also possible to set LUTs
- Image Scaling --> Input Scaling
- Set "Mismatched resolution files" to "Center crop with no resizing"

Timeline --> Selection follows Playhead should be deactivated.
Playback --> Render_Cache should be set to "Smart".
Note: It's possible to reset the user interface with Workspace --> Reset UI Layout

### 6.6 Timeline Proxy Mode and Timeline Resolution

Two things can be done for faster editing:

1. You can set Playback --> Timeline_Proxy_Mode to "Half Resolution" or "Quarter Resolution". It's not necessary to set it back to the desited output size before delivering the final video. The output size is set in File --> Project_Settings. This is the recommended method.
2. The timeline resoltion (in File --> Project_Settings) can be set to s smaller size. Don't forget that you must set it back to the desired output size before you deliver the final video. Otherwise the video would be scaled up from the smaller to the larger resolution, which means a loss of detail. A drawback of this method is that objects may be shifted a little bit in Fusion.

See also the DR17 manual, part 2, chapter 7, page 159ff: "Improving Performance, Proxies, and the Render Cache"

### 6.7 The "Media" page in DaVinci Resolve

This page is used for adding media to the project. The media files (video and audio) remain in their original folders and are not changed or overwritten. DaVinci Resolve in completely non-destructive with respect to the media files.

A new project can be created with File --> New Project

In the media pool, if the media files are shown as pictures (click on the ::: symbol), you can change the sorting order by clicking on the $\equiv \downarrow$ symbol. In the listing mode (click on the $: \equiv$ symbol) sorting isn't possible.

Make a new bin: Right click in the master bin, then "New Bin". A "Bin" is a virtual folder.
"Power Bins" are bins that are available in all your projects.
"Smart Bins" are bins which contain files that fulfill certain search criteria.

Add files to media pool while keeping the original sub-folders:
Select all source folders, right-click and select "Add Folder and SubFolders into Media Pool (Create Bins)".

Note: Symbols were found in "Segoe UI Black" and "Segoe UI Sybmol" character sets.

If you have a numbered sequence of JPG, CR2 or DNG images (*.jpg, *.cr2, *.dng), you can drag and drop them to the timeline as a video.
If you want individual images instead, click in the media pool on the $\bullet \bullet$ symbol and then use "Show Individual Frames".

### 6.8 Archive projects

File --> Project Manager opens the project manager. Alternatively you can click on the "Project Manager" icon in the bottom right corner.
In the project manager you can right-click on a project and then choose "Export Project Archive". A *.dra archive file contains all files that were used in the project. Usable for example if you want to give the whole project to someone else.
A project can be restored by right-clicking on "Untitled project" and then using "Restore Project Archive".

You can generate new folders by right-clicking in an empty space. Projects can be moved by drag and drop.

Projects can be imported by loading a *.drp file. These files contain only the timeline and not all the media files. It's expected that the media files are already at their correct places. If some or all media is shown as "offline", click on the "Relink Media" icon in the Media Pool (that's the broken chain symbol), then select the correct folder.

To import a *.drf timeline file, right-click in the Media Pool, then use Timelines --> Import --> AAF_EDL_XML_DRT_ADL...

## 6.9

## The "Cut" page in DaVinci Resolve

It's not really necessary to use the "Cut" page for editing a video, as most things can also be done in the "Edit" page. The Speed Editor is optimized for the "Cut" page.

The "Cut" page is useful if you have one long video and want to cut out many sections.
This is very efficient because you don't need the mouse. It can all be done with these keyboard shortcuts:

| Ctrl-B | Cut at the playhead. |
| :--- | :--- |
| Shift-V | Select the clip at the playhead. |
| Backspace | Delete the selected section of the clip. The rest is shifted towards left. |
| Left / right arrows | Move the playhead one frame. |
| Shift left / right arrows | Move the playhead in bigger steps. |
| Up / down arrows | Move the playhead to the next / previous clip. |
| CtrI-Y | Select everything to the left. |
| Alt-Y | Select everything to the right. |

A "smooth cut" inserts motion interpolation.

The visibility of the timeline is from above for the video clips and from below for the audio clips!
If there is a white line above the timeline, this acts as a protection for the timeline below. Any changes will only be applied to the selected part where the white line is visible. It can be deleted with Mark $\rightarrow$ Clear_In_and_Out
Note: The DEL and BACKSPACE keys have different meanings.
These things are always possible (in "Selection" mode and also in "Trim Edit" mode):

| Insert | new clip: CCCCCC <br>  123456 <br> before: AAAAAABBBBBB <br> after: 123456123456 <br>  AAAAAACCCCCCBBBBBB <br>  123456123456123456 | Drag the new clip (here clip C) and then press CTRL+SHIFT while dropping it in the timeline. The clip $B$ is not overwritten. <br> Alternatively you can place the playhead at the correct position, then select the new clip in the media pool and press F9. <br> Alternatively you can drag the new clip over the clip window and release the mouse button over the "Insert" icon. |
| :---: | :---: | :---: |
| Overwrite | new clip: CCCCCC <br>  123456 <br> before: AAAAAABBBBBB <br>  123456123456 <br> after: AAACCCCCCBBB <br>  123123456456 | Place the playhead where the new clip shall begin (here in the middle of clip A). Select a clip in the media pool (here clip C) and press F10. The clip will overwrite parts of clips A and B. <br> Alternatively you can drag the new clip over the clip window and release the mouse button over the "Overwrite" icon. |
| Replace | new clip: DDD <br>  123 <br> before: AAAAAABBBBBBCCCCCC <br>  123456123456123456 <br> after: AAAAAADDDBBBCCCCCC <br>  123456123456123456 | Place the playhead where the new clip shall begin (here at the end of clip A). Select the new clip in the media pool (here clip D) and press F11. The total length of the timeline doesn't change. If the new clip is shorter than the old clip, it will overwrite the beginning of the old clip. If the new clip is longer than the old clip, it will be cut to the old clip's length. <br> Alternatively you can drag the new clip over the clip window and release the mouse button over the "Replace" icon. <br> You can place the playhead at a specific point in the source window, and the other playhead over a specific point in the timeline. When you use replace, these points will match. |
| Ripple Delete | before: AAAAAABBBBBBCCCCCC <br>  123456123456123456 <br> after: AAAAAACCCCCC <br>  123456123456 | Select a clip (here clip B) and press DEL. The gap is automatically closed. |

| Delete clip, leave gap | before: <br> after: | AAAAAAABBBBBBCCCCCC  <br> 123456123456123456  <br> AAAAAA CCCCCC <br> 123456 123456 | Select a clip (here clip B) and press BACKSPACE. A gap remains. |
| :---: | :---: | :---: | :---: |
| Roll | before: <br> after: | AAAAAABBBBBBCCCCCC 123456123456123456 AAAAAAAAABBBCCCCCC 123456789456123456 | To roll an edit, moving the Out point of the outgoing clip and the In point of the incoming clip at the same time, drag an edit point between two clips to the left or right. |
| Ripple Overwrite | new clip: <br> before: <br> after: | DDD 123 <br> AAAAAABBBBBBCCCCCC 123456123456123456 <br> AAAAAADDDCCCCCC <br> 123456123123456 | Replaces a clip by another clip of different length. The total length of the timeline will change. Place the playhead where the new clip shall begin (here after clip A). Select a clip in the media pool (here clip D) and press SHIFT+F10. <br> Alternatively you can drag the new clip over the clip window and release the mouse button over the "Ripple Overwrite" icon. |
| Fit to Fill | new clip: <br> before: <br> after: | CCCCCC  <br> 123456  <br> AAAAAA BBBBBB <br> 123456 123456 <br> AAAAAACCCBBBBBB  <br> 123456135123456  | Place the playhead at the beginning of a gap (here after clip A), select a clip in the media pool (here clip C) and press SHIFT+F11. The clip will be inserted and its speed will be adjusted so that it fits in the gap. <br> Alternatively you can drag the new clip over the clip window and release the mouse button over the "Fit to Fill" icon. |
| Append at End | new clip: <br> before: <br> after: | CCCCCC 123456 <br> AAAAAABBBBBB <br> 123456123456 <br> AAAAAABBBBBBCCCCCC <br> 123456123456123456 | Select a clip in the media pool (here clip B) and press SHIFT+F12. The clip will be appended at the end of the timeline. The playhead position doesn't care. <br> Alternatively you can drag the new clip over the clip window and release the mouse button over the "Append at End" icon. |
| Exchange clips | before: <br> after: | AAABBBBBBCCCCCCDDD 123123456123456123 AAACCCCCBBBBBBDDD 123123456123456123 | Drag the clip (here clip B) and press CTRL+SHIFT while dropping it in the new position in the timeline (here between clips C and D). The snapping tool should be activated. <br> You can also select a clip and press CTRL+SHIFT+, to move it to the right or CTRL+SHIFT+, to move it to the left. |
| Insert gap | before: <br> after: | AAAAAABBBBBBCCCC  <br> 1234561234561234  <br> AAAAAA BBBBBBCCCC <br> 123456 1234561234 | Set the playhead to the first clip that you want to move to the right (here clip B), then press $\mathbf{Y}$. This will select the current clip and all clips to the right. Then move the clips to the right. |

$\left.\begin{array}{|l|lll|l|}\hline \text { Delete gap } & \text { before: } & \text { AAAAAAA } & \text { BBBBBBCCCCC } \\ & \text { after: } & \begin{array}{l}\text { 123456 } \\ \text { AAAAAABBBBBBCCCCC }\end{array} \\ & 123454561234561234\end{array}\right)$

These things are possible in Selection Mode (Click the "Selection" 「 icon, or press the A key)

| Moving | before: <br> after: | AAAAAAABBBBBBCCCCCC  <br> 123456123456123456  <br> AAAAAA BBBBBBCCC <br> 123456 123456456 | To move clips, drag any clip in the timeline to any other position. If you drag a clip to overlap another clip, the clip you're dragging overwrites the clip you're dropping it onto (here clip C). To move clips in the timeline up or down to other tracks while keeping them at the same time: Hold the SHIFT key down while dragging clips. |
| :---: | :---: | :---: | :---: |
| Resize | before: <br> after: <br> after: | AAAAAABBBBBBCCCCCC 123456123456123456 AAAAAAAAABBBCCCCCC 123456789456123456 AAA BBBBBBCCCCCC 123123456123456 | To shorten or lengthen clips: Move the Selection Mode pointer over the beginning or end of a clip, and when it turns into the Resize cursor, drag the In or Out point to the left or right to change the clip's length. It will either overwrite another clip, or a gap appears. |
| Duplicate clip | before: <br> after: | AAAAAABBBBBB 123456123456 AAAAAABBBBBBBBBBBB 123456123456123456 | Hold the ALT key and drag and drop the duplicated clip to the new position. This works also for audio clips. |

These things are possible in Trim Edit Mode (Click the "Trim Edit" $\mathrm{U}^{\mathrm{D}}$ 曰 icon, or press the T key)

| Ripple | before: <br> after: <br> after: | AAAAAABBBBBBCCCCCC 123456123456123456 AAAAAAAAABBBBBBCCCCCC 123456789123456123456 AAABBBBBBCCCCCC 123123456123456 | To ripple the outgoing or incoming part of an edit to add or remove media to a clip while simultaneously moving all other clips at the right in the timeline to make room, click the Trim tool, and drag an edit point to a new position in the timeline. |
| :---: | :---: | :---: | :---: |
| Slip | before: <br> after: | AAAAAABBBBBBCCCCCC 123456123456123456 AAAAAABBBBBBCCCCCC 123456456789123456 | To slip a clip's range of content without changing its position in the timeline, click the middle top region of a clip, and then drag to the left or right to "slip" the clip to contain a different range of frames. A dashed overlay shows the total duration of media available for you to slip with, which moves left and right as you drag. |

| Slide | before: AAAAAABBBBBBCCCCCC |
| :--- | :--- |
|  | after:AAAAAAAAAABBBBBBCCC <br>  <br> $\quad 123456789123456456$ |

To slide a clip, moving it to another position in the timeline while simultaneously adjusting the Out point of the previous clip and the In point of the next clip to accommodate the change in position of the current clip being dragged, click the bottom-middle name bar of the clip and drag it to another position.
Dynamic trim mode: This does only mean that a small interval around the playhead is played repeatedly. It has nothing to do with trimming. The durations can be set in Preferences --> User --> Editing --> Pre-roll time and Post-roll time

Toggle between one / two clip windows: Click on $\square \square$ and $\square$ symbols. Or toggle Workspace --> Single Viewer Mode

You can copy attributes from one clip to another. Select the source clip, right-click --> Copy, then select the target clip, right-click --> Paste_Attributes. Then you can select which attributes you want to copy.

### 6.11 Speed Change

If you want to change the speed of a clip, make a right-click on the clip in the timeline and select "Retime Controls" or press CTRL-R. The clip will get higher with "Speed Change" visible in the headline. Also it gets blue arrows. Pick the clip at the top right corner (see the red arrow) to change its length and speed. When the speed is above $100 \%$, the blue arrows will become more dense, and if the speed is below $100 \%$ the arrows will become yellow.

In the inspector you can also reverse the speed or set the speed to zero.
More options can be set in the inspector under "Retime and Scaling", for example you can set "Retime Process" to "Optical Flow".
The default for these settings can be set in Project_Settings --> Master_Settings --> Frame_Interpolation
Note: Activate "Ripple Timeline" to avoid that a gap is created after the clip.

### 6.12 Change the framerate of a clip

Right-click on a clip, select "Clip Attributes" and set the framerate to the same value as the timeline framerate. The clip will then play with a different speed and have a different length. No frames will be duplicated or skipped. The audio will be out of sync.

### 6.13 GUI Controls in the "Edit" page

| V 1 | Video 1 | The rectangle with red border indicates in which track new clips will be inserted. <br> <> Symbol: This is the "Auto Track Selector". It's important in "Trim Edit Mode" when you want to specify which tracks are <br> affected by trimming. |
| :--- | :--- | :--- |
| P | Linked Selection: <br> If it's activated, selecting one clip will automatically select also the other linked clip. <br> If it's deactivated, you can move the clips individually. If they are already both selected, first deselect them by clicking in an <br> empty area, then select one of them. <br> To link two or more clips, select the clips, right-click in one of them and use "Link Clips". |  |
| $+\square$ | Above the preview window ther is a "Bypass Color Grades and Fusion Effects" icon, which can be used to disable all color <br> gradings and effects. This can be used for comparing before and after. |  |

### 6.14 Markers

| M | If a clip is selected: Set a marker inside the clip $\quad$ If no clip is selected: Set a marker in the timeline |
| :--- | :--- |
| MM | Enter a name and color for the marker |
| ALT+draw a marker | Specify a time range |
| SHIFT+ $\uparrow$ | Jump to the next marker |
| SHIFT+ + Jump to the previous marker |  |

### 6.15

## Edit the audio volume of a clip

In the "Edit" page the audio volume can be adjusted in the timeline:

- You can change the volume of a whole clip by clicking in the clip with the left mouse button and moving up/down.
- You can add keyframes by holding the ALT key and clicking with theleft mouse button in the audio clip. These keyframes can be moved left/right/up/down.
- Of course you can also change the volume in the inspector and set keyframes there.

### 6.16 Normalize Audio

Audio can be normalized as follows in the "Edit" page:
Use the selection pointer and select one or more audio clips in the timeline. Right-Click one of them and select "Normalize Audio Levels". Set the target level to the desired value. Use "Relative" if all clips shall be normalized to the maximum level of all clips, or "Independent" if each clip is normalized to its own local maximum. Then click on "Normalize".
Rules of thumb for sound levels:

- Normal spoken dialogue: about -12 dB.
- Sound effects: between -10 and - $\mathbf{3 0} \mathrm{dB}$.
- Music: between -20 and -30 dB.

### 6.17 The "Fusion" page in DaVinci Resolve

Before you switch to the "Fusion" page, place the playhead over the clip that you want to edit. But you can also select another clip when you open the "Clips" window in the "Fusion" page.

Below the preview window is a frames scale with two yellow markers. These are the "In" and "Out" points from the edit page.
Above the preview window is the "Show Color Channel" icon, where you can select between Color, RTed, Green, Blue and Alpha.
In "Fusion" page press SHIFT+SPACE to get a search window for new tools.

## A "node" in DaVinci Resolve is the same as a "filter" in FFmpeg.

The colors of the nodes' connections are very important. The positions of the inputs don't care, they will change when you move the nodes.

Foreground inputs: $>\Delta \nabla \quad$ Background inputs: $\Delta \Delta \nabla \quad$ Mask inputs: $\Delta \Delta \nabla>\Delta \nabla \quad$ Outputs: $\square$

CTRL+P toggles a node on/off in "Fusion" page.

Export a Fusion composition as a file: File --> Export Fusion Composition
If the composition contains input images, the absolute paths to these images are included in the file.
Import a Fusion composition: Go to the "Fusion" page and then use File --> Import Fusion Composition
Drawback: The imported composition replaces the existing composition. You cannot append the imported composition to the already existing composition.
Workaround for appending a Fusion composition to an existing composition: Draw a rectangle around the existing composition and press CTRL+C. Import the new composition and then paste the old composition with CTRL+V.

Save a setting file as a template: Draw a rectangle around all nodes, right-click on one of the nodes and use Settings --> Save As.
The path should be Blackmagic_Design --> DaVinci Resolve --> Support --> Fusion --> Templates --> Fusion
To load a setting file, go to the Effects Library and right-click on "Templates", use "Show Folder", then drag and drop the file to the Fusion window.

To insert a new node in an existing connection between two nodes, drag the new node and drop it when the tip of the mouse pointer is over the connection and the color of the line changes from white to other colors.

To remove a node out of a connection, hold the SHIFT key and drag the nore with the mouse. The same technique can be used for inserting it again in the connection.

There are two ways how to connect a node output to two or more inputs of other nodes:

- The simple way is to connect the output to several inputs.
- It's possible to create several "instances" of the node. Copy the node (CTRL+C) and paste an instance (CTRL+SHIFT+V). The instanced node behaves exactly the same as the original node. If properties of the original node are changed, they are also automatically changed in the instanced node. But there is one important exception from this rule: You can deinstance any properties of the instanced node in the inspector. Just right-click on a property and use "Deinstance". Then this property can be changed independently of the corresponding property in the original node. The effect can be reversed by using "Reinstance".
"Sticky Notes" can be used for adding comments to a Fusion composition.
"Wireless Nodes" are useful if you want to connect nodes which are far away from each other, without visible interconnection lines. The input of the "Wireless Node" can be connected to any other node. You can either type the name of the other node, or you can make a right-click on "Input" and then choose "Connect To".

Nodes can be copied with Edit --> Copy and Edit --> Paste. All their properties are also copied.
See also this Youtube video (in german):
Fusion Node besser strukturieren und damit Geld und Zeit Sparen - 7 Tipps https://www.youtube.com/watch?v=2vItcx3BypE

### 6.18 Add a new "Medialn" node

If you need one more "Medialn" in your Fusion composition, you can just drag and drop the video from the media pool to the composition. A new "Medialn" node will be generated automatically. However it seems to be impossible to add a "Medialn" node and then connect this node to an existing video clip.
Note: "Medialn" is not a clip, but a track (which may contain several clips).

## Each Fusion clip has its own timeline!

- Drag and drop a clip in the timeline.
- Right-click on this clip and use "New Fusion Clip".
- Now you have "Fusion Clip 1" in the media pool.
- In the top left corner of the timeline window, click on the symbol and select "Stacked Timelines".
- Drag and drop the "Fusion Clip 1" from the media pool to the " + " symbol in the headline of the timeline window.
- Now you see the timeline of the Fusion clip.
- Optionally you can rename the "Video1" track to "Layer 0 Video"
- Drag and drop another clip to the "Video2" track of the timeline of the Fusion clip.
- Optionally you can rename the "Video2" track to "Layer 1 Video"
- Now click on "Timeline1". Here you see only "Fusion Clip 1" and not the other clip(s).
- Go to the Fusion page.
- Here you see two (or more) Medialn nodes. These correspont to the clips in the timeline of the Fusion clip. In the inspector you can set different values for "layer". "layer 0 " corresponds to "Video1" track, "layer 1" corresponds to "Video2" track and so on.
- In the timeline of the Fusion clip it's possible to move or cut the input clips.

## Problem:

- If the timeline of the Fusion clip is shown, it's possible to move the clips with respect to each other. However you can't see the output of the Fusion composition simultaneously.
- If "Timeline 1 " is shown, you can see the output of the Fusion composition, but you can't move the input clips with respect to each other.
- A possible solution is to insert one or more "TimeSpeed" nodes after the "Medialn" nodes in the Fusion composition. Then you can adjust the "Delay" properties of the"TimeSpeed" nodes to move the clips, and you can see the result in real time.

### 6.20

## The "Color" page in DaVinci Resolve

Primaries - Color Wheels:

| Temp | Adjusts the color temperature Note: Acts in wrong direction, positive value means shift towards red. |
| :---: | :---: |
| Tint | Magenta / green adjustment, useful if flourescent lamps were used |
| MD | Adjusts the midtone details |
| Col Boost | Adjusts saturation only for low-saturation regions |
| Shad | Adjusts the shadow details |
| HL | Some kind of adjustment for highlights ??? If you can explain it, please let me know. |

| Lift | Adjust the shadows |
| :---: | :---: |
| Gamma | Adjust the midtones |
| Gain | Adjust the highlights |
| Offset | Adjust all of the above |

| Contrast | Adjusts the contrast |
| :---: | :---: |
| Pivot | Sets the neutral point for contrast adjustments |
| Sat | Adjusts the saturation |
| Hue | Adjusts the color rotation in HSB color model. |
| Lum Mix | ??? If you can explain it, please let me know. |

Set the black point: Click on the --. symbol (above "Lift") and select the black point in the image. The "Lift" value will be modified.
Set the white point: Click on the + -。symbol (above "Gain") and select the white point in the image. The "Gain" value will be modified.
The $\square$ Symbol is for "Auto Balance".

For comparing the clip before and after color grading, use the "Bypass Color Grades and Fusion Effects" icon above the preview window.
Alternatively you can press CTRL+D.

The pipette icon (above "Lift") is for setting the white balance with a gray card.4

If a clip has the wrong color space, right click on it and set "Input Color Space" to the correct value. This is only possible if you die use "DaVinci YRGB Color Managed" in Project_Settings --> Color Management --> Color Space \& Transforms --> Color Science.
"Color Managed" means that DaVinci Resolve tries to set the color space automatically, but in some cases it fails and then it's necessary to set it manually.

## Gradings can be copied from one clip to another clip with Edit --> Copy and Edit --> Paste or CTRL+C and CTRL+V.

Alternatively you can select the target clip and then click in the source clip with the middle mouse button.
Alternatively you can copy the color grading from one clip to the next clip: Select the next clip and use Color --> Apply Grade from One Clip Prior

Saving a still: Right-click in the clip or preview window and use "Grab Still". The still will appear as a small image in the top left "Gallery" window. Please note that this is not only a "still image" but instead also all details of the grading are saved.

The gallery has different sections:

- Stills Contains grades that are only available in the current project
- PowerGrade Contains grades that are available from all projects

A still can be exported as an image file by right-clicking on the still (in the gallery) and using "Export". Possible formats are TIFF, JPG, PNG and others.
Apply a color grade from a still to one or more clips: Select one or more clips, then make a right-click on a still (in the gallery) and use "Apply Grade".

## Zoom in / out: Mouse whee

Moving when zoomed in: Middle mouse button
Zoom to fit window: Press $Z$ key.

Multiple playheads: https://www.youtube.com/watch?v=HOrKbHNpujM

Combining keys:
See "Combining Power Windows with the Mask Control" (Page 2731ff in DR16 manual) See chapter 126 in the manual, "Combining Keys and Using Mattes" (Page 2852ff in DR16 manual)

Static keyframe: The value remains constant right of the keyframe.
Dynamic keyframe: The value is ramped right of the keyframe.

### 6.21 Corrector nodes in "Color" page

Each corrector node has two inputs and two outputs:

- Green triange: Normal input (RGB)
- Blue triangle: Alpha input
- Green square: Normal output (RGB)
- Blue square: Alpha output

Nodes can be labeled by right-clicking and then use "Node Label".
Nodes can be enabled or disabled by clicking on the number in the lower left corner of the node. Alternatively you can select one or more nodes and press CTRL+D.

### 6.22 Secondary Adjustments

Primary adjustments: Work on the entire image.
Secondary adjustments: Work on specific parts of an image.

Power windows:

Hint: If you can't shift the window far enough, it may help to move the entire preview image with the middle mouse button.

Select between inside and outside:

If you have a node for color corrections inside the window, you can also create another node for color corrections outside of the window as follows: Right-click on the node, Add_Node --> Add_Outside
When you change the first window, the second window changes automatically.
You can apply one FX effect per node. Click on "fx Effects" in top right, then drag and drop an effect to a node. The effect can be removed by rightclicking in the node and using "Remove OFX plugin".

### 6.23 Save Color Gradings

There are two ways how a color grading can be saved:

- Right-click on a clip (in the clips window) and use "Generate LUT". It's discrete with integer arithmetic. Best method for cameras or monitors.
- Grab a still. These are lossless because they are floating point.

### 6.24 Wipes

Wipes are an easy way to compare a clip before and after color grading.

- Before you begin color grading, grab a still.
- After you have done color grading, select the reference still and press CTRL+W to toggle the wipe mode (or use View --> Show Reference Wipe), or double-click on the still in the gallery.
- You can click in the image and move the wipe with the mouse.
- The wipe can be inverted with ALT+W (or use View --> Invert Wipe).
6.25 The "Fairlight" page in DaVinci Resolve

Rules of thumb for sound levels:

- Normal spoken dialogue: about -12 dB.
- Sound effects: between -10 and $\mathbf{- 3 0} \mathrm{dB}$.
- Music: between -20 and -30 dB.

### 6.26 The "Deliver" page in DaVinci Resolve

All image processing is done with the timeline resolution. It's possible to deliver with a higher resolution, but that means upscaling and in most cases it doesn't make sense. You can change the timeline resolution anytime (but not the framerate!). If you want to deliver at multiple different resolutions, use the highest resolution in the timeline.

Settings for upscaling (superscaling) can be found in Project_Settings --> Image_Scaling --> Output_Scaling

Above the timeline you can set "Render" to either "Entire Timeline" or "In/Out Range", to define which part of the timeline will be delivered. You can set "In" and "Out" points.
For selecting the whole timeline, use the "Pos1" and "End" keys to set the playhead, before setting the "IN" and "Out" points. Or simply set "Render" to "Entire Timeline".

How to deliver only one frame: If you set both the "In" and "Out" points to the same position, only one frame will be delivered (for example as a TIFF image).

## Set "Encoder" to "NVIDIA" if a NVIDIA GPU is available.

Quality "High" is sufficient in most cases. "Best" is time consuming and produces large files.

You can save your own preset by clicking on the ৫৫• symbol and then use "Save New Preset".

Recommended bitrate for FHD videos: about 30000 kBit/s
Recommended bitrate for 4K videos: about 60000 kBit/s

[^2]
### 6.27 Day-for-Night

See https://www.youtube.com/watch?v=XKoGpT4CaM0

### 6.28 Dynamic Zoom

Select a clip in the "Edit" page and open the inspector. Switch on "Dynamic Zoom". Click on "Dynamic Zoom" to show more properties. There are only two, "Dynamic Zoom Ease" and "Swap".
Click on the $\vee$ icon in the bottom left corner of the preview window.
Select "Dynamic Zoom". Now you see two rectangles over the preview video. These are the size at the beginning and end of the dynamic zoom. You can change their size and position.
If the zoom is in the wrong direction, click on "Swap" in the inspector. Now the two rectangles are swapped.
The "Dynamic Zoom Ease" option can be used to generate smooth transitions at the beginning and end.

Let's assume you have a video with audio recorded by the camera, and additionally you have a second audio track that was recorded by an audio recorder. The two audio tracks aren's synchrone because the camera and audio recorder wenen't started simultaneously.
Load both files to the media pool and select them both. It's important that this is done before the clip is drawn to the timeline.
Make a right click on one of the clips and select "Auto Sync Audio". Then you can select between four options. The first two are only available with timecode.
"Based on Waveform" means the audio tracks are synchronized automatically and the original audio track (from the camera) is replaced by the better audio track from the audio recorder. This is the recommended method it you are sure that the audio track from the recorder is the better one.
"Based on Waveform and Append Tracks" means the audio tracks are synchronized automatically and both audio tracks are appended to the video. You can later adjust the volume of both audio tracks individually. This is the recommended method it you aren't yet sure which of the audio tracks is the better one.
Now you can draw the clip to the timeline. The synchronized audio track is shown in the timeline with a $\bullet$ symbol in front of the filename.

### 6.30 Cutting on the beat of the music

Play the music and press the " $M$ " key on each beat. Each keypress will set a marker. The playhead will snap to the markers and you can cut the clips at these positions.

### 6.31 Video stabilization

- Select a clip.
- Open the inspector and double click on "Stabilization".
- Set the parameters and click on "Stabilize".
- If you also select "Camera Lock", the panning of the camera is also compensated.
- If you did change the In or Out points of a clip, then you must stabilize the clip again. If the "Stabilize" button is deactivated, use the workaround to tick "Camera Lock" two times. Then you can stabilize again
- There is also a "SphericalStabilizer" in Fusion --> Add Tool --> VR --> Spherical Stabilizer

You can also use "Smart Reframe" which is in the inspector at the bottom of "Transform".

### 6.32 Processing of drone videos

- Use video stabilization.
"Mode" = Translation
Tick "Zoom"
- "Cropping Ratio" = 0.9
- "Smooth" and "Strength" = 1.0
- Use deflicker to suppress the propellers in the top left and top right corners. Effects --> OpenFX --> Deflicker

Temporal NR:

- Use "Advanced Controls".
- "Frames Either Side" = 5
- "Mo. Est. Type" = None
- "Luma Threshold" and "Chroma Threshold" = 100
- Speed Optimization Options
- Tick "Limit Analysis Area" and set the box to the upper part, where the propellers are visible
- Restore Original Detail After Deflicker
- "Detail to Restore" = 0

### 6.33

It's important that in the project settings you have set Image Scaling --> Input Scaling --> "Mismatched resolution files" to "Center crop with no resizing" (not sure if this is correct)

Go to "Edit" page and insert two clips to the timeline:
Track "Video1" contains the clip with the moving object, which we want to track.
Track "Video2" is above "Video1" and contains the clip that shall be overlaid over the moving object.

Select "Video2", go to the inspector and move the small video to the position that it shall cover.

Select both clips, make a right-click and use "New Fusion Clip". It's normal that now the upper track has vanished.
Now go to "Fusion" page and add these nodes:

Medialn1 is the clip which contains the moving object, which we want to track.
Medialn2 is the clip that shall be overlaid over the moving object.
Select the "PlanarTracker1" and make these settings in the inspector:

- Operation Mode = Track
- Tracker = Point
- Motion Type = Translation
- Output = Background This means the output signal of the PlanarTracker is the same as its input signal.

Now you must define the search window for the object.
Use the "Click Append" tool (it's the leftmost icon above the image) to draw a polygon consisting of several points. The last point must close the polygon. $A$ " + " must appear next to the mouse pointer.
Now set the playhead to the first frame and click on "Track to End" to track the object. The PlanarTracker will generate the spline for the moving object.
This spline must somehow be transferred to the PlanarTransform node. There are two ways how to do this:

1. First let the PlanarTracker track the object. Then select the PlanarTracker, go to the inspector and click on "Create Planar Transform". This will create a "PlanarTransform" node that is already filled with the spline data.
2. If you add the "PlanarTransform" node with "Add Tool" function, then the new node will be "empty" (although it looks exactly the same as if generated with method 1). The PlanarTransform node doesn't know the spline data from the PlanarTracker. In this case you must select the new PlanarTransform, go to the inspector and right-click on "Right-click here for Track spline", then use "Connect To" --> "PlanarTransform1" --> "Track".

Can the spline somehow be saved in a file? I haven't yet found out.

How to save a tracker path in a file:

- Select the tracker
- In the inspector, choose "Modifiers".
- Right-click on "Tracker1Tracker1Path" and select "Edit Splines".
- In the "Spline" window, right-click on "Displacement", then "Export" --> "Samples". The *.spl file contains the frame numbers and the displacements, but not the $x, y$ coordinates.
- This method is better: In the "Spline" window, right-click on "Tracker1" --> "Settings" --> "Save As". The *.settings file contains many data:
- Pattern $X=X$ coordinate of pattern center (relative to image width)
- Pattern $\mathrm{Y}=\mathrm{Y}$ coordinate of pattern center (relative to image height)
- PatternCenter1 = same as above?
- PatternWidth1 = width of pattern (relative to image width)
- PatternHeight1 = height of pattern (relative to image height)
- SearchWidth1 = width of the dashed search box (relative to image width)
- SearchHeight1 $=$ height of the dashed search box (relative to image height)
- $X=X$ coordinate with respect to image center (relative to image width)
$Y=Y$ coordinate with respect to image center (relative to image height)
$L X=$ relative change in $X$ coordinate to the previous frame (relative to image width)
$\mathrm{LY}=$ relative change in Y coordinate to the previous frame (relative to image height)
. $R X=$ relative change in $X$ coordinate to the next frame (relative to image width)
RY = relative change in $Y$ coordinate to the next frame (relative to image height)

### 6.34 Track and blur (or pixelize) an object

|  | From left to right: |
| :--- | :--- | :--- |
| Window, Tracker and Blur icons |  |

- Place the playhead over the clip and go to the "Color" page.
- Click on the "Window" icon and place a rectangular or circular window over the object.
- Click on the "Tracker" icon, place the playhead on the first frame of the clip
- Tick "Pan" and "Tilt", and perhaps also "Zoom".
- Track the object by clicking on the icon.
- Click on the "Blur" icon and adjust the Radius.
- Instead of applying blur, you can also open the "OpenFX" window, select "ResolveFX Blur --> Mosaic Blur" and drop it in the corrector node.
- "Blur" and "Mosaic Blur" can also be combined.

### 6.35 Track an object and cover it by a colored rectangle

Medialn1 is the clip which contains the moving object, which we want to track and cover.
Make these settings in the inspector:
PlanarTracker1 --> Controls

- Operation Mode = Track
- Tracker = Point
- Motion Type = Translation
- Output = Background
- Track Channel = Luma

Draw a closed polygon around the object and then click the "Track to End" symbol.
Merge1 has the default settings.
Background1 --> Color --> Background

- Set the desired color

Transform1 --> Controls --> Transform

- Set Center X, Center Y, Size X and SizeY so that the rectangle covers the object.

PlanarTransform1 --> Controls

- Right-click on "Right-click here for Track spline" and select "Connect to" --> "PlanarTRacker1" --> "Track"

Medialn1 is the background video, and Medialn2 is an image.
The purpose of the Letterbox node is to convert the dimensions (width $x$ height) of the image to the same values as the video. Go to the inspector and set Mode = "Pan-and-Scan". If the image does already have the same dimensions as the video, then Letterbox can be omitted.
If the image is a PNG file and if one color in this file is defined as transparent, then the DeltaKeyer node can be omitted.
However the DeltaKeyer has very good results for keying and spill removal. Don't try to define the transparent color in IrfanView. The result will be much better when you use the DeltaKeyer.

The Transform node is used for adjusting the size and position of the overlay picture.

Problem: The image doesn't correctly track the object. It's moving too slow. How can this be explained?
Solution: This problem appears when the image has different dimensions than the video. The tracker spline is saved in relative coordinates, that means the coordinates are relative to the video width and height. If these relative coordinates are applied relative to the smaller image, the motion will be too slow. That's why the image must be converted to the same dimensions as the video, before applying PlanarTransform.

Theoretically it should be possible to convert the image automatically to the same size by setting File --> Project Settings --> Image Scaling --> Input Scaling to "Scale entire image to fit". But this didn't work as expected when I tested it. Who can explain it?

### 6.37 Track an object and corner pin an image

Medialn1 is the background video and Medialn2 is an image.

- Select the clip and go to "Fusion" page.
- Select PlanarTracker and make these settings in the inspector:
- Set Operation Mode to "Corner Pin" and adjust the four corners to the object.
- Set Operation Mode to "Track", set the playhead to the beginning and track the object.
- Set operation mode back to "Corner Pin".

### 6.38 Isolate Humans with "Magic Mask"

https://www.youtube.com/watch?v=31uWz7a464Q

- Open the Effects Library
- Choose Toolbox --> Titles
- Drag "Text" or "Text+" and drop it in a new video track (above your clips) in the timeline.
- Set the playhead over the text clip. If you forget this step, you wouldn't see the text.
- Select the text clip, open the inspector and edit the properties.
- Fade-in and fade-out can be adjusted directly in the timeline.
- If you want to apply other special effects to the text, you must first convert the text to a clip. Right-click on the text and use "New Compound Clip". This can be revered by right-clicking and "Decompose in Place".

## Color matching

- Use a clip that contains a color checker, and set the playhead to the correct position.
- Set the lower left window to "Color Match" mode.
- Select the correct color checker, for example "X-Rite ColorChecker Classic".
- Set the "Source Gamma" to the same as in the camera, for exampe "VLog" (even if the camera was set to VLog-L).
- Set "Target Gamma" and "Target Color Space", for example to Rec. 709
- Set the desired output color temperature, if required. The default is 6500 K . This is not the color temperatrure of the illumination during the shot, and it's not the color temperature that was set in the camera. It's just an adjustment of the output color temperature.
- Set the white level. The checkbox is disabled by default. It lets you manually choose the target white point that the automatic correction should use. Raising or lowering this value will stretch or compress the contrast of the final correction.
- Click on View --> Viewer Overlay --> Color Chart to overlay the color chart over the clip. You can toggle the overlay on/off by pressing the ` key two times.
- Drag and drop the corners of the overlay to the correct positions. You can zoom in with the mouse wheel and move the selection with the middle mouse button.
- Click on "Match".

### 6.41

## Generate a LUT

Generate a LUT in the "Color" page:

- Right-click on a clip and select "Generate LUT", then choose either 17, 33 or 65 Point Cube. Save the file in the suggested default path.

### 6.42 Apply a look-up-table to a clip

## There are several methods how to apply a LUT to a clip:

- In the "Color" page, right-click on a clip and select "LUT". The list contains many pre-defined LUTs and at the bottom are your own LUT's.
- Right-click on the clip in the media pool, then select 3D_LUT --> Panasonic --> V-Log to V-709. Warning: It's not shown in the timeline that a LUT was already applied to the clip. You have to know what you have already done.

### 6.43 Spline Editor

- 7 Step In
- $\llcorner$ Step Out
- ll or CTRL-A Set loop

### 6.44 Special effects

## Example: "Film Damage" effect

- This can be done in "Edit" page.
- Click on "Effects Library", then choose "OpenFX". Scroll down the list and choose "ResolveFX Texture / Film Damage".
- Drag "Film Damage" and drop it onto the clip in the timeline.
- Select this clip.
- In the inspector you have now a second page called "OpenFX".
- In this page you can edit the properties of the "Film Damage" effect.
- The last property at the bottom of the list is "Global Blend", which can be used for fading the effect in or out.

Removing a special effect that's in its own video track: Just select it and press DEL.
Removing a special effect that's overlaid over a clip: Click the trashcan symbol in the inspector.

Overview of special effects:

| Toolbox - -> Transitions --> Dissolve --> Cross Dissolve | Normal crossfading |
| :--- | :--- |
| Toolbox --> Titles --> L Lower 3rd | Text in left lower third |
| Toolbox --> Titles --> M Lower 3rd | Text in middle lower third |
| Toolbox --> Titles --> R Lower 3rd | Text in right lower third |
| Toolbox --> Titles --> Scroll | Text scrolling up, alignment is adjustable |
| Toolbox --> Titles --> Text | Normal text |
| Toolbox --> Titles --> Text+ | Normal text, different parameters |
| Toolbox --> Titles --> Subtitles --> Subtitle | Subtitle |
| Generators --> 10 Step | 10 Step grayscale |

| Generators --> 100mV Steps | 8 Step grayscale in 100 mV steps (0.7V analog video signal) |
| :--- | :--- |
| Generators --> EBU Color Bar | 8 Color bars: white, yellow, cyan, green, magenta, red, blue |
| Generators --> Four Color Gradient | The colors in the corners are selectable, can be used for making a background with a <br> gradient |
| Generators --> Grey Scale | Grey scale that can also be rotated |
| Generators --> SMPTE Color Bar | A test image |
| Generators --> Solid Color | A uniform color image |
| Generators --> Window | I don't understand this. If you can explain it, please let me know. |
| Generators --> YCbCr Ramp | ??? |
| OpenFX --> ResolveFX Blur --> Box Blur | Makes an image unsharp, can be adjusted independently in X and Y direction |
| OpenFX --> ResolveFX Blur --> Directional Blur | Similar to box blur, but the blur angle is adjustable |
| OpenFX --> ResolveFX Blur --> Gaussian Blur | This is superior to box blur |
| OpenFX --> ResolveFX Blur --> Lens Blur | Simulates lens blur |
| OpenFX --> ResolveFX Blur --> Mosaic Blur | Makes larger pixels |
| OpenFX --> ResolveFX Blur --> Radial Blur | This is in fact a tangential blur! |
| OpenFX --> ResolveFX Blur --> Zoom Blur | This is in fact a radial blur! |
| OpenFX --> ResolveFX Color --> ACES Transform | Rec.709, Rec.2020, sRGB If you can explain it, please let me know. |
| OpenFX --> ResolveFX Color --> Chromatic Adaption | Can be used to correct for different illumination types. Illuminant type can also be set <br> to color temperature. |
| OpenFX --> ResolveFX Color --> Color Compressor | I don't understand this. If you can explain it, please let me know. |
| OpenFX --> ResolveFX Color --> Color Space Transform | Input Gamma can be set to Panasonic V-Log |
| OpenFX --> ResolveFX Color --> Color Stabilizer | I don't understand this. If you can explain it, please let me know. |
| OpenFX --> ResolveFX Color --> Contrast Pop | Seems to be a contrast enhancement filter |
| OpenFX --> ResolveFX Color --> DCTL | I don't understand this. If you can explain it, please let me know. |
| OpenFX --> ResolveFX Color --> Dehaze | Dehazing filter |
| OpenFX --> ResolveFX Color --> Gamut Limiter |  |
|  | don't understand this. If you can explain it, please let me know. |

| OpenFX --> ResolveFX Color --> Gamut Mapping | I don't understand this. If you can explain it, please let me know. |
| :--- | :--- |
| OpenFX --> ResolveFX Color --> Invert Color | You can select which color channels are inverted (R, G, B, A) |
| OpenFX --> ResolveFX Generate --> Color Generator | Same as "Generators --> Solid Color"? <br> purpose this might be useful. |
| OpenFX --> ResolveFX Generate --> Color Palette | Superimposes a grid |
| OpenFX --> ResolveFX Generate --> Grid | Simulates aperture diffraction |
| OpenFX --> ResolveFX Light --> Aperture Diffraction | Glow effect, difficult to explain |
| OpenFX --> ResolveFX Light --> Glow | Simulates a lens flare, consisting of manderstand for which |
| OpenFX --> ResolveFX Light --> Lens Flare | Simulates lens reflections, difficult to explain |
| OpenFX --> ResolveFX Light --> Lens Reflections | Simulates light rays, difficult to explain |
| OpenFX --> ResolveFX Light --> Light Rays | I don't understand this. If you can explain it, please let me know. |
| OpenFX --> ResolveFX Refine --> Alpha Matte Shrink and Grow adjustable parameters |  |
| OpenFX --> ResolveFX Refine --> Beauty | Seems to be a filter for making faces beauty. |
| OpenFX --> ResolveFX Revival --> Automatic Dirt Removal | Automatic dirt removal |
| OpenFX --> ResolveFX Revival --> Chromatic Aberration | Corrects chromatic aberration |
| OpenFX --> ResolveFX Revival --> Dead Pixel Fixer | Corrects dead pixels |
| OpenFX --> ResolveFX Revival --> Deband | Deband filter |
| OpenFX --> ResolveFX Revival --> Deflicker | Deflicker filter |
| OpenFX --> ResolveFX Revival --> Patch Replacer | Replaces a region of the clip by another region |
| OpenFX --> ResolveFX Sharpen --> Sharpen | Sharpening filter |
| OpenFX --> ResolveFX Sharpen --> Sharpen Edges | Edge sharpening filter |
| OpenFX --> ResolveFX Sharpen --> Soften \& Sharpen | Has adjustments for small, medium and large texture |
| OpenFX --> ResolveFX Stylize --> Abstraction | Abstraction filter |
| OpenFX --> ResolveFX Stylize --> Blanking Fill | Makes unsharp stripes at the edges |
| OpenFX --> ResolveFX Stylize --> Drop Shadow | I don't understand this. If you can explain it, please let me know. |
| OpenFX --> ResolveFX Stylize --> Edge Detect | Edge detect filter |
|  |  |

| OpenFX --> ResolveFX Stylize --> Emboss | Emboss effect, kind of a high pass filter |
| :--- | :--- |
| OpenFX --> ResolveFX Stylize --> JPEG Damage | Simulates JPEG damages |
| OpenFX --> ResolveFX Stylize --> Mirrors | Simulates one or more mirrors |
| OpenFX --> ResolveFX Stylize --> Pencil Sketch | Simulates a pencil sketch |
| OpenFX --> ResolveFX Stylize --> Prism Blur | Prism blur effect |
| OpenFX --> ResolveFX Stylize --> Scanlines | This simulates a smaller framerate, one frame is duplicates multiple times |
| OpenFX --> ResolveFX Stylize --> Stop Motion | Difficult to explain |
| OpenFX --> ResolveFX Stylize --> Stylize | Makes some regions unsharp |
| OpenFX --> ResolveFX Stylize --> Tilt-Shift Blur | Simulates vignetting |
| OpenFX --> ResolveFX Stylize --> Vignette | Watercolor simulation |
| OpenFX --> ResolveFX Stylize --> Watercolor | Simulates many different errors in analog TV transmission |
| OpenFX --> ResolveFX Texture --> Analog Damage | Simulates many different errors in cine film |
| OpenFX --> ResolveFX Texture --> Film Damage | Simulates film grain |
| OpenFX --> ResolveFX Texture --> Film Grain | Adds camera shake |
| OpenFX --> ResolveFX Transform --> Camera Shake | Adds flicker, type can be set to Lift, Gamma, Gain or Vignette |
| OpenFX --> ResolveFX Transform --> Flicker Addition | Different types of warping, can be used for "Black hole" simulation! <br> "Type 2" is good for enlarging eyes, try Size=0.2 and Strength=0.4 |
| OpenFX --> ResolveFX Warp --> Dent | "Sine" can also be used with strength= 0.3 |
|  | Simulates lens distortions |
| OpenFX --> ResolveFX Warp --> Lens Distortion | Simulates concentric waves |
| OpenFX --> ResolveFX Warp --> Ripple | Simulates a vortex |
| OpenFX --> ResolveFX Warp --> Vortex | Warping by setting points: |
| OpenFX --> ResolveFX Warp --> Warper | Shift-click: Define points that don't move, these are red. <br> Click and drag: Define the warp points, these are gray. <br> Important: Enable the "OpenFX Overlay" in lower left of clip window. |
| OpenFX --> ResolveFX Warp --> Waviness | Simulates linear waves |

### 6.45 Alpha masking

- In "Color" page: Right-click in the nodes window and select "Add Alpha Output".
- Connect the blue alpha output of the last node with the blue alpha output.
- alpha=0 means transparent, alpha=255 means opaque
- Go to "Color" page and use the pipette tool.
- Mark several points in the image by drawing a line with the left mouse button pressed.
- You can add more points by using the "Pipette +" tool.
- You can remove points by using the "Pipette -" tool.
- You can use the "Highlight" tool in the clip window to see which area is selected.
- You can change the hue, saturation and luminance ranges in the "Qualifier" window.
- Hue, saturation and luminance can also be switched on / off.
- If required, use the "Invert" icon in the "Qualifier" window.
- If it's not possible to select the desired region by hue, saturation and luminance alone, then you can add additional windows to exclude some areas.
- More than one window can be generated with +Linear +Circle +Polygon +Curve +Gradient buttons:

Each mask has two modification buttons (below "Gradient" and "Delete").

- The left symbols inverts the mask.
- The right symbol switches between add (logical or) and subtract (logical and) mode.
- You can give each mask a name by double clicking in the black space in the middle.

Let's assume you want to convert a clip to black and white, except two small regions that shall keep their colors.

- Select the clip in the timeline and go to the "Color" page.
- Create two rectangular windows by clicking two times on "+Linear". This should also work with other shaped windows.
- It's important that one of the masks is inverted (that's the left symbol) and the other one is switched to subtract mode (that's the right symbol).
- Now change the saturation to zero. This will be applied only to the background, but not to the two masked regions.

### 6.48 Snowfall

Let it snow!

"Medialn" is the background clip. Make the following settings in the inspector:
pEmitter --> Controls --> Emitter

- Number = $\mathbf{5 0}$
- Number Variance $=\mathbf{5 0}$
- Lifespan = 200
pEmitter --> Controls --> Velocity
- Velocity = 0.05
- Velocity Variance $=\mathbf{0 . 0 8}$
- Angle = -90
pEmitter --> Style --> Style
- Style = Blob
- Noise = 0.5
pEmitter --> Style --> Color Controls
- Color = white
pEmitter --> Style --> Size Controls
- Size $=0.25$
- Size Variance $=0.25$
pEmitter --> Region --> Region
- Region = Line
pEmitter --> Region --> Start
- Start $X$ Offset $=\mathbf{- 0 . 5}$ That means the start point of the line is in the upper left corner.
- Start Y Offset 0.28
pEmitter --> Region --> End
- End $X$ Offset $=0.5$ That means the end point of the line is in the upper right corner.
- End Y Offset 0.28
pTurbulence --> Controls
- X Strength $=0.025$
- $Y$ Strength $=0.025$
- $Z$ Strength $=0$

## pRender

- Tick "Automatic Pre-Roll" These two parameters are important if you also want to have snow at the bottom in the first frames
- Pre-Generate Frames $=\mathbf{2 0 0}$ You can set this parameter to values greater than 100 by double clicking and using the keyboard.

### 6.49 Polyline toolbar

This is the pure horror :-(
Who can explain it with simple words?

How to overlay realistic dynamic lightning over a clip (the original idea is from Gerald Schulze, simplified by me):

"Medialn" is the background clip. Make the following settings in the inspector:
Background1 --> Color --> Background

- Type = Gradient
- Gradient Type = Linear
- Start $X=0$
- Start $Y=0.6$ This must equal the $Y$ coordinate of the lowest point of the lightning, where it hits the ground or house.
- End $X=0$
- End $Y=1$
- Click on the left $\rangle$ symbol below the "Gradient" image and set the color to black.
- Click on the right $\bar{N}$ symbol below the "Gradient" image and set the color to white.

Fastnoise1 --> Noise --> Noise

- Detail = 5
- Contrast = 1.2
- Brightness $=0$
- Lock XY can be either ticked or unticked, it gives different effects
- Scale = 5
- Angle = 0
- Seethe = 0
- Seethe Rate $=0.5$

Fastnoise1 --> Color

- Type = Gradient

Fastnoise1 --> Color --> Gradient

- Gradient Type = Uni
- Color = black

## Polygon1 --> Controls

- Tick "Show View Controls"
- Level = 1
- Filter = Fast Gaussian
- Soft Edge = 0
- Border Width $=0.003$
- Tick "Solid"
- Position = 0
- Length = 1

Draw a line from the lowest point of the lightning (where it hits the ground or house) to the highest point (slightly above the top border of the frame).
Displace1 --> Controls

- Type $=$ XY
- X Channel = Luma
- $\mathbf{X}$ Offset $=0$
- X Refraction $=0.07$

Background2 --> Color --> Background

- Type = Solid Color
- Color = black with alpha = 0 (fully transparent)

Blur1 --> Controls

- Blur Size = 25

ColorCorrector1 --> Correction

- Channel = Blue
- Gain $=9.0$

Merge1, Merge2 and Merge3 have the default settings.

### 6.51 Adjustment clips

An adjustment clip can be created by dragging Effects Library $-->$ Effects $-->$ Effects $-->$ Adjustment Clip to the timeline and dropping it above the video track. Then you can right-click on the adjustment clip and select "Open in Fusion Page", where you can apply any Fusion compositions.
The adjustment clip has many advantages:

- It can be easily moved in the timeline and adjusted in length.
- It's easy to add fade-in and fade-out.
- You can see the effect in real time in the viewer window.

6.52 Trails

Example for trails:

### 6.53 Fog Effect

How to overlay realistic dynamic fog over a clip:

"Medialn" is the background clip. Make the following settings in the inspector:

## pFastNoise --> Noise --> Noise

- CenterX Set to any value, if you want dynamic moving fog. Use two or more keyframes.
- Detail $=2$
- Contrast = 1
- Brightness $=0$
- Scale
- Angle

Try out different values

- Seethe Try out different values
- Seethe Rate Try out different values
Try out different values

### 6.54 Explosion effect

"Medialn" is the background clip. Make the following settings in the inspector:
Text --> Text

- Enter the text and set the color ans size.
- Global In/Out: Set the range from 0 to the middle of the explosion, so that the text disappears during the exlposion pEmitter --> Controls
- Number $=0$ at the beginning,
- Number $=0$ just before the explosion,
- Number $=500$ at the explosion for about 5 to 10 frames,
- Number = 0 after the explosion
- Velocity = 0.4
- Angle Variance = 360
pEmitter --> Style --> Style
- Style = Blob or nGon
pEmitter --> Style --> Color Controls
- Set the color
pEmitter --> Style --> Size Controls
- Size $=3$
pEmitter --> Region --> Region
- Region = Bitmap
- Region Bitmap = Text1
- Channel = Alpha
- low = 0.5
- high = 1.0
- Drop the background video to the timeline (as track V1).
- Drop the greenscreen video on top of the background video (as track V2).
- Select the greenscreen video and go to the Fusion page.
- Click at an empty spot in the "Nodes" window, type shift-space and then enter "Delta Keyer".
- Alternatively, right-click in the "Nodes" window, use "Add Tool" --> "Matte" --> "Delta Keyer"
- Drag the DeltaKeyer over the line, hold the shift key and release the left mouse button when the line becomes blue and yellow.
- Alternatively, you can connect the lines manually with the mouse.
- In the inspector window you see the background color. Use the pipette tool (right of "Background Color") and pick the background color from the video.
- Then click on the $\boldsymbol{\sim}$ symbol and fine adjust the two threshold values, and if required also the other parameters.

Note: The two small black / white dots at the bottom left of the "Delta Keyer" specify if the output is shown in the left or right (or both) windows.

Note: There is another (more complicated) method for creating a greenscreen video, in Color page with a qualifier and alpha channel.
Other method for greenscreen, very easy in "Edit" page:

- Drag and drop the background clip to the timeline.
- Drag and drop the foreground (greenscreen) video above the background clip in the timeline.
- In the bottom left corner of the video window, select "Open FX Overlay".
- Open the Effects Library and drag the "3D Keyer" over the greenscreen clip in the timeline.
- Click on the greenscreen clip and open the inspector.
- Click the pipette "Pick" symbol and draw a line in the video, over those areas that shall become transparent.

### 6.56 3D Effects

This is an example for 3D effects:

Many 3D effects can be found in Add Tool --> 3D --> ...

### 6.57 3D Water Effect

- Shape3D --> Controls --> Shape = Plane

See page 1577ff in DaVinci Resolve 17 manual.
See also the video tutorial "3D-Compositing in Fusion" https://www.blackmagicdesign.com/de/products/davinciresolve/training

- Step 1: Select the clip and go to the "Fusion" page. Select the first frame.
- Step 2: Define the regions that are used for camera tracking. These must be regions that are "cast to the scene". No persons, no animals, no waves, no trees that move in the wind, no moving clouds. Make sure that you also mask the shadows of moving objects!
- Select the "Polygon" tool and drag and drop it to the nodes window.
- Select the first region (rocks) by left-clicking several points around the rocks. Rename the node "POLY_ROCKS".
- Go to the end of the clip and move the polygon, if required.
- You can select all points of the polygon by drawing a rectangle around it. Then all points will move together. This doesn't always work. I don't understand why. You can also select the "Select All Points" icon or press SHIFT+A to select all points of the polygon, and then move them together.
- By holding down the S key, left-clicking the neutral point and moving the mouse left/right you can scale the polygon or a part of it.
- By holding down the T key, left-clicking the neutral point and moving the mouse left/right you can rotate the polygon or a part of it.
- By holding down the $\mathbf{X}$ key, left-clicking the neutral point and moving the mouse left/right you can scale the polygon in horizontal direction.
- By holding down the $\mathbf{Y}$ key, left-clicking the neutral point and moving the mouse up/down you can scale the polygon in vertical direction.
- Repeat the previous steps at multiple keyframes, until the mask is at the right place in all frames.
- You can switch from one frame to the next or previous frame with the cursor keys. But this works only if the polygon is not selected (it must be either invisible or green). With an english keyboard the [ ] keys can always be used for switching to the previous or next frame. Left-clicking in the inspector before pressing the cursor keys does also work.
- Repeat the previous steps to create other polygon nodes and rename them POLY_BEACH, POLY_WOMAN, POLY_PIRATES. The nodes are all connected in series. For the polygons for the persons, change the "Paint Mode" in the inspector to "Subtract".
- You can see the masks as black/white images by selecting the small white dot under the last "Polygon" node.
- Step 3: Add a "CameraTracker" node in the main signal past between the input and output nodes.
- Connect the output of the last "Polygon" node to the "Track Mask" input of the "CameraTracker" node.
- Select the "CameraTracker" node, select the "Track" tab (which is the default) and make the following settings in the inspector:
- Activate "Preview AutoTrack Locations"
- Select suitable values for "Detection Threshold" and "Minimum Feature Separation". Green points will appear in the preview window. To make these points better visible, you can click on the e८e icon above the preview window, select "Gain / Gamma" and make the image darker. This is only an adjustment for the preview window.
- Activate "Bidirectional Tracking".
- "Gutter Size" defines how close the points can be to the borders.
- Set "Track Channel" to "Luma".

Click on "Auto Track".
Select the "Camera" tab in the inspector and make the following settings:

- Set the focal length, for example 15.36 mm if a 24 mm lens is used with the 0.64 x SpeedBooster
- Set the "Film Gate", that's a synonym for the chip size of the camera. You can choose one from the list, in this case the "Aperture width" and "Aperture height" values are set automatically. These are the chip size in Inches. If your camera isn't listed, choose "User".
- In the latter case you must enter the values for "Aperture width" and "Aperture height" manually, for example for the Panasonic GH5S in FHD or 4K mode: $18.8 \mathrm{~mm} \times 10.6 \mathrm{~mm}$ ( $0.740^{\prime \prime} \times 0.417^{\prime \prime}$ ).
- If you don't know the chip size and/or the focal length, you can calculate a valid combination from the measured field of view: $x / f=2$ * $\tan (f o v / 2)$ with $x=$ image width or height in $m m, f=$ focal length in $m m$, fov = Field of view
- For example a drone camera has $2688 \times 1512$ pixels (16:9) and it's known that the horizontal field of view is $120^{\circ}$. If we assume that the chip size is $8 \mathrm{~mm} \times 4.5 \mathrm{~mm}$, the focal length would be 2.31 mm . It's not important if the chip size and focal length are correct. Only the ratio $x$ / $f$ matters.
- If you don't know the date, you could also have a look at the metadata of the clip. Click on the "SubView" icon above the preview window and select "Metadata".

Select the "Solve" tab in the inspector and make the following settings:

- Click on "Solve". Solving may take some time.
- Check the average solve error, it should be smaller than 1 for FHD, or smaller than 2 for 4 K footage.
- You can improve the average solve error by removing some problematic tracke, especially those that are red, orange or yellow. Just select a track or a group of tracke and use "Delete" under "Operations On Selected Tracks"
- You can also use the track filtering in the inspector for removing tracks. Then click on "Select TRacks Satisfying Filters" and click on "Delete".
- Click on "Solve" again. The solve error should now be smaller than before.
- Select the "Export" tab in the inspector and make the following settings:
- Under "3D Scene Transform" change from "Aligned" to "Unaligned".
- Select a group of points that are on the ground plane. "Selection is" should be set to "XZ plane (ground)". Now under "Orientation" click on "Set from Selection".
- Select a group of points that will become the origin of the coordinate system. Now under "Origin" click on "Set from Selection".
- Click the "Export" button. A group of five nodes will appear in the nodes window. You can move them to an empty space.

The "Camera3D" node is our virtual camera that matched the movement of the real camera.
"Command key" (Mac) is equivalent to "CTRL key" (Windows)
"Option key" (Mac) is equivalent to "ALT key" (Windows)

## Navigating in the 3D viewer:

To pan in a 3D Viewer, hold the middle mouse button and drag in the viewer.
To zoom in/out hold down the CTRL key and use the scroll wheel of the mouse.
To rotate around, hold down the ALT key and middle-button-drag in the viewer.

Press Shift-F to Fit all objects in the viewer.
Press F to Fit to selection (or Fit All if nothing is selected).
Press D to Rotate the viewer to look at the center of the currently selected object without moving the viewer's position.

Important: There are three icons "Move", "Rotate" and "Scale" above the preview window. These icons are not for manipulating the 3D view. They are for manipulating individual items in the 3D view, for example for moving or rotating the camera.

Problem with CameraTracker: The "Cancel" button doesn't work while solving.

### 6.60 Resolve Live

This works only with special hardware, either Blackmagic Design DeckLink or UltraStudio video interfaces can be used to connect a camera.

### 6.61

 Time remappingMake a right click on a clip in the timeline, then select "Retime Controls" and "Retime Curve".
Set the playhead to the position where you want to begin the time remapping, then set a keyframe by clicking the icon in the top right corner of the "Retime Frame" window. Repeat this step at the end of the remapping interval, and at one or more positions in between.
Now you remap the timing by moving the points in the curve.
You can also move the white vertical markers in the "Speed Change" window. These have different behaviour if you pick them at the top or at the bottom If you click on the small $\nabla$ icons in the "Speed Change" window, you get a context menue with many functions. One of then is "Reset Clip" for returning to normal speed.
Select a clip and open the inspector. Double click on "Retime And Scaling". One of the options for "Retime Process" is "Optical Flow", this means motion interpolation. Even better motion interpolation is possible if you set "Motion Estimation" to "Enhanced Better" or "Speed Warp".

### 6.62 Slow motion and timelapse

To change the speed of a clip, make a right click on the clip and select "Change Clip Speed".
Question: What does "Ripple Sequence" mean in this context?

### 6.63 Reducing the framerate (Super 8 simulation)

The framerate can be reduced by using two "TimeSpeed" nodes one after the other. In the first node "Speed" is set to a value greater than 1 , and in the second node it's set to the reciprocal value. In both nodes "Interpolation Mode" must be set to "Nearest", so that no frames are interpolated.

### 6.64

## Noise reduction

It seems that DaVinci Resolve's noise reduction doesn't work for 4K 10-bit videos from the Panasonic GH5S.
These videos must be preprocessed as follows:

```
ffmpeg -i P1000860.MOV -map_metadata 0 -pix_fmt yuv422p10le -c:v dnxhd -profile:v 4 -c:a pcm_s24le -color_range pc
-movflags write_colr -y out.mov
pause
```

The output video can then be denoised in DaVinci Resolve with ResolveFX --> ResolveFX Revival --> Noise Reduction.
Recommended settings for videos of stars:

- Temporal NR

Frames Either side = 5

- Temporal Threshold
- Luma = 100
- Chroma = 100
- Motion = 100
- Blend = 0
- Spatial Threshold
- Luma = 0
- $\mathbf{C h r o m a}=0$

The same thing can also be done in the "Color" page. Click on the "Motion Effects" icon.

Temporal averaging (like "tmix" filter in FFmpeg) is possible with ResolveFX --> ResolveFX Temporal --> Smear.

### 6.65 Reverse a video

Make a right-click on the clip, then select "Change Clip Speed", then tick "reverse speed".

This is also explained in german in the chapter "Audio in einer Timeline aufzeichnen" in: Paul Saccone, Dion Scoppettuolo: Der Ultimative Leitfaden zu DAVINCI RESOLVE 15

- Let's assume you are using the built-in microphone in your laptop, or the audio-in connector which is connected to the same A/D converter.
- Open a project, click on File --> "Project Settings", then click on "Capture and Playback", then select in the field "Save Clips to" the folder where you want to save the new audio tracks. Close the project settings with "Save".
- Hide the level meter and show the mixer (if it's not already visible). The mixer icon is at top left.
- Make a right click on any track headline and choose "Add Track" --> "Mono". Or "Stereo", if required. But normally a voice over is recorded in mono.
- Double click the headline of the new audio track and change the name to "VO" for voice over.
- You can also change the track color if you want.
- The following things are only possible if you switch to the "Fairlight" page, that's the $\sqrt[J]{ }$ icon.
- The new track is also shown in the mixer, and in the row "Input" it's marked as "No Input". Click on this field, select "Input..." and then a "Patch Input/Output" window will appear. At the left side you can select the microphone and at the right side you select the VO track. Click on "Patch" and close this window.
- All audio tracks have a "R" icon which can be activated for recording. Do this for the "VO" track. Most probably you will now hear an acoustic feedback loop. This is because the sound from the speakers is coupled back to the microphone. To avoid this acoustic feedback, either set the level for the "Main1" output to the lowest possible level (all way down), or simply activate the "Mute" icon for the "Main1" output (this is the "M" icon).
- Set the "VO" track to "Solo" by activating the "S" icon.
- Now you can start a record by clicking on the © icon in the timeline (which is only available in the "Fairlight" page).

Question: When a voice-over is recorded, the speaker must be muted to avoid feedback. When you want to play the record, the speaker must be on again. In most cases the voice-over must be recorded several times, which means you must manually switch the speaker on and off many times. Isn't it possible to mute the speaker automatically during the voice-over?
Workaround: Use headphones.

Other possible workaround: In Fairlight --> Input_Monitor_Style you can set how you want to monitor inputs while recording. There are five possible options, and "Mute" is the option to avoid acoustic feedback:

| Input | You only hear the live signal being input, and not the content of the tracks (i.e. what is currently or what has previously been <br> recorded). |
| :--- | :--- |
| Auto (this is the default) | When one or more tracks are armed for recording, you hear the live input signal, while on playback you hear the contents of <br> each track. |
| Record | You only hear the live input signal while actively recording, meaning the Record button has been pressed while one or more <br> tracks are armed for recording. You don't hear the input signal while tracks are merely armed. |
| Repro | While recording, you only hear what's just been recorded, played from the track. In other words, you're not listening to the <br> live input, but you're reviewing what's just been recorded as it's recording. |
| Mute | You hear nothing while actively recording. The drawback is that you can't see the waveform while it is recorded. But it will <br> appear immediately after you have stopped the recording. |

## ADR (Automated Dialog Replacement)

- Click on File --> "Project Settings", then click on "Capture and Playback", then select in the field "Save Clips to" the folder where you want to save the new audio tracks. Close the project settings with "Save". This setting must be done only one time.
- Connect a good microphone to your computer.
- Go to Fairlight page ( $\delta$ icon) and select "ADR", which means automated dialog replacement.
- Hide the level meter and show the mixer (if it's not already visible). The mixer icon is at top left.
- Make a right click on any track headline and choose "Add Track" --> "Mono". Or "Stereo", but in most cases mono is sufficient.
- Give the new track a name, for example "Dialogs".
- The new track is also shown in the mixer, and in the row "Input" it's marked as "No Input". Click on this field, select "Input..." and then a "Patch Input/Output" window will appear. At the left side you can select the microphone and at the right side you select the VO track. Click on "Patch" and close this window.
- All audio tracks have a "R" icon which can be activated for recording. Do this for the "VO" track. Most probably you will now hear an acoustic feedback loop. This is because the sound from the speakers is coupled back to the microphone. To avoid this acoustic feedback, either set the level for the "Main1" output to the lowest possible level (all way down), or simply activate the "Mute" icon for the "Main1" output (this is the "M" icon).
- Speak a dialog and set the level so that the leven meter doesn't go into the red range.
- Set the In and Out points in the timeline. This defines the maximum length of the dialog.
- In the ADR window, select "List" and click on "New Cue". You see the length of the dialog in the list.
- Mute the other audio tracks, because you don't want to hear them when you record the dialog. Alternatively you can set the "Dialog" track to "Solo" by activating the " S " icon.
- In the ADR window, select "Record" and start recording by clicking on the © icon.
- Create a new project.
- Open the project settings and set the resolution to "custom", using a $\mathbf{2 : 1}$ aspect ratio, for example $3840 \times 1920$.
- Also set the correct framerate.
- Import the equirectangular video.
- Go to "Fusion" page and make a right-click on the clip. Select " $360^{\circ}$ View" and "Auto".
- Move around in the $360^{\circ}$ video by holding dowm the shift key and the right mouse button, or by holding down the ALT key and the middle mouse button.
- Zoom in / out by holding down the CRTL key and the middle mouse button. This doesn't work if "Scale" is set to "Scale to Fit". Right-click on the clip and set "Scale" to any other value. You can also zoom in with NUM+ and zoom out with NUM-.
- Open the "Effects Library" and select Tools --> VR --> PanoMap
- Drag and drop it as a new node in the signal path
- Open the inspector and set both "From" and "To" to "LatLong".
- Double click on "Rotation" and set the rotation angles for several keyframes. You can also set the rotation order.

This doesn't yet work:

- Select Tools --> VR --> LatLong Patcher and insert it into the signal path after PanoMap.
- In the inspector set "Mode" to "Apply".
- Right-click in the nodes window and add a "Paint" tool after the LatLong Patcher.
- Select "Brush Controls"--> Brush Shape, set the size to a large value.
- Select a suitable color.
https://www.youtube.com/watch?v=x|Ohluai5mk

### 6.69

 Reframing $360^{\circ}$ videos with KartaVRKartsVR is a plugin for DaVinci Resolve written by Andrew Hazelden.
Found here: DaVinci Resolve 17 - reframe ANY 360 video (Insta360 ONE X2, GoPro MAX, Qoocam 8K) FREE in REAL TIME https://www.youtube.com/watch?v=CWw2DaXC7OU

Documentation for KartaVR: http://www.andrewhazelden.com/projects/kartavr/docs/

- Download the "Reactor Installer" here (the filename is "Reactor-Installer.lua"): https://www.steakunderwater.com/wesuckless/viewtopic.php?f=32\&t=3067
- Drag and drop this file into the DR Fusion Nodes window. A window "Ready to Install" will appear.
- Click "Install and Launch".
- After a few minutes, a window "Fusion Reactor" appears and you can close this window.
- Go to Workspace --> Scripts --> Reactor --> Reactor Preferences
- Set "Concurrent cURL Transfers" to 1 (if it's not already set to 1), then click OK
- Go to Workspace --> Scripts --> Reactor --> Open Reactor
- At the left side, select "Karta VR". Check either all lines in the right window, or select only "KartaVR Tools | Reframe360 Ultra"
- Wait 10-20 minutes until everything is installed, then restart DaVinci Resolve.
- Drag and drop an equirectangular video to the timeline.
- Drag "Effects Library --> Toolbox --> Effects --> Fusion Effects --> KartaVR/Viewer/kvrReframe360Ultra" and drop it on the clip in the timeline.
- Alternatively you can in the Fusion page use Add Tool --> KartaVR --> kvrReframe360Ultra and insert the node in the signal path.
- In the inspector you can change these properties:
- Field of view
- Pitch, Yaw, Roll
- Rectilinear Projection, Tiny Planet Projection

These macros are also interesting:

- Add Tool --> Macros --> KartaVR --> Conversion --> Equirectangular2Fisheye
- Add Tool --> Macros --> KartaVR --> Conversion --> Fisheye2Equirectangular
- Add Tool --> Macros --> KartaVR --> Conversion --> Equirectangular2Angular
- Add Tool --> Macros --> KartaVR --> Conversion --> Angular2Equirectangular
- Add Tool --> Macros --> KartaVR --> Conversion --> Equirectangular2InverseAngular
- Add Tool --> Macros --> KartaVR --> Conversion --> Rectilinear2Equirectangular
- Add Tool --> Macros --> KartaVR --> Conversion --> Equirectangular2MeshUV (requires a *.fbx file)
- Add Tool --> Macros --> KartaVR --> Conversion --> Equirectangular2DomeMaster180
- Add Tool --> Macros --> KartaVR --> Conversion --> Equirectangular2DomeMaster220

Problem: DaVinci Resolve crashes, if "kvrReframe360Ultra" is used and then Playback --> Proxy Mode is changed from full to half.
Workaround: Remove the "kvrReframe360Ultra" effect from the clip, then change the proxy mode, then apply the effect again to the clip.

Problem: A black circle region appears in the zenith and nadir zones of the panoramic video when reframing footage in the Resolve Edit/Fusion page.
Workaround: The issue is related to the source MP4 video file having a $2: 1$ aspect ratio, if the editing timeline was set to use a 16:9 aspect ratio or $1: 1$ aspect ratio for the output. Resolve's default Timeline Settings will typically fit the panoramic footage to the frame size on one axis, and crop the footage on the other axis which creates the black hole artifact.
To fix the black region at the bottom of the frame issue, you should edit the Resolve Timeline settings. In the Timeline Settings window, uncheck the "[x] Use Project Settings" checkbox. Then edit the "Mismatched Resolution" preference so it is set to "Stretch frame to all corners". This will fit the source MP4 video so the width and height are scaled to precisely match the frame size of the rendered video. The "Mismatched resolution files" setting can also be defined in the "Project Settings > Image Scaling > Input Scaling" preferences window, too.
Source: Andrew Hazelden, https://www.facebook.com/groups/kartavr/permalink/983312762472770/

- Create a new project.
- Open the project settings and set the resolution to "custom", using a 2:1 aspect ratio, for example $3840 \times 1920$.
- Also set the correct framerate.
- Import the equirectangular video.
- Go to "Fusion" page and add the following nodes:
- "CoordinateSpace", set it in the inspector to "Polar to Rectangular".
- Connect the output to a "Scale" node, and in the inspector untick "Lock X/Y" and set "X Size" to 0.5 or "Y Size" to 2.0
https://www.youtube.com/watch?v=hYgvn68dklo

What's the CoordinateSpacs node doing? This is "Polar to Rectangular":

### 6.71 Spherical stabilizer

This is an example for SphericalStabilizer and Little Planet projection and making a square output video.

Set the timeline resolution to $960 \times 960$

Medialn is an equirectangular input video with resolution 1920x960.
Make the following settings in the inspector:
SphericalStabilizer --> Controls

- Tick "Reject Dominant Motion Outliers While Tracking"

SphericalStabilizer --> Controls --> Stabilizing Rotation

- Stabilize Strength = 0.5 or 1.0
- Smoothing = 1.0

SphericalStabilizer --> Controls --> Offset Rotation

- Set as many keyframes as required to keep the trees in the video vertical. Use all three rotation angles.

Then set the playhead to the beginning and click on "Track forward".

PanoMap --> Controls --> Rotation

- X = -45 Adjustment of viewing direction (This could have also be done already in SphericalStabilizer)
- From = Auto
- To = LatLong

## CoordinateSpace --> Controls

- Shape $=$ Polar to Rectangular

## Transform --> Controls --> Transform

- X Size $=0.5$
- $Y$ Size $=2.0$
- Angle = -90
- Tick horizontal flip

Resize --> Controls

- Width $=960$
- Height $=960$

- Right click in the media pool and use "New Fusion Composition". Drag the new Fusion composition to the timeline.
- Add a "Shape3D" node.
- Shape = Sphere
- Base Subdivisions $=100$
- Height Subdivisions $=100$
- Add a "Merge3D" node. (Can be removed if the camera is omitted.)
- Add a "Renderer3D" node.
- Add a "Camera3D" node. (It's possible to omit the Camera, if the sphere is made smaller.) - Adjust the $\mathbf{Z}$ translation so that the whole sphere is visible in the right window.
- Drag and drop the equirectangular video to the Fusion window.
- Add a "SphereMap" node.
- You can adjust the rotation angles.
- Add a "Reflect" node.
- Controls --> Reflection --> Strength Variability = "Constant" or "By Angle"
- Controls --> Reflection --> Glancing Strength $=0.2$
- Controls $-\mathrm{-}$ R Reflection $-->$ Face On Strength $=1.0$
- Controls --> Reflection --> Falloff $=4$
- Add a "Blinn" node (This allows more settings for the sphere's surface properties. Can be omitted if reflection is $100 \%$ ). - Set the color to black.
- Connect the output of "SphereMap" to the "Reflection.Color.Material" input of "Reflect".

This is the simplified version:

## YouTube Video:

- Schwarze Löcher erschaffen in Davinci Resolve - Tutorial (german): https://www.youtube.com/watch?v=Cst9-uSGtdY

These are the nodes for the black hole effect:

- Track an object in the video, either 2D or 3D tracking (3D tracking is only available in the DR Studio version). The tracked object can be one of the following:
- Small sphere on invisible tripod. This is my preferred method.
- Small sphere located at the correct position, hold by four very thin fishing lines.
- Any other object which is at the same distance as the black hole, but not too far away from it. See (1) below.
- Go to the Fusion page and add a "Tracker" node. Use "Frames per Point" = 1, "Adaptive Mode" = "none" and "Path Center" = "Pattern Center".
- Make the search window around the object (small sphere on invisible tripod) as small as possible.
- Track the object.
- Add a "Dent" node. Warning: There are two different "Dent" nodes available:
"Dent" is available by using Add_Tool --> Resolve_FX_Warp --> Dent, or by pressing SHIFT-SPACE and then select "Dent".
- "Dent (Dnt)" is available by using Add_Tool --> Warp --> Dent, or by pressing SHIFT-SPACE and then select "Dent (Dnt)".

This is the wrong node because it doesn't have a "Black Hole" mode.

- Set "Dent Type" to "Black Hole" and adjust "Size" and "Strength".
- Right-click on "Position" and select Connect_To --> Tracker1Tracker1Path --> Position
- Add a "Merge" node.
- Add a "Background" node and use the default color black.
- Add an "Ellipse" node. In the explorer, right-click on "Center" and select "Connect_To --> Tracker1Tracker1Path --> Position
- right-click on "Height", select "Expression" and enter "Width". Now you can adjust the width so that if fits to the central part of the black hole. The height will automatically be set to the same value.
- (1) If the black hole isn't yet at the intended position, click in the inspector on "Modifiers", select "Tracker1Tracker1Path" and change the X,Y positions.
- It's possible to couple the size of the ellipse to the size of the black hole as follows:

Right-click on Ellipse - -> Width, select "Expression" and enter "( 0.5 * Dent1.size) - 0.01 ". I did subtract 0.01 because that's the minimum size of the "Dent" node.
It's important that "size" is lower case. If in doubt about the correct syntax, hold the mouse pointer over the source parameter (in inspector for "Dent") and look at the lower left of the screen.

- Now you can animate the size of the "Dent" node. Because the size of the black hole can't be set smaller than 0.01 , to let it disappear you must also set "Strength" to 0.

### 6.74 Wormhole effect

A simplified wormhole effect can be realized by using a black hole effect and overlaying a mirror-sphere effect over the central part of the black hole.

### 6.75 Programming fuses

https://www.youtube.com/watch?v=_cFUIOKd RM

### 6.76 Multicam Editing

"Multicam" means you have filmed the same scene simultaneously with several cameras and/or audio recorders, and now you want to cut between these clips.

- Go to "Media" page and select all clips.
- Make a right-click and select "Create New Multical Clip Using Selected Clips".
- Enter a multicam clip name, set "Angle Sync" to "Sound" and then click "Create".
- Go to the "Edit" page and drag and drop the new multicam clip to the timeline. Only one track is shown, but it contains the tracks from all cameras.
- Below the bottom left corner of the left image window is a symbol where you can select "Multicam".
- Now you see all "Angles" simultaneously in the left window.
- Now you can play the video. When you want to make a cut, just click on the angle that you want to use. The mouse pointer will become a blade.

### 6.77 Subtracting a darkframe

[^3]
### 6.78

 SubtitlesOne or more subtitle tracks can be added to a timeline. Open the Effects Library and drag and drop "Subtitle" in the timeline. Use one subtitle track for each language.
Select "Custom" in the "Deliver" page and scroll down to "Subtitle Settings", where you tick "Export Subtitle".
There are several choices for "Format":

- If the file format is set to "MP4", then you can select between
- "As a separate File" This is a *.srt file (normal ASCII text, readable with each editor)
- "Burn into Video" This means the subtitles are painted into the frames, so that they can't be switched on/off in the player.
- If the file format is set to "Quicktime", then you can additionally select
- "As embedded captions" These are subtitles that can be switched on/off in the player. But in DaVinci Resolve 16 this works only with one single subtitle track.

If you want two or more subtitle tracks (which can be switched on/off in the player) in a video, then you can use the following workaround:
Set the format to "As a separate File", set "Export As" to "SRT" and tick both "Subtitle 1" and "Subtitle 2".
After the render process has finished, you have a video (without subtitles) and two *.srt files.
These three files can be combined with FFmpeg to a single *.mov video. It's not possible to do this with normal *.mp4 containers.
This is the FFmpeg batch file (assuming that subtitle track 1 is german and track $\mathbf{2}$ is english):

```
ffmpeg -i input.mp4 -i "Subtitle 1.srt" -i "Subtitle 2.srt" -c:v copy -c:a copy -c:s mov_text -map 0 -map 1 -map 2 -metadata:s:s:0 language=ger
-metadata:s:s:1 language=eng -y output.mov
pause
Note: The quotation marks "" around the subtitle filenames are only required because the filenames contain a space character.
The output video can be played for example with the VLC player and you can toggle the subtitle tracks with the "V" key.
```

There was one problem to solve in Davinci Resolve before this worked:
The problem was that the timecode in the subtitle files did begin with 01:00:00:00 (which means 1 hour).
This can be corrected in Preferences --> User --> Editing --> New Timeline Settings --> Start Timecode, where you can enter 00:00:00:00.
I don't know why the default is 01:00:00:00.
To change the starting timecode of an already existing timeline, right-click on the timeline in the media pool, select Timelines --> Starting Timecode.. and set it to 00:00:00:00.
SMPTE timecode is presented in hour:minute:second:frame format. (Source: https://en.wikipedia.org/wiki/SMPTE_timecode )

### 6.79 Supported Codecs

Transcodings can be made under File --> Media_Management
See also: https://documents.blackmagicdesign.com/SupportNotes/DaVinci Resolve 16 Supported_Codec List.pdf

### 6.80 Convert *.mkv videos for DaVinci Resolve

Davinci Resolve can't import *.mkv videos, but you can convert them lossless and very fast to *.mp4 with FFmpeg:

```
ffmpeg -i in.mkv -c:v copy -c:a copy -y out.mp4
pause
```

### 6.81

The free DaVinci Resolve 15, 16 and 17 versions can't import 4K 4:2:2 10 bit videos (from Panasonic GH5S). But this FFmpeg conversion does the job:

```
ffmpeg -i P1000975.MOV -map_metadata 0 -pix_fmt yuv422p10le -c:v dnxhd -profile:v 4 -c:a pcm_s24le -color_range pc
-movflags write_colr -y out.mov
pause
```

What's the meaning of the options in this command line?

| $-\mathrm{c}: \mathrm{v}$ dnxhd | Video codec: "DNxHD" (Digital Nonlinear Extensible High Definition) You won't find much about this in FFmpeg <br> documentation. |
| :--- | :--- |
| -profile:v 4 | Can be in range [0..5], see below output of ffmpeg -h encoder=dnxhd |
| -c:a pcm_s24le | Audio codec: "PCM signed 24-bit little-endian" |
| -color_range pc | Set the color range in the stream, 'tv' means limited range and 'pc' means full range. |
| -movflags write_colr | This is an option of the "mov" muxer, see output of ffmpeg -h muxer=mov <br> Write colr atom even if the color info is unspecified (Experimental, may be renamed or changed, do not use from scripts) |

Output of ffmpeg -h encoder=dnxhd

```
Encoder dnxhd [VC3/DNxHD]:
        General capabilities: threads
```

        Threading capabilities: frame and slice
        Supported pixel formats: yuv422p yuv422p10le yuv444p10le gbrp10le
    dnxhd AVOptions:

E. .V......
E. .V.....

You can also apply the VLog-L to Rec709 LUT in the same command line:

```
ffmpeg -i P1000975.MOV -vf lut3d="VLog_to_V709.cube" -map_metadata 0 -pix_fmt yuv422p10le -c:v dnxhd -profile:v 4 -c:a
pcm_s24le -color_range pc -movflags write_colr out.mov
```

The original Vlog-L to Rec709 LUT from Panasonic can be downloaded here:
https://av.jpn.support.panasonic.com/support/global/cs/dsc/download/lut/index.html
or here: https://na.panasonic.com/us/resource-center/v-log-v-709-3d-lut

Other VLog-L to Rec709 LUTs are available here: https://nickdriftwood.com/product/driftwood-v-log-v-gamut-sample-lut and here: https://luts.iwltbap.com/free-lut-log-to-rec709-and-rec709-to-log-conversion/ and here: https://groundcontrolcolor.com/products/free-sony-v-log-to-rec-709-lut

This batch file is doing the same thing, but you can drag and video over it's icon on the desktop and it will automatically generate a renamed (P100*.* $\rightarrow$ $C^{*}$.*) and converted video in the same folder where the input video came from:

```
set "INPUT=%1" :: Input by drag-and-drop
set "OUTPUT=%INPUT:P100=C%" :: Specify how to rename the video
set "LUT=C:\\Users\\astro\\Desktop\\VLog_to_V709.cube" :: Full path of *.cube LUT file,
    :: use either single forward slashes or double backslashes!
rem Rename P100*.* to C*.*, apply LUT VLog to V709 and convert for DaVinci Resolve
ffmpeg -i %INPUT% -vf lut3d=\'%LUT%\' -map_metadata 0 -pix_fmt yuv422p10le -c:v dnxhd -profile:v 4 -c:a pcm_s24le
-color_range pc -movflags write_colr -y %OUTPUT%
pause
```

Note: If the LUT file is in the same folder as the input video, you can simply use lut3d=\%LUT\% but if it's in another folder, then you must specify the full path and use this tricky and hard to understand escaping: lut3d=|'\%LUT\%|'

Apply the LUT and convert all P100*.MOV videos in the current folder and save the converted videos as $\mathrm{C}^{*}$.MOV, so that they become readable by the free DaVinci Resolve version. This works fine for FHD and 4K videos:

```
rem Convert all videos in current folder for DaVinci Resolve
for %%f in (P1*.MOV) do call :for body %%f
goto : the_end
    : for_body
    set INPUT=%1
    set OUTPUT=%INPUT : P100=C%
    ffmpeg -i %INPUT% -vf lut3d="VLog_to_V709.cube" -map_metadata 0 -pix_fmt yuv422p10le -c:v dnxhd -profile:v 4 -c:a
pcm_s24le -color_range pc -movflags write_colr -y %OUTPUT%
exi\overline{t /b}
: the end
pause
```

It's possible to show properties of clips (metadata) in the "Media", "Edit" and "Fusion" page. Click on "Metadata" in the top right corner. If some informations are missing, try FFprobe instead.

### 6.83 Sound library

You can download the "Blackmagic Fairlight Sound Library 1.0" here: https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion The default installation path is C:IUserslusernamelMovies\Fairlight Sound Library
In my opinion it's not worth the download.

How to list all sounds in the library:

- Type *** in the search window.

How to remove the whole sound library:

- If you delete the sound files or the whole folder, the sounds will still be listed in DR.
- To remove them from the database, open the Project Manager and click on the icon to the left of Projects that says "ShowlHide Databases". Right click on "Local Database" under "Disk" and select "Open File Location". A folder "Resolve Projects" should appear, click on it and delete the file "SoundLib.db". Now you can rebuild your database in DR using the "Add Library" function.
- The path to the deleted file is C:IProgramDatalBlackmagic Design\DaVinci ResolvelSupportlResolve Disk DatabaselResolve Projects

This test can be found by clicking on the Windows icon in the bottom left corner, then click on "Blackmagic Design" --> "Blackmagic RAW speed test"

### 6.85 DaVinci Resolve, Problems and Solutions

DaVinci Resolve is designed for Windows10. There are many problems when you run it on Windows7. Don't do it!
One problem is that recording sound from USB soundcards is impossible or difficult. Although the USB soundcard is shown in the "Patch Input/Output" window and a patch can be created, there comes no signal from this soundcard.

I got it working with this workaround: Go to Davinci Resolve --> Preferences --> Video and Audio I/O --> Speaker Setup and make these settings:
Speaker Configuration: Manual
Monitor Set: MAIN
Device: Lautsprecher (Realtek High Definition Audio)
Monitor Set Format: Stereo
With these settings, I got the USB soundcard working. But it seems my Windows7 computer is too slow and can't record a voice-over track in real time without disturbing artefacts.

Error message "Render Job 1 failed as the current clip could not be processed."
Solution: Use Windows10 instead of Windows7.
Error message: "The GPU failed to perform image processing because of an error. Error Code: 702"
Solution: Do not use the NVIDIA gaming driver. Use the NVIDIA studio driver instead. It's available on the NVIDIA website.
Error message: Attempting to view depth channel, but none exists in this image.
Solution: Click above the image on the $\checkmark$ symbol right of " $Z$ ", and select "Color".
Error message: "Media offline" for only a part of a clip.

## Solution: Sometimes it helps to close and re-start DaVinci Resolve.

## Problem: Something went wrong and the whole timeline is destroyed.

Solution: Do not save the project and close DR. Restart DR, and in the first dialog where you can choose the project, right click on the project and choose "Revert to last saved Project".

### 6.86 Miscellaneous unsorted things

View --> Safe Area This overlays a mask for showing the safe area that's always visible on a TV screen

Playback $\rightarrow$ Proxy Mode Off / Half Resolution / Quarter Resolution
*.svg Standard Vector Graphics

7 Shotcut

Shotcut is a free, open-source video editor.
https://www.shotcut.org/

It does have a $360^{\circ}$ stabilizer.

The software OpenShot https://www.openshot.org/ seems to be similar, but Shotcut might be the better one of these two.

With this tool you can show all EXIF data that are contained in pictures or videos. https://exiftool.org/
Usage is very simple if you create this batch file once and put it on your desktop:

```
exiftool %1
pause
```

Now you can simply drag the picture or video you want to examine with the mouse onto the icon of this batch file, and you will immediately see the result without having pressed a single key. The parameter \%1 causes the file name to be passed to Exiftool.

Exiftool can be combined with the batch command "findstr", if you want to filter only a few lines from the large Exiftool output:

```
@echo off
exiftool %1 | findstr /C:"File Name" /C:"File Size" /C:"Duration" /C:"Image Width" /C:"Image Height" /C:"Video Frame
Rate" /C:"Exposure Time" /C:"F Number" /C:"Exposure Program" /C:"ISO" /C:"Photo Style" /B /C:"Noise Reduction"
/C:"Contrast " /C:"Saturation" /C:"Sharpness" /C:"Avg Bitrate" /C:"Track Create Date"
pause
```

"findstr" is in detail explained here: https://ss64.com/nt/findstr.html

The option -u means "extract unknown tags":

```
exiftool -u %1
pause
```

Exiftool does also list "Internal Serial Number" and "Lens Serial Number", however in both cases the listed numbers don't agree with the serial numbers printed on my GH5S and Leica DG 12-60mm f/2.8-4.0.

## Example for extracting GPS metadata from a video:

```
exiftool -p gpx.fmt -ee input.mp4 > output.gpx
```

```
-p FMTFILE Print output in specified format
-ee Extract information from embedded files
```

## Example for setting a metadata tag:

```
exiftool -ProjectionType="equirectangular" out.jpg
```

Note: The original file is renamed as "out.jpg_original" and the new file is saved as "out.jpg".

## 9 IrfanView

How to show the mouse coordinates:
Options $\rightarrow$ Properties/Settings $\rightarrow$ Viewing $\rightarrow$ Show_mouse_coordinates_in_the_Statusbar

How to set (or remove) resampling:
View $\rightarrow$ Display_Options_(window_mode) $\rightarrow$ Use_Resample_for_fitting_(better_quality)
and
View $\rightarrow$ Display_Options_(window_mode) $\rightarrow$ Use_Resample_for_zooming

Enable Color Management: Options --> Properties/Settings --> Tick "Enable color management..."

### 9.1 Create an image with a transparent color

- Open the image
- Click on Image --> Replace_Color
- Set the transparent coloir by clicking in the image, and set a tolerance value (for example 20)
- Choose a "New Color", use a color dhat doesn't exist in the image.
- Click "ok".
- If the result isn't as expected, repeat the previous steps with a different color or tolerance value.
- Click "Save as", set the file format to "PNG".
- Choose a suitable filename.
- In the "PNG/PNM/ICO save options" window tick "Save Transparent Color".
- Click on "Save".
- Select the transparent color in the image.

## Faststone Image Viewer

This is a free image viewer that can automatically the screen when the image file is overwritten by a new image. https://www.faststone.org/FSViewerDetail.htm

## 11 Adobe DNG converter

This is a tool for converting RAW images from many different cameras to the DNG format, which has a lossless compression.
Note: You can only specify the folder and not the images. It's normal that you don't see the images. Make sure that you click on "Convert" and not on "Extract".

Some useful links for writing batch files:
https://en.wikibooks.org/wiki/Windows_Batch_Scripting (english)
https://de.wikibooks.org/wiki/Batch-Programmierung/_Druckversion (german)
https://ss64.com/nt/
https://ss64.com/nt/syntax.html

### 12.1 Wildcards in filenames

* any sequence of one or more characters
? a single character other than a period "."

When a command-line argument contains a filename, a special syntax can be used to get various information about this file:

| Syntax | Result | Example for F:IMeteors_2019ICUT00380.MOV |
| :--- | :--- | :--- |
| $\% 1$ |  | CUT00380.MOV |
| $\% \sim 1$ | \%1 with no enclosing quotation marks | CUT00380.MOV |
| $\% \sim \mathbf{f 1}$ | Full path with a drive letter | F:IMeteors_2019ICUT00380.MOV |
| $\% \sim$ d1 | Drive letter | F: |
| $\% \sim \mathrm{p1}$ | Drive-less path with the trailing backslash | IMeteors_2019 |
| $\% \sim \mathrm{n1}$ | For a file, the file name without path and extension <br> For a folder, the folder name | CUT00380 |
| $\% \sim \mathrm{x} 1$ | File name extension including the period | .MOV |

## Change the extension of a filename in a batch file:

```
set OLDFILENAME=%1
set NEWFILENAME=%OLDFILENAME : MOV=MP4%
pause
```

Please note that all instances of "MOV" will be replaced by "MP4". This fails if "MOV" is part of the path or filename, as in "MOVEMENT.MOV"

### 12.2 Create beeps in a batch file

```
@echo #
@timeout 1
@echo #
@timeout 1
@echo #
```

In this example the \# stands for the non-printable character (ASCII code 7), which you can't enter with Notepad.
You can type any other character instead and later use a hex editor to replace it by 0x07.

Another way for creating the ASCII 7 is to type this command line at the command prompt:

```
echo @echo ^G>test33.bat
```

where ${ }^{\wedge}$ G means typing CTRL G

This is an endless loop for beeping every 10 seconds, without any output on the screen (except a line feed):

```
: beep
@echo #
@timeout 10 > nul
@goto :beep
```

```
for %%f in (img*.jpg) do call :for_body %%f
goto :the end
for_body
    ffmpeg -i %1 -y %~n1.png
exit /b
: the_end
pause
```

Note: "goto :the_end" can be replaced by "goto :eof" which is a predefined label at the end of the file. In this case it's unnecessary to write ":eof" at the end.

### 12.4 Create short text files or append text to a file

```
echo Hello !> test.txt
echo This is the 2nd line>> test.txt
```

Note: The first line (with ">") creates a new file or overwrites an existing file. The second line (with ">>") appends text to an already existing file.

### 12.5 Calculate variables in a batch file

It's possible to calculate variables, but only integer artihmetic is supported:

```
set "A=5"
set /a "B=2*%A%"
```

```
if %MODE%==1 echo test1
pause
```

This doesn't work because the variable "MODE" is undefined. The left side of the comparison is empty. The batch file will immediately exit in the first line without any error message.
To avoid this problem, you can add two dots to each side of the comparison (thanks to Dan Bridges for this idea):

```
if %MODE%.==1. echo test2
pause
```

In this case the left side isn't empty. You won't see the "test2" echo because the left and right sides aren't equal. The batch file won't exit in the first line and will wait for a keypress in the second line.

### 12.7 Start a new process

This is an example for starting two new processes:

```
start ffplay -noborder -x 640 -y 480 -left 0 -top 200 udp://239.0.0.1:1234
start ffplay -noborder -x 640 -y 480 -left 640 -top 200 udp://239.0.0.1:1234
pause
```

## 13 Batch files (Unix, Linux)

Unix batch files (shell scripts) have a different syntax than DOS/Windows batch files. For converting a batch file from DOS to Unix, see this website: https://tldp.org/LDP/abs/html/dosbatch.html

## 14 VLC Player

https://www.videolan.org/vlc/ Documentation: https://wiki.videolan.org/Documentation:User_Guidel

This is a subset of VLC's keyboard hotkeys:

| Key | Notes |
| :--- | :--- |
| F | Toggle fullscreen |
| ESC | Leave fullscreen/close dialogue |
| space | Play/pause |
| E | Next frame |
| + | Faster |
| - | Slower |
| = | Normal rate |
| ] | Faster (fine) |
| [ | Slower (fine) |
| S | Stop |
| T | Position/time |
| Ctrl + Q | Quit |
| M | Mute |
| B | Cycle audio track |
| V | Cycle subtitle track |
| Shift + s | Make a snapshot picture |

My notebook doesn't have enough computing power for playing 4K videos (400Mbit/s from Panasonic GH5S) smoothly with VLC player. This batch file reduces the size to $50 \%$ and then plays the video. Simply drag and drop the video on the batch file's icon. The parameter \%1 causes the file name to be passed to FFmpeg. In the second line the path must be written in quotation marks because there is a space character in "Program Files".

```
ffmpeg -i %1 -vf scale=w=iw/2:h=ih/2 -y half_size.mp4
"c:\Program Files\VideoLAN\VLC\vlc.exe" half_size.mp4
```

## 15 MPV

MPV is a video player and can be downloaded here: https://mpv.io/installation/
You must install two files: mpv.exe and mpv.com

How to show filter curves:

```
mpv av://lavfi:aevalsrc="not(mod(n\,32768)):d=50" -lavfi-complex
```

"[aid1] lowpass, asplit[ao],showfreqs=overlap=0:win_size=32768:win_func=rect:ascale=log,format=rgb0[vo] "

MPV supports the same filters as FFmpeg. This is an example for translating a FFmpeg command with a complex filterchain to MPV:

```
rem FFmpeg:
ffmpeg -i 7Z7A2027.jpg -filter complex
"split[1][2];[1]hue=h=0:s=1:b=-2[3];[2][3]hstack" -y out.jpg
rem This is the same thing with MPV:
mpv 7Z7A2027.jpg --keep-open=yes
--lavfi-complex="[vid1]split[1][2] ; [1]hue=h=0:s=1:b=-2[3]; [2][3]hstack,scale=iw/2:ih/2[vo]"
```

Notes:

- Don't use "-i" before the input file.
- "--keep-open=yes" means that mpv doesn't close shortly after showing the output image.
- "-filter_complex" must be replaced by "--lavfi-complex="
- The input pad in the filter chain must be called [vid1]. You can't omit it as in FFmpeg.
- The output pad in the filter chain must be called [vo]. You can't omit it as in FFmpeg.

16 CD Rippers

Free CD to MP3 converter: https://www.eusing.com/CDRipper/CDRipper.htm

17 DVD Rippers

## 18 SpyderX Elite, Monitor calibration

The *.icm calibration files are saved in this path: C:IWindows\System32lspoolldriverslcolor

## 19 Color grading with 3D LUT Creator

3D LUT Creator is a software for color grading. A free demo version is available, and the full version costs $\mathbf{\$ 2 4 9}$ (July 2019). Sometimes there seems to be 25\% discount.

Website: https://3dlutcreator.com/
Drawback of this software: The written manual is totally outdated, and for the latest version you have to watch many video tutorials (what I don't like so much).
All video tutorials can be found here: https://3dlutcreator.com/3d-lut-creator---tutorials.html

A guide for all hotkeys in 3D LUT Creator:
https://medium.com/@alexeyadamitsky/3d-lut-creator-ultimate-hotkeys-guide-17a32f957077

This is a very powerful software for creating and editing color-look-up-tables. It's also possible to match the colors to a ColorChecker.
A ColorChecker is a card with 24 different colors, which is hold in the camera's field of view.

Original X-Rite ColorChecker:
https://www.xrite.com/categories/calibration-profiling/colorchecker-targets
There are also cheap (\$20-\$25) chinese ColorCheckers available. Their colors may be a little bit different from the original.

## Hotkeys:

CTRL N New Preset (Reset All)
CTRL O Load an image
CTRLE Save the LUT
CTRL + Zoom in
CTRL - Zoom out

I'd like to describe the workflow for making a video with a ColorChecker, and how to create a LUT and apply that LUT to the video.

Step 1: Make a video where at some time the ColorChecker is visible, preferably at the beginning of the video. It doesn't care which file format you use, as FFmpeg can decode almost all of them.

Step 2: Open the video in a viewer (for example VLC player) and check at which time the ColorChecker is visible.

Step 3: Use this batch file to extract a single picture from the video and save it lossless as PNG. Of course, you must enter your filename and the correct time in the batch file. The picture will be automatically 8-bit or 16-bit PNG, depending on the bit depth of the input video, so that there is no loss of quality.

```
set "IN=my_video.mov" :: Input video
set "T=3"- :: Time in seconds, where picture shall be extracted
ffmpeg -ss %T% -i %IN% -frames 1 -y picture.png
pause
```

In the previous example I did use variables, because they make the batch file more readable. The following batch file is doing exactly the same thing:

```
ffmpeg -ss 3 -i my_video.mov -frames 1 -y picture.png
pause
```

The -y option means that the output file will be overwritten if it already exists (without asking). Without the -y option, FFmpeg would ask before overwriting.

The pause command means that you have to press a button before the window closes. Without this command the window would close immediately when FFmpeg is finished, making is impossible to see if there were any error messages.

Step 4: Drag and drop this picture into 3D LUT Creator (or alternatively press CTRL+O). In the field to the left of the "Match" button select "Curves+3DLUT". Click on the "Color Chart Grid Tool" icon (this is a small rectangle with 6 dots in it). Move the corners of the grid tool with the mouse to the corresponding ColorChecker fields in the picture. Then click on "Match". After a few seconds the picture should be shown with all colors matched to the ColorChecker. Click on "Save 3DLUT" in the bottom left corner (or alternatively press CTRL+E) to save the CLUT as my_lut.cube

Step 5: Use this batch file to apply the LUT to your video:

| set "IN=my_video.mov" | $::$ Input video |
| :--- | :--- |
| set "LUT=my_lut.cube" | $::$ Look-Up-Table |
| set "OUT=Out.mov" | $::$ Output video |
| ffmpeg -i \%IN\% -vf lut3d="\%LUT\%" |  |
| pause |  |

If you want to see only a few seconds at the beginning of the video, you can limit the length with the -t parameter.

```
set "IN=my video.mov" :: Input video
set "LUT=my_lut.cube" :: Look-Up-Table
set "OUT=out.mov" :: Output video
set "T=10" :: Length of output video
ffmpeg -i %IN% -vf lut3d="%LUT%" -t %T% -y %OUT%
pause
```

You can also show the video simultaneously before and after applying the LUT. The scale filter is used to reduce the size to $\mathbf{5 0 \%}$, and the hstack filter is used to combine two videos side by side.

```
set "IN=my_video.mov" :: Input video
set "LUT=my_lut.cube" :: Look-Up-Table
set "OUT=out.mov" :: Output video
set "T=10" :: Length of output video
ffmpeg -i %IN% -filter_complex scale=iw/2:ih/2,split[a][b];[b]lut3d="%LUT%"[c];[a][c]hstack -t %T% -y %OUT%
pause
```

## Some notes about paths and filenames under Windows:

This doesn't work because the colon ":" isn't escaped properly and the filter regards the path as two separate filter parameters:

```
lut3d=C:/test/test.cube
Instead use one of these solutions
```

```
lut3d=C\\:/test/test.cube // don't use '' but escape twice
```

lut3d=C<br>:/test/test.cube // don't use '' but escape twice
lut3da'C\//test/test.cube'
lut3da'C\//test/test.cube'
// use '' and escape once

```
// use '' and escape once
```

Here is a converter for different types of color-look-up-tables:
https://grossgrade.com/en/downloads-en/

This software can also fit colors to a ColorChecker:
https://www.xrite.com/service-support/downloads/c/colorchecker_camera_calibration_v1_1_1
But it has two severe drawbacks:

1. It requires a DNG image as input. That's no problem for photography, but there's no way to extract a DNG from a video.
2. The output of this software is a camera profile in Adobe *.dcp format and I don't know how this can be converted into a CLUT for FFmpeg.

### 19.1 Known problems and solutions

Problem: Error message "MSVCP120.dII" and "MSVCR120.dII" missing when running 3D Lut Creator on Windows 10
Solution: Install either Visual Studio 2013, or the Visual-C-2013-Redistributable Package

Problem: When you drag and drop an image to 3D Lut Creator, the image doesn't become visible in 3D Lut Creator.
Solution: Preferences --> Integration --> Remove the tick at "Enable Open CL"

Another tool for color grading is "Grossgrade" which is available here: https://grossgrade.com/en/

### 19.2 Beginner tutorials for 3D LUT Creator

1. What is the LUT? https://www.youtube.com/watch?time_continue=2\&v=3ZpbUOGDWLE

This video explains 1D and 3D LUTs. 3D LUT Creator can save LUTs in many different formats, including *.cube and *.png
2. Working with LUTs in Photoshop and 3D LUT Creator https://www.youtube.com/watch? time_continue=7\&v=KOt-HSO-OUU
3. Working with Lightroom and 3D LUT Creator https://www.youtube.com/watch?v=0968FH1kV3w
4. Working with the Image window https://www.youtube.com/watch?v=TmZAITX5tfU

The working image can be loaded by drag and drop.
For an optional reference image use "File / Load Reference Image".
In the video he says you can toggle between working image and reference image by pressing the = key, but that's wrong. It's the + key.
CTRL + Zoom in CTRL - Zoom out
For moving the image in the window, press the mouse wheel and move the mouse.++
"Image / Assign Color Profile" doesn't change the image, it changes only the way how the image is displayed.
"Image / Convert to Profile" does change the image.
Toggle the compare mode by pressing the c key.
By pressing the $\mathbf{x}$ key the image is split in the middle, one half is before and the other is after.
By pressing the $\mathbf{v}$ key you can toggle between horizontal and vertical splitting.
5. Look manager https://www.youtube.com/watch?v=dY_6MeE-gAg

Window / Look Manager
Open a folder to see all presets applied to your image.
The size of the images can be changed with the + and - buttons in the top left corner.
6. Working principle of $A / B$ and $C / L$ color grids https://www.youtube.com/watch?v=AiSYkjdDdqs

In the A/B grid we can change only hue (position angle) and saturation (radial distance from center). Lightness stays unchanged.

In the C/L grids we can change only saturation (left - right, neutral in center) and lightness (vertical).
7. HSP and LAB color models https://www.youtube.com/watch?v=mJfEgvheWeM

In this video he explains the difference between the different HSP color models, and which model to use for which purpose.
8. LXY, MXY, MABe, MXYe, SXY, YUV, CMYK and RGBW color models https://www.youtube.com/watch?v=7uC1vtS1BnU
9. The Luminance curve and the Brightness slider https://www.youtube.com/watch?v=BBjY3ivCjPg
10. Saturation curves https://www.youtube.com/watch?v=TnUp3Dsb_DU
11. Basics of working with the A/B color grid https://www.youtube.com/watch?v=35EoR_c4D9w
12. Practice with A/B color grid, part 1 https://www.youtube.com/watch?v=BYe VOUF5os
13. Practice with A/B color grid, part 2 https://www.youtube.com/watch?v=dR4pjHRpUOY
14. Tools for working with the A/B color grid https://www.youtube.com/watch?v=etIX_e8-lk
15. Batch processing in 3D LUT Creator https://www.youtube.com/watch?v=1wv1NqXywiY

### 19.3 Advanced tutorials for 3D LUT Creator

1. Color Match with the Reference image https://youtu.be/kOYQNm7TINM
2. How to create 3D LUT files from Lightroom presets or Photoshop Plugins https://youtu.be/MOiEciUlISU

This is the custom ColorChecker file for the cheap chinese ColorChecker, using the RGB values printed on teh back side and converted to LAB. Save this file as "MyColorChecker.txt". The differences to the original X-Rite ColorChecker seem to be quite small.

Color converter for different color spaces: https://www.nixsensor.com/free-color-converter/

The software is available here and the installation is quite simple: https://obsproject.com/
Wiki: https://obsproject.com/wiki/
After installation, OBS first asks some questions that I don't remember exactly. But they are important because they are used to make many basic settings. So you should answer the questions as good as possible.

In OBS you can see the black window at the top, this is the area that will be streamed. Set the size of this area to the maximum value that your streaming target accepts, for example 1280x720 for Facebook Live.
Important is the "Sources" window. Here you can specify one or more sources to be displayed in the black window. Click on the "+" icon at the bottom of the "Sources" window. A long list of possibilities appears. The most important are these four:

- Image, for example a background image with a logo.
- Display Capture, that means the whole display area is copied
- Window Capture, that means the window from one application (for example SharpCap) is copied
- Video Capture Device, for example a webcam

The most important thing is "Window Capture", so I choose that one. You can now specify which window should be taken (SharpCap). Of course the SharpCap window must already exist, so SharpCap must have been started before. You can now see a copy of the SharpCap window at the top of the black window. You can drag the size and position with the mouse as you like. Only the black area will be visible later. If you move the SharpCap window out to the side, diagonally striped areas appear which would not be visible in the stream.
In the "Sources" window there is an "Eye" icon to the right of "Window Capture", so you can switch the visibility on and off.
If you don't want to copy the whole SharpCap window but only a part of it, it works like this: In the "Sources" window, right-click on "Window Capture" and then select "Filters". Click on the " + " icon at the bottom left and then select the "Crop/Pad" filter. Now you can set the four values left, top, right and bottom as you like. Then click on "Close".
My "Crop" values for SharpCap: 1, 50, 640, 248
My video resolution in SharpCap: $2560 \times 1440$, binning=2 (which gives 1280×720)
You can also create multiple sources in the "Sources" window. The order determines what is hidden by whom. You can change the order by right clicking --> Order. So you could e.g. add a "Video Capture Device" source and display it in the lower right corner of the black window, so that you can see yourself while you are talking. If the webcam video is to be displayed in the foreground (i.e. in front of the SharpCap window), then it must be in first place in the "Sources" window. If it is not, you have to change the order.

In OBS there is also the "Audio Mixer" window. Here you can see the levels of all audio sources, and below that there are sliders to adjust the sensitivity. The level should rarely go into the red area, and never to the right stop.
OBS also offers the option of not streaming, but simply recording a video, by clicking "Start recording" in the lower right corner. This is useful for testing. You can watch the just recorded video with File --> Show Recordings ( R ). The videos are saved in the folder Username / My videos

### 20.1 OBS - Problems and solutions

- How can you test in advance if everything works properly without everyone seeing it live on Facebook? There are two possibilities: a) In OBS you don't click on "Start Streaming" but on "Start Recording". Then only a video will be recorded, which you can watch afterwards. b) You can broadcast the stream live to Facebook, but set the target group in Facebook to "Only me" so that no one else can see it. But this is only possible on your own Facebook page.
- Problem: The viewer can't see the mouse pointer. Solution: Two conditions must be met for the mouse pointer to be visible to the viewer. 1. in the properties of the Window Capture (right click on it, Properties) the checkbox "Record mouse pointer" must be checked. 2. The mouse pointer is only visible to the viewer if it is over the source window and if this window is active (i.e. it must be clicked). In Windows only one window is active at a time. If you move the mouse pointer over the OBS window and try to show something there, the viewers can't see the mouse pointer!
- What's with the "Scenes"? One scene is basically always present. You can add more scenes (click on the "+" icon below, then give it a meaningful name). Now you can see what it is all about. You can click on the scenes and then the black window changes. The second scene has no sources yet, so the whole window is black. Each scene can have its own sources (which can be the same or different), and you can also arrange the windows in each scene differently. During the presentation, you can switch back and forth between the scenes by clicking on the corresponding scene in the "Scenes" window. Strangely enough, this doesn't work if you click on the ${ }^{\wedge} \mathbf{v}$ icons below (I don't know what this is supposed to do).
- How do you switch back and forth between different scenes quickly and easily? You can do that by clicking on the appropriate scenes in OBS You can also define hotkeys in OBS. You have to be careful that you only use hotkeys that have no function in the other programs used (here: SharpCap). I have now created three scenes for example. In the hotkey list there is an entry "Scene name / Switch to scene" for each scene. There I have entered 1, 2, or 3 . Now I can select the corresponding scenes by pressing the buttons 1, 2 or 3 . Interestingly, OBS even detects the keypress when it is not active and in the background.
- The image from the webcam is reversed. How do you correct this? Solution: Right click on "Video Capture Device", then "Transform" and "Flip Horizontal".
- The image (or Window capture or Video capture Device) is displayed too small or in the wrong place in the black window. Solution: Simply move or drag the size with the mouse.
- The image (or Window capture or Video capture Device) is displayed too large in the black window so that only a partial area is visible. You cannot make it smaller with the mouse, because the right border isn't visible at all. How can you adjust it to the visible area? Solution: Right click on the corresponding entry in the "Sources" window, then Transform --> Fit to screen
- OBS also works (in contrast to the simple operating mode with Facebook) with cameras that are not listed under "Image processing devices" in the control panel but instead under "USB controllers", for example the uEye UI-1240ML camera from IDS and the STC-TB33USB camera from Sentech. You only have to install the drivers for the cameras (from the manufacturer's website, after registration) and can then use them directly as "Video Capture Device", i.e. you don't need to run any third-party software (like SharpCap). With these cameras you can set the exposure manually. If someone is interested: I have some of both cameras in stock. The IDS camera has $1280 \times 1024$ pixels at 25.8 fps and the Sentech STCTB33USB has $640 \times 480$ pixels at 60 fps, both cameras are monochrome. IDS has a metal housing with a C-mount connector, while Sentech STCTB33USB is just an electronic module without a housing (i.e. you have to build a housing around it yourself).
- How do you record a presentation to review and then upload it to Facebook? Solution: In OBS you don't click on "Start Streaming" but on "Start Recording". Then a video is recorded which you can watch afterwards. You can also stream and record simultaneously with OBS.
- How can you insert a mouse pointer into a video in postprocessing to explain something? Example: https://www.youtube.com/watch? $\mathrm{v}=5 \mathrm{QR} \times 4 \mathrm{GRNxSU}$ Solution: Two sources are added to OBS: 1. a Window Capture pointing to the VLC player. 2. An Audio Output Capture where you select the built-in speakers as the device. It is useful to work with two screens. If one screen is used, the VLC Player runs in full screen mode without any menus. In this window you can explain things with the mouse pointer. On the second screen OBS is running. First you start the video in the VLC Player. Then rewind to the beginning and stop it immediately with the space key. Then you start the recording in OBS. Then you start the video in the VLC Player.
- How to apply a LUT to the video capture device? Right click on the video capture device in the "sources" window, choose "Filters", then click on the " + " icon below the "Effect filters" window and select "Apply LUT". Then enter the path to the LUT file which can be a *.cube file. Don't forget to activate the filter by clicking on the icon left of "Apply LUT".

### 20.2 CPU Load

I've been experiencing audio blackouts. This was not a bandwidth problem when transferring to Facebook, because the same problem occurred when I only recorded the video in OBS.
It turned out that the CPU load was too high. The problem could be mitigated by limiting the framerate to 4 or 8 fps in SharpCap and setting 10 fps in OBS (Settings -> Video). With these settings I see in the Task Manager about 25\% CPU load for SharpCap, 20-25\% for OBS and about 20\% for a total of 6 Firefox processes. That's only about $70 \%$, but even with that there are still short dropouts in the sound. So note: It is recommended to have the Task Manager open on a second screen and keep an eye on the CPU load. The peak load is higher than what you see in the y,t diagram. Rough thumb value: The average value should not exceed 50\%.

You can create a shortcut to the Task Manager on the (Windows 7) desktop as follows:
Right click on a free space on the desktop, then New --> Shortcut and then enter "\%SYSTEMROOT\%lsystem32ltaskmgr.exe".
You can create a shortcut to the Device Manager on the (Windows 7) desktop as follows:
Right mouse click on a free space on the desktop, then New --> Shortcut and then enter "\%SYSTEMROOT\%lsystem32ldevmgmt.msc".

## 20.3

## Facebook Live

This chapter is about live presenting of astronomical contents in Facebook Live. Because my Facebook account is set to german language, I'm not sure how some things are called in the english version. I add the german terms in [brackets].
On your own Facebook page there is a menu item "Live-Video" to the right of "Create Post" [Beitrag erstellen]. If you click on it, you can choose between "Camera" [Kamera] and "Connect" [Verbinden]. These are two fundamentally different modes of operation.
First of all: I also get a message "Try Live Producer" [Live Producer ausprobieren]. This didn't work properly for me under Windows 7 and can be clicked away. In the following chapters I describe the two operating modes "Camera" and "Connect".

### 20.4 Facebook Live - Mode "Camera"

"Camera" [Kamera] is the simpler of the two operating modes. Either the camera built into the notebook is used, or an external webcam connected via USB. Picture and sound is transferred from the browser (or probably by a hidden Javascript) to Facebook. No additional software is required.
In the right window some settings have to be made:

- "Select where you want to post your live broadcast:" [Wähle aus, wo du deine Live-Übertragung posten möchtest:] is set to "Share in your timeline" [In deiner Chronik teilen], or "Share on a page you manage" [Auf einer Seite, die du verwaltest, teilen].
- At "Say something about this live video" [Sag etwas über dieses Live-Video] you can write something meaningful into it. The audience can see this text.
- Below this you set who can see the live video. For the first test it makes sense to set "Only me" [Nur ich]. Later, when you have gained enough experience and are sure that everything works, you can set "Friends" [Freunde] or "Public" [Öffentlich].
- Below that you can select which camera and microphone is used. If only one camera or only one microphone is available, there are of course not many options to choose from.
- At "Title" [Titel] you set a meaningful headline. The audience can see this headline.
- At the very bottom, the "Go Live" [Live gehen] button starts the live broadcast (after a countdown 3-2-1) and at the same place a red "Stop Live Video" [Live-Video beenden] button appears, which allows you to stop the broadcast at any time.

This mode is only useful for shots that have a normal contrast range, e.g. when you sit in front of the camera and talk about something. Simple webcams have an automatic gain control which unfortunately cannot be deactivated. For objects with a high contrast range, e.g. moon or Venus through the telescope, the automatic gain control fails. The bright parts of the image are totally overexposed.

Not all webcams are suitable. Facebook seems to have problems with such cameras that are not listed in the Windows Device Manager under "Image Processing Devices" [Bildverarbeitungsgeräte] but under "USB Controller". This applies, for example, to the uEye UI-124xML camera from IDS and the STC-TB33USB from Sentech. This is unfortunate, because with these cameras you can manually adjust the exposure.

### 20.5 Facebook Live - Mode "Connect"

"Connect" [Verbinden] is the more complicated operating mode, but it offers much more possibilities. The transmission of audio and video to Facebook isn't done by the browser, but by a special streaming software that you have to install first. There are many streaming applications available. I use OBS (Open Broadcaster Software).
After clicking on the menu item "Live Video" on your Facebook page to the right of "Create Post" [Beitrag erstellen] and then on "Connect" [Verbinden] at the top, you will see a page with the title "Connect your Live Stream to the Live API" [Verbinde deinen Live Stream mit der Live API]. You have to make some settings on the right:

- "Select where you want to post your live broadcast:" [Wähle aus, wo du deine Live-Übertragung posten möchtest:] is set to "Share in your timeline" [In deiner Chronik teilen], or "Share on a page you manage" [Auf einer Seite, die du verwaltest, teilen] and below that, the correct page is selected.
- At "Say something about this live video" [Sag etwas über dieses Live-Video] you can write something meaningful into it. The audience can see this text.
- Below this you set who can see the live video. For the first test it makes sense to set "Only me" [Nur ich]. Later, when you have gained enough experience and you are sure that everything works, then you set "Friends" [Freunde] or "Public" [öffentlich]. On some Facebook pages it's not possible to select "Only me" [Nur ich], i.e. everything that is streamed there is visible to everyone. For testing you therefore better use your own Facebook page first.
- At "Title" you set a meaningful headline. The audience can see the headline.

The "Stream Key" [Stream-Schlüssel] is displayed on the left side of the page. If you click on "copy" [kopieren] to the right of it, this key is copied to the clipboard.
This key must now be entered into OBS under Settings (this is in the lower right corner) --> Stream --> Stream Key [--> Stream --> Streamschlüssel]. If there is already a key in there, it can be overwritten. Then click on "Start Streaming" [Stream starten] and switch back to Facebook in the browser window. This will take a few seconds, and then the streamed video sent from OBS will appear in the browser. What you see here is a few seconds delayed. You can move the scrollbar down to see the whole video. But so far this is only a preview, which is not yet broadcasted live.
Before you start the live broadcast, you select the entry scene in OBS, for example your background logo.
At the bottom right of the Facebook page is the "Go Live" [Live gehen] button. This starts the live broadcast and a red "Stop Live Video" [Live-Video beenden] button appears at the same place, so you can stop the broadcast at any time.

You now switch to the OBS window and start the live broadcast. You can switch back and forth between different scenes. I have used the following scenes so far:

- Background image with observatory logo
- SharpCap window, cropped to hide the menues
- SharpCap window, additionally a small video overlay in the lower right corner where I'm seen while I'm talking (comes from the webcam built into my notebook)
- A window with a star chart (Guide 9.1)
- other images that l've taken in advance

During the live presentation you can operate the camera, move the telescope, change exposure time or gain, and you can also use the cursor to explain things.

Important: If you want to explain something with the mouse pointer, the mouse pointer must not be over the OBS window, but over the source window (e.g. SharpCap or Guide 9.1). If you try to explain something with the mouse pointer in the OBS window, the audience cannot see the mouse pointer!

Therefore it's advisable to move the OBS window to a second screen.

### 20.6 YouTube Live

- Log into your YouTube account
- Click the "Create Video" button
- Click on "Go Live" [Livestream starten]
- Select "New Stream" and fill in the requested fields
- Click on "Create Stream"
- Click on "Copy" [Kopieren] right of "Stream Key (paste in encoder)" [Streamschlüssel (in Encoder einfügen)]
- Paste this key in OBS and start streaming
- Click the "Go Live" [LIVESTREAM STARTEN] button.

Youtube Live is complicated. I don't like the user interface. It's very complicated to find the menue where you can delete your own test videos. Facebook Live has better user interface.

See also: http://johnriselvato.com/ffmpeg-how-to-obtain-a-youtube-streaming-key/
See also: http://johnriselvato.com/ffmpeg-how-to-stream-a-file-to-youtube/

### 20.7 Desktop for live broadcasting

- It is advisable to connect a second screen to the notebook. Then you can leave the windows that should be visible to viewers on the notebook screen, while on the second screen you have the OBS window and additionally the task manager to control the CPU load. The second screen is
set up via Control Panel --> Hardware and Sound --> Connect to a projector --> Advanced or alternatively via a function key on the notebook (tht depends on the notebook)
- Secure all (USB) cables with clamps to prevent loose contacts during broadcasting
- The neighbours are a nuisance, as they start lawnmowers or garden shredders in the middle of the live broadcast. I have no solution :-(
- Viewers can write comments and ask questions during the live presentation. But those who do the presentation don't see them, because they are fully occupied with narration and have to switch back and forth between the SharpCap and OBS windows. It is absolutely impossible to have the browser window with Facebook in view at the same time. The only solution is to divide the work: a second person must have a look at the Facebook page at the same time in order to answer questions promptly.
- Problem: The WLAN does not reach far enough to where the transmission is to be made, and there is no LAN cable of the required length available. Solution: Use RG-59 coaxial cable ( $75 \Omega$ ) or the white $75 \Omega$ antenna cable. At each end the shielding is removed over a length of 4 cm . So the inner conductor protrudes 4 cm at the end of the cable. The insulation of the inner conductor does not need to be removed. This is a $1 / 4$ wave antenna. One end is placed close to the WLAN device (a few centimeters next to the transmitting antenna) and the other end is placed near the notebook.

### 20.8 Live broadcasting, or recording in advance?

What's better, a live broadcast or a recording that is sent with a time delay?
Recording in advance has several advantages:

- You can repeat the recording if something went wrong
- You can upload the recorded video both to Facebook and to the YouTube channel
- Sometimes Facebook Live doesn't seem to work at all, an error message appears when you click on "Go Live" (although the stream is already running and the preview is visible in Facebook), with a note that you should try again. But after the 10th try I gave up and instead made a recording.
- OBS can also be used to stream and record a video simultaneously. Just click on "Start Stream" and "Start Recording" one after the other. But you have to keep an eye on the CPU load.
Whether live broadcast or recording, OBS is the appropriate tool to create a broadcast that uses different sources.

### 20.9 Using the same source multiple times

It's possible to use the same video source multiple times. For example you can crop and enlarge multiple regions from the same source and show them in the output.

The trick is to add the source to a group and apply the (crop) filters to the groups instead of the source.

## 21 Tips and tricks for video

- Learn by analyzing other videos and films
- Use a variable neutral density filter, so that you can use wide open aperture for narrow depth of field
- Always record 3 seconds before the action begins and also 3 seconds after action has ended.
- Use a good tripod for video. A recommended manufacturer is Sachtler.
- Interviewing two people: Record one from the left and the other from the right.
- Know your camera before you begin to record videos.

Cinema advertizing: DCP format (Digital Cinema Package), see also https://dcpomatic.com/

## Checklist:

- Is the focus correct?
- Is the exposure correct? Check with a 18\% graycard.
- Is the sound recorder set to the correct level?
- Camera running
- Sound recorder running
- Synchronization signal
- Wait 3 seconds
- Action

Wait 3 seconds

- Stop camera and sound recorder

### 21.1 Neutral Density Filters

| ND <br> Optical <br> Density | f-stops | Transmission | Filter type | Exposure time factor <br> (Sometimes also called <br> "ND...") |
| :--- | :--- | :--- | :--- | :--- |
|  | 0 | $100 \%$ |  | 1 x |
| 0.3 | 1 | $50 \%$ | 101 | $2 x$ |
| 0.45 | 1.5 | $35 \%$ |  | $2.8 x$ or $3 x$ |
| 0.6 | 2 | $25 \%$ | 102 | $4 x$ |
| 0.9 | 3 | $12.6 \%$ | 103 | $8 x$ |
| 1.0 | 3.33 | $10 \%$ |  | $10 x$ |
| 1.2 | 4 | $6.3 \%$ | 104 | $16 x$ |
| 1.5 | 5 | $3.125 \%$ | 105 | $32 x$ |
| 1.8 | 6 | $1.6 \%$ | 106 | $64 x$ |
| 2.0 | 6.67 | $1 \%$ |  | $100 x$ |
| 2.1 | 7 | $0.78 \%$ | 107 | $128 x$ |
| 2.4 | 8 | $0.39 \%$ | 108 | $256 x$ |
| 2.6 | 8.67 | $0.25 \%$ |  | $400 x$ |
| 2.7 | 9 | $0.2 \%$ | 109 | $512 x$ |
| 3.0 | 10 | $0.1 \%$ | 110 | $1000 x$ or $1024 x$ |
| 3.3 | 11 | $0.05 \%$ | 111 | $2000 x$ or $2048 x$ |
| 3.6 | 12 | $0.024 \%$ | 112 | $4000 x$ or $4096 x$ |
| 3.9 | 13 | $0.012 \%$ | 113 | $8000 x$ or $8192 x$ |
| 4.0 | 13.33 | $0.01 \%$ |  | $10000 x$ |
| 4.2 | 14 | $0.006 \%$ | 114 | $16000 x$ or $16384 x$ |
| 4.5 | 15 | $0.003 \%$ | 115 | $32000 x$ or $32768 x$ |
|  |  |  |  |  |
|  |  |  |  |  |

| 5.0 | 17 | $0.001 \%$ | 117 | 100000 x |
| :--- | :--- | :--- | :--- | :--- |
| 6.0 | 20 | $0.0001 \%$ | 120 | 1000000 x |
| 7.0 | 23 | $0.00001 \%$ | 123 | 10000000 x |
| 8.0 | 27 | $0.000001 \%$ | 127 | 100000000 x |

Transmission $=100 \% / \mathbf{2}^{\wedge}(f-$-stop $)$

Note: "ND4" can mean two different things:

- A filter with 13 f-stops which has $0.01 \%=1 \mathrm{e}-4$ transmission, this is thewidely accepted definition
- A filter with 2 f-stops which has $\mathbf{2 5 \%}=\mathbf{1 / 4}$ transmission, I saw this definition for chinese filters

## 23 Unix (Ubuntu), compiling FFmpeg

Unix is very different when you're coming from Windows, and unfortunately you need a lot of time to get familiar with it. It's a totally different world. Warning: Everything in this chapter might be wrong.

Some useful Unix (Ubuntu) commands:

| Command | Description |
| :--- | :--- |
| \$ apt-get install ffmpeg | Install FFmpeg (but this might not be the latest version!) <br> Problem: Error messages "Could not open lock file /var/lib/dpkg/lock-frontend - open (13: Permission <br> denied)" or "Unable to acquire the dpkg frontend lock (/var/lib/dpkg/lock-frontend), are you root?" <br> Solution: This happens when you haven't used the computer for a long time, and now many upgrades are <br> automatically running in the background. Just wait a few hours and restart the computer a few times... <br> hopefully the problem will disappear. |
| \$ git clone <br> http: //git. ffmpeg.org/ffmpeg.git | Download the FFmpeg source code (write all in one line). Unfortunately the source code is badly <br> commented (at least those files that I had a look at). |
| $\$$ cd ffmpeg | Go to the ffmpeg folder. |
| $\$ . /$ configure | "configure" is a script file in the ffmpeg folder. You must run it before building FFmpeg. <br> Please note that if you use configure without any options, onla a very basic FFmpeg version will be <br> created and many features are disabled. For example PNG as output format isn't possible. <br> Question: What does the configure script do, what's its output file? |
| \$./configure --list-encoders | This command lists all encoders that can be enabled. |
| $\$ . /$ configure --enable-encoder=png | This command does for example enable the png encoder. Well, only theoretically. In the real world you <br> get the error message "Warning: Disabled png_encoder because not all dependencies are satisfied: zlib". |
| $\$$ sudo apt-get install zlib1g-dev | This installs the "zlib" library, which is required for the png encoder. |
| $\$ . / c o n f i g u r e ~--e n a b l e-z l i b ~$ | This command enables all features that are possible with the "zlib" library (not only the png encoder). |
| $\$$ make | These two commands are required for building FFmpeg. The "make" command may take 30 minutes or |

[^4]$\left.\left.\begin{array}{|l|l|}\hline \text { \$ sudo make install } & \begin{array}{l}\text { so, if you have changed the configuration. } \\ \text { For detailed instructions see also } \underline{\text { https://trac.ffmpeg.org/wiki/CompilationGuide/Ubuntu }} \\ \text { Question: In which folder is the executable file ffmpeg.exe? It must be somewhere, but I can't find it. }\end{array} \\ \hline \text { \$ sudo apt install vlc } & \text { Install VLC player (or any other program) What's the difference to apt-get? }\end{array} \right\rvert\, \begin{array}{l}\text { Makes a script file executable. Unix script files have no extension. The first line in the script file must } \\ \text { contain: \#!/bin/bash } \\ \text { Problem: Error message: "bash: ./test: /bin/bash^M: bad interpreter: No such file or directory" } \\ \text { Solution: Most probably the batch file came from Windows and has a carriage return character in } \\ \text { addition to In at the end of the lines. This can be corrected with the next command. }\end{array}\right\}$

### 23.1 GIT

Warning: Don't use this chapter for learning anything about GIT. I never really figured out how GIT works, and everything in this chapter might be wrong.
Sadly, this link does best describe my experience with GIT: https://m.xkcd.com/1597I It's so true. Delete the project and download a fresh copy. I can't remember how many times I have done that

Install GIT, if it isn't yet installed:
\$ apt-get install git-core
How to change something in the FFmpeg documentation and how to use GIT? This example is from Carl Eugen Hoyos 27.9 .19 in the FFmpeg user mailing list:

```
$ git clone http://git.ffmpeg.org/ffmpeg.git
```

\$ cd ffmpeg
edit a file in the doc directory.
\$ git commit doc
(I suspect this will ask you to set your name and email when running
it for the first time)
\$ git format-patch HEAD^
This produces a file that you can send to the mailing list after
visual inspection for commit message and your name
\$ git reset HEAD^

Here is a page with instructions for GIT http://www.ffmpeg.org/git-howto.html but unfortunately it's not written in a way a beginner can understand.
A tutorial for GIT (in german language) is here https://open.hpi.de/courses/git2020 and the required time is estimated as 2-5 hours per week over $\mathbf{4}$ weeks.
Another tutorial for GIT: https://cworth.org/hgbook-git/tour/
Another tutorial (in german): https://www.dev-insider.de/git-und-die-wichtigsten-git-befehle-kennenlernen-a-720311/

The following workflow seems to work, but I don't really understand what l'm doing:

```
$ git clone http://git.ffmpeg.org/ffmpeg.git
$ cd ffmpeg
(now edit something in the file libavfilter/vf_v360.c)
Now you can use one of these two possibilities:
    1. $ git add libavfilter/vf_v360.c
        $ git commit
    2. $ git commit -a
```

The resulting file is written to a hidden folder. Very confusing! You must enable "Show Hidden Files" in the GUI!
\$ git format-patch HEAD^
This command opens an editor where you can insert the commit message. Then it produces a file in the current folder (should be ffmpeg) and this file can be sent to ffmpeg-devel@ffmpeg.org (In an e-mail? Or as an attachment? I don't know.)

The meaning of the $\wedge$ character after HEAD is difficult to understand. It is part of the specification of the commit range. The commit range is specified as $a$ half-open range ( $a, b$, $c$ ] which means only $b$ and $c$ are in the range. In the above example HEAD^ is the commit before the commit where HEAD is pointing to. Which means the new commit contains all changes that were made after the last commit. (Did I understand this? No.)

## Not yet tested:

## \$ git reset

This removes the commits from the history, but the files stay unchanged.
\$ git reset --hard HEAD^
This reverses all changes in all files since the last commit. Only untracked files stay unchanged.
With other words: With this command you get one step back. The command can be used multiple times, if required.
\$ git reset --hard origin/master
This command sets the branch back to the last synchronized state.
FFmpeg: Handle (apply and undo) patches from an email: http://www.das-werkstatt.com/forum/werkstatt/viewtopic.php?f=24\&t=2002
My summary for GIT:
C programming is fun, but GIT is extremely complicated and no fun at all. I don't want to use it.

## 23.2

## Compiling FFmpeg under Windows

This is very complicated, and I decided not to give it a try. There are several projects on github that might be helpful: https://github.com/rdp/ffmpeg-windows-build-helpers
https://github.com/m-ab-s/media-autobuild_suite

## 24

 Cameras and lenses for fulldome video production|  | Canon 6D | Panasonic LUMIX GH5S | PanoView XDV360 | Kodak SP360_4K |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
| Fulldome resolution | $\begin{array}{ll}180^{\circ}: & 3648 \times 3648 \text { (Pictures) } \\ 180^{\circ}: & 1080 \times 1080 \text { (Video) }\end{array}$ | $\begin{array}{ll} 180^{\circ}: & 2880 \times 2880 \text { (Pictures) } \\ 180^{\circ}: & 2496 \times 2496 \text { (Video) } \end{array}$ | $\begin{array}{ll} 220^{\circ}: & 2448 \times 2448 \\ 180^{\circ}: & 2104 \times 2104 \end{array}$ | $\begin{array}{ll} 235^{\circ}: & 2880 \times 2880 \\ 180^{\circ}: & 2456 \times 2456 \end{array}$ |
| Sound recording | stereo 48000 Hz , but both channels are identical, if no external microphone is connected | stereo 48000 Hz , but both channels are identical, if no external microphone is connected | mono 8000 Hz , there is no connector for an external microphone | stereo 48000 Hz , but both channels are almost equal because the microphones are close together; no connector for external microphones |
| Suitable for fulldome video? | yes, if a fisheye lens is used which has a $180^{\circ}$ image diameter less than 20.2 mm | yes, if a fisheye lens is used which has a $180^{\circ}$ image diameter less than 13.0 mm | yes | yes |
| Suitable for fulldome video at night? | yes | yes, very good | no, too much noise | no, too much noise |
| Suitable for fulldome timelapse? | yes, arbitrary interval times with external timer | yes, arbitrary interval times with external timer | yes, with internal timer | yes, with internal timer |

## 24.1

Problem: A full format chip has the size $36 \mathrm{~mm} \times 24 \mathrm{~mm}$ and thus the format $3: 2$. For video recording, however, the format $16: 9$ is used, so that only a part with the dimensions $36 \mathrm{~mm} \times 20.25 \mathrm{~mm}$ is read out. But as a full format fisheye normally illuminates a 24 mm diameter circle, there are two strips missing at the top and bottom of the video.
If the entire image circle of the fisheye lens is to be recorded in the video, the image circle diameter of the lens must not be greater than the read-out height of the chip at the set video resolution.

| Camera | Chip Size | Pixels | Video Resolution | Read-out Part of the Chip, Width x Height |
| :---: | :---: | :---: | :---: | :---: |
| Canon 6D | $35.8 \mathrm{~mm} \times 23.9 \mathrm{~mm}$ | $5472 \times 3648$ | $640 \times 480$ (4:3) | $31.87 \mathrm{~mm} \times 23.9 \mathrm{~mm}$ |
| Canon 6D | $35.8 \mathrm{~mm} \times 23.9 \mathrm{~mm}$ | $5472 \times 3648$ | $1920 \times 1080$ Full HD (16:9) | $35.9 \mathrm{~mm} \times 20.19 \mathrm{~mm}$ |
| Canon 5D MK4 | $36 \mathrm{~mm} \times 24 \mathrm{~mm}$ | $6720 \times 4480$ | $1920 \times 1080$ Full HD (16:9) | $36 \mathrm{~mm} \times 20.25 \mathrm{~mm}$ |
| Canon 5D MK4 | $36 \mathrm{~mm} \times 24 \mathrm{~mm}$ | $6720 \times 4480$ | $4096 \times 2160$ C4K (17:9) | $21.94 \mathrm{~mm} \times 11.57 \mathrm{~mm}$ (Not the whole chip width is used) |
| Canon 7D | $22.3 \mathrm{~mm} \times 14.9 \mathrm{~mm}$ | $5184 \times 3456$ | $1920 \times 1080$ Full HD (16:9) | $22.30 \mathrm{~mm} \times 12.54 \mathrm{~mm}$ |

Effective chip size of GH5S with $0.64 \times$ SpeedBooster, in FHD or 4K mode: $29.37 \mathrm{~mm} \times 16.56 \mathrm{~mm}$
Effective chip size of GH5S with $0.64 x$ SpeedBooster, in Anamorphic 4:3 mode: $27.03 \mathrm{~mm} \times 20.31 \mathrm{~mm}$

### 24.2 Overview of available fisheye lenses

| Lens | Mount | Aperture | Image Angle and Image Circle Diameter |  | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Canon EF $8-15 \mathrm{~mm}$ at 8 mm | Canon EF | f/4.0 | $180^{\circ} 22.9 \mathrm{~mm}$ (measured myself) |  | Very good image quality |
| Sigma EX DG 8mm | Canon EF ... | f/3.5 | $180^{\circ} 22.7 \mathrm{~mm}$ (measured myself) |  | Mediocre image quality |
| Nippon Kogaku 8mm | M42 / Canon EF | f/2.8 | $180^{\circ} 23.0 \mathrm{~mm}$ (measured myself) |  | M42 mount with adapter to Canon EF |
| Sigma EX DG 4.5mm | Canon EF ... | f/2.8 | $180^{\circ} 12.3 \mathrm{~mm}$ (measured myself) |  | Mediocre image quality |
| Meike 6 -11mm at 6 mm | Canon EF ... | f/3.5 | $180^{\circ} 15.1 \mathrm{~mm}$ (measured myself) |  | Good image quality |
| Meike $6-11 \mathrm{~mm}$ at 7.5 mm | Canon EF ... | f/3.5 | $180^{\circ} 18.4 \mathrm{~mm}$ (measured myself) |  | Good image quality |
| Meike $6-11 \mathrm{~mm}$ at 9.5 mm | Canon EF ... | f/3.5 | $180^{\circ} 23.7 \mathrm{~mm}$ (measured myself) |  | Good image quality |
| Meike $\mathbf{6 - 1 1 \mathrm { mm } \text { at } 1 1 \mathrm { mm }}$ | Canon EF ... | f/3.5 | $180^{\circ} 28.7 \mathrm{~mm}$ (measured myself) |  | Good image quality |
| Meike 8mm | Canon EF ... | f/3.5 | $180^{\circ}$ approx. $26.9 \mathrm{~mm} \quad 200^{\circ}$ approx. 29.9 mm |  |  |
| Opteka 6.5mm | Canon EF | f/3.5 | $180^{\circ}$ approx. 30 mm |  | Bad image quality, true focal length is about 9 mm |
| Entaniya HAL250 6.0 mm | Canon EF ... | f/5.6 | $180^{\circ} 18.2 \mathrm{~mm}$ | $250^{\circ} 23.7 \mathrm{~mm}$ | Only suitable for mirrorless cameras, very expensive |
| Entaniya HAL250 4.3 mm | Canon EF ... | f/4.0 | $180^{\circ} 13.1 \mathrm{~mm}$ | $250^{\circ} 17.0 \mathrm{~mm}$ | Only suitable for mirrorless cameras, very expensive |
| Entaniya HAL250 3.6 mm | Canon EF ... | f/2.8 | $180^{\circ} 11.0 \mathrm{~mm}$ | $250^{\circ} 14.25 \mathrm{~mm}$ | Only suitable for mirrorless cameras, very expensive |
| Entaniya HAL250 3.0 mm | Canon EF ... | f/2.8 | $180^{\circ} 9.2 \mathrm{~mm}$ | $250^{\circ} 11.9 \mathrm{~mm}$ | Only suitable for mirrorless cameras, very expensive |
| Entaniya HAL200 6.0 mm | Canon EF ... | f/4.0 | $180^{\circ} 18.2 \mathrm{~mm}$ | $200^{\circ} 19.9 \mathrm{~mm}$ | Only suitable for mirrorless cameras, very expensive |
| Entaniya HAL200 5.0 mm | Canon EF ... | f/5.6 | $180^{\circ} 15.2 \mathrm{~mm}$ | $200^{\circ} 16.6 \mathrm{~mm}$ | Only suitable for mirrorless cameras, very expensive |
| Samyang 8mm Fisheye II | EF-M, Sony E | f/2.8 | $180^{\circ}$ approx. $29.7 \mathrm{~mm} 188^{\circ}$ approx. 31 mm |  | Only suitable for mirrorless cameras, short flange distance |
| Meike 6.5 mm | MFT | f/2.0 | $180^{\circ} 15.4 \mathrm{~mm} 190^{\circ} 15.85 \mathrm{~mm}$ (measured myself) |  | Only suitable for mirrorless cameras, short flange distance |
| Meike 3.5mm | MFT | f/2.8 | $180^{\circ} 11.0 \mathrm{~mm}$ | $220^{\circ} 12.5 \mathrm{~mm}$ | Only suitable for mirrorless cameras, short flange distance |
| Olympus M.Zuiko 8mm | MFT | f/1.8 | $180^{\circ}$ approx. 22 mm |  | Lens hood must be removed mechanically |
| 7artisans (Viltrox) 7.5mm | MFT ... | f/2.8 | about 27 mm (APS-C without vignetting) |  | Lens hood must be removed mechanically |
| ZLKC (OCDAY) 7.5mm | MFT ... | f/2.8 | about 27 mm (APS-C without vignetting) |  |  |
| Laowa 4mm | MFT | f/2.8 | $180^{\circ} 11.6 \mathrm{~mm}$ | $210^{\circ} 12.9 \mathrm{~mm}$ | Only suitable for mirrorless cameras, short flange distance |

| iZugar MKX200-ASPH 3.8mm | MFT | $\mathrm{f} / 2.8$ | $180^{\circ} 11.7 \mathrm{~mm} \quad 200^{\circ} 13.0 \mathrm{~mm}$ | Only suitable for mirrorless cameras, short flange distance |
| :--- | :--- | :--- | :--- | :--- | :--- |
| iZugar MKX22 3.25 mm | MFT | $\mathrm{f} / 2.5$ | $180^{\circ}$ approx. $8.2 \mathrm{~mm} \quad 220^{\circ}$ approx. 10 mm | Only suitable for mirrorless cameras, short flange distance |
| Yumiki 2.5 mm | CS-Mount | $\mathrm{f} / 1.6$ | $180^{\circ}$ approx. $6.1 \mathrm{~mm} \quad 190^{\circ}$ approx. 6.4 mm |  |
| SMTSEC 2.27 mm | CS-Mount | $\mathrm{f} / 1.4$ | $185^{\circ} 7.2 \mathrm{~mm}$ |  |
| Fujinon 1.8 mm | C-Mount | $\mathrm{f} / 1.4$ | $180^{\circ} 5.5 \mathrm{~mm} \quad 185^{\circ} 5.7 \mathrm{~mm}$ |  |
| Fujinon 2.7 mm | C-Mount | $\mathrm{f} / 1.8$ | $180^{\circ} 8.4 \mathrm{~mm} \quad 185^{\circ} 8.6 \mathrm{~mm}$ |  |

For measurements of fisheye lens nonlinearity, see also Paul Bourke's website: http://paulbourke.net/dome/fisheyecorrect/
Note: The $x$ axis of the diagrams is the veiwing angle in radians and the $y$ axis is the normalized radius in the image plane (1.0 at the circular edge).

### 24.3 Favorable camera / fisheye combinations

| Camera | Video resolution | Lens | Aperture | Fully illuminated image circle | Diameter of fully illuminated image circle in pixels |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Canon 6D | $640 \times 480$ (4:3) | Canon EF 8 -15mm at 8 mm | f/4.0 | $180^{\circ}$ | 460 Pixel |
|  | $1920 \times 1080$ Full HD (16:9) | Sigma EX DG 4.5mm | f/2.8 | $180^{\circ}$ | 656 Pixel |
|  |  | Meike $6-11 \mathrm{~mm}$ at 8.2 mm | f/3.5 | $180^{\circ}$ | 1080 Pixel |
|  |  | Canon EF $8-15 \mathrm{~mm}$ at 8 mm | f/4.0 | $159^{\circ}$ | 952 Pixel |
| Canon 5D MK4 | $1920 \times 1080$ Full HD (16:9) | Sigma EX DG 4.5mm | f/2.8 | $180^{\circ}$ | 654 Pixel |
|  |  | Meike $6-11 \mathrm{~mm}$ at 8.2 mm | f/3.5 | $180^{\circ}$ | 1080 Pixel |
|  |  | Canon EF $8-15 \mathrm{~mm}$ at 8 mm | f/4.0 | $159^{\circ}$ | 955 Pixel |
|  | $4096 \times 2160$ C4K (17:9) | Sigma EX DG 4.5mm | f/2.8 | $170^{\circ}$ | 2160 Pixel |
| Canon EOS R | $3840 \times 21604 \mathrm{~K}(16: 9)$ | Entaniya HAL250 3.6mm | f/2.8 | $180^{\circ}$ | 2054 Pixel |
| Sony A7S II | $1920 \times 1080$ Full HD (16:9) | Sigma EX DG 4.5mm | f/2.8 | $180^{\circ}$ | 663 Pixel |
|  |  | Meike 6.5 mm | f/2.0 | $180^{\circ}$ | 832 Pixel |
|  |  | Meike $6-11 \mathrm{~mm}$ at 8.2 mm | f/3.5 | $180^{\circ}$ | 1080 Pixel |
|  | $3840 \times 2160$ 4K (16:9) | Sigma EX DG 4.5mm | f/2.8 | $180^{\circ}$ | 1325 Pixel |
|  |  | Meike 6.5 mm | f/2.0 | $180^{\circ}$ | 1663 Pixel |
|  |  | Meike $6-11 \mathrm{~mm}$ at 8.2 mm | f/3.5 | $180^{\circ}$ | 2160 Pixel |
|  |  | Olympus M.Zuiko 8mm | f/1.8 | approx. $164^{\circ}$ | 2160 Pixel |
| Sony A7S II with external recorder | $3840 \times 2160$ 4K (16:9) | Sigma EX DG 8mm | f/3.5 | $180^{\circ}$ | 2060 Pixel |
|  |  | Olympus M.Zuiko 8mm | f/1.8 | $180^{\circ}$ | ca. 1996 Pixel |
| Panasonic LUMIX GH5S | $1920 \times 1080$ Full HD (16:9) | Sigma EX DG 4.5mm, SpeedBooster 0.71x | f/2.0 | $180^{\circ}$ | 888 Pixel |
|  |  | Sigma EX DG 4.5mm, SpeedBooster 0.64x | f/1.8 | $180^{\circ}$ | 800 Pixel |
|  |  | Meike $6-11 \mathrm{~mm}$ at 6.8 mm , SpeedBooster 0.64x | f/2.2 | $180^{\circ}$ | 1080 Pixel |
|  | $3328 \times 2496$ Anamorphic (4:3) | Sigma EX DG 4.5mm | f/2.8 | $180^{\circ}$ | 2356 Pixel |
|  |  | Nippon Kogaku 8mm, SpeedBooster 0.64x | f/1.8 | $159{ }^{\circ}$ | 2496 Pixel |
|  |  | Meike 6.5 mm | f/2.0 | $152^{\circ}$ | 2496 Pixel |

|  |  | Meike $\mathbf{6 - 1 1 m m}$ at 7.5mm, SpeedBooster 0.71x | f/2.5 | $180^{\circ}$ | 2496 Pixel |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Meike 6 -11mm at 8.2 mm , SpeedBooster 0.64x | f/2.2 | $180^{\circ}$ | 2496 Pixel |
|  |  | Olympus M.Zuiko 8mm | f/1.8 | $106^{\circ}$ | 2496 Pixel |
|  |  | Meike 3.5 mm | f/2.8 | $220^{\circ}$ | 2400 Pixel |
|  | $3840 \times 2160$ 4K (16:9) | Sigma EX DG 4.5mm, SpeedBooster 0.71x | f/2.0 | $180^{\circ}$ | 1775 Pixel |
|  |  | Sigma EX DG 4.5mm, SpeedBooster 0.64x | f/1.8 | $180^{\circ}$ | 1600 Pixel |
|  |  | Meike 6 -11mm at 6.8 mm , SpeedBooster 0.64x | f/2.2 | $180^{\circ}$ | 2160 Pixel |
| Nikon D800 | $1920 \times 1080$ Full HD (16:9) | Meike $6-11 \mathrm{~mm}$ at 7.3 mm | f/3.5 | $180^{\circ}$ | 1080 Pixel |

### 24.4 Fisheye projection lenses

| Lens | Focal Length | Image Circle | Max. HalfAngle | F/\# | Transmittance | Max. <br> Lumens | MTF <br> Center | MTF <br> Edge | Lateral Color R-G | Lateral Color B-G | F-Theta Distortion | Relative Illumination | Approx. Price |

Formula for exact numbers: f_no = $\mathbf{2}^{\text {^ }}(\mathrm{n} / 6)$ with $\mathrm{n}=-2$ to 15

### 24.8 Test patterns for fulldome projection

Very nice fulldome test patterns on Paul Bourke's website: http://www.paulbourke.net/dome/testpattern/
Update January 2022: Paul has added equirectangular test patterns at the bottom of his website.

Make a double-fisheye test image and an equirectangular test image:

```
set "IN=1200.png" :: Test pattern from http://www.paulbourke.net/dome/testpattern/1200.png
set "OUT=double_fisheye_test.png" :: Double fisheye test image
ffmpeg -i %IN% -i %IN% -lavfi "[0]transpose=1[left];[1]transpose=2,negate[right];[left][right]hstack" -y %OUT%
set "IN=double fisheye test.png"
set "OUT=equirectangulār_test.png" :: Equirectangular test image
ffmpeg -i %IN% -lavfi "v360=input=dfisheye:output=e:ih_fov=180:iv_fov=180:pitch=90" -y %OUT%
pause
```

Make a double equirectangular test image, consisting of two equirectangular test images vertically stacked together. The top half is yellow and the bottom half is magenta. This can be used for wormhole simulations:

```
set "IN=1024.png" :: Test pattern from http://www.paulbourke.net/dome/testpattern/1024.png
set "OUT=double_equirect.png" :: Double equirectangular test image
ffmpeg -i %IN% -i %IN% -lavfi "[0]transpose=1[left];[1]transpose=2,negate[right];[left]
[right]hstack,v360=input=dfisheye:output=e:ih fov=180:iv fov=180:pitch=90,split[e1][e2];
[e1] colorchannelmixer=.33:.33:.33:0:.33:.33:.\overline{33:0:0:0:0:\overline{0}[yellow];};
[e2] colorchannelmixer=.33:.33:.33:0:0:0:0:0.33:.33:.33:0[magenta];[yellow][magenta]vstack" -y %OUT%
```

pause

Make a double equirectangular test image, consisting of two equirectangular test images vertically stacked together. The top half is yellow and the bottom half is magenta. Each image contains a grid and is labelled "SOUTH WEST NORTH EAST UP DOWN". This can be used for wormhole simulations:

```
ffmpeg -lavfi color=c=black@0:s=720x360,format=rgba,^
drawtext=text="DOWN":x=145:y=173: fontsize=24,^
drawtext=text="UP":x=523:y=173:fontsize=24,^
v360=e:e:roll=90:interp=near,^
drawtext=text="NORTH":x=322:y=173: fontsize=24,^
scroll=hpos=0.5,^
drawtext=text="SOUTH": x=322:y=173 : fontsize=24,^
drawtext=text="WEST":x=510:y=173: fontsize=24,^
drawtext=text="EAST":x=154:y=173: fontsize=24[text];^
color=c=yellow:s=720x360,format=rgba,drawgrid=w=45:h=45:c=gray[grid];^
[grid][text]overlay -frames 1 -y yellow.png
ffmpeg -lavfi color=c=black@0:s=720x360,format=rgba,^
drawtext=text="DOWN":x=145:y=173: fontsize=24,^
drawtext=text="UP":x=523:y=173: fontsize=24,^
v360=e:e:roll=90:interp=near,^
drawtext=text="NORTH":x=322:y=173: fontsize=24,^
scroll=hpos=0.5,^
drawtext=text="SOUTH": x=322:y=173: fontsize=24,^
drawtext=text="WEST":x=510:y=173:fontsize=24,^
drawtext=text="EAST": x=154:y=173: fontsize=24[text] ;^
color=c=magenta:s=720x360,format=rgba,drawgrid=w=45:h=45:c=gray[grid] ;^
[grid][text]overlay -frames 1 -y magenta.png
ffmpeg -i yellow.png -i magenta.png -lavfi [0][1]vstack -y double_equirectangular.png
pause
```

Resolution: $6.720 \times 4.480$, RAW 14-bit

Fisheye lenses: Field_of_view_in_degrees $=180^{\circ}$ * x $/$ Image_circle_diameter Normal lenses: Field_of_view_in_degrees = 2 * $\arctan (x / 2 f)$
with $\mathrm{x}=$ image width or height in mm

The Canon 5D-Mark4 has a very good autofocus and is perfect for photography of fast moving objects (e.g. wildlife, birds).
I'm not a friend of video tutorials, but for the Canon 5D-Mark4 I found some tutorials that are indeed helpful. I will summarize the content below:

Grant Atkinson: Canon 5D Mk IV - Autofocus: Part 1/4-Control Setup for Moving Subjects
https://www.youtube.com/watch?v=7iP60Np01pw

| AF Operation | Notes |
| :--- | :--- |
| ONE SHOT | For non-moving objects |
| AI FOCUS | This decides automatically if the object is moving or <br> not. Not recommended. |
| AI SERVO | For moving objects, recommended as default. |

| Drive Mode | Notes |
| :--- | :--- |
| - | Single shot |
| H | 7 Pictures per second |
| - | 3 Pictures per second |
| S | 3 Pictures per second, silent mode |
| Clock Symbol | 10 Seconds self timer |
| Clock Symbol 2 | 2 Seconds self timer |

Orange Menu (second from right) --> 3 --> Custom Controls

| Shutter Button | leave as-is |
| :--- | :--- |
| AF_ON Button | set to AF_OFF, that means when you are in AF_SERVO mode you can hold the focus as long as you press this button. |
| * Button | set to ONE_SHOT/SERVO, that means by pressing this button you can toggle very fast between ONE_SHOT and AF_SERVO. <br> Additionally you must press the INFO button and select the option to the right. <br> But this function isn't very important, because you can work without ONE_SHOT. <br> In another video he sets the *button also to AF_OFF, which is useful if you accidentally press the wrong button. |
| Multi_Controller | Set to "Direct AF point selection" |
| AF Area Selection Button | Set to "Direct AF area selection" |
| SET Button | In another video he sets the SET button to "Exposure Compensation" |

## Grant Atkinson: Canon 5D Mk IV - Autofocus: Part 2/4-The 7 Focus Modes

https://www.youtube.com/watch?v=4IPrjb5w1Zw

Pink AF Menü (second from left) --> 4 --> Select AF area selec. mode
Here you can select which of the 7 AF area selection modes you want to use. He chooses 2, 3 and 5.

| (1) Spot AF (Square with Point) | Very small, good choice if you take pictures through branches |
| :--- | :--- |
| (2) Single Point AF | This is the default setting, very precise and fast, if you manage to hold the point on the object. |
| (3) Expand AF area (5 Points) | Recommended method for moving objects. The center point is prioritized and if this point looses focus, then one <br> of the neighbor points is used. Place the center point on the eye of the object. |
| (4) AF Expand Surround (9 Points) | Same as (3), but 8 neighbor points. |
| (5) Zone AF (9 or 12 Points) | All selected points have the same weight. You don't know which point is actually used. Don't use this method if <br> you want to have the focus on the eye of the object. |
| (6) Large Zone | Same as (5), but more points. |
| (7) Auto AF Selection (all 61 Points) | This may be useful for birds in the sky, if there is sufficient depth of focus. You don't know which point is actually <br> used. Don't use this method if you want to have the focus on the eye of the object. |

Pink AF Menü (second from left) --> 4 --> Selectable AF Point
Here you can reduce the number of selectable points. His choice: 61 or 15, because then you can choose the best point very fast.

## Grant Atkinson: Canon 5D Mk IV - Autofocus: Part 3/4-Prioritizing Your Autofocus Options

https://www.youtube.com/watch?v=VOilQs1UEI8

Pink AF Menü (second from left) --> 2
Here you can set the priorities for the first picture and for all subsequent pictures. His choice: 1th image: RELEASE, 2nd image: 0 to -2
Focus Priority $\quad$ This means the first picture is taken not before the focus is found. This may lead to pauses, if no focus is found.

## Grant Atkinson: Canon 5D Mk IV - Autofocus: Part 4/4-AF Cases

https://www.youtube.com/watch?v=vp8sHvGArgg

Pink AF Menü (second from left) --> 1

The "cases" contain predefined settings. He doesn't use them, however he has put the three settings (Tracking Sensitivity,
Accel/decel tracking and AF pt auto switching) into "MyMenu". This can be done as follows:
Press Q, until "My Menu" is selected.
Add My Menu Tab, OK
Configure MyMenu1
Select items to register.
Now select the three items that were mentioned above. They are now available in "My Menu".

| Tracking Sensitivity | This is by far the most important parameter! It describes how easily the focus can move away from the previously found focus. |
| :--- | :--- |
| Accel/decel tracking | This is difficult to understand. Best if you leave it at 0. |
| AF pt auto switching | This describes, how fast the camera switches from one AF point to a neighbor AF point. He leaves it at 0, which means <br> deactivated. |

## Grant Atkinson: Canon 5D Mark IV - Settings For Wildlife Photography

```
https://www.youtube.com/watch?v=yy 72JQ-QT4
```

Red Camera Menu (first from left)

| Page 1 --> Lens aberration correction | He switches all options off, so that the pictures can be saved faster. |
| :--- | :--- |
| Page 2 --> Auto Lighting Optimizer | OFF |
| Page 3 --> High ISO speed NR | OFF |
| Page 2 --> ISO speed settings | AUTO 100-12800 for both ranges |
| Page 1 --> Release Shutter without card | Disable |

Pink AF Menü (second from left)
Page 4 --> Auto AF pt sel: EOS iTR AF OFF

## Grant Atkinson: Shooting Canon 5D Mark IV in M mode with auto ISO

https://www.youtube.com/watch?v=Xmud7-O8HNs

You can use the M mode together with "Auto ISO". Exposure compensation is also possible in M mode.

Tony \& Chelsea Northrup: How to Photograph Flying Birds
https://www.youtube.com/watch?v=GFghMNX9zr|

Shutter: $\mathbf{1 / 2 0 0 0}$ s TV, Auto ISO might be useful

| Birds in front of trees or water | Use a single AF point and hold it on the object. |
| :--- | :--- |
| Birds in the sky | It's easier to use all AF points. |

## 26 Panasonic LUMIX GH5S

Manual: ftp://ftp.panasonic.com/camera/om/dc-gh5s_adv_en_om.pdf

### 26.1 GH5S Record formats

| Record format | Bits | Video <br> Codec | Audio <br> Codec | Anamorphic | VFR | HLG | Notes |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| AVCHD | 8 | $?$ | $?$ | no | some | no | This data format is suitable for when playing back on a high- <br> definition TV, etc. |
| MP4 | 8 | $?$ | $?$ | no | no | no | This data format is suitable for when playing back on a PC, etc. |
| MP4 HEVC <br> (High Efficiency <br> Video Coding) | 10 | h.265 | $?$ | no | no | yes | This data format is for HDR motion picture and suitable for <br> playback on a HDR (HLG format)-compatible TV or recorder. |
| MP4 (LPCM) | 8 or 10 | h.264 | LPCM <br> (uncompressed) | possible | some | only 10 bit | The MP4 data format for image editing. |
| MOV | 8 or 10 | h.264 | $?$ | possible | some | only 10 bit | Data format for image editing. |

See also: https://pro-av.panasonic.net/en/dvx4k/pdf/ag-dvx200 tech_brief_vol6 en.pdf
The following is taken from the above links:
With VLOG-L, the brightest clipped highlights will display on the zebras and on the waveform at about 80 IRE. Nothing brighter than about 81 IRE will ever be displayed.

Exposing to the right (ETTR):
This is a technique based on using a histogram for exposure. The general idea behind ETTR is to expose the image as bright as you possibly can, so long as none of the video information "clips" off the top. If required, you can always push it back down to proper exposure in post. Clipping occurs at 80 IRE. If you set your zebras at 80 IRE, you are free to expose up until the zebras appear. Anywhere that the zebras are displayed, you've clipped the image and would need to back off your exposure. Do be aware though that at higher exposure levels, even though the luminance may not have clipped yet, an individual color channel may begin clipping before the zebras display. As such, you might want to back off a little more (by setting the zebras no higher than 75 IRE), to leave a little room to minimize any clipping of chroma channels. When exposing using ETTR, skin tones may end up being recorded brighter or darker in every scene, simply based on where the highlights happen to be in that particular shot, and every shot will need to be corrected to bring the skin tones back to a reasonably consistent level so that your footage will intercut cleanly and seamlessly. And, depending on just how bright the highlights are in any given scene, ETTR may result in a scenario where the skin tones and midtones are significantly underexposed in an effort to catch and preserve all the highlights. Generally, cinematography is (and should be) more about the subject than it should be about the highlights; excessive attention to the highlights may mean compromising other aspects of the footage, so a strict "ETTR" approach is not always going to provide the overall best results in a video project.

## Exposing For Middle Gray:

An alternative method of exposure is to expose for middle gray $=18 \%$ gray. When exposing for middle gray, you'll find the zebras and the waveform monitor vastly more useful than the histogram. In VLOG-L, middle gray is properly exposed at 42 IRE. VLOG-L gamma curve maps the following brightness levels to the following IRE levels:

| Reflectance | IRE | 10-bit code value |
| :--- | :--- | :--- |
| $0 \%$ (black) | 7.3 | 128 |
| $18 \%$ (middle gray) | 42 | 433 |
| $90 \%$ (white) | 61 | 602 |
| absolute clipped superwhite | 80 IRE |  |

In VLOG-L, the curve is laid out so that there are 8 stops below middle gray, and 4 stops above middle gray. You can, of course, choose to modify that by underexposing middle gray some; if you underexpose by one stop, you'll then have 7 stops below middle gray and 5 stops above it. In all cases you'll get 12 stops of dynamic range; the recommended allocation is for middle gray to be at 42 IRE with 8 stops below and 4 stops above, but you can shift that on an as-needed basis, so long as you account for it in post. The advice is to expose middle gray at 42 IRE whenever possible.

Using Zebras and Waveform Monitor:
With VLOG-L placing middle gray at 42 IRE, $90 \%$ white at 61 IRE, and black at 7 IRE gives a wide exposure range that allows for 4 stops of exposure over middle gray, and 8 stops under middle gray. Using these general exposure levels, you'll find that properly-exposed highlights on skin tones will usually range between about 42 IRE for dark-skinned subjects up to a maximum of about 55 IRE for light-skinned subjects.
For VLOG-L, it's recommendes to set Zebra 1 at 55 IRE and Zebra 2 at 75 IRE. If you have your zebras higher than 80, they will never trigger.

## Summary:

Exposing properly for VLOG-L is the key to getting the best results; aim to expose an $18 \%$ gray card at about 42 IRE, keep your Caucasian skin highlights to below 55 IRE, and set your Zebra 2 to 75 IRE to keep from clipping highlights.

Some people recommend to use +1 stop exposure compensation (which means one stop overexposed).
The formula for the VLog curve is given in the V-Log/V-Gamut Reference manual:
https://pro-av.panasonic.net/en/cinema_camera_varicam_eva/support/pdf/VARICAM_V-Log_V-Gamut.pdf

## VLog table:

| Stops = $\log _{2}$ (in $/ 0.18$ ) | In = 0.18 * $^{\text {^ }}$ Stops | out | out * 1023 | IRE $=-7.24+116.33$ * out |
| :--- | :--- | :--- | :--- | :--- |
| $-\infty$ | 0 (0\% black) | 0.1250 | 128.0 | 7.3 |
| -8 | 0.000703125 | 0.1290 | 131.9 | 7.8 |
| -7 | 0.00140625 | 0.1329 | 135.9 | 8.2 |
| -6 | 0.0028125 | 0.1407 | 144.0 | 9.1 |
| -5 | 0.005625 | 0.1565 | 160.1 | 11.0 |
| -4.17 | 0.01 | 0.1810 | 185.2 | 13.8 |
| -4.17 | 0.01 | 0.1810 | 185.2 | 13.8 |
| -4 | 0.01125 | 0.1878 | 192.1 | 14.6 |
| -3 | 0.0225 | 0.2346 | 240.0 | 20.1 |
| -2 | 0.045 | 0.2915 | 298.2 | 26.7 |
| -1 | 0.09 | 0.3554 | 363.5 | 34.1 |
| 0 | 0.18 (18\% middle gray) | 0.4233 | 433.0 | 42 |
| 1 | 0.36 | 0.4936 | 504.9 | 50.2 |
| 2 | 0.72 | 0.5650 | 578.0 | 58.5 |
| 2.32 | 0.90 (90\% white) | 0.5882 | 601.7 | 61 |
| 3 | 1.44 | 0.6371 | 651.7 | 66.9 |
| 4 | 2.88 | 0.7095 | 725.8 | 75.3 |
| 4.559 | 4.24246 | 0.7500 | 767.2 | 80 (maximum value for VLog-L) |
| 5 | 5.76 | 0.7820 | 800.0 | 83.7 (only available in VLog) |
| 6 | 11.52 | 0.8546 | 874.3 | 92.2 (only available in VLog) |
|  | 23.04 | 1.0000 | 1023 | 109.1 (only available in VLog) |

The function for converting from linear signal to V-Log data is as follows.
With linear reflection as "in" and V-Log data as "out"
out $=5.6^{*}$ in $+0.125 \quad($ in <cut1 )
out $=\mathrm{c} * \log _{10}($ in +b$)+\mathrm{d} \quad($ in $>=$ cut1 $) \quad$ with cut1 $=0.01, \mathrm{~b}=0.00873, \mathrm{c}=0.241514, \mathrm{~d}=0.598206,0<=$ out <= 1
The function for reverting compressed V-Log data to linear refection is as follows.
With V-Log data as "in" and linear reflection as "out",
in = (out - 0.125) / 5.6
( out < cut2 )
in $=\operatorname{pow}(10.0,(($ out -d$) / \mathrm{c}))-\mathrm{b} \quad($ out $>=$ cut2 $) \quad$ with cut2 $=0.181,0<=$ out $<=1$

This batch file makes a 10-bit VLog test video with 18 vertical bars. The brightness levels (from left to right) are black and from $\mathbf{- 8}$ to $\mathbf{+ 8}$ stops:

```
set "T=10" :: Duration in seconds
rem Make a 10-bit VLog video:
ffmpeg -f lavfi -i nullsrc=s=svga,format=gray16 -lavfi
```

```
12)+726*eq(ld (0) ,13) +800*eq(ld(0),14)+874*eq(ld(0),15)+949*eq(ld(0),16)+1023*eq(ld(0) ,17))',oscilloscope=tw=1:s=1
-pix_fmt yuv444p10le -color_range pc -crf 10 -c:v h264 -t %T% -y vLog_10bit.mov
pause
```

Note: If "-color_range pc" is omitted, the video still plays fine in FFplay but it doesn't play correctly in VLC Player. The two brightest bars are shown with the same brightness.
It seems that if "-color_range" is not specified in a video, by default FFplay is assuming it's "PC" however VLC is assuming it's "TV".
Important: Always specify "-color_range"!

This is the VLOG-L curve:

(Source: https://business.panasonic.co.uk/professional-camera/sites/default/eu-files/professional-camera-2014/case_study_pdf/The \%20DVX200\%20Book.pdf)

The green line is the limit for the DVX200 camera. The limit for the GH5S is a little bit higher (approximately at 768).

## 26.3

## GH5S HLG (Hybrid Log Gamma)

See also: https://en.m.wikipedia.org/wiki/Hybrid_Log-Gamma
HLG is a nonlinear transfer curve in which the lower half of the signal values use a gamma curve and the upper half of the signal values use a logarithmic curve.
$E^{\prime}=r^{*}$ sqrt (E) for $0 \leq E \leq 1$
$E^{\prime}=a^{*} \ln (E-b)+c$ for $1<E$
where
$E$ is the signal normalized by the reference white level and $E^{\prime}$ is the resulting nonlinear signal $r$ is the reference white level and has a signal value of 0.5
and the constants $a, b$, and $c$ are defined as $a=0.17883277, b=0.28466892$, and $c=0.55991073$
The signal value is 0.5 for the reference white level while the signal value for 1 has a relative luminance that is 12 times higher than the reference white level. ARIB STD-B67 has a nominal range of 0 to 12.

A free HLG to Rec709 LUT is available here: https://nickdriftwood.com/product/hlg-rec709
This LUT is quite large (almost 10 MB ) because the numbers have 10 decimal places, which is totally unnecessary. More than $\mathbf{3}$ or 4 make no sense.

## 26.4

 GH5S Metering ModesThe four possible metering modes are "Multiple", "Centre Weighted", "Spot" and "Highlight Weighted". The last one was added in firmware version 1.4 and is missing in the manual.

### 26.5 GH5S Autofocus

There are several focusing modes:

| Focus mode | [Continuous AF] |  |
| :--- | :--- | :--- |
| AFS/AFF/AFC | MODE 1 | Continuous AF only works while recording video. |
|  | MODE 2 | Continuous AF works all the time. |
|  | OFF | The camera maintains the focus position at the start of recording. <br> While recording video it's possible to focus by pressing the shutter button halfway. |
| MF | ON or OFF | You can focus manually. |

| AFS | "Auto Focus Single". The focus stays locked while the shutter button is pressed halfway, so you can perform recording while changing the composition. |
| :--- | :--- |
| AFF | "Auto Focus Flexible". If the subject moves while the shutter button is pressed halfway, the focus is readjusted automatically according to the movement of <br> the subject. |
| AFC | "Auto Focus Continuous". In this mode, while the shutter button is pressed halfway, focusing is constantly performed to match the movement of the subject. |

There are two possible ways how to get rid of the "AF" icon in the lower right corner of the screen:

- Totally disable the touch screen as follows: Custom Menue --> Oeration --> Touch_Settings --> Touch_Screen = OFF
- Use a video mode that allows variable frame rate (VFR), switch VFR to ON and set the variable frame rate to the same value as the rec frame rate, for example 25/25. In this case the "AF" icon disappears, and the camera does record audio. However at all other variable frame rates, it doesn't record audio.

### 26.6 GH5S Recommended settings

|  | Cinelike-D | VLOG-L | HLG (Hybrid Log Gamma) |
| :---: | :---: | :---: | :---: |
| "Phote Style" in Exif Data |  | Unknown (10) | Unknown (13) |
| Contrast | 0 | [NA] | [NA] |
| Sharpness (1) | -5 ? | -5 ? | -5 ? |
| Noise Reduction (2) | -5 | -5 | -5 |
| Saturation | -5 | [NA] | -5 |
| Hue | 0 | [NA] | 0 |
| Luminance Level | 0-1023 (0-255 for 8 bit) | fixed at 32-200 (128-800 for 10 bit) (3) | fixed at 0-1023 |
| Zebras | 100\% | 75\% | 90\% |
| Exposure compensation |  | +1 |  |
| Possible ISO range for "Dual Native ISO Settings" = Low | 80-800 | 320-1600 | 320-1600 |
| Possible ISO range for "Dual Native ISO Settings" = High | 800-204800 | 1600-25600 | 1600-204800 |
| Dynamic range [F-Stops] | 10.5 | 11.58 | 11.5 |
| Notes |  | Best choice for video post processing! | Best choice for night sky! |

(1) At higher ISO values (for example 25600), the sharpness setting is quite irrelevant, as there is no big difference in videos taken with sharpness $\mathbf{- 5}$ and +5. I'm unsure if negative sharpness values are a low pass filter or not.
(2) Any setting greater than -5 will suppress fainter stars in the night sky!
(3) V-LOG L uses only the range [128..800] (or 128..768?) from the possible range [0..1023], which means it's closer to 9-bit than to 10-bit

### 26.7 GH5S Custom settings C1, C2, C3-1, C3-2, C3-2

Up to 5 settings can be saved in Menu -> Settings -> Cust.Set Mem.
They can be loaded by turning the wheel to C1, C2 or C3.
In case of C3, you must additionally press the menu button and then select C3-1, C3-2 or C3-3.

My own settings:

|  | Rec Format | Pixel | fps | ISO, Photo Style | Exposure Mode, Exposure time | System Frequency | Application |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| C1 | [4K/10bit/150M/25p] 422 / 10Bit / Long GOP | $\begin{aligned} & 3840 \times 2160 \\ & 4 \mathrm{~K} \end{aligned}$ | 25 | $\begin{aligned} & \text { 400, } \\ & \text { STD } \end{aligned}$ | M, 1/50s | $\begin{aligned} & \text { 50.00Hz } \\ & \text { (PAL) } \end{aligned}$ | For 4K videos |
| C2 | [C4K/10bit/150M/25p] 422 / 10Bit / Long GOP | $\begin{aligned} & \text { 4096x2160 } \\ & \text { C4K } \end{aligned}$ | 25 | Auto, STD | M, 1/50s | $50.00 \mathrm{~Hz}$ (PAL) | For C4K videos |
| C3-1 | [4K/A/150M/25p] 422 / 10bit / Long GOP | $3328 \times 2496$ <br> Anamorphic | 25 | $\begin{aligned} & 51200 \\ & \text { HLG, NR=-5 } \end{aligned}$ | M, 1/25s | $\begin{aligned} & \mathbf{5 0 . 0 0 \mathrm { Hz }} \\ & \text { (PAL) } \end{aligned}$ | For meteor astronomy with SpeedBooster and Nippon Kogaku 8mm f/2.8 fisheye lens |
| C3-2 | [FHD/8bit/100M/25p] 420 / 8Bit / Long GOP | $\begin{aligned} & \text { 1920×1080 } \\ & \text { FHD } \end{aligned}$ | 125 | $\begin{aligned} & \text { 51200, } \\ & \text { STD } \end{aligned}$ | $\begin{aligned} & M, \\ & 1 / 125 \mathrm{~s} \end{aligned}$ | $\begin{aligned} & \text { 50.00Hz } \\ & \text { (PAL) } \end{aligned}$ | For video astronomy: <br> Variable framerate: 125 <br> Ex. Tele Conv is OFF, but can be set to ON |
| C3-3 | [FHD/8bit/100M/25p] 420 / 8Bit / Long GOP | $\begin{aligned} & 1920 \times 1080 \\ & \text { FHD } \end{aligned}$ | 25 | $\begin{aligned} & \text { 51200, } \\ & \text { STD } \end{aligned}$ | $\begin{aligned} & M, \\ & 1 / 25 s \\ & (1 / 2 s-1 / 25 s) \end{aligned}$ | 50.00 Hz (PAL) | For video astronomy: <br> Variable framerate: off <br> Ex. Tele Conv is OFF, but can be set to ON |

My function key settings:
Fn1 Sound Rec Level Adj.
Fn2 Histogram
Fn3 Waveform Monitor
Fn4 Zebras
Fn5 Ex. Tele Conv.

### 26.8 GH5S Luminance level

Motion Picture > Luminance Level
Select the luminance range to match the use of video. Settings: [0-255]/[16-235]/[16-255]

- If you set Rec Quality to a 10bit motion picture setting, the available options change to [0-1023], [64-940], and [64-1023]
- This function works only for motion pictures. Still pictures (including those you take during motion picture recording) will be taken with [0-255].
- When Rec Format is set to AVCHD or MP4, [0-255] in Luminance Level will switch to [16-255].
- When Photo Style is set to Hybrid Log Gamma, setting is fixed to [0-1023]. The manual says [64-640], but I think this is wrong.
- When Photo Style is set to V-Log L, setting is fixed to [32-200] or [128-800]. The manual says [0-255], but I think this is wrong.

### 26.9 GH5S Master pedestal level

Creative Video > Master Pedestal Level

- $\quad$ This side creates a high contrast image with a crisp atmosphere.

0 Standard

+ This side creates a slightly misty atmosphere.
This function is not available when Photo Style is set to V-Log L

### 26.10 GH5S Video size

| Mode | Resolution | Read-out Chip Size | Diagonal Size | Number of Pixels |
| :--- | :--- | :--- | :--- | :--- |
| 4K | $3820 \times 2160(16: 9)$ | $18.8 \mathrm{~mm} \times 10.6 \mathrm{~mm}$ | 21.6 mm | 8251200 |
| C4K | $4096 \times 2160(17: 9)$ | $19.2 \mathrm{~mm} \times 10.12 \mathrm{~mm}$ | 21.7 mm | 8847360 |
| Anamorphic | $3328 \times 2496(4: 3)$ | $17.3 \mathrm{~mm} \times 13.0 \mathrm{~mm}$ | 21.6 mm | 8306688 |
| FHD | $1920 \times 1080(16: 9)$ | $18.8 \mathrm{~mm} \times 10.6 \mathrm{~mm}(1)$ | 21.6 mm | 2062800 |
| FHD with 2.1× Extra Tele Conversion | $1920 \times 1080(16: 9)$ | $8.95 \mathrm{~mm} \times 5.05 \mathrm{~mm}$ | 10.3 mm | 2062800 |

(1) Read-out chip size is smaller when frame rate is greater than 200
26.11 GH5S Mechanical / electronic shutter

Rec > Shutter Type

| Shutter Type | ISO | Exposure Time Range |
| :--- | :--- | :--- |
| Mechanical shutter | $100-204800$ | $60 \mathrm{~s}-1 / 8000 \mathrm{~s}$ |
| Electronic shutter | 204800 | $1 / 30 \mathrm{~s}-1 / 16000 \mathrm{~s}$ |
|  | 102400 | $1 / 15 \mathrm{~s}-1 / 16000 \mathrm{~s}$ |
|  | 51200 | $1 / 8 \mathrm{~s}-1 / 16000 \mathrm{~s}$ |
|  | 25600 | $1 / 4 \mathrm{~s}-1 / 16000 \mathrm{~s}$ |
|  | 12800 | $1 / 2 \mathrm{~s}-1 / 16000 \mathrm{~s}$ |
|  | $100-6400$ | $1 \mathrm{~s}-1 / 16000 \mathrm{~s}$ |

### 26.12 GH5S Longer exposure time than framerate allows

When making a $25 f$ fs video, exposure times longer than $1 / 25 \mathrm{~s}$ up to $1 / 2 \mathrm{~s}$ are possible. Duplicated frames are written to the SD card. At least these settings are required (there may be more requirements that I don't know):
-- Creative film mode
-- Exposure mode "M"
-- Autofocus must be switched off at the lens
-- "SS/Gain Operation" must be set to "SEC/ISO"
-- Not in variable framerate mode

Note: Normally the GH5S dosn't record any audio in VFR mode. But there is one exception: When you switch VFR to ON and set the variable frame rate to the same value as the rec frame rate. For example, if "Rec Quality" is set to [FHD/8bit/100M/25p] then you can record audio only if the variable frame rate is set to 25 .

### 26.15 GH5S Cable remote trigger

The cable remote trigger has a 2.5 mm connector with 4 contacts:

| Tip contact | not connected |
| :---: | :---: |
| 2nd contact | not connected |
| 3rd contact | not pressed: $38.5 \mathrm{k} \Omega$ to ground (Difference to "half pressed" is $33 \mathrm{k} \Omega$ ) half pressed: $5.5 \mathrm{k} \Omega$ to ground (Difference to "full pressed" is $3.3 \mathrm{k} \Omega$ ) full pressed: $2.2 \mathrm{k} \Omega$ to ground |
| Outer contact | ground |

### 26.16 GH5S Cheap chinese battery adapters

If a $10 \mathrm{k} \Omega$ resistor is soldered between the "-" and "T" contacts, the GH5S will accept all voltages from 6.5 to 8.5 Volts without any error messages. Without this resistance, the input voltage is much more critical. The original Panasonic DMW-AC10E power supply is rated 8.4 V at 2.5 A and the voltage is about 9.1 V without load.

### 26.17 GH5S Telescopic effect

Set the [Ex. Tele Conv.] parameter to [ON] for a fixed 2.1x telescopic effect. This is on page $2 / 5$ in the motion pictures menu.
This function is not available when [HDR] is set to [ON], or when motion pictures size is set to [C4K] or [4K] in [Rec Quality], or when a frame rate of 150fps or higher is set for [Variable Frame Rate].

### 26.18 GH5S External HDMI

It's impossible to use USB-C for control, HDMI for monitor, and internal monitor operate at the same time. You have to pick a combination of two of these
It's possible to capture the HDMI output signal with a cheap chinese HDMI to USB converter. The input resolution can be up to 4 K and the output resolution is $1920 \times 1080$ maximum. This converter also accepts anamorphic $3328 \times 2496$ (4:3) input and converts it to $1920 \times 1080$ output, with black borders added at the left and right sides. It can also convert the $3328 \times 2496$ (4:3) input to $1600 \times 1200$ (4:3) output.
How to disable the overlays on the external HDMI output signal: Go to Video menue --> HDMI_Rec_Output --> Info_Display --> OFF

### 26.19 GH5S Synchro Scan

This is a fine adjustment of shutter speed, used to reduce flickering and horizontal stripes. It's only available when [Exposure Mode] is set to either [S] or [M] in Creative Video Mode.
Flicker-free calculator: https://www.red.com/flicker-free-video

## 27 Immersive $360^{\circ}$ videos

See also: Hugh Hou, How to Film \& Edit $360^{\circ}$ Drone Video - Insta360 ONE X2 + DaVinci Resolve 17 In-Depth Tutorial https://www.youtube.com/watch?v=ypB2J_p1Ayk\&t=0s

Instructions for Insta360 ONE X2: http://onlinemanual.insta360.com/onex2/en-us/camera/basic

## 28 PanoView XDV360 camera

This is a very cheap chinese camera with a $200^{\circ} 1.1 \mathrm{~mm} f / 2.0$ fisheye lens.
Some hints for using:

Change the mode (Video / Photo / Timelapse / Settings) by short pressing the "on/off" button.
You can go directly to the settings by pressing the "arrow down" button.
Scroll in the settings with "arrow down" and "arrow up" buttons.
Switch to the right for the next menue with the "on/off" button.
Select and confirm with "start/stop" button.
Possible square video resolutions: 2448 / 2048 / 1440 / 1072 with 30 fps or 1440 / 1072 with 60 fps
Recommended exposure correction for video:
-- If the sun is in the field of view, use 0
-- In the woods, but sun is not directly visible: use 0 to $\mathbf{+ 3}$
-- If in doubt, you aren't wrong if you use 0.

Table with crop values for different field of view:

| Field of View | Top and left border | Width and height |
| :--- | :--- | :--- |
| $180^{\circ}$ | 176 | 2104 |
| $185^{\circ}$ | 144 | 2168 |
| $190^{\circ}$ | 116 | 2224 |
| $195^{\circ}$ | 88 | 2280 |
| $200^{\circ}$ | 60 | 2336 |

## 29 Kodak PIXPRO SP360 4K camera

This is a small camera with a $235^{\circ} 0.85 \mathrm{~mm} f / 2.8$ fisheye lens. The maximum video size is $\mathbf{2 8 8 0} \times \mathbf{2 8 8 0}$ pixels and in this mode the filesize is about 7.5 MB per second.

English instruction manual: https://kodakpixpro.com/support/downloads/resources/cameras/360-vr/sp360-4k//docs/sp360-4k-usermanual-en.pdf
Possible video resolutions in fisheye mode:

| $2880 \times 2880$ | $2048 \times 2048$ | $1440 \times 1440$ | $1072 \times 1072$ | $720 \times 720$ |
| :--- | :--- | :--- | :--- | :--- |
| $30 f p s$ | $30 f p s$ | $30 f p s$ or $60 f p s$ | $30 f p s$ or $60 f p s$ | $120 f p s$ |

Possible still image resolutions:

| $2 M$ | $4 M$ | $8 M$ |
| :--- | :--- | :--- |
| $1920 \times 1080(16: 9)$ | $2304 \times 1728(4: 3)$ | $2880 \times 2880(1: 1)$ |

Crop values for different field of view, for 2880x2880 resolution:

| Field of View | Top and left border | Width and height |
| :--- | :--- | :--- |
| $180^{\circ}$ | 210 | 2456 |
| $185^{\circ}$ | 174 | 2528 |
| $190^{\circ}$ | 142 | 2592 |
| $195^{\circ}$ | 106 | 2664 |
| $200^{\circ}$ | 74 | 2728 |

Charging the battery with the external battery charger: Lamp is red while charging and becomes green when battery is full. The charging time is at least 4 hours for a completely empty battery.

Charging the battery in the camera: Just plug in the USB cable and don't switch the camera on. The lamp is blinking orange while charging and goes off when the battery is full.
Error in instruction manual: The lamp is not continuously orange when the battery is charging.
Warning: The battery is always empty when you need it. Charge before using! Most probably it has also lost all settings. Check the video mode!

When recording, the LED is blinking red.
Test report (german): https://www.digitaleyes.de/Tests/Testbericht_Kodak_Pixpro_SP360_4K_360-Grad-Actioncam/9819

### 29.1 Remote control

Remote control via Bluetooth is possible with the PIXPRO 360 VR SUITE, which can be downloaded here:
https://kodakpixpro.com/Europe/de/support/downloads/?id=a04
But it's much easier to use the RR-BK01 remote control.
When taking a $2880 \times 2880$ fisheye image or video, it's important that the left switch of the remote control is in the lower position!
The right switch selects between still image or video.
Importantnote: If the left switch is in the upper position, the recording format would be $3840 \times 2160$ and not the whole $235^{\circ}$ fisheye circle is visible!

### 29.2 Convert $235^{\circ}$ fisheye image to equirectangular panorama

```
set "IN=114_0020.jpg"
set "FOV=23\overline{5}"
Input field of view in degrees
set "YAW=135" :: Yaw rotation angle in degrees
set "OUT=out.png" :: Equirectangular output image or video
ffmpeg -i %IN% -vf v360=input=fisheye:ih_fov=%FOV%:iv_fov=%FOV%:output=equirect:rorder=pyr:yaw=%YAW%:pitch=-
90,crop=iw:ih*%FOV%/360:y=0 -y %OUT%
pause
```

|  | This is a cheap chinese panoramic camera with two $220^{\circ}$ fisheye lenses. <br> Video resolution: 1920x960@30fps, 2880x1440@25fps, 3840x1920@15fps, there is no exposure compensation setting Lenses: $\mathrm{f}=0.88 \mathrm{~mm}$ F/2.0, distance between the two lenses is about 26 mm <br> Audio: 44.1 kHz , 16-bit, stereo <br> The bitrate is about 12 Mbps at $1920 \times 960 @ 30 \mathrm{fps}$ (1.5MB per second) <br> After downloading the video from the Micro SD card, it is already an equirectangular video and can be viewed as-is with the VLC player. The stitching is already done in the camera and there is no postprocessing required. <br> Warning: The battery is always empty when you need it. Charge before using! <br> Charging via USB: Blue lamp is on while charging, and goes off when battery is full. <br> If you mount this camera on a selfie stick, the stick itself isn't visible in the video. But it's shadow is visible! So it's a good idea to choose the diameter of the stick as small as possible. <br> It's difficult to find now. Search terms for Google: "Amkov Amköv VR 360 Handheld 4K WiFi Panorama Camera" <br> My Checklist: <br> - Is the battery fully charged? <br> - Is the SD card installed? <br> - Have you set the desired video resolution? |
| :---: | :---: |

Problem: Nothing happens when you press the "Record" button. Solution: You forgot to install the SD card.
Small problem: The two cameras aren't running exacty synchrone, meaning that the two frames aren't exposed exactly at the same time. It's noticeable when the video contains fast moving objects.

The LED is green while the battery is charging, and goes off when the battery is full.
Press the upper button to switch the camera on. The LED will become blue ( or green if the USB cable is connected). If it's blinking, the battery is low. The MODE button toggles between the modes STILL, VIDEO and LIVE STREAMING (only when a USB cable is connected).
The LED below the camera symbol is blinking red while a video is recorded.
At the bottom is a LED that warns if the memory is almost full (blinking) or full (permanently on).
Recording a video: Press the large RECORD button, and press it again to stop recording.
The bitrate is about 57 Mbps at $3840 \times 1920 @ 30 \mathrm{fps}$ (7.2MB per second)
For still images the size is $5376 \times 2688$.
Instruction manual: https://support.theta360.com/en/manual/v/
The required apps can be downloaded here: https://support.theta360.com/en/download/
This is the workflow for making a $360^{\circ}$ video with ambisonic sound:

- Download the video from the camera. The filename is R001xxxx.MP4 where xxxx is a 4-digit number. This video contains two circular fisheye images from the two lenses and isn't yet stitched together. The sound is mono, this is the ambisonic $R$ channel. The ambisonic $X, Y$ and $Z$ channels are hidden in the MP4 container. I don't know if they can be extracted with FFmpeg. If you know it (without the "Ricoh Theta Movie Converter App") please let me know.
- Drag and drop this video to the "Ricoh Theta Basic app". This app stitches the hemispheres together to an equirectangular video. If you tick the "top/bottom correction" box, the video will automatically be rotated so that the ground is at the bottom. This is possible because the camera has a built-in 3-axis gravity sensor. The output filename is R001xxxx_er.MP4 and the sound is the same mono sound as before, with the $X$, $Y$ and $Z$ channels still hidden in the MP4 container.
- For converting the mono audio channel to 4 ambisonic channels RYZX, drag and drop the equirectangular *.MP4 video to the "Ricoh Theta Movie Converter App". This conversion is quite fast and the output video has the filename R001xxxx_er.mov. This video has 4 audio channels and these are the ambisonic channels $R, Y, Z$, and $X$ in this order. This video can be played for example with VLC player, including ambisonic sound. Which means you can change the viewing direction with the mouse, and the sound will change accordingly. This video can also be uploaded to Facebook.
- The camera has 4 built-in microphones, but for true ambisonic sound you need the TA-1 microphone. Surprisingly there is absolutely no difference in the EXIF data. The only way for finding out if a video was taken with or without TA-1 seems to be to check with a player and headphones. If I'm wrong, please let me know.
The workflow is also described in this thread: https://community.theta360.guide/t/youtube-spatial-audio-support-now-available/1675
A helpful Youtube video: https://www.youtube.com/watch?v=w8q3sFmNN8Y

### 31.1 Plugins

Plugins are available here: https://pluginstore.theta360.com/\#official

### 31.2 Bluetooth remote control

It's possible to use a "Joby Impulse" Bluetooth remote controller for taking pictures.

1. Power on the camera.
2. If the white light is blinking, continue with step 8.
3. Press the mode button longer than 3 s . If the white light is blinking, continue with step 8.
4. Run the "Ricoh Theta Basic app" and click on Start --> Plugin_Management.
5. Connect the camera with USB cable.
6. Select the "Remote App" and click "ok".
7. Disconnect the USB cable. Continue with step 1.
8. Hold the button of the remote control until the remote starts blinking red. Then release the button.
9. After $\mathbf{1 0 - 2 0}$ seconds, you will hear a sound from the camera. Now the remote is paired with the camera.
10. It will stay paired if the camera goes into sleep mode. You can wake it up with the remote. Sleep time can only be set via smartphone to $3,5,7,10$ minutes or off.
11. After power down / power up, it must be paired again.

For instructions see also: https://www.thetalab.ricoh/en/howto/tips/remotecontroller/

### 31.3 Change the viewing direction

```
ffmpeg -i R0010079.jpg -lavfi v360=e:e:yaw=180 -y out.jpg
exiftool -ProjectionType="equirectangular" out.jpg
pause
Note: ProjectionType=equirectangular is sufficient for Facebook to recognize the image as spherical \(360^{\circ}\)
See also: http:/lecheng.com/articles/editing-360-photos-injecting-metadatal
```

### 31.4 How to hide something from a $360^{\circ}$ image

## Method 1: Edit the image manually with IrfanView

- IrfanView --> Edit --> Show Paint Dialog --> "Clone Tool"
- Select a suitable brush diameter, then right-click at the replacement area, then left-click (or draw) at the place that shall be covered.

Method 2: Rotate the spot to the center, apply "delogo" filter, then rotate back:

```
set "X=1926" :: Delogo x position
set "Y=830" : : Delogo y position
set "W=200" :: Delogo width
set "H=160" :: Delogo height
```

```
pause
```

Note: The drawback is that there is some loss of resolution, because each v360 filter uses interpolation.

## Method 3: Cover a circular area at the bottom with a uniform color:

```
set "IN=R0010080.jpg" :: Input image
set "DIA=30" :: Diameter of covered circular area in degrees
set "C=brown" :: Color
set "OUT=out.jpg" :: Output image
ffmpeg -i %IN% -lavfi drawbox=c=%C%:t=fill:y=ih*(1-%DIA%/360):w=iw:h=ih*%DIA%/360 -y %OUT%
exiftool -ProjectionType="equirectangular" %OUT%
pause
```

Method 4: Cover a circular area at the bottom with a uniform color, using an unsharp edge:

```
set "IN=R0010080.jpg" :: Input image
set "SIZE=5376x2688" :: Input and output size
set "DIA=30" :: Diameter of covered circular area in degrees
set "EDGE=10" :: Width of unsharp edge in degrees
set "C=brown" :. Color
set "OUT=out.jpg" :: Output image
ffmpeg -f lavfi -i color=brown:size=%SIZE% -frames 1 -y bg.png
ffmpeg -f lavfi -i nullsrc=size=%SIZE% -lavfi format=gray8,geq='clip(128+256/(H*%EDGE%/180)*(Y-H*(1-%DIA%/360)),0,255)
-frames 1 -y mask.png
ffmpeg -i %IN% -i bg.png -i mask.png -lavfi [0]format=gbrp[fg];[2]format=gbrp[mask];[fg][1][mask]maskedmerge -y %OUT%
pause
```

## Method 5: Cover a circular area at the bottom with data from a different part of the same image, using an unsharp edge:

```
set "IN=R0010186_neu.jpg" : : Input image
set "SIZE=5376x2\overline{688" : : Input and output size}
set "DIA=23" :: Diameter of covered circular area in degrees,
:: must be larger than diameter of photographer plus EDGE
set "Y=45" :: Yaw angle where cover area is taken from
set "P=23" :: Pitch angle where cover area is taken from,
set "OUT=out.jpg" :: Output image
ffmpeg -f lavfi -i nullsrc=size=%SIZE% -lavfi format=gray8,geq='clip(128+256/(H*%EDGE%/180)*(Y-H*(1-%DIA%/360)) ,0,255)'
-frames 1 -y mask.png
ffmpeg -i %IN% -i mask.png -lavfi [0]format=gbrp,split[fg][bg];[bg]v360=e:e:yaw=%Y%:pitch=%P%[bg];[1]format=gbrp[mask];
[fg][bg][mask]maskedmerge -y %OUT%
exiftool -ProjectionType="equirectangular" %OUT%
pause
```

A good viewer for $360^{\circ}$ images is the "Ricoh Theta Basic app".

### 31.5 Make an equirectangular $360^{\circ}$ image or video

This batch file extracts an image from a video and converts it into an equirectangular panorama image, which is $360^{\circ}$ wide and $180^{\circ}$ high:

```
set "IN=R0010032.mp4" :: Input video from Ricoh Theta V
set "H=1920"
set "FOV=192.2"
set "C=5"
set "T=100"
set "OUT=equi.png"
Height of input video
: Horizontal and vertical field of view of the fisheye lenses in degrees
    : Width of interpolation band in degrees, must be smaller or equal than (FOV-180}\mp@subsup{}{}{\circ}\mathrm{ )
    : Time in seconds where the image is extracted from the input video
: Output image
rem Create the mergemap file
ffmpeg -f lavfi -i nullsrc=size=%H%x%H% -vf "format=gray8,geq='clip(128-128/%C%*(180-%FOV%/(%H%/2)*hypot(X-%H%/2,Y-%H
%/2)) ,0,255)',v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV%" -frames 1 -y mergemap.png
rem Merge the two fisheye images from the double-fisheye input video, and convert to equirectangular projection
ffmpeg -ss %T% -i %IN% -i mergemap.png -lavfi "[0]format=rgb24,split[a][b];
[a]crop=ih:iw/2:0:0,v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV%[c];
[b] crop=ih:iw/2:iw/2:0,v360=input=fisheye:output=e:yaw=180:ih_fov=%FOV%:iv_fov=%FOV%[d];[1] format=gbrp[e];[c][d]
[e]maskedmerge,v360=input=e:output=e:yaw=90:pitch=90" -frames 1 -y %OUT%
pause
```

Note: The "Ricoh Theta Basic app" gives a better stitching result than the above FFmpeg batch file, because it also corrects alignment errors of the two fisheye objectives. Use this batch file to extract an image:

```
set "IN=R0010032_er.mp4" :: Input video from Ricoh Theta V
set "T=100" :: Time in seconds where the image is extracted from the input video
set "OUT=out.png" :: Output image
ffmpeg -ss %T% -i %IN% -frames 1 -y %OUT%
pause
```

This batch file extracts an image from the equirectangular video and lets the camera make a horizontal $360^{\circ}$ rotation:

```
set "IN=R0010032_er.mp4" :: Input video from Ricoh Theta V
set "T=100" :: Time in seconds where the image is extracted from the input video
set "D=20" :: Duration for one 360
set "FR=50"
set "H FOV=80" :: Horizontal field of view
set "V_FOV=45" :: Vertical field of view
set "W=1920" :: Width of output video
set "H=1080" :: Height of output video
set "OUT=out.mp4" :: Output video
ffmpeg -ss %T% -i %IN% -frames 1 -y image.png
ffmpeg -loop 1 -i image.png -vf fps=%FR%,scroll=h='1/(%FR%*%D%)',v360=e:flat:h_fov=%H_FOV%:v_fov=%V_FOV%:w=%W%:h=%H% -t
%D% -y %OUT%
pause
```

### 31.6 Make a "Little-Planet" picture or video

This batch file extracts an image from a video and converts it into a "Little Planet" image with $\mathbf{2 7 0}{ }^{\circ}$ fisheye projection:

```
set "IN=R0010032.mp4" :: Input video from Ricoh Theta V
set "H=1920"
set "FOV=192.2"
set "C=5"
set "LP=270"
set "T=100"
set "OUT=out.png"
:: Height of input video
: Horizontal and vertical field of view of the fisheye lenses in degrees
    : Width of interpolation band in degrees, must be smaller or equal than (FOV-180}\mp@subsup{}{}{\circ}\mathrm{ )
    : Little planet output field of view in degrees
: Time in seconds where the image is extracted from the input video
:: Output image
rem Create the mergemap file
ffmpeg -f lavfi -i nullsrc=size=%H%x%H% -vf "format=gray8,geq='clip(128-128/%C%* (180-%FOV%/(%H%/2)*hypot(X-%H%/2,Y-%H
%/2)) ,0,255)',v360=input=fisheye:output=e:ih_fov=%FOV%:iv_fov=%FOV%" -frames 1 -y mergemap.png
rem Merge the two fisheye images from the double-fisheye input video, and convert to little planet projection
ffmpeg -ss %T% -i %IN% -i mergemap.png -lavfi "[0]format=rgb24,split[a][b];
[a]crop=ih:iw/2:0:0,v360=input=fisheye:output=e:ih fov=%FOV%:iv fov=%FOV% [c];
[b] crop=ih:iw/2:iw/2:0,v360=input=fisheye:output=e:yaw=180:ih_fov=%FOV%:iv fov=%FOV%[d];[1] format=gbrp[e];[c][d]
[e]maskedmerge,v360=input=e:output=fisheye:h_fov=%LP%:v_fov=%\overline{LP%:yaw=90" -frames 1 -y %OUT%}
pause
```

Note: The "Ricoh Theta Basic app" gives a better stitching result than the above FFmpeg batch file. Use this batch file to make the "Little Planet" image:

```
set "IN=R0010032_er.mp4"
set "LP=270" : : Little planet output field of view in degrees
set "T=100" :: Time in seconds where the image is extracted from the input video
set "OUT=out.png" :: Output image
ffmpeg -ss %T% -i %IN% -lavfi "v360=input=e:output=fisheye:h_fov=%LP%:v_fov=%LP%:pitch=-90" -frames 1 -y %OUT%
pause
```

I found it useful to use an additional distortion that shrinks the center of the image and enlarges the horizon in radial direction. This distortion is applied to the equirectangular image, before transforming it to $270^{\circ}$ fisheye projection. The resulting image seems to have the camera higher above the ground:

```
set "IN=R0010032_er.mp4" : : Input video from Ricoh Theta V
set "W=3840" :: Width of input video
set "H=1920" :: Height of input video
set "LP=270" : : Little planet output field of view in degrees
set "S=0.6" :: Strength of additional distortion (can be disabled with s=0)
set "T=100"
set "OUT=out2.png"
: Time in seconds where the image is extracted from the input video
:: Output image
rem Create the remap_x file (this is a simple identity map)
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=gray16,geq='X' -frames 1 -y remap_x.pgm
rem Create the remap_y file, using the function y = (1 - s) * y + s * y^3 where -1 < y < 1
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=gray16,geq='st(0, 2*Y/%H%-1); %H%/2+%H%/2*((1-%S%)*ld(0) +%S
%*pow(ld(0),3))' -frames 1 -y remap_y.pgm
rem Apply the remap filter and transform to "Little Planet" projection
ffmpeg -ss %T% -i %IN% -i remap x.pgm -i remap y.pgm -lavfi
"format=pix_fmts=rgb24,remap,v3\overline{6}0=input=e:output=fisheye:h_fov=%LP%:v_fov=%LP%:pitch=-90" -frames 1 -y %OUT%
pause
```

This is the same for still pictures (with higher resolution $5376 \times 2688$ ):

```
set "IN=R0010175.jpg"
Input image from Ricoh Theta
set "W=5376"
    : Width of input video
set "H=2688"
set "LP=270"
set "S=0.6" :: Strength of additional distortion (can be disabled with s=0)
    Height of input video
    : Little planet output field of view in degrees
set "OUT=out.png"
:: Output image
rem Create the remap_x file (this is a simple identity map)
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=gray16,geq='X' -frames 1 -y remap_x.pgm
rem Create the remap_y file, using the function y = (1 - s) * y + s * y^3 where -1 < y< 1
ffmpeg -f lavfi -i nullsrc=size=%W%x%H% -vf format=gray16,geq='st(0, 2*Y/%H%-1);%H%/2+%H%/2*((1-%S%)*ld(0)+%S
%*pow(ld(0),3))' -frames 1 -y remap_y.pgm
rem Apply the remap filter and transform to "Little Planet" projection
ffmpeg -i %IN% -i remap_x.pgm -i remap_y.pgm -lavfi "format=pix_fmts=rgb24,remap,v360=input=e:output=fisheye:h_fov=%LP
%:v_fov=%LP%:pitch=-90"--frames 1 -y %OUT%
pause
```

Here are the results, left side with $\mathbf{s}=0$ and right side with $\mathbf{s}=0.6$

### 31.7 Ambisonics

For an introduction to Ambisonics see https://en.wikipedia.org/wiki/Ambisonics
This is a very good introduction to Ambisonics: https://www.researchgate.net/publication/280010078_Introduction_to_Ambisonics
This book (Zotter, Franz, Frank, Mathias: Ambisonics) is available for free download: https://www.springer.com/de/book/9783030172060
See also https://community.theta360.guide/t/hi-guys-may-i-ask-two-simple-questions-about-the-audio-of-ricoh-theta-v/4705

You can use this batch file for extracting the four $R, Y, Z$, and $X$ audio channels from the *.mov file:

```
set "IN=R0010009_er.mov" :: *.MOV Input video
```

```
X.wav
pause
```

I did use this batch file for verifying that the four channels are really different from each other. All difference files are indeed non-zero:

```
set "IN=R0010009_er.mov" :: *.MOV Input video
ffmpeg -i %IN% -af "aeval=val(0)-val(1)" diff01.wav
ffmpeg -i %IN% -af "aeval=val(0)-val(2)" diff02.wav
ffmpeg -i %IN% -af "aeval=val(0)-val(3)" diff03.wav
ffmpeg -i %IN% -af "aeval=val(1)-val(2)" diff12.wav
ffmpeg -i %IN% -af "aeval=val(1)-val(3)" diff13.wav
ffmpeg -i %IN% -af "aeval=val(2)-val(3)" diff23.wav
pause
```

This batch file shows the volume of the four $R, Y, Z$ and $X$ audio channels over time:

```
set "IN=R0010009_er.mov" :: *.MOV Input video
ffmpeg -i %IN% -lavfi showwavespic=split_channels=1:s=1024x800 -y waveform.png
pause
```

The coordinate system used in Ambisonics follows the right hand rule convention with positive $X$ pointing forwards, positive $Y$ pointing to the left and positive $Z$ pointing upwards. Horizontal angles run anticlockwise from due front and vertical angles are positive above the horizontal, negative below. (Source: Wikipedia)

For more examples for "showwavespic" see: https://trac.ffmpeg.org/wiki/Waveform

### 31.8 Making $360^{\circ}$ test videos with ambisonic sound

This batch file reads an equirectangular input video and replaces the audio channel by an ambisonic test tone, which is coming from a specified direction.

```
set "IN=R0010008_er.mp4" :: Equirectangular input video
set "T=10" :: Duration in seconds
set "F=440" :: Tone frequency in Hz
set "YAW=90" :: The yaw angle of the sound source is anticlockwise from the front:
set "PITCH=45"
set "SYCP=0.707"
set "CYCP=0"
set "SP=0.707"
set "OUT=test.mov"
ffmpeg -i %IN% -f lavfi -i sine=f=%F%:r=48000-lavfi [1]pan="4.0|C0=0.707*c0|c1=%SYCP%*c0|c2=%SS%*C0|c3=%CYCP%*C0"[a]
-map 0:0 -map [a] -c:v copy -t %T% -y %OUT%
pause
```

Note: Before playing this video, you must inject the spatial metadata with the "Spatial Media Metadata Injector". Tick the boxes "My video is spherical (360)" and "My video has spatial audio (ambiX ACN/SN3D format)".

The injector is available here: https://github.com/google/spatial-media/releases/tag/v2.1

This batch file is similar to the previous example, but uses an equirectangular test video. The position of the sound source is marked in the equirectangular output video with the word "SOUND":

```
set "IN=1200.png" :: Test pattern from http://www.paulbourke.net/dome/testpattern/1200.png
set "T=10" :: Duration in seconds
```

```
set "F=440"
```

```
set "F=440"
```

```
set "F=440"
set "YAW=90"
set "YAW=90"
set "YAW=90"
set "PITCH=45"
set "PITCH=45"
set "PITCH=45"
set "SYCP=0.707"
set "SYCP=0.707"
set "SYCP=0.707"
set "CYCP=0"
set "CYCP=0"
set "CYCP=0"
set "SP=0.707"
set "SP=0.707"
set "SP=0.707"
set "OUT=ambisonic_test.mov"
```

```
```

set "OUT=ambisonic_test.mov"

```
```

```
set "OUT=ambisonic_test.mov"
```

```
```

```
    Tone frequency in Hz
    The yaw angle of the sound source is anticlockwise from the front:
    O is front, }90\mathrm{ is left, 180 is back, -90 is right
    The pitch angle is positive upwards: 0 is front, 90 is up, -90 is down
sin(yaw) * cos(pitch) Unfortunately you must manually calculate these
    cos(yaw) * cos(pitch) values, because there are no expressions
    sin(pitch) allowed in the options of the pan filter
ffmpeg -loop 1 -i %IN% -f lavfi -i color=black@0:s=2400x1200,format=rgba -f lavfi -i sine=f=%F%:r=48000 -lavfi
[0] split[a][b]; [a]transpose=1[left]; [b]transpose=2,negate[right]; [left]
```

```
%*C0|c3=%CYCP%*c0"; [1]drawtext="fontsize=80:text='SOUND';box=1 :boxcolor=red:boxborderw=10 : fontcolor=yellow: x= (w-
text_w)/2:y=(h-text_h)/2",v360=e:e:rorder=pyr:pitch=-%PITCH%:yaw=%YAW%[d]; [c][d]overlay -t %T% -y %OUT%
pause
```

Note: Don't forget to inject the spatial metadata with the "Spatial Media Metadata Injector".

This batch file makes an ambisonic test video with a moving sound source. A mosquito is flying in the horizontal plane around the observer:

```
set "IN=equirectangular_test.png" :: Equirectangular image or video
set "F=550" :: Mosquito frequency in Hz (Sawtooth wave)
set "VOL=0.1"
set "R=2"
set "T=10"
set "OUT=mosquito.mov" :: Equirectangular output video with ambisonic sound
ffmpeg -loop 1 -i %IN% -f lavfi -i aevalsrc='%VOL%*(0.5-mod(%F%*t,1)):c=mono:s=48000',aeval="0.707*val(0)|
sin(2*PI/%R%*t)*val(0)|O|\operatorname{cos}(2*PI/%R%*t)*val(0)" -ac 4-t %T% -y %OUT%
pause
```

Note: Don't forget to inject the spatial metadata with the "Spatial Media Metadata Injector".

If you play a video with ambisonic sound for example with VLC player, the player will automatically handle the conversion from 4 ambisonic channels to 2 stereo channels for your headphones.
Things are more complicated if you want real ambisonic sound with four speakers, for example in a planetarium dome. I did buy a cheap USB audio device which supports the 5.1 channel layout.

This is one possible way to convert the $\mathbf{W}, \mathrm{Y}, \mathrm{Z}$ and X signals into signals for $\mathbf{4}$ speakers in the horizontal plane:

| front | ( W + X ) / 2 |
| :---: | :---: |
| right | ( W - Y ) / 2 |
| back | ( W - X ) / 2 |
| left | ( W + Y ) / 2 |

This batch file converts the W, Y, Z and $X$ audio channels to Front, Left, Back and Right audio channels, which can be fed to four speakers. The $Z$ channel is not used, because all four speakers are in the horizontal plane. In this example the division by 2 is omitted. That's no problem if the volume isn't too close to the upper limit. The 5.1 channel layout is us used. This layout has 6 channels in this order: FL = front left, FR = front right, FC = front center, LFE = low frequency, BL = back left, BR = back right. The FC and LFE channels are unused and set to zero. Please note that the speakers must be positioned as follows: $F L$ channel = front, $F R$ channel = left, BL channel = back, BR channel = right.

```
set "IN=R0010013_er.mov" :: *.MOV Input video
ffmpeg -i %IN% -lavfi pan="5.1|c0=c0+c3|c1=c0+c1|c2=0*c0|c3=0*c0|c4=c0-c3|c5=c0-c1" -c:v copy -y out.mp4
pause
```

This batch file converts an equirectangular input video with ambisonic sound to a fisheye output video with 5.1 sound for 4 speakers in the horizontal plane (FL channel = front, FR channel = left, BL channel = back, BR channel = right):

```
set "IN=R0010013_er.mov" :: Equirectangular input video
set "FOV=220" :: Output field of view in degrees
set "S=1200"
Output width and height
set "OUT=fish.mov"
: Fisheye output video
ffmpeg -i \%IN\% -lavfi [0:0]v360=e:fisheye:h_fov=\%FOV\%:v_fov=\%FOV\%:pitch=90,scale=\%S\%:\%S\%;[0:1]pan="5.1|c0=c0+c3|
c1=c0+c1|c2=0*c0|c3=0*c0|c4=c0-c3|c5=c0-c1"-y %OUT%
pause
```

Note: In the previous examples theoretically you could also use the 4.0 channel layout, because anyway you don't need the FC and LFE channels. But then the player doesn't recognize that the file contains signals for 4 individual speakers which are $90^{\circ}$ apart in the horizontal plane. That's why it's better to use the 5.1 channel layout and leave two of the channels unused.

This is another way for converting the $\mathbf{W}, \mathrm{Y}, \mathbf{Z}$ and X signals into signals for $\mathbf{4}$ speakers in the horizontal plane:

This batch file converts the W, Y, Z and X audio channels to FrontLeft, BackLeft, BackRight and FrontRight audio channels, which can be fed to four speakers. The $\mathbf{Z}$ channel is not used, because all four speakers are in the horizontal plane:

```
set "IN=R0010013_er.mov" :: *.MOV Input video
ffmpeg -i %IN% -lavfi pan="5.1|c0=c0+0.707*c1+0.707*c3|c1=c0+0.707*c1-0.707*c3|c2=0*c0|c3=0*c0|c4=c0-0.707*c1+0.707*c3|
c5=c0-0.707*c1-0.707*c3" -c:v copy -y out.mp4
pause
```

Play an equirectangular video with ambisonic sound in a planetarium dome with 4 speakers. The output channel layout is 5.1 (FL, FR, FC, LFE, BL, BR),
where FC and LFE are silent:

| set "IN=mosquito.mov" | $:$ : Equirectangular input video with ambisonic sound |
| :--- | :--- |
| set "FOV=200" | $:$ : Field of view of fisheye projection |
| set "S=1080" | $:$ : Size of output video |

 $c 0=c 0+0.707 * c 1+0.707 * c 3|c 1=c 0+0.707 * c 1-0.707 * c 3| c 2=0 * c 0|c 3=0 * c 0| c 4=c 0-0.707 * c 1+0.707 * c 3 \mid c 5=c 0-0.707 * c 1-$ $0.707 * c 3$ " -q:v 2 -f nut - $\mid f f p l a y ~-f s ~-a u t o e x i t ~-~$
pause

This is the output of the USB 5.1 device on an oscilloscope, $\mathrm{CH} 1=\mathrm{FL}, \mathrm{CH} 2=\mathrm{FR}, \mathrm{CH} 3=\mathrm{BR}, \mathrm{CH} 4=\mathrm{BL}$ :

This is the same as before, but with an additional subbooster channel which is using the W channel as input for the "asubboost" filter:

```
set "IN=R0010013_er.mov" :: Equirectangular input video with ambisonic sound
set "FOV=200" :: Field of view of fisheye projection
set "S=1080"
set "DRY=0"
set "WET=1"
set "DECAY=0.7"
set "FEEDBACK=0.5"
set "CUTOFF=100"
set "SLOPE=0.5"
set "DELAY=20"
Size of output video
. asubboost: Set how much of original signal is kept. Allowed range is from 0 to 1. Default value is 0.5.
- asubboost: Set how much of filtered signal is kept. Allowed range is from 0 to 1. Default value is 0.8
:: asubboost: Set how much of filtered signal is kept. Allowed range is from 0, to 1. Default value 
:: asubboost: Set delay line decay gain value. Allowed range is from 0 to 1. Default value is 0.7. 
:: asubboost: Set cutoff frequency in Hz. Allowed range is 50 to 900. Default value is 100.
:: asubboost: Set slope steepness in [1/octave]. Allowed range is 0.0001 to 1. Default value is 0.5
:: asubboost: Set delay in Milliseconds. Allowed range is from 1 to 100. Default value is 20.
ffmpeg -i \% IN\% -lavfi [0:v]v360=e:fisheye:pitch=90:h_fov=\%FOV\%:v_fov=\%FOV\%:w=\%S:h=\%S\%;[0:a]pan="FL+FR+FC+BL+BR|
\(c 0=c 0+0.707 * c 1+0.707 * c 3|c 1=c 0+0.707 * c 1-0.707 * c 3| c 2=0 \star c 0|c 3=c 0-0.707 * c 1+0.707 * c 3| c 4=c 0-0.707 * c 1-0.707 * c 3[4 \mathrm{CH}] " ;[0: a: 0] a s u b b o o s t=d r y=\) \(\% D R Y \%:\) wet \(=\% W E T \%:\) decay \(=\%\) DECAY \(\%:\) feedback \(=\%\) FEEDBACK \(\%:\) Cutoff \(=\% C U T O F F \%: s l o p e=\% S L O P E \%: d e l a y=\% D E L A Y \%\) [LFE]; [4CH]
[LFE]join=channel_layout=5.1:map="0.0-FL|0.1-FR|0.2-FC|0.3-BL|0.4-BR|1.0-LFE" -q:v 2 -f nut - |ffplay -fs -autoexit -
pause
```

Note: I didn't understand the meaning of the "decay" and "feedback" values. If you can explain it, please let me know. For this filter a block diagram would be very helpful.

Note: The unit of the "slope" parameter can also be set in dB / octave, for exampe -20dB.

Because it's unclear how "asubboost" actually works, I decided it's better to use instead a "lowpass" filter and enhance the volume:

```
set "IN=R0010013_er.mov" :: Equirectangular input video with ambisonic sound
set "FOV=200" : : Field of view of fisheye projection
set "S=1080" :: Size of output video
set "CUTOFF=100" :: Subbooster cutoff frequency in Hz
set "BOOST=10" :: Subbooster amplification factor
```

ffmpeg -i \%IN\% -lavfi [0:v]v360=e:fisheye:pitch=90:h_fov=\%FOV\%:v_fov=\%FOV\%:w=\%S\%:h=\%S\%;0:a]pan="FL+FR+FC+BL+BR|

\%, volume= $=\mathrm{BOOST}$ [LFE]; [4CH][LFE]join=channel_layout=5.1:map="0.0-FL|0.1-FR|0.2-FC|0.3-BL|0.4-BR|1.0-LFE" -q:v 2 -f nut - | ffplay -fs
-autoexit -
pause

Let's try to reverse engineer the "asubboost" filter. This command makes a curve with a step at $\mathbf{t = 0 . 1 s}$ and shows the step response of the "asubboost" filter:

```
ffmpeg -f lavfi -i aevalsrc='0.5*gt(t,0.1)':d=1 -lavfi asplit[a][b];[b]asubboost=dry=0:wet=1:decay=0.5:feedback=0.5:delay=100[c],[a]
[c]join,showwaves=draw=full:s=1920x1080:r=1 -frames 1 -y out.png
pause
```

This is the reverse engineered block diagram of the "asubboost" filter:

```
IN
```

```
                            ^
DELAY
```

This batch file creates an audio test file with 5.1 channel layout with 4 different sine frequencies for the FL, FR, BL and BR channels. The FC and LFE channels are unused and remain silent:

```
set "F1=250" : : Frequency for front left
set "F2=500" : : Frequency for front right
set "F3=1000" : : Frequency for back left
set "F4=2000" : : Frequency for back right
set "T=10" : : Duration in seconds
set "V=0.2" :: Volume
set "OUT=audio_test_4.wav" :: Output filename
ffmpeg -lavfi aevalsrc="%V%*sin(2*PI*%F1%*t)|%V%*sin(2*PI*%F2%*t)|0|0|%V%*sin(2*PI*%F3%*t)|%V%*sin(2*PI*
%F4%*t):C=5.1" -t %T% - % %OUT%
ffmpeg -i %OUT% -lavfi atrim=duration=0.025,showwavespic=split_channels=1:s=1024x800 -y
audio_test_waveform.png
pause
```

For more examples for "showwavespic" see: https://trac.ffmpeg.org/wiki/Waveform

## 32 Lightning

Lightning guide for portrait photography: https://www.digitalcameraworld.com/tutorials/cheat-sheet-pro-portrait-lighting-setups

## 33 Color temperature test with video lights

The L4500 video lights have an adjustable color temperature from 3200 K to 5600 K in 13 steps. At each color temperature I did take a picture of a white piece of paper with a Canon 5D-MK4, which was set to the same color temperature as the two lamps. Exposure time was $1 / 125 \mathrm{~s}, \mathrm{f} / 5.6$, ISO800. The lamps were set to $100 \%$ brightness and the diffusor was installed. The CR2 images were converted with IrfanView to 8 -bit PNG and then the average value for the R, G and B channels were calculated with Fitswork.

| Color Temperature | Illuminance <br> [lux] @ 1m | R | G | B | $S=R+G+B$ | R/S | G / S | B / S |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3200 K | 426 (Minimum) | 140.4 | 132.5 | 137.3 | 410.2 (Minimum) | 34.2\% (Minimum) | 32.3\% (Maximum) | 33.5\% |
| 3400 K | 456 | 149.1 | 138.1 | 145.9 | 433.1 | 34.4\% | 31.9\% | 33.7\% (Maximum) |
| 3600 K | 474 | 156.5 | 143.5 | 152.7 | 452.7 | 34.6\% | 31.7\% | 33.7\% (Maximum) |
| 3800 K | 494 | 161.9 | 145.9 | 155.1 | 462.9 | 35.0\% | 31.5\% | 33.5\% |
| 4000 K | 508 | 165.8 | 149.2 | 158.6 | 473.6 | 35.0\% | 31.5\% | 33.5\% |
| 4200 K | 518 | 169.8 | 151.5 | 160.6 | 481.9 | 35.2\% | 31.4\% (Minimum) | 33.3\% |
| 4400 K | 525 | 172.5 | 153.9 | 162.7 | 489.1 | 35.3\% | 31.5\% | 33.3\% |
| 4600 K | 531 | 174.1 | 154.9 | 163.1 | 492.1 | 35.4\% | 31.5\% | 33.1\% |
| 4800 K | 535 (Maximum) | 175.9 | 156.5 | 163.3 | 495.7 | 35.5\% (Maximum) | 31.6\% | 32.9\% |
| 5000 K | 535 (Maximum) | 175.9 | 156.9 | 162.6 | 495.4 | 35.5\% | 31.7\% | 32.8\% (Minimum) |
| 5200 K | 534 | 175.4 | 157.8 | 163.9 | 497.1 (Maximum) | 35.3\% | 31.7\% | 33.0\% |
| 5400 K | 530 | 174.5 | 158.0 | 164.5 | 497.0 | 35.1\% | 31.8\% | 33.1\% |
| 5600 K | 502 | 169.8 | 156.1 | 164.5 | 490.4 | 34.6\% | 31.8\% | 33.5\% |

Hint: L4500 lights can be operated with one NP-F970 battery. It's not required to connect two batteries simultaneously.
1 lux $=0.0929 \mathrm{fc}$ (Foot-candle) $1 \mathrm{fc}=10.76$ lux

Same test for Neewer RGB660 lamp with diffusor installed, brightness is set to 100\%:

## 34 TASCAM DR-70D

| Main Menue | Sub Menue | Recommended Setting | Notes |
| :---: | :---: | :---: | :---: |
| BASIC | RECORD | ON / OFF | Choose the channels you want to use |
|  | PAN |  | Balance for monitoring the inputs, this doesn't affect the record |
|  | GAIN | LOW / MID / HIGH / HI+PLUS | Choose the input gain |
|  | INPUT | XLR/TRS | Choose the input |
| MONITOR | MIX |  | Dont't care, this is only for the monitor output |
| INPUT | INPUT GAIN | MIC+PHANTOM |  |
|  | LIMITER | OFF |  |
|  | LOWCUT | OFF | High pass filter |
|  | DELAY | 0 | Delay time to channel 1 |
|  | PHASE | OFF | Reverses the polarity |
| RECORD | FILE TYPE | STEREO | One or two stereo files will be written |
|  | FORMAT | WAV 24bit | Best quality |
|  | SAMPLE | 44.1 kHz / 48kHz / 96kHz / 192kHz | Use 96kHz for ultrasound conversion |
|  | DUAL REC | OFF or -1db to -12dB | This is only possible if channels 3 and 4 are deactivated |
| SLATE |  |  | Slate signal |
| MIC | MS MODE 1/2 | OFF |  |
|  | MS MODE $3 / 4$ | OFF |  |
|  | PHANTOM VOLT | 48 V | Phantom voltage for Rode MT-1 microphones |
| OTHERS | SYSTEM --> FORMAT |  | Formatting the SD card |
|  | BATTERY | NIMH / ALKAL | Battery type |
|  | DATE / TIME |  | Setting date and time |

I typically make either 4-channel records, or 2-channel records with DUAL REC -10dB. These settings must be changed:

| Application: | BASIC --> RECORD CH3+4 | RECORD --> DUAL RECORD |
| :--- | :--- | :--- |
| 4-Channel Recording | ON | OFF |
| 2-Channel Recording with DUAL REC -10dB | OFF | -10dB |

WAV 24bit 44.1 kHz , maximum recording length with 2GB SD card: 3h 22m

Always power the recorder with an external powerbank. The internal batteries are much too small, especially if phantom voltage is used.

TASCAM DR-701D

| Menue | Recommended Setting | Notes |
| :---: | :---: | :---: |
| 1/19 INPUT | GAIN: LINE / LOW / MID / HI / HI+ SEL: IN 1-2 IN 3-4 | Choose the input gain and which inputs are used LOW: +20dB, MID: +40dB, HI: +52dB, HI+: +64dB |
| 2/19 MIXER | LVL: 100, 100, 100, 100 PAN: L12, R12, L12, R12 MS: OFF | Important: If you set PAN to "C", both stereo channels are equal! |
| 3/19 PHASE / DELAY | 0, OFF | Reverse the polarity, set a delay time |
| 4/19 LEVEL CONTROL | OFF |  |
| 5/19 TRIM GANG | GRP 1: all ON GRP2: all OFF | Adjust all channels simultaneously with channel 1 knob |
| 6/19 OUTPUT LEVEL | CAMERA: 30db <br> LINE: 0db | Set the output levels |
| 7/19 MIC POWER | PHAN: all ON, VOLTAGE : 48V PLUGIN: OFF | Use 48V for RODE NT1 microphones PLUGIN is the supply voltage for microphones at the EXT IN $1 / 2$ input |
| 8/19 RECORD | CH1, CH2, CH3, CH4: ON MIX: OFF <br> DUAL: OFF or 1-2, -12dB | When DUAL mode is used, channels 3 and 4 are automatically deselected |
| 9/19 REC SETTING | FILE TYPE: STEREO FORMAT: WAV 24bit SAMPLE: 44.1 kHz / 48kHz / 96kHz / 192kHz | One or two stereo files will be written <br> Use 44.1 kHz or $\mathbf{4 8 k H z}$ for normal sound, or 96 kHz for ultrasound |
| 10/19 FILE | NAME TYPE: DATE WORD: TASCAM |  |
| 11/19 MEDIA | FORMAT | Here you can format the SD card |
| 12/19 TIME CODE |  |  |
| 13/19 SLATE TONE | AUTO: OFF OSCILLATOR | Use the OSCILLATOR feature for generating a -20dB test tone |

| 14/19 HDMI AUDIO ASSIGN | OFF |  |
| :--- | :--- | :--- |
| 15/19 AMBISONICS | OFF |  |
| 16/19 METER/TRIM | PEAK HOLD: 2sec <br> TRIM MIN: MIN |  |
| $17 / 19$ POWER MANAGEMENT | BATTERY TYPE: ALKALI <br> AUTO PWR SAVE: 30min <br> BACKLIGHT: 10sec | Setting date and time |
| $18 / 19$ REMOTE | DATE / TIME |  |
| $19 / 19$ SYSTEM |  |  |

I typically make either 4-channel records, or 2-channel records with DUAL REC -10dB. For toggling between these modes, only one setting must be changed: Set RECORD / DUAL to OFF or 1-2.

Always power the recorder with an external powerbank. The internal batteries are much too small, especially if phantom voltage is used.

Pinout of 3.5 mm stereo connectors: Tip contact is left channel, middle contact is right channel, outer contact is ground.

### 35.1 Matching the DR-701D's output level to the GH5S' input level

The output level of the TASCAM DR-701D camera output can be set in the menue OUTPUT LEVEL / CAMERA in the range -24 dB to +42 dB . There are hardware switches between 0 dB and 1 dB , between 12 dB and 13 dB and between 30 dB and 31 dB .
A 1 kHz test tone can be generated in the menue SLATE TONE / OSCILLATOR, with level -18 dB or -20 dB . The reference level seems to be about 62 mV without load.

Output level at the TASCAM's camera output (measured with high impedance):

| OUTPUT LEVEL $/$ <br> CAMERA | Output voltage <br> (OSCILLATOR = -18dB) | Output voltage <br> (OSCILLATOR = -20dB) | Maximum 1kHz sine output <br> voltage, just before clipping <br> occurs in the output signal. |
| :--- | :--- | :--- | :--- |
| 0dB | 7.5 mV _rms | 6.2 mV _rms | 62 mV _rms |
| 12dB | 30.3 mV _rms | 24.0 mV _rms | 240 mV _rms |
| 20dB | 79.0 mV _rms | 62.0 mV _rms | 620 mV _rms |
| 30dB | 249.6 mV rms | 200.0 mV rms | 2.00 V_rms |
| 40dB | 795 mV rms | 622 mV rms | 3.35 V_rms |
| 42dB | 993 mV _rms | 795 mV _rms | 3.35 V_rms |

The output level of the TASCAM DR-701D line output can be set in the menue OUTPUT LEVEL / LINE in the range -12dB to +12dB. There ia a hardware switch between 0 dB and 1 dB .

Output level at the TASCAM's line output (measured with high impedance):

| OUTPUT LEVEL / LINE | Output voltage (OSCILLATOR = -18dB) | Output voltage (OSCILLATOR = -20dB) | Maximum 1kHz sine output voltage, just before clipping occurs in the output signal. |
| :---: | :---: | :---: | :---: |
| -12dB | 62 mV _rms | 49 mV _rms | 0.5 V_rms |
| -3dB | 175 mV_rms | 139 mV _rms | 1.41 V_rms |
| OdB | 248 mV_rms | 197 mV _rms | 2.0 V_rms |
| 12dB | 990 mV_rms | 785 mV_rms | 3.27 V_rms |

The input level of the Panasonic LUMIX GH5S can be set to "LINE" in the menue Motion_Picture --> Mic_Socket.
The Motion_Picture --> Sound_Rec_Level_Adj. parameter can be set in the -12dB to +6dB range.
For measuring the clipping voltage, make sure that Motion_Picture --> Sound_Rec_Level_Limiter is OFF.

| Sound Rec Level Adj. | Input voltage when level indicator is at -12 dB mark | Maximum sine voltage before clipping occurs | Maximum peak voltage before clipping occurs |
| :---: | :---: | :---: | :---: |
| -12dB | 1050 mV_rms | 4.88 V_rms | +-6.90 V |
| -6dB | 525 mV _rms | 2.44 V_rms | +-3.45 V |
| 0dB | 262 mV_rms | 1.22 V_rms | +-1.73 V |
| +6dB | 131 mV_rms | 0.61 V_rms | +-0.86 V |

So after all these measurements, what's a good match between the output level of the TASCAM and the input level of the GH5S?

| TASCAM DR-701D  Panasonic LUMIX GH5S |
| :--- |
| Camera output 27dB <br> or line output -3dB |
| Or alternatively: |
| TASCAM DR-701D  <br> Set microphone input to "LINE" and <br> Sound_Rec_Level_Adj. to 0dB  <br> Camera output 30dB <br> or line output 0dB $\longleftrightarrow$Set microphone input to "LINE" and <br> Sound_Rec_Level_Adj. to -3dB |

With these settings both recorders get the same amplitude and clipping occurs at the same level.

This is a machine for creating sound effects for horror films. It was envisioned by movie composer Mark Korven and created by guitar maker Tony Duggan-Smith. http://apprehensionengine.com/
The apprehension engine was used to make the sounds for the movie "The Witch": https://en.wikipedia.org/wiki/The_Witch_(2015_film)
Some videos by Jakob Balogh showing what you can do with this engine:
The Apprehension Engine - First Look Part 01 (Horror Machine) https://www.youtube.com/watch?v=dSVzFD6bDwQ
The Apprehension Engine - First Look Part 02 (Horror Machine) https://www.youtube.com/watch?v=61Cw5vApw-0
The Apprehension Engine - First Look Part 03 (Horror Machine) https://www.youtube.com/watch?v=n5nAXLdBc40
Other videos showing how to use the engine and similar instruments:

## Matrixbrute: $4.0879 \mathrm{~Hz}-16744 \mathrm{~Hz} \quad$ Subsequent $37: 8.1768 \mathrm{~Hz}-8372.0 \mathrm{~Hz} \quad$ Microbrute: $\mathbf{3 2 . 7 0 3 ~ H z - 2 0 9 3 . 0 ~ H z}$

Midi numbers: from 0 (C-1) to 127 (G9)
In electronic music, pitch is often given by MIDI number m, which is $\mathbf{6 9}$ for note $\mathbf{A 4}$ and increases by one for each equal tempered semitone, so this gives us these simple conversions between frequencies and MIDI numbers:
$m=12^{*} \log _{2}\left(f_{m} / 440 \mathrm{~Hz}\right)+69$
$f_{m}=440 \mathrm{~Hz}{ }^{*} 2^{(m-69) / 12}$
$\log _{2}(x)=\ln (x) / \ln (2)$

## $37.3 \quad$ Midi

There are 128 midi controllers. Controllers from 0 to 31 are 14-bit, the MSB is at adresses $\mathbf{0 - 3 1}$ and the LSB is at adresses 32-63.

### 37.4 USB/MIDI Adapters

The device name can be different, for example "UBB2.0-MIDI" or "USB A".
Connect the "OUT" connector to "IN" at the synthesizer, and vice versa.
In rare cases I had transmission errors with the "USB2.0-MIDA" adapter. It seems better to use the direct USB cable to the MatrixBrute.

### 37.5 Synthesizer Abbreviations

CV = Control Voltage
DAW = Digital Audio Workstation
ENV = Envelope
LFO = Low Frequency Oscillator
MCC = Midi Control Center
PW = Pulse Width
VCA = Voltage Controlled Amplifier
VCO = Voltage Controlled Oscillator
VCF = Voltage Controlled Filter

|  | Matrixbrute | Subsequent 37 |
| :--- | :--- | :--- |
| Initialize a preset with a <br> basic sound | Hold PANEL and then press PRESET. |  |
| Load a preset | Press PRESET if it's not already illiminated, then press one of <br> the matrix buttons. | Press the "BANK" button and then one of the 16 "PRESET" <br> buttons to select a bank. <br> Then press one of the 16 "PRESET" buttons to load a preset. |

## $37.7 \quad$ Potentiometer behaviour

| Behaviour | Matrixbrute | Subsequent 37 |  |
| :--- | :--- | :--- | :--- |
| Absolute mode, the value <br> changes immediately when <br> you turn the potentiometer. | In MIDI Control Center, device tab: Set 2pot mode2 to <br> "Jump". <br> On MatrixBrute: Press PRESET+SEQ+MOD, then press G1. | Press "GLOBAL", scroll down to <br> "POT MODE", then select "ABS". | Recommended for <br> creating new sounds. |
| Value changes, when you <br> turn the potentiometer past <br> the current setting. | In MIDI Control Center, device tab: Set 2pot mode2 to <br> "Hook". <br> On MatrixBrute: Press PRESET+SEQ+MOD, then press G2. | Press "GLOBAL", scroll down to <br> "POT MODE", then select "THRU". | Recommended for life <br> performance. |
| Value changes relative to <br> potentiometer adjustment. x <br> Then you must first turn it to <br> the other extreme position. | In MIDI Control Center, device tab: Set 2pot mode2 to <br> "Scaled". | Press "GLOBAL", scroll down to <br> On MatrixBrute: Press PRESET+SEQ+MOD, then press G3. <br> Drawback: If the potentiometer is at the extreme position, <br> you cannot move it further. | Recommended for life <br> performance. |

### 37.8 MatrixBrute: Oscillator tuning

Wait at least 5 minutes after warm-up. Hold "Panel" and then press "Kbd Track". You should see "Tun" in the display.

## $37.9 \quad$ MatrixBrute power saving mode

In the system settings editor (PRESET + SEQ + MOD), row "P", column " 4 " is "OFF" and column " 5 " is "ON".

### 37.10 MatrixBrute AUDIO MOD Section

It's unclear what type of modulation the "VCO1>VCO2" and "VCO1<VCO3>VCO2" potentiometers are doing. It appears to be a combination of amplitude, frequency and phase modulation.

### 37.11 MatrixBrute Control Voltages I/O

| VCO1 Pitch | $0-10 \mathrm{~V}$ |
| :--- | :--- |
| VCO1 Ultra Saw | +-5 V |
| VCO1 Pulse Width | +-5 V |
| VCO1 Metalizer | +-5 V |

| 40s | 90 | 3s | 180 | 6s | 270 | 9s | 360 | 12s | 450 | 15s | 540 | 18s | 720 | 24s | 1080 | 36s | 2160 | 72s |
| 60s | 60 | 2s | 120 | 4s | 180 | 6s | 240 | 8 s | 300 | 10s | 360 | 12s | 480 | 16s | 720 | 24s | 1440 | 48s |
| 120s | 30 | 1s | 60 | 2s | 90 | 3s | 120 | 4s | 150 | 5s | 180 | 6s | 240 | 8s | 360 | 12s | 720 | 24s |

How to re-format SD cards which have multiple partitions (this happens for example if the card comes from a Raspberry Pi) ?
Windows 10: Right-click on the Windows symbol in the lower left of the desktop, and choose "Datenträgerverwaltung" (If you know how it's called in english, please let me know). Find the drive in the list, right-click and format.

## Zhiyun Crane 3S

See also: https://www.zhiyun-tech.com/crane3s/en

| Mode | Pan axis <br> (left / right) | Tilt axis <br> (up / down) | Roll axis <br> (rotate image) | How to activate <br> this mode | Joystick | Description |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| PF | following | stabilized | stabilized | Press MODE <br> button | Pan + Tilt | Pan following mode (This is the default mode after startup) <br> Note: The "MODE" button is only on the main body. |
| L | stabilized | stabilized | stabilized | Press MODE <br> button | Pan + Tilt | Locking mode <br> Note: The "MODE" button is only on the main body. |
| POV | following | following | following | Press POV <br> button | -- | Point of view mode, press FOV button again to return to previous mode |
| V | following | following | following | Press POV <br> button twice | Pan | I don't understand this mode. If you can explain it, please let me know. |
| F | following | following | stabilized | Press F button | Roll | Following mode, press F button again to return to previous mode |
| GO | fast <br> following | fast <br> following | stabilized | Press GO <br> button | -- | Following mode, similar to "F" mode but faster following. <br> Press GO button again to return to previous mode |

Firmware upgrade: In the manual is described that you need "Zhiyun Gimbal Tools", but you won't find this on the website. Search for "Calibration Upgrade Tool" instead.
If the joystick and the buttons on the main body don't work: Move the "FN" switch to the left side.
Enter or exit standby mode: Long press the MODE button.

Note: GH5S must be set to USB Mode "PC(Tether)". Don't forget to set it back to "PC(Storage)" when you want to read out the SD card.

When using the gimbal, should the stabilization in the lens be activated or not?
I did make a test in PF mode with GH5S and Leica DG 12-60mm f/2.8-4.0 lens. The result is better if image stbilization in the lens is activated.

Balance adjustment table:

| Camera + Lens | Camera left/right | Tilt axis | Roll axis | Pan axis |
| :--- | :--- | :--- | :--- | :--- |
| GH5S + Leica DG 12-60mm f/2.8-4.0 | 22 mm | 48 mm (maximum) | 27 mm | 54 mm |
| GH5S + Canon CN-E 24mm T1.5 L F <br> with 0.64x SpeedBooster and variable ND filter and focus motor | 22 mm | 27 mm | 8.5 mm | 43 mm |
| N |  |  |  |  |

Note: The extension arm is not required.

Note for Canon CN-E 24 mm lens: Set the focus position to 0.7 m before powering on the gimbal. Then the focus range is from 0.4 m to infinite.

## How to use the $A B$ settings for limiting the focus range:

Press DOWN button, rotate to select "wheel", press RIGHT, rotate to select "Abpoint", press RIGHT.
Rotate the wheel to the first focus point, then select "A" and press RIGHT. Rotate the wheel to the second focus point, then select "B" and press RIGHT. It doesn't care if the larger distance is A or B. Now the focus setting is limited between A and B. This setting is not permanently saved. You can delete it with the "clear" function in the same menue.

## 40 Timelapse+ View

This is a small device that connects to a camera and controls the exposure time, aperture and ISO automatically, so that day-to-night or night-to-day timelapses are possible.
https://www.timelapseplus.com/

Important notes:

- Set the camera to manual (M) mode
- Use a native ISO setting (not Auto ISO)
- Save as RAW (not RAW + JPG)
- Manual focus (no autofocus)
- Disable image stabilization
- Check all parameters before using
- Don't rely on the internal battery, use an external powerbank
- Save the images in the camera, not in the Timelapse+ View
- The "Night Exposure" parameter describes how much darker the video shall become at night. Typical values are -0.5 to -0.75. Please note that the unit of this parameter isn't specified. These are not exposure compensation values! I did try $\mathbf{- 2}$ and the resulting video was much too dark in the night (about -11 exposure values).

Example for HDR timelapse with Timelapse+ View: https://www.facebook.com/groups/395686464095972/permalink/1413928625605079/

## 41 Timelapse_Control_V2

This is a C\# project I did program in 2016, before the "Timelapse+ View" became available. It's a program for controlling the exposure values of a Canon 6D camera for day-to-night or night-to-day timelapses. It should also work with other Canon cameras. The software calculates the altitude of the sun above or below the horizon, and based on this angle chooses a "light value". This "light value" is then translated into a combination of exposure time, aperture and ISO settings. All this is defined in the file "default.cfg" which is an ASCII text file that can be edited.

My source code can be downloaded here: http://www.astro-electronic.de/source/Timelapse Control V2.zip

Hint: You must allow unsafe code in the project: Click on project $\rightarrow$ properties $\rightarrow$ build $\rightarrow$ allow unsafe code The following libraries from Canon are required: Edslmage.dII, EDSDK.dII

This chapter may be a little bit off-topic in this document, because Guide 9.1 is an astronomy program. But I didn't want to create a new document for my notes about it.
Website: https://www.projectpluto.com/
The manual is available here: https://www.projectpluto.com/user_man/manual.pdf

### 42.1 Install Guide 9.1

- Insert the Guide 9.0 DVD and open the folder, then run "setup.exe". This will install Guide 9.0 very fast, but most of the data is still on the DVD. Which means it does only work if you let the DVD in the drive.
- If you have enough space on the harddisk, it's recommended to install all on the harddisk. Run Guide 9.0 and click on Extras / Install_on_hard_drive. It's best if you select all, except those languages that you don't need.
- It's highly recommended to install the upgrade to Guide 9.1, which is available here: https://www.projectpluto.com/ This upgrade is required for communication with a telescope over the serial port, and also for downloading the latest comet orbit data.

### 42.2 Control a LX200-compatible telescope

- If your computer doesn't have a RS232 port, then use a USB / RS232 adapter. Plug this adapter into a free USB port and find out which COM number was assigned to the adapter, e.g. COM10. Use always the same USB port. Otherwise the COM number will change.
- In Guide 9.1 click on Settings / Scope_Control. here you choose the COM number and as telescope type you use "LX200". Then click on "OK".
- Now there is a new menue "Scope Pad". When you click on it, a small window opens. Here you can control the telescope. It's described in the FS2 manual.
- USB adapters don't work with Guide 9.0. You must install the Guide 9.1 upgrade.

### 42.3 Add new comets to Guide 9.1

The "Add MPC Comets / Asteroids" function does no longer work. You can use this workaround:
Go to http://astro.vanbuitenen.nl/cometelements?format=guide
and save this file in your Guide folder as soft02cm.txt (this is used for Guide) and also as comets.dat or cometg.dat (this is used for Charon, use the filename that already exists).

The broken "Add MPC Comets / Asteroids" function in Guide9.1 can be repaired if you copy and paste the following content to the "add_mpc.hee" file. In german installations the filename may be "add_mpc.hed". This desn't work with Guide 9.0, the upgrade to Guide 9.1 is required. (Thanks to Larry Wood who posted this in the Guide user group, September 18, 2019)

```
The ^Minor Planet Center (MPC)//xhttps://www.minorplanetcenter.net/cfa/ps/mpc.html^ and the
^IMCCE//xhttp://www.imcce.fr/fr^
provide orbital elements for comets. Guide updates its list of comets
using both sources; MPC gives currently-observable comets, IMCCE all
comets since about 1995. (Data for historical comets is already built
into the Guide DVD.) You can click on the following to download
some of these files, getting orbital data for newly-found objects and
improving orbits for already known objects. About 600 KBytes will be
downloaded
^Click to download updated comet data and add it to Guide//dhttp://astro.vanbuitenen.nl/cometelements?format=guide
soft02cm.txt;dhttps://www.projectpluto.com/eltdat.txt eltdat.txt;a2789^
Guide can also import other orbital elements if they're provided in
the "eight-line format", or the "one-line format" used for Daily Orbit
Updates. You wouldn't normally do this, but if you have generated an
orbit using Find Orb, for example, you could import the resulting file
of orbital elemeñts using the following command.
```

^Add MPC asteroids/comets//!2052^

Please note that the long line in the middle must be written in one line and there is a space character between "guide" and "soft02cm".

The path of those comets or asteroids which have a close encounter with other objects (e.g. planets) can't be described by orbital elements for a longer time. If you want to add the ephemeride of such an object point-wise into Guide 9.1, follow these instructions:

Go to this MPC website: http://www.minorplanetcenter.net/iau/MPEph/MPEph.html
and write the name of the object in the large white field (e.g. 2012DA14). Then fill in some more fields (use your own data, of course):
Ephemeris start date: e.g. 20130215 19:00
Number of dates to output: e.g. 400
Ephemeris interval: e.g. 1 minute
Longitude: e.g. 10.3454
Latitude: e.g. 51.3829
Altitude: e.g. 257
Display R.A./Decl. positions in: full sexagesimal
Tick the box "Suppress output if sun above local horizon" if that makes sense for your object.
Then click on "Get Ephemerides/HTML page". Now copy and paste the data lines (without the header) to an editor. It should look like this:

Save this file as "2012DA14.dat" to your Guide folder (e.g. C:/GUIDE9).
It's absolutely required that all data are in the correct columns, as shown above.

Now create another file "2012DA14.tdf" and save it in the same folder. This is the content:

```
file 2012DA14.dat
title Asteroid 2012DA14
RA H 19 2
RA M 22 2
RA S 25 4
de d 30 3
de m 34 2
de s 37 2
mag 70 4
pref 2012DA14
epoch 2000
type scl;e0,0,30; #green circle, 30 pixels diameter
shown 1
end
```

That's all. Start Guide and the positions will be shown.

### 42.5 Add an overlay with comments

- Click on "Overlays" and select "Edit Overlay".
- Click on "(Create new overlay)", then clock "ok".
- Enter a name for the new overlay, for example "Comments".
- A small new window appears, where you can select "Add Text".
- Right-click somewhere in the star chart and enter your comment.
- The data is saved in a *.uov file in the Guide folder, but the file isn't easily editable.

### 42.6 Update the position of Jupiter's great red spot

The longitude of Jupiter's great red spot must be updated from time to time. To do this, open the file "grs_long.txt" from the Guide folder with an editor Then insert a new line near the top, for example:
$2019 \quad 6 \quad 1311$ (user)

In this example the longitude is $311^{\circ}$ for date 2019 June 1th.
Save the file with the same filename.

The longitude can be found here, for example
https://skyandtelescope.org/observing/interactive-sky-watching-tools/transit-times-of-jupiters-great-red-spot/

### 42.7 Add a user-defined horizon

Either measure the horizon heights with a azimutal telescope, or make a $180^{\circ}$ fisheye image of your location. The lens is pointing to the zenith. Convert this image to an equirectangular image as follows:

```
set "FF=c:\ffmpeg\ffmpeg" :: Path to FFmpeg
set "IN=s3.jpg" :: Input fisheye image, south at the bottom
set "SQ=3648" :: Height of input image (width doesn't care)
set "OUT=s3.png" :: Stereographic output image 360x90 pixel,
    :: north at the left, south in the center, horizon at the top, zenith at the bottom
%FF% -i %IN% -lavfi
"crop=ih:ih,scale=180:180,pad=w=2*iw,v360=input=dfisheye:output=e :rorder='rpy':roll=180:pitch=90,crop=iw:ih/2:y=0,vflip"
-y %OUT%
pause
```

Open the output image with IrfanView. The $X$ coordinate is the azimuth angle in degrees, and the $Y$ coordinate is the height over the horizon in degrees. Now you can manually read out the pixel positions of the horizon line for all azimuth angles in 5 - or 10-degree steps.

Then you can insert the horizon line at the beginning of the horizon.dat file:

| hor $3200 \quad ;$ | these are the RGB colors |  |  |
| :--- | :--- | :--- | :--- |
| 0 | 25 |  |  |
| 10 | 21 |  |  |
| 20 | 20 |  |  |
| 30 | 16 |  |  |
| 40 | 22 |  |  |
| 50 | 18 |  |  |
| 60 | 16 |  |  |
| 70 | 22 |  |  |
| 80 | 19 |  |  |
| 90 | 16 |  |  |
| 100 | 22 |  |  |
| 110 | 20 |  |  |
| 120 | 15 |  |  |

```
130 6
140 10
150
160
170
180
190
200
210
220
230
230
240
250 8
260 14
270 16
280 8
290 12
300 17
310 21
320 24
33026
340 28
35029
360 25
hend
i N_for_North 0 . 5 . 5
i N_for_North 43 .5 .4
i E for East 47 . 5 . }
i E-for East 90 .5 .5
i S for-South 133 .5 .
i E for East 137 .5 . }
i S for South 180 . 5 . 5
i S_for_South 223 .5 .4
i W_for_West 227 . 5 . }
i W for West 270 . 5 . 5
i N-for North 313 .5 . 4
i W_for_West 317 . 5 . 4
```

If you have several horizon files and you want to switch between them, you can create one batch file for each horizon, with this content:

```
copy d:\guide9\my_horizon_1.dat d:\guide9\horizon.dat
```

Put the batch files on the desktop and execute one of them by double-clicking. It will automatically overwrite the horizon.dat file with your own horizon file. You can change the horizon file while Guide is running. After overwriting the horizon file, just click in the Guide window to refresh the graphics and then you see the new horizon.

## $42.9 \quad$ Install the Gaia2 catalog for Guide 9.1

Thanks to Jost Jahn who made it possible to download the Gaia2 catalog for Guide 9.1 here:
http://www.gaia2.de/index.htmI
Simply follow the instructions there.

### 42.10 Set up Guide 9.1 to show only the Gaia2 catalog

This is useful for making realistic timelapse videos of the proper motion of stars over 10000's of years. The trick is to create a second Guide folder which contains a minimal installation of Guide 9.1, with only those files that are absolutely required. No star catalogs are present in this folder.

- Create a new folder "guide_gaia_only"
- Copy the following files and folders from the original guide folder to the new folder: cache (folder), ngcic (folder), astnum, bitfont, cometg.dat, constbnd.ove, constlab.ove, gaia-std.tdf, gscdata2.idx, guide.dat, guide9.exe, hotkey.dat, lunar.dll, marks.nam, maximum.dat, messier.hee, overlays.nam, startup.mar, strings.dat, tdf_list.dat, temp_mar.txt, vsop.bin, win_meng.dat and win_menu.dat
- Open the file "gaia-std.tdf" with an editor and search/replace "file !:ISTDI" to "file D:IGuidelSTD\" using the actual path to the Gaia catalog. You don't want to have this catalog on your harddisk twice. There are 180 instances in the file that must be changed.
- Start Guide in the new folder.

For example, if you want to find the star "TYC 5965965 " from the Tycho catalog, use GoTo --> Star --> Guide Star catalog --> 5965965

### 42.12 Moon libration

In Tables --> Lunar Data you can generate tables which contains the moon's libration.
"AMT" is the amount of libration in degrees, and "PA" is the position angle, counter-clockwise from the north pole.

Libration in latitude:

- A positive value means the north pole is visible.
- A negative value means the south pole is visible.

Libration in longitude:

- A positive value means more details are visible at the left side (longitude west), that's the side where Mare Procellarum is.
- A negative value means more details are visible at the right side (longitude east), that's the side where Mare Crisium is.

## www.stellarium.org

How to create equirectangular images of the night sky: http://paulbourke.net/dome/stellariumsphere/

This is a physically correct simulation program for astronomy and space, covering the whole universe. It was developed by Vladimir Romanyuk. The known part of the universe is simulated with real data, and the unknown part is filled with procedural galaxies, stars and planets.
http://spaceengine.org/

- The latest version costs 20.99 EUR. A Nvidia GPU is required. Older versions are free, but don't work with newer graphics cards.
- There is a "SpaceEngine Pro" version that costs additional 52.99 EUR, but it doesn't have any features that I need.
- It's surprising that such a good program has such a bad documentation.
- The informations on the website are several years old and parts of it are outdated. For example, it's written there "Look at the readme_eng.txt file located in the SpaceEngineldocs\folder, it contains a list of all controls in the program." But this folder doesn't exist. The folder was renamed "license" and still contains the mentioned file. But the informations in this file is also outdated.
Another example: On the website is written "Alternately, you can open the in-game controls menu by the [F8] key to view and modify the controls." This doesn't work either.
- Click in the left menu in "Settings" and then on "Controls" to get a list of all keyboard shortcuts. Unfortunately this list can't be printed out.
- There are some tutorials in Planetarium --> Tutorials, but they cover only a small subset of all functions.
- The resolution of a saved video is the same as the resolution of the desktop. My notebook has a $1920 \times 1080$ screen, but the resolution is doubled to $3840 \times 2160$ if a 4 K beamer is connected. Then the video is saved with $3840 \times 2160$ resolution. It's not necessary to power on the beamer, connecting it with a HDMI cable is sufficient.
- In window mode, it's possible to make the window larger than the desktop. The window can be moved with Alt key and left mouse button.
- What's called "Cylindrical" in the display menu is in fact an equirectangular projection. When you read "cylindrical" in SE's documentation, you can always translate it to "equirectangular".

### 44.1 Keyboard shortcuts

Common controls:

| Main Menu | Esc |  |
| :--- | :--- | :--- |
| Video capture settings | F9 |  |
| Video capture | CtrI-F9 |  |
| Screenshot without GUI | F11 |  |
| Screenshot with GUI | Ctrl-F11 | Ö on german keyboard <br> Type "FPS" to enable the framerate counter. <br> Type "TARDIS" to get the same time warp settings as the planetarium mode. <br> Type "FOV 90" to set the field of view to 90. |
| Console |  |  |
| Switch to fullscreen | Shift-Enter |  |
| Switch to next display | Ctrl-Enter |  |
| Minimize window | Numpad / |  |
| Stereoscopic 3D | Enter |  |
| Reset pose in VR | Alt-F4 | This key is not assigned by default. I did assign the "Insert" key to this function. When <br> you hold the "Insert" key pressed, you can orbit around the object with the Numpad 4, <br> Numpad 6, Numpad 2, and Numpad 8 keys. |
| Exit to desktop | Insert |  |
| Orbit Object |  |  |
| Journey log | Tab |  |
| Universe map (selection) | Ctrl-F1 or Ctrl-M |  |
| Universe map (current position) | F8 or 0 |  |
| Solar system chart |  |  |
| Solar system browser (selection root) |  |  |
|  |  |  |

| Solar system browser (selection level) | F2 |  |
| :--- | :--- | :--- |
| Solar system browser (current position) | Ctrl-F2 |  |
| Find object | F3 |  |
| Star browser | Shift-F3 |  |
| Spacecraft manager | Ctrl-F3 |  |
| Locations | F6 |  |
| Wiki | I |  |
| Settings | F4 |  |
| Visual style | Ctrl-Shift-F4 |  |
| Filter objects | Shift-F4 |  |
| Graphics | Ctrl-F4 |  |
| Sound | Ctrl-F12 |  |
| Music player | Shift-F12 |  |
| Editor | Shift-F2 |  |
| Debug mode | Numpad * or Shift-8 |  |
| Select previous object | Backspace |  |
| Select home object | Shift-H |  |
| Free binding to object | Shift-D |  |
| Follow object | Shift-F |  |
| Rotate with object | Shift-R |  |
| Reverse time speed | J |  |
| Decelerate time speed | K |  |
| Accelerate time speed | L |  |
| Pause time | Spacebar |  |
| Set normal time speed | I |  |

This chapter was written by Vladimir Romanyuk, source: http://spaceengine.org/news/blog170924/
The "approved" planet classification scheme is the following:
[temperature class] [volatiles class] [mass prefix][bulk composition class]
The temperature class is like in previous versions of SE, but with slightly changed limits:
frigid ( 90 K ) cold ( 170 K ) cool ( 250 K ) temperate ( 330 K ) warm ( 500 K ) hot ( 1000 K ) torrid
This format of notation means that, for example, the temperate class lies between $\mathbf{2 5 0} \mathrm{K}$ and $\mathbf{3 3 0} \mathrm{K}$, and torrid is greater than 1000 K . These subdivisions are based on the properties of important substances:
90 K is the limit for the liquefaction of nitrogen, methane and other hydrocarbons found on very cold Titan-like worlds;
170 K is the water snow line in the Solar system and the temperature of outer asteroids in the Main asteroid belt;
$\mathbf{2 5 0} \mathrm{K}$ is the equilibrium temperature of Earth, and the assumed minimum average temperature of an Earth-like planet which could have temperate zones on its surface (with temperatures above water's freezing point);
330 K is close to the maximum temperature on Earth, and the assumed maximum average temperature of an Earth-like planet which does not fall into a runaway greenhouse effect;
500 K and 1000 K boundaries are arbitrary, and could be adjusted in the future to match some observational or theoretical characteristics of the hottest exoplanets.

The volatiles class is a combined atmosphere + hydrosphere description. It includes:
airless - a planet with an atmospheric pressure less than 1 nanobar;
desertic - a planet with atmospheric pressure greater than 1 nanobar, but with no liquids on its surface;
lacustrine - a planet with a small amount of liquid on its surface (lakes), and, obviously, with an atmosphere (because liquid cannot exist in a vacuum);
marine - a planet with seas of a liquid substance, i.e. a significant amount of it, but not completely covering the surface;
oceanic - a planet with a global ocean, completely covering the surface;
superoceanic - a planet with a very deep ocean (hundreds of kilometers deep), with exotic forms of ice forming on its bottom (ice VI and ice VII). I will explain this in more detail in the next blog post.

The mass prefix is different for solid and gaseous planets; it is chosen to match the modern astronomical terminology at some points. Here 'Me' is Earth mass, and ' Mj ' is Jupiter mass ( 318 Earth masses).
Solid planets (ferria, carbonia, terra, aquaria):
micro ( 0.002 Me ) mini ( 0.02 Me ) sub ( 0.2 Me ) no prefix ( 2 Me ) super ( 10 Me ) mega
Ice giants (neptunes):
mini (4 Me) sub (10 Me) no prefix ( 25 Me ) super ( 62.5 Me ) mega

Gas giants (jupiters):
sub ( 0.2 Mj ) no prefix ( 2 Mj ) super ( 10 Mj ) mega
The bulk composition classes define the fundamental substances of which the planet is made:
Ferria - metals (iron, nickel) and siderophilic elements such as sulfur. The boundary is $\mathbf{>} \mathbf{5 0 \%}$ by mass.
Carbonia - carbon and its compounds like carbides, also CO and methane. The boundary is $\mathbf{>} \mathbf{2 5 \%}$ by mass.
Aquaria - water in the form of exotic ices and liquid (but not vapor or supercritical fluid - that is a minineptune). The boundary is $\mathbf{>} \mathbf{2 5 \%}$ by mass.
Terra - not ferria, not carbonia and not aqauria. The primary component is silicates (rocks).
Jupiter - hydrogen and helium. The boundary is $\mathbf{>} \mathbf{2 5 \%}$ by mass.
Neptune - not any of the previous classes. Typically, $\mathrm{H} / \mathrm{He}$ is less than $\mathbf{2 5 \%}$; other substances are water/ammonia/methane and a rocky core. An aquaria with a supercritical vapor atmosphere is classified as a minineptune/subneptune.

Let me explain why the classification is as such.
The first 4 classes are "terrestrial" or "solid" planets, usually referred as "earths" in astronomy. Currently there is no accepted subdivision by bulk composition like this one, because astronomers can't detect the bulk composition from observations of exoplanets - they can only estimate it based on a computed bulk density. This is enough to distinguish earths, neptunes and jupiters, but intermediate cases are hard to classify (a large water planet is indistinguishable from a small neptune, and a massive neptune is indistinguishable from a small jupiter). The exception is our Solar system - we can measure the density distribution inside a planet or moon by the precise measurement of the motion of a spacecraft near it. Combining this with knowledge about various substances under pressure (and for some planets, using information about the propagation of seismic waves), one can develop a model of the internal structure of a space body. Mercury with its large iron core ( $60 \%$ of the planet mass) should be classified as ferria in SE. This corresponds to a theoretical iron planet. Venus, Earth, Mars, the Moon, and lo are classified as terra (Earth is a marine terra); other moons of gas giants and all dwarf planets are aquaria. Ceres and Europa are complex cases - they are on the boundary between terra and aquaria (about $25 \%$ of water and ice). Uranus and Neptune are neptunes, Jupiter and Saturn and jupiters. No carbonia worlds exist in the Solar system; this class is the theoretical carbon planet. Aquaria corresponds to the theoretical water or ocean planet, if it is warm enough to melt the icy crust; otherwise it corresponds with an ice planet.

The most used mass/size prefixes in modern astronomy are super- and sub- for solid planets. The upper boundary of 10 Earth masses for super-earths is well defined, while the lower boundary differs in various sources. For SE I chose 2 Earth masses to make the scale more regular. There is speculation about the existence of more massive solid planets called mega-earths. Possible candidate mega-earths are Kepler-10c and K2-3d, although recent reestimations of their masses have moved them back to the super-earth class. The boundaries of the sub-earth class (in some sources called mini-earth) are also not well defined in literature; I chose it to be between 0.02 and 0.2 Earth masses so both Mercury and Mars fall into this class, but the Moon does not. Interestingly, Ganymede and Titan are also in the sub-earth class (they are subaquarias). The "mini" class is added to SE for planets less massive than 0.02 Earth masses; this is between the mass of the Moon and Ganymede. And the "micro" class is for the tiniest objects, which still have a round shape and should be classified as planets/dwarf planets/moons, unlike irregularly-shaped asteroids. The boundary of 0.002 Earth masses is arbitrary, just to make the scale uniform.

There is no sharp boundary between asteroids and "planetoids", because it depends on composition, tidal heating and the history of the body. For example, Ceres has a mass of 0.0001566 Earths and a round shape, while the asteroid Vesta is 0.0000432 and non-round. So we could assume that the boundary for rocky asteroids is near 0.0001 Earth masses. But we have a counter-example: Mimas (Saturn's moon) is just 0.0000062 Earths and round,
while Proteus (Neptune's moon) is slightly more massive - 0.0000083 Earths, and has an irregular shape. So the boundary for icy bodies cannot be defined by their mass only. For now, SE generates a slightly randomized boundary for each procedural body, about 0.0001 Earth masses for rocky objects and 0.000006 Earth masses for icy ones.
Ice giants, or "neptunes", are planets formed mainly from water/ammonia/methane ices (in fact as a supercritical fluid) and often with a thick atmosphere of hydrogen and helium, up to $25 \%$ of their mass. But they can also be very massive rocky planets (more than 10 Earth masses) that have a supercritical atmosphere (that is, in a state of supercritical fluid with enormous pressures and temperatures of thousands of degrees). Therefore the term "neptune" looks more appropriate than "ice giant"; it also eliminates confusion from names like "hot ice giant". Neptunes in SE have their own size prefix scale, overlapping with the classes of solid planets. The subdivision by mass is arbitrary, but astronomers often distinguish mini-neptunes into a separate class - those are small planets with extremely low bulk density (typically, rocky or water planets with a thick supercritical atmosphere). It corresponds to both the mini- and sub- classes in SE, but this additional subdivision is done for clarity (more details in the next blog post). The mega-neptunes are theoretical planets more massive than the smallest gas giants ( $\sim 60$ Earth masses), but composed predominantly of ices, not of hydrogen and helium. The overall scale is logarithmic with a 2.5 step: 4-10-25-62.5

Unlike ice giants, gas giants or "jupiters" are composed predominantly of hydrogen and helium. Hydrogen forms a metallic layer deep inside the planet. Saturn-mass planets are sometimes called "sub-jupiters" or "sub-giants", or even "saturns". So 0.2 Jupiter masses is a good choice for this class boundary (the mass of Saturn is 0.3 Jupiter masses). 0.2 Jupiter masses is roughly equal to 60 Earth masses, so the sub-jupiter class overlaps with the mega-neptune class. This emphasizes the difference in the nature of these two types of planets. The mass of 2 Jupiters is around the theoretical limit for the largest (by radius) planet. More massive gas giants are smaller because of the compression of gas by their enormous gravity. Such planets are called super-jupiters in this classification. And the most massive giants of more than 10 Jupiter masses are called mega-jupiters - they are close to the brown dwarf mass limit (13 Jupiters). Technically, brown dwarfs which have run out of deuterium fuel could be classified as extremely massive planets, so the mega-jupiter class could be used for them in future updates (for now SE doesn't model the evolution of brown dwarfs, and so can't determine if fusion already stopped). Super-jupiters and mega-jupiters in SE correspond to super-jupiters in literature, although there are huge differences in the definition of this class in various sources. The size prefix scale of gas giants resembles the scale of solid planets, so one can add the mini-jupiter class by analogy - planets with a mass lower than 0.02 Jupiters (about 6 Earth masses). It is doubtful that such small gas giants could exist in reality. The SE planet generator also don't produce them.

This classification resembles one proposed by the Planetary Habitability Laboratory.
Changes in the engine made to support the new classification system include adding the bulk composition data into planet scripts. SE generates it procedurally if it's missing, but for the Solar system's planets and moons we want to have real data. This data is displayed in the Wiki. Note the new "Hydrosphere" tab - it displays information about seas, including their chemical composition (this is a topic for the next blog post). The procedural planet generator now creates all of the types of planets described above, including mini-neptunes, carbonias and even frozen terras.

Note: Brown dwarfs are considered as main sequence stars with spectral class types $M, L, T$, and $Y$.

### 44.3 Interesting objects

- S/2009 S1, dwarf moon in Saturn's rings
- 2010 TK7, Trojan asteroid on Earth's orbit
- Planemo = Free planet without a star: They are very dark, use Settings / Camera / Ambient_Lighting to make them visible.

### 44.4 Export Textures

## Tools --> Export Textures

The files will be saved to this folder: E:ISteamLibrarylsteamappslcommonlSpaceEnginelexport
44.5 Export Skybox

Tools --> Export Skybox
Six cubemap files will be saved to this folder: E:ISteamLibrarylsteamappslcommonlSpaceEnginelexport
The filenames are:
sky_neg_x.jpg sky_pos_x.jpg
sky_neg_y.jpg sky_pos_y.jpg
sky_neg_z.jpg sky_pos_z.jpg

The six cubemap images can be converted to an equirectangular image with this FFmpeg command:

```
fmpeg i sky_pos x.jpg i sky_neg_x.jpg -i sky_pos_y.jpg -i sky neg_y.jpg -i sky_pos_z.jpg -i sky_neg_z.jpg -lavfi
hstack=6,v360=c6x1:e -y out.jpg
pause
```

### 44.6 Scripts

This is an example script for Olympus Mons on Mars:

```
// Olympus Mons
// omons.sc
// Put in [SpaceEngine]\addons\scripts (for SE 0.980)
// Open console, type:
// Run omons (without .sc)
Time Current
//Time 2016.05.04 15:03:07
GotoFast Mars
Wait 3.0
```

Put it in 'E:ISteamLibrarylsteamapps\common\SpaceEngineladdonslscripts', then open the console (with the tilde '~') and type 'run omons'

## This is an example for overlaying a PNG image with alpha channel:

```
// Watermark
// Empress.se
Watermark
{
    Path "D:/Programme/Steam/steamapps/common/SpaceEngine/addons/textures/cockpits/Empress of the Universe.png"
    Opacity 1.0
    Visible true
}
```

See also https://spaceengine.org/manual/making-addons/introduction/

### 44.8 Abbreviations

- RS = Random Star
- $\quad$ RG = Random Galaxy
- RSC = Random Star in a Cluster
- RN = Random nebula

### 44.9 Suggestions for improvement

- Messier objects are difficult to find because there is a space character between " $M$ " and the number, which is quite unusual.
- Saturn's ring particles are always behind S/2009 S1, never in front of it.
- Add brown dwarfs
- Add mergers of black holes or neutron stars
- Saved locations don't work in flight simulator mode
- Stars close to the black hole in center of the milky way appear too late when the observer gets closer to them
- Nebula RN 8496-8003 Central stars appear dark red, even when the nebula is behind the stars
- From about $\mathbf{2 0 0 0 0 0 0 k m}$ distance, the moon appears brighter than the earth (only in HDR mode)
- Implement a realistic user-defined start location on earth, for example with several equirectangular drone images at height $0 \mathrm{~m}, \mathbf{1 0 m}, \mathbf{2 0 m}, \ldots$ 100 m ? I would really like to start my spaceship from my own location.
- Renaming saved locations: It should be possible to append some text to the location name. But when new text is typed in, the old text is immediately deleted.
- "Display" menu: What's called "Cylindrical" is in fact "Equirectangular". Calling the projection "Cylindrical" isn't wrong because equirectangular projection belongs to the large class of cylindrical projections. "Equirectangular" is just more specific.
- Add the Cirrus nebula = NGC 6960 and NGC 6995
- Add the Blue snowball = NGC 7662
- More details for Ina structure on the moon https://en.wikipedia.org/wiki/Ina_(crater) https://wms.Iroc.asu.edu/Iroc/view_rdr/NAC DTM_INACALDERA1
- Add NGC1360 Robins Egg Nebula

## DeepSkyStacker 4.2.3

DeepSkyStacker 4.2.3 can be downloaded here: http://deepskystacker.free.fr/english/index.htmI
Support group: https://groups.io/g/DeepSkyStacker
Youtube video from Frank Sackenheim (in german): https://www.youtube.com/watch?v=LrMptU0kLPE

A big advantage of version 4.2.2 and later is that it can read the RAW files from the Canon 5D-MK4.

The language used by DeepSkyStacker is automatically set from the language used in the operating system. If you want to force another language you can change it from the "About" box.

## Known problems:

When you open the light / dark / flat / offset images, unfortunately DSS always opens by default the folder from the last session. Same problem when you save the file list. Take care that you don't accitentally overwrite the file list from the last session! There is no known workaround to fix this problem. You have to select five times the same new folder!

### 45.1 How to align images without stacking them

Let's assume you want to align several images of star fields, for example if you want to make a timelapse from them.
This is possible with DSS if you go to Options --> Settings --> Stacking settings --> Intermediate Files and then tick the box at "Create a registered / calibrated file for each light frame". The resulting intermediate images are calibrated, shifted and de-rotated. You can use FFmpeg to make a timelapse from them.

Normally the comet must be marked in at least 3 images: The first, the last and the reference image. If the first or last image is the reference image, then two images are sufficient. Marking the comet is simple if the comet is clearly visible in the images.
However things are getting difficult if either the comet is invisible (because it's too faint and hidden in the noise) or if the comet is so diffuse that it's difficult to define it's center. In these cases you can proceed as follows:

- It's required that north is up in all images, and that all images are already registered.
- Use the first or the last image as reference image. Use that one with the higher score. That means you have to mark the comet only in two images.
- Mark the same star as a comet in the first and last image. It's best to choose a star near the comet.
- These two images must also be checked in the leftmost column in the file list.
- Save the file list. It's not required to close DSS.
- The motion of a comet can be found for example in Guide9.1, if you make a right click on the comet and then click on "More info". The RA and DE motions are given in the last line in degrees/day. Example: "Motion is $\mathbf{- 0 . 4 2}$ degrees/day in RA, $\mathbf{- 0 . 3 6}$ degrees/day in dec"
- Calculate the time difference between the first and last image in the unit "days". Example: $2 \mathrm{~h} 55 \mathrm{~m} 37 \mathrm{~s}-2 \mathrm{~h} 40 \mathrm{~m} 57 \mathrm{~s}=0.0102 \mathrm{~d}$
- Calculate how far the comet has moved in RA and De during this time. Example: -0.42 $/ \mathrm{d}^{*} 0.0102 \mathrm{~d}=\mathbf{- 0 . 0 0 4 2 8}{ }^{\circ},-\mathbf{0 . 3 5} / \mathrm{d}$ * $0.012 \mathrm{~d}=-\mathbf{0 . 0 0 3 6 7}{ }^{\circ}$
- Calculate the image scale in degrees/pixel. Example for a full frame camera with 36 mm image width, 6744 horizontal pixels and a 400 mm lens: $\arctan (36 \mathrm{~mm} /(6744 * 400 \mathrm{~mm}))=0.000765^{\circ} /$ pixel
- Now you can calculate how man pixels the comet has moved between the two images. Example: $\mathrm{X}=\mathbf{0 . 0 0 4 2 8 ^ { \circ }} / \mathbf{0 . 0 0 0 7 6 5} / \mathrm{pixel}=-5.60 \mathrm{pixel}$ (to the left), $Y=-0.00367^{\circ} / 0.000765^{\circ} /$ pixel $=-4.80$ pixel (downwards)
- Open the file "last_image.info.txt" with an editor. In the 6th line from the top is the position of the comet, for example: Comet = 4022.09, 1957.80
- Now modify these coordinates. To the $X$ coordinate you add the value that you calculated above $4022.09+(-5.60)=4016.49$ and from the $Y$ coordinate you subtract the value from above. That's because the direction of the Y axis is top down. 1957.80-(-4.80) = 1962.60
- Save the file with the same filename.
- Open the file list in DSS.
- Check that in the first image the comet is still marked at the same star as before. However in the last image the violet circle must have moved with respect to the star. Check that it has moved in the correct direction of the comet's movement.
- Check if under Settings / Stacking_Settings / Comet the box at "Comet Stacking" is ticked, and then start stacking.

Print out this form for the calculations:
RA_speed = RA comet motion in degrees per day =
DE_speed = DE comet motion in degrees per day =
T1 $=$ Time of first image $=$
$\mathrm{T} 2=$ Time of last image $=$
$\mathrm{dT}=$ Time difference in days $=\mathbf{T} \mathbf{2} \mathbf{- T 1 =}$
RA_deg $=$ RA comet movement in degrees $=$ RA_speed $*$ dT $=$
DE_deg = DE comet movement in degrees = DE_speed * dT =
S = Image scale in degrees per pixel =
For Canon 5D-MK4 with 400 mm lens: $\mathbf{0 . 0 0 0 7 6 5}$ /pixel
RA_pix = RA comet movement in pixels = RA_deg / S =
DE_pix = DE comet movement in pixels = DE_deg / S =
X_old = Original $X$ value in info.txt =
Y_old = Original $\mathbf{Y}$ value in info.txt =
X_new $=$ New $X$ value in info.txt $=$ X_old + RA_pix $=$
Y_new $=$ New $Y$ value in info.txt $=$ Y_old $-D E \_$pix $=$

## 46 SharpCap

https://www.sharpcap.co.uk/

## AutoHotKey

AutoHotkey is a free, open-source scripting language for Windows that allows users to easily create scripts for all kinds of tasks such as: redefining function keys, auto-clicking, macros, etc. https://www.autohotkey.com/
How to make a remote control for SharpCap, which can be used outside at the telescope in winter with gloves on?
Get the cheapest USB keyboard you can find. Disassemble it and keep only the electronics. Examine the keyboard matrix and find out which contacts must be connected for the F1-F12 keys. Replace the original keyboard matrix by large bushbuttons. I did use 12 buttons, but you can use less or more if you want. Search for "Arcade button" on Aliexpress or Ebay. Buttons are also available with built-in LED for illumination.
This is my remote control for SharpCap:

This is the AutoHotKey script for my SharpCap remote control:

```
#IfWinActive SharpCap
F1: :
    MouseClick,left,1051,65 ; Zoom
    MouseClick,left,1030,85 ; Auto
    MouseMove 1600,50 ; Move the mouse out of the picture
    return
F2: :
    MouseClick,left,1051,65 ; Zoom
    MouseClick,left,1030,310 ; 300%
    MouseMove 1600,50 ; Move the mouse out of the picture
    return
F3::
    send,{F1} ; Exposure -
    return
F4::
    send,{F2} ;' Exposure +
    return
F5: :
    Seeing Monitor on/off
    send,!t m
; Alt-t m
    return
F6: :
; unused
    MsgBox, , ,F6,2
    return
F7: :
    send, {F3}
    ; Gain -
    return
F8: :
    send, {F4 }
    return
```

send,!t h
return
F10::
send,!t f {Enter}
return
F11::
send, !q
SoundBeep,1000,200
return
F12: :
send, {esc}
SoundBeep,500,200
return

```

49 Tycho Tracker
https://www.tycho-tracker.com/

From time to time I have to deal with C\# programming to stay in practice. This year's task is: A digital topographic map is available for an area of approx. \(10 \mathrm{~km} \times 10 \mathrm{~km}\). In addition, digital elevation data is available, which is to be superimposed on the map. Virtual noise sources are to be placed along the roads on the map. Then those places should be found that are affected as little as possible by the noise sources. It should be assumed that the sound propagates in a straight line and can be shadowed by mountains. We are therefore looking for places from which all noise sources are hidden behind mountains. These are the places where I want to record nature sounds.

\subsection*{50.1 Where is the best place for recording nature sounds?}

That's more difficult than you might think, because you have to find a place without any disturbing noise:
- Road and rail traffic requires a distance of several kilometres. It's helpful if there is no direct line of sight, i.e. mountains in between are advantageous.
- If you don't want to record the sound of running water, you have to avoid valleys.
- Wind noise is disturbing already at quite small wind speeds despite fur windshield. Wind noise can be attenuated by a high pass filter. However on days with strong wind it's wasted time to make a record.
- Airplanes cause that approx. \(50 \%\) of the sound recordings are unusable (even in the Harz Mountains in Germany, where there is no large airfield within a radius of 80 km ).

Rain sounds: https://www.youtube.com/watch?v=hKfgHAE7pYU

\subsection*{50.2 Digital topographic maps}

A very good source for free digital topographic maps is OpenTopoMap, the web version is here: https://opentopomap.org/\#map=13/51.66473/10.42482
On this page is briefly mentioned (in german) how tiles of size \(256 \times 256\) pixels can be downloaded: https://opentopomap.org/about
This is a sample download of one tile (this is the place where I live): https://a.tile.opentopomap.org/13/4331/2718.png In this case the zoom level is 13, the \(X\) value is 4331 and the \(Y\) value is 2718.

This page contains very detailed explanations about the folder structure and mathematics of the zoom levels and coordinates: https://wiki.openstreetmap.org/wiki/Slippy map tilenames
Coordinate transformation from latitude and longitude to \(X\) and \(Y\) :
```

n = 2 ^ zoom
x = n * ((lon_deg + 180) / 360)
y = n * (1 - (

```

Coordinate transformation from \(X\) and \(Y\) to latitude and longitude:
```

n = 2 ^ zoom
lon deg = X / n * 360.0 - 180.0
lat_rad = arctan(sinh(pi * (1 - 2 * Y / n)))
lat_deg = lat_rad * 180.0 / pi

```

This returns the north west (top left) corner of the tile. Use \(\mathrm{X}+1\) and/or \(\mathrm{Y}+1\) to get the other corners. Use \(\mathrm{X}+0.5\) and \(\mathrm{Y}+0.5\) to get the coordinates of the tile's center.

Calculate the resolution:
```

resolution = 156543.03 meters/pixel * cos(latitude) / (2 ^ zoom)

```

Note: You can create your own layers in the french version of OpenStreetMap: umap.openstreetmap.fr

\subsection*{50.3 Digital elevation data}

I found several sources for free digital elevation data:
- Bundesamt für Kartografie und Geodäsie, elevation data on a 200 m grid is free, and higher resolution data must be paid (too expensive for my project): https://gdz.bkg.bund.de/index.php/default/catalog/product/view/id/756/s/digitales-gelandemodell-gitterweite-200-m-dgm200/category/8/
- NASA Earthdata Search: https://search.earthdata.nasa.gov/search After registering you can download free elevation data with 1 arcsec resolution (which is about 27 m in latitude, and less than 27 m in longitude). Search for the ASTER Digital Elevation Model (AST14DEM): https://Ipdaac.usgs.gov/products/ast14demv003/ However the elevation data seems to be inaccurate, as I found some peaks in the mountains about 40 m too low.
- https://opendem.info/download_srtm.html This is a very large 272MB GeoTiff file of Germany with 13201x10801 pixels. The resolution is 1200 pixels per degree. You can choose between surface data (including buildings and vegetation) and terrain data (without buildings and vegetation). The elevation data isn't perfect, as I found some peaks in the mountains up to 17 m too low. But for my project that's good enough and Idid use the terrain data file.

This really large 16 -bit GeoTiff file contains Germany from longitude \(5^{\circ}\) to \(16^{\circ}\) and from latitude \(47^{\circ}\) to \(56^{\circ}\). It covers a \(11^{\circ}\) longitude range with 13201 pixels and a \(9^{\circ}\) latitude range with 10801 pixels. The top left corner is at \(5^{\circ}\) longitude and \(56^{\circ}\) latitude. Please note that the resolution (in Meter) is different for longitude and latitude. The pixels aren't square. The pixel size is about \(92.63 \mathrm{~m} \times 149.74 \mathrm{~m}\).

Of course we need only a small part of the map, so how to crop it? GeoTiff's can be read the same way as Tiff's, but the software must be able to read and write 16-bit data.
- IrfanViev can read 16-bit Tiff, but converts it internally to 8-bit.
- Fitswork can read and write 16-bit Tiff and crop the region, but it can't write PGM files.
- Gimp can read and write 16-Bit Tiff. You can crop the region as follows: Make a double click on the "Rectangle Select Tool". Draw a rectangle in the picture. Now fill in the values for position and size. Then use "Image / Crop_to_Selection". Gimp can also save the output image as 16 -bit ASCII PGM (P2 Portable Gray Map) file, which is easy to read by C\# code.
- FFmpeg can read and write 16-bit Tiff and also crop the region. It can write binary PGM (P5) files, but unfortunately it can't write ASCII PGM (P2) files.

Here is an example for cropping a region of the GeoTiff with FFmpeg:
```

rem Crop a large GeoTiff file and save it as Tiff or binary PGM file
set "FF=c:\ffmpeg\ffmpeg" :: Path to FFmpeg
set "IN=srtm germany dtm.tif" :: Input GeoTiff file
set "WIDTH=2\overline{64"}
set "HEIGHT=131"
set "LEFT=6340"
set "TOP=5128"
set "OUT=elevation.tif" : : Output Tiff or binary PGM file; it isn't possible to write an ASCII PGM file
%FF% -i %IN% -vf format=pix_fmts=gray16le,crop=%WIDTH%:%HEIGHT%:%LEFT%:%TOP% - Y %OUT%
pause

```

However, it's also possible to read the GeoTiff file directly with C\# code, using the external BitMiracle.LibTiff.NET library. I did use this library in my C\# code.
I found useful instructions here: http://build-failed.blogspot.com/2014/12/processing-geotiff-files-in-net-without.htmI
This is the link to the library: https://bitmiracle.com/libtiff/

My source code can be downloaded here: http://www.astro-electronic.de/source/Topographie.zip
50.4 Noise map (red = traffic noise, blue = running water noise)

\subsection*{51.1 Moon observing}

What's the best time for moon observing? That depends on the moon's phase as follows:
\begin{tabular}{|l|l|l|}
\hline Moon phase: & Largest altitude: & When has the ecliptic the steepest angle to the horizon? \\
\hline New Moon & (not during darkness) & \\
\hline Waxing crescent & (not during darkness) & Spring, March 20, at sunrise \\
\hline First quarter & Spring, March 20, 18:00 o'clock & \\
\hline Waxing gibbous & Winter, February 5, 21:00 o'clock & \\
\hline Full moon & Winter, December 20, 0:00 o'clock & \\
\hline Waning gibbous & Autumn, November 5, 3:00 o'clock & \\
\hline Last quarter & Autumn, September 20, 6:00 o'clock & \\
\hline Waning crescent & (not during darkness) & Autumn, September 20, at sunset \\
\hline
\end{tabular}

The given dates are a rough estimate plus or minus one month, only valid for observers on the northern hemisphere.

Interactive map of the moon: https://quickmap.Iroc.asu.edu/
Irregular mare patches: https://en.wikipedia.org/wiki/Irregular_mare_patch
Crater Ina: https://en.wikipedia.org/wiki/Ina_(crater)
Digital elevation data for Ina: https://wms.Iroc.asu.edu/lroc/view_rdr/NAC_DTM_INACALDERA1
Resolution of the moon surface (in arc seconds):
\begin{tabular}{|l|l|l|l|}
\hline Distance & 1 km & 2 km & 4 km \\
\hline 350702 km (Perigee) & 0.59 " & 1.18 " & \(2.35^{\prime \prime}\) \\
\hline 378692 km (mean distance) & 0.54 " & 1.09 " & \(2.18^{\prime \prime}\) \\
\hline 401032 km (Apogee) & 0.51 " & 1.03 " & 2.06 " \\
\hline
\end{tabular}

Note: The earth's radius for latitude \(51.5^{\circ}\) and the moon's radius are already subtracted.

\subsection*{51.5 Useful calculations for Magnitudes}

Convert magnitude \(m_{V}\) [mag] to illuminance \(E_{V}\) [Lux]:
\(E_{v}=10^{\wedge}\left(-14.18-M_{v}\right) / 2.5\)

Convert illuminance \(E_{v}[L u x]\) to magnitude \(m_{v}\) [mag]:
\(M_{v}=-14.18-2.5{ }^{*} \log _{10} E_{v}\)

Convert illuminance \(E_{V}[L u x]\) to irradiance \(E_{E}\left[W / m^{\wedge} 2\right]\), for wavelength 555nm:
\(E_{E}=E_{V} / 683 \mathrm{Ix} / \mathrm{W}\)

Convert irradiance \(E_{E}\left[W / m^{\wedge} 2\right]\) to illuminance \(E_{V}\) [Lux], for wavelength 555 nm : \(E_{V}=E_{E}\) * \(683 \mathrm{Ix} / \mathrm{W}\)

\section*{51.6} Crab Pulsar

The crab pulsar is a supernova remnant and consists of a neutron star which is rapidly spinning with a frequency of about \(\mathbf{3 0} \mathbf{~ H z}\). It emits pulses in radio, visual, X-ray and gamma spectral range.
https://en.wikipedia.org/wiki/Crab_Nebula\#Central_star
The frequency is slowly decreasing and the latest measurement results can be found here:
https://heasarc.gsfc.nasa.gov/W3Browse/all/crabtime.html

\section*{http://www.jb.man.ac.uk/~pulsar/crab/crab2.txt}

In the book "Paul Horowitz, Winfield Hill: The Art of Electronics, Second Edition, Page 1030ff" is described how to measure the light curve with a 60" telescope, a photomultiplier and a signal averager. They used 5 million sweeps which is more than 41 hours of sampling time.

When averaging the signal, three effects must be considered:
1. The pulsar's frequency decreases by about \(1.326 \mu \mathrm{~Hz}\) per hour.

For \(51.5^{\circ}\) latidude the velocity is \(0.288 \mathrm{~km} / \mathrm{s}\) towards the east point of the local horizon.
The Doppler frequency shift is \(f_{D}=f * V / c\) where \(c\) is the speed of light \(300000 \mathrm{~km} / \mathrm{s}\).
For \(\mathrm{f}=30 \mathrm{~Hz}\) the Doppler frequency shift is \(28.8 \mu \mathrm{~Hz}\) at the east horizon and \(-28.8 \mu \mathrm{~Hz}\) at the west horizon. The frequency shift is 0 at the meridian. Near the meridian the Doppler frequency shift decreases by \(7.5 \mu \mathrm{~Hz}\) per hour.
3. The Doppler effect due to earth orbiting around the sun. The velocity of the observer is: \(\mathrm{V}=2\) * \(\mathbf{~ p i}\) * \(149.6 \mathrm{e} 6 \mathrm{~km} / 365.25 \mathrm{~d} / 86400 \mathrm{~s}=29.786 \mathrm{~km} / \mathrm{s}\) towards a point on the ecliptic which is about \(90^{\circ}\) west of the sun.
The Doppler frequency shift is \(f_{D}=f * V / c\) where \(c\) is the speed of light \(300000 \mathrm{~km} / \mathrm{s}\).
For \(\mathrm{f}=30 \mathrm{~Hz}\) the Doppler frequency shift is \(99.3 \mu \mathrm{~Hz}\) on the ecliptic \(90^{\circ}\) west of the sum and \(-99.3 \mu \mathrm{~Hz}\) on the ecliptic \(90^{\circ}\) east of the sun. At midnight in winter the pulsar is approximately \(180^{\circ}\) away from the sun, so that the Doppler frequency shift is small. Under these conditions the frequency shift decreases by \(2.13 \mu \mathrm{~Hz}\) per hour.

Adding these three effects, the observed pulsar frequency decreases by about \(11 \mu \mathrm{~Hz}\) per hour (valid only in winter at midnight, when the pulsar is in the south near the meridian).

An error \(\Delta f\) in the reference frequency will produce after time \(t\) a phase error \(\Delta p\) with respect to the pulsar phase as follows: \(\Delta p / 360^{\circ}=t * \Delta f\)

Example: If the reference frequency is off by \(10 \mu \mathrm{~Hz}\), after 2 hours there will be a phase error of \(25.92^{\circ}\).

The latest exact frequency of the pulsar is from December 15, 2019:
\(f=29.6122791665 \mathrm{~Hz}-\mathbf{0 . 0 0 0 0 0 1 3 2 6 ~ H z} /\) hour

\subsection*{51.7 How to visualize the size of the universe}

I found this in the discussion forum for Space Engine:
"If you spread out all the stars over the surface of the earth, each square \(\mathbf{c m}\) would have \(\mathbf{6 0 . 0 0 0}\) stars in it. And on average, of the \(\mathbf{6 0 . 0 0 0}\) stars, around 2600 of them will have Super Earth's within their habitable zone."

\section*{52 DCF77 Decoding}

DCF77 is a 77.5 kHz longwave time signal transmitter in Germany. The time signal is coded with 59 short ( \(100 \mathrm{~ms}=\) " 0 ") or long ( \(200 \mathrm{~ms}=\) " 1 ") impulses as follows:
\begin{tabular}{|l|l|}
\hline Bit & Description \\
\hline 0 & Start of minute, is always 0 \\
\hline \(1-16\) & Civil warning bits and other informations \\
\hline 17 & CET: \(0 \quad\) CEST: 1 \\
\hline 18 & CET: \(1 \quad\) CEST: 0 \\
\hline 19 & Leap second announcement \\
\hline 20 & Always 1 \\
\hline 21 & Minutes 1 \\
\hline 22 & Minutes 2 \\
\hline 23 & Minutes 4 \\
\hline 24 & Minutes 8 \\
\hline 25 & Minutes 10 \\
\hline 26 & Minutes 20 \\
\hline 27 & Minutes 40 \\
\hline 28 & Even parity over minute bits 21-2 \\
\hline & \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Bit & Description \\
\hline 29 & Hours 1 \\
\hline 30 & Hours 2 \\
\hline 31 & Hours 4 \\
\hline 32 & Hours 8 \\
\hline 33 & Hours 10 \\
\hline 34 & Hours 20 \\
\hline 35 & Even parity over hours bits \(\mathbf{2 9 - 3 5}\) \\
\hline \(36-41\) & Day of month \\
\hline \(42-44\) & Day of week \\
\hline \(45-49\) & Month number \\
\hline \(50-57\) & Year within century \\
\hline 58 & Even parity over the date bits \(\mathbf{3 6}\)-58 \\
\hline 59 & No impulse \\
\hline 0 & Previous defined time is valid at the beginning of this impulse (which is always 0 ) \\
\hline
\end{tabular}

Schematic diagram of a DCF77 receiver which produces 2 kHz beeps for recording with the GH5S camera:

This is an (almost) invisible lattice mast, made of 0.3 mm carbon fiber rods. At the top of the 1400 mm high mast is a small white ball with 8 mm diameter.
The purpose is to have a small motionless object fixed in space, as a target for inserting special effects into videos, for example for simulation of wormholes with a moving camera.

The C\# program for calculating the lattice mast can be downloaded here: http://www.astro-electronic.de/source/Gittermast.zip

This is the result
\begin{tabular}{|c|c|c|c|c|}

\hline
\end{tabular}

\footnotetext{
I don't show a picture of the invisible lattice mast here. It makes no sense because it's invisible. You couldn't see it :-)
}

\section*{54 Fireflies, glowworms, lightning bugs}

See also: https://en.wikipedia.org/wiki/Firefly
There are only three firefly species in central Europe:
- Kleiner Leuchtkäfer, Gemeines Glühwürmchen, Johanniskäfer oder Johanniswürmchen (Lamprohiza splendidula) See also (only available in german): https://de.wikipedia.org/wiki/Kleiner_Leuchtk\%C3\%A4fer Search for them in warm summer nights in June and July, in riparian forests.
- Großer Leuchtkäfer, Großes Glühwürmchen oder Großes Johannisglühwürmchen (Lampyris noctiluca) See also https://en.wikipedia.org/wiki/Lampyris_noctiluca
- Kurzflügel-Leuchtkäfer (Phosphaenus hemipterus)

Source: https://de.wikipedia.org/wiki/Leuchtk\%C3\%A4fer
Interactive map (in german) showing where fireflies have been observed: https://www.naturgucker.de Search for the species "Lamprohiza splendidula", "Lampyris noctiluca" or "Phosphaenus hemipterus".

Larvae of Lampyris noctiluca? Found in December 2021 near Bad Lauterberg. Pictures by Sandra Zi.

See also https://en.wikipedia.org/wiki/Rotation matrix
See also http://paulbourke.net/geometry/transformationprojection/
This is the rotation matrix for yaw rotation:
```

cos(yaw)
sin(yaw)
l

| $-\sin ($ yaw $)$ | 0 |
| :---: | :---: |
| $\cos ($ yaw $)$ | 0 |
| 0 | 1 |

```

This is the rotation matrix for pitch rotation:
\begin{tabular}{llll}
\(\cos (\) pitch \()\) & 0 & \(\sin (\) pitch \()\) & ) \\
0 & 1 & 0 \\
\(-\sin (\) pitch \()\) & 0 & \(\cos (\) pitch \()\)
\end{tabular}

This is the rotation matrix for roll rotation:
\(\left.\begin{array}{lllcl}( & 1 & 0 & 0 \\ ( & 0 & \cos (\text { roll }) & -\sin (\text { roll })\end{array}\right)\)

This is the rotation matrix for yaw, pitch and roll rotations (in this order):
```

cos(yaw) * cos(pitch)
sin(yaw) * cos(pitch)
sin(yaw)
cos(yaw) * sin(pitch) * sin(roll) - sin(yaw) * cos(roll)
sin(yaw) * sin(pitch) * sin(roll) + cos(yaw) * cos(roll)
cos(pitch) * sin(roll)

```
cos(yaw) * sin(pitch) * cos(roll) + sin(yaw) * sin(roll) sin(yaw) * sin(pitch) * cos(roll) - cos(yaw) * sin(roll)
cos(pitch) * cos(roll)

\section*{)}
(yaw) * cos(pitch) \(-\sin (p i t c h)\)

Angular distance between two stars:
\(\cos (\) distance \()=\cos (\alpha 1-\alpha 2) * \cos (\delta 1) * \cos (\delta 2)+\sin (\delta 1) * \sin (\delta 2)\)

For small distances the above formula is not recommended, because the cos terms are near 1. In this case it's better to use this approximation: Distance^2 \(=(\alpha 1-\alpha 2)^{\wedge} 2+(\delta 1-\delta 2)^{\wedge} 2\)

\section*{56 My To Do List}
-- Darkframe subtraction with DaVinci Resolve?
-- Deep zoom in zoompan=zoom='if(mod(inl,40)l,zooml,0)+0.01':d=40:x='iw/2-(iw/zoom/2)':y='ih/2-(ih/zoom/2)'
-- I know that the Windows scripts in this book need some modifications if they are to be used on MAC or Linux computers. But I have no experience with MAC and Linux. Who wants to write a short chapter about the differences of Windows/MAC/Linux scripts? l'd like to add it to this book, of course with proper credit to the author.
-- Stitching \(360^{\circ}\) videos from two or more cameras
-- Spherical transformations for dlp beamer
-- ffmpeg -i INPUT -vf zscale=transfer=linear,grayworld,zscale=transfer=bt709,format=yuv420p OUTPUT
-- There seems to be a surprisingly large void of information about these subjects and their interactions:
FFmpeg / HDR / SDR / zscale / tonemapping / DNG / Rec709 / Rec2020 / colorspace / colormatrix
https://web.archive.org/web/20190722004804/https://stevens.li/guides/video/converting-hdr-to-sdr-with-ffmpeg/
https://codecalamity.com/encoding-uhd-4k-hdr10-videos-with-ffmpeg/

\section*{57 List of Abbreviations}

ALL-I = Intraframe compression method, which saves all frames as intraframes (= l-frames = keyframes)
CRF = Constant Rate Factor
DAR \(=\) Display Aspect Ratio \(=\) the aspect ratio of the image
DLP = Digital Light Processing (Beamer)
DR = Dynamic Range or DaVinci Resolve
DTS = Decoder Time Stamp
DVR = Digital Video Recoder, but the abbreviation is also used for "DaVinvi Resolve"
ETC = Extra Tele Conversion
ETTL = Expose To The Left
ETTR = Expose To The Right
EV = Environment Variable
FPS = Frames Per Second
FX = Special Effects
GFX = Graphical Effects
GOP = Group of Pictures
HDR = High Dynamic Range
HEVC = High Efficiency Video Coding
HLG = Hybrid Log Gamma
HSB = Hue-Saturation-Brightness
HSV = Hue-Saturation-Value
IPB = Interframe compression method, which saves three types of frames: Intraframes (l-frames), predicted frames (P-frames) and bi-directional predicted frames ( \(B\)-frames)
IR = Impulse Response

IRE = a measurement of composite video signals, 100 IRE = the difference between black and white level
LHS = Left Hand Side
LUT = Look-up-Table
MTF = Modulation Transfer Function
NR = Noise Reduction
POV = Point Of View, which means a scene in which the camera sees what a person sees
\(P Q=\) Perceptual Quantization
PTS = Presentation Tine Stamp
RHS = Right Hand Side
SAR = Sample Aspect Ratio = the aspect ratio of the pixels
SDR = Standard Dynamic Range
SMPTE = A timecode format, see https://en.wikipedia.org/wiki/SMPTE_timecode
SNR = Signal to Noise Ratio
TBC = Time Base Corrector, corrects/standardizes the timing of analog signals coming from tape, see https://en.wikipedia.org/wiki/Time_base_correction
VFR = Variable Frame Rate
VO = Voice-Over

\section*{58 Special characters}
- Windows: Click in lower left corner on the Windows symbol, then choose "Windows Accessories" --> "Character Map"
- Unicode character recognition: Shapecatcher http://shapecatcher.com/index.html

\section*{59 Acknowledgements}

I found many of the FFmpeg hints and examples somewhere in the internet. Thanks to all who posted them!
Thanks to all who contributed to the great FFmpeg software, and special thanks to Carl Eugen Hoyos, Paul B Mahol, Moritz Barsnick, Roger Pack and Gyan Doshi who answered many questions on the FFmpeg user mailing list.
Thanks to Dan Bridges for some sample scripts for FFmpeg.
Thanks to Anders Jiras and Andrei B. for a few hints for FFmpeg.
Thanks to Alexander Strasser for helping me with GIT.
Thanks to Bill Gray for writing the best astronomy software (Guide 9.1), and to Jost Jahn and Larry Wood for help with Guide 9.1.
Thanks to all who contributed to DeepSkyStacker software.
Thanks to all contributors to OpenStreetMap, OpenTopoMap, OpenDEM and Sergey Bobrovsky and Vitaliy Shibaev of BitMiracle for the LibTiff.net library. Thanks to Gerald Schulze for his DaVinci Resolve course.
Thanks to Hugh Hou for pointing me to the KartaVR plugin for DR, and for several very helpful Youtube videos about \(360^{\circ}\) content.
Thanks to Andrew Hazelden for the KartaVR plugin for DR.
Thanks to Sandra Zi for pictures of fireflies.
Thanks to Rainer Rosenthal and Andreas Leitgeb for help with a complicated mathematical problem is de.sci.mathematik
Thanks to Gavin Lucas and Bernd Klimm for a great DaVinci Resolve Webinar.

[^0]:    1 Why is FFmpeg's official documentation so incomplete? I think documentation has the lowest possible priority for the developers, and most of those users who could write better documentation (including me) are unable or inwilling to work with GIT, which is the only way to make any changes.

[^1]:    Note: For almost all commands, it doesn't matter if you set an option directly in the command line, or via sendcmd, or via zmq. The effect is the same in all three cases. But there is one exception from this rule: These are the options yaw, pitch and roll in the v360 filter. Directly in the command line that are absolute angles, however if sent via sendemd or zmq that are relative angles. Don't try to understand it. It's stupid.

[^2]:    Hint: You can also export clips from other pages (for example from the "Edit" page) by using File --> Quick_Export

[^3]:    See https://vimeo.com/251055924

[^4]:    2 Theory: "All nontrivial functions should have a comment above them explaining what the function does, even if it is just one sentence." (Source: http://www.ffmpeg.org/developer.html\#Comments)
    Reality: Comments must be avoided under all circumstances. If you use too many comments, someone else could actually understand the holy code.
