*To my partner in life, Andrea Krause.
And many thanks to Gordon Burghardt and
Michael Domjan for instilling in me a
passion for science and discovery.*

Mark Krause

*To Kim, Sophie, and
Jonah . . . for everything.*

Dan Corts

*To my wonderful wife, Jenn, and
our amazing children, Oliver
and Clara. Thank you for
putting up with me.*

Stephen Smith

*To my partner, Safa Ali, who is my unfailing
support and inspiration toward wisdom. To
my children, Alexandra, Kate, and Geoff,
who love this world so deeply. And
of course, to Steve, without whom
this textbook would never
have gotten finished!*

Dan Dolderman

INTRODUCING PSYCHOLOGICAL SCIENCE |

Module 1.1 :: The Science of Psychology 2

- The Scientific Method 3
 - Hypotheses: Making Predictions 3
 - Theories: Explaining Phenomena 4
 - The Biopsychosocial Model 5
 - Quick Quiz 1.1a 5
- Building Scientific Literacy 6
 - Working the Scientific Literacy Model: How We Learn and Remember 7
 - Critical Thinking, Curiosity, and a Dose of Healthy Skepticism 9
 - Myths in Mind: Abducted by Aliens! 10
 - Quick Quiz 1.1b 10
- Module Summary 11

Module 1.2 :: How Psychology Became a Science 12

- Psychology's Philosophical and Scientific Origins 13
 - Influences from the Ancients: Philosophical Insights into Behaviour 13
 - Influences from Physics: Experimenting with the Mind 14
 - Influences from Evolutionary Theory: The Adaptive Functions of Behaviour 16
 - Influences from Medicine: Diagnoses and Treatments 16
 - The Influence of Social Sciences: Measuring and Comparing Humans 18
 - Quick Quiz 1.2a 19
- The Beginnings of Contemporary Psychology 19
 - Structuralism and Functionalism: The Beginnings of Psychology 20
 - The Rise of Behaviourism 21
 - Humanistic Psychology Emerges 22
 - The Brain and Behaviour 23
 - The Cognitive Revolution 24
 - Social and Cultural Influences 25
 - Quick Quiz 1.2b 27
- Module Summary 28
- Work the Scientific Literacy Model 29

READING AND EVALUATING SCIENTIFIC RESEARCH 30

Module 2.1 :: Principles of Scientific Research 31

- Five Characteristics of Quality Scientific Research 32
 - Scientific Measurement: Objectivity, Reliability, and Validity 32
 - Generalizability of Results 34
 - Sources of Bias in Psychological Research 35
 - Working the Scientific Literacy Model: Demand Characteristics and Participant Behaviour 36
 - Techniques That Reduce Bias 38
 - Psych @ The Hospital: The Placebo Effect 38
 - Sharing the Results 39
 - Replication 40
 - Quick Quiz 2.1a 40
- Five Characteristics of Poor Research 40
 - Quick Quiz 2.1b 42
- Module Summary 43

Module 2.2 :: Scientific Research Designs 44

- Descriptive Research 45
 - Case Studies 45
 - Working the Scientific Literacy Model: Case Studies as a Form of Scientific Research 46
 - Naturalistic Observation 47
 - Surveys and Questionnaires 48
 - Quick Quiz 2.2a 49
- Correlational Research 49
 - Myths in Mind: Beware of Illusory Correlations 50
 - Quick Quiz 2.2b 51
- Experimental Research 51
 - The Experimental Method 51
 - The Quasi-Experimental Method 52
 - Converging Operations 53
 - Quick Quiz 2.2c 53
- Module Summary 54

Module 2.3 :: Ethics in Psychological Research 55

- Promoting the Welfare of Research Participants 56
 - Weighing the Risks and Benefits of Research 56
 - Obtaining Informed Consent 57
 - The Right to Anonymity and Confidentiality 58
 - The Welfare of Animals in Research 58

Working the Scientific Literacy Model:
Animal Models of Disease 59

REBS for Animal-Based Research 61

Quick Quiz 2.3a 61

Ethical Collection, Storage, and Reporting of Data 61

Quick Quiz 2.3b 62

Module Summary 63

Module 2.4 :: A Statistical Primer 64

Descriptive Statistics 65

Frequency 65

Central Tendency 65

Variability 67

Quick Quiz 2.4a 68

Hypothesis Testing: Evaluating the Outcome of the Study 69

Working the Scientific Literacy Model: Statistical Significance 70

Quick Quiz 2.4b 71

Module Summary 72

Work the Scientific Literacy Model 73

3 BIOLOGICAL PSYCHOLOGY 74

Module 3.1 :: Genetic and Evolutionary Perspectives on Behaviour 75

Heredity and Behaviour 76

The Genetic Code 76

Behavioural Genomics: The Molecular Approach 78

Myths in Mind: Single Genes and Behaviour 78

Behavioural Genetics: Twin and Adoption Studies 79

Gene Expression and Behaviour 80

Quick Quiz 3.1a 82

Evolutionary Insights into Human Behaviour 82

Evolutionary Psychology 83

Intra- and Intersexual Selection 83

Working the Scientific Literacy Model: Ruby Red Lipstick and That Sexy Red Dress 85

Evolution, the Brain, and Behaviour 87

Evolution and Cognition 88

Biopsychosocial Perspectives: Hunters and Gatherers: Men, Women, and Spatial Memory 89

Quick Quiz 3.1b 90

Module Summary 91

Module 3.2 :: How the Nervous System Works: Cells and Neurotransmitters 92

Neural Communication 93

The Neuron 93

Glial Cells 94

Myths in Mind: We Are Born with All the Brain Cells We Will Ever Have 95

The Neuron's Electrical System: Resting and Action Potentials 95

Quick Quiz 3.2a 97

The Chemical Messengers: Neurotransmitters and Hormones 97

Types of Neurotransmitters 98

Working the Scientific Literacy Model: Pain and Substance P 100

Drug Effects on Neurotransmission 101

Hormones and the Endocrine System 102

Neurons in Context 103

Quick Quiz 3.2b 103

Module Summary 104

Module 3.3 :: Structure and Organization of the Nervous System 105

Divisions of the Nervous System 106

The Central Nervous System 106

The Peripheral Nervous System 106

Quick Quiz 3.3a 108

The Brain and Its Structures 108

The Hindbrain: Sustaining the Body 108

The Midbrain: Sensation and Action 109

The Forebrain: Emotion, Memory, and Thought 110

The Cerebral Cortex 111

The Four Lobes 112

Psych @ The Gym 114

Left Brain, Right Brain: Hemispheric Specialization 115

The Changing Brain: Neuroplasticity 116

Working the Scientific Literacy Model: Neuroplasticity and Recovery from Brain Injury 117

Quick Quiz 3.3b 118

Module Summary 119

Module 3.4 :: Windows to the Brain: Measuring and Observing Brain Activity 120

Insights from Brain Damage 121

Lesioning and Brain Stimulation 121

Quick Quiz 3.4a 122

Structural and Functional Neuroimaging 122

Structural Neuroimaging 123

Functional Neuroimaging 124

Working the Scientific Literacy Model: Functional MRI and Behaviour 125

Quick Quiz 3.4b 127

Module Summary 128

Work the Scientific Literacy Model 129

4 SENSATION AND PERCEPTION 130

Module 4.1 :: Sensation and Perception at a Glance 131

Sensing the World Around Us 132

Stimulus Thresholds 134

Signal Detection 135

Myths in Mind: Setting the Record Straight on Subliminal Messaging 136

Quick Quiz 4.1a 137

Perceiving the World Around Us	137
Gestalt Principles of Perception	137
Working the Scientific Literacy Model: Backward Messages in Music	139
Attention and Perception	140
Quick Quiz 4.1b	141
Module Summary	142

Module 4.2 :: The Visual System 143

The Human Eye	144
How the Eye Gathers Light	144
The Structure of the Eye	145
Common Visual Disorders	148
Quick Quiz 4.2a	149
Visual Perception and the Brain	149
The Ventral Stream	150
Working the Scientific Literacy Model: Are Faces Special?	151
The Dorsal Stream	153
Depth Perception	154
Psych @ The Artist's Studio	156
Quick Quiz 4.2b	157
Module Summary	158

Module 4.3 :: The Auditory System 159

Sound and the Structures of the Ear	160
Sound	160
The Human Ear	160
Quick Quiz 4.3a	162
The Perception of Sound	162
Sound Localization: Finding the Source	162
Theories of Pitch Perception	162
Auditory Perception and the Brain	164
The Perception of Music	164
Working the Scientific Literacy Model: Music, Emotion, and Advertising	165
Quick Quiz 4.3b	166
Module Summary	167

Module 4.4 :: Touch and the Chemical Senses 168

The Sense of Touch	169
Feeling Pain	170
Working the Scientific Literacy Model: Empathy and Pain	171
Phantom Limb Pain	172
Quick Quiz 4.4a	173
The Chemical Senses: Taste and Smell	173
The Gustatory System: Taste	173
The Olfactory System: Smell	175
Multimodal Integration	175
Quick Quiz 4.4b	177
Module Summary	178
Work the Scientific Literacy Model	179

CONSCIOUSNESS 180

Module 5.1 :: Biological Rhythms of Consciousness: Wakefulness and Sleep 181

What Is Sleep?	182
Biological Rhythms	182
The Stages of Sleep	183
Quick Quiz 5.1a	185
Why We Need Sleep	185
Theories of Sleep	185
Sleep Deprivation and Sleep Displacement	186
Quick Quiz 5.1b	189
Theories of Dreaming	189
The Psychoanalytic Approach	189
The Activation–Synthesis Hypothesis	189
Working the Scientific Literacy Model: Dreams, REM Sleep, and Learning	190
Quick Quiz 5.1c	192
Disorders and Problems with Sleep	192
Insomnia	192
Nightmares and Night Terrors	193
Movement Disturbances	193
Sleep Apnea	194
Narcolepsy	195
Overcoming Sleep Problems	195
Quick Quiz 5.1d	196
Module Summary	197

Module 5.2 :: Altered States of Consciousness: Hypnosis, Meditation, and Disorders of Consciousness 198

Hypnosis	199
Theories of Hypnosis	199
Applications of Hypnosis	200
Myths in Mind: Recovering Lost Memories through Hypnosis	201
Quick Quiz 5.2a	201
Meditation	201
Types of Meditation	201
Meditation, Cognition, and Emotion	202
Quick Quiz 5.2b	203
Disorders of Consciousness	203
Working the Scientific Literacy Model: Assessing Consciousness in the Vegetative State	205
Quick Quiz 5.2c	208
Module Summary	208

Module 5.3 :: Drugs and Conscious Experience 209

Physical and Psychological Effects of Drugs	210
Short-Term Effects	210
Long-Term Effects	211
Quick Quiz 5.3a	212
Commonly Abused Illegal Drugs	213
Stimulants	213

- Hallucinogens 214
- Biopsychosocial Perspectives: Recreational and Spiritual Uses of Salvia divinorum* 215
- Marijuana 216
- Working the Scientific Literacy Model: Marijuana, Memory, and Cognition* 217
- Quick Quiz 5.3b 219
- Legal Drugs and Their Effects on Consciousness 219
 - Sedatives 219
 - Prescription Drug Abuse 219
 - Alcohol 221
 - Psych @ University Parties* 221
 - Why Are Some Drugs Legal and Others Illegal? 222
 - Quick Quiz 5.3c 222
- Module Summary 223
- Work the Scientific Literacy Model* 224

- Applications of Operant Conditioning 251
 - Shaping 251
 - Psych @ The Special Needs Classroom* 251
 - Schedules of Reinforcement 251
 - Working the Scientific Literacy Model: Reinforcement and Superstition* 253
 - Applying Punishment 255
 - Are Classical and Operant Learning Distinct Events? 256
 - Quick Quiz 6.2b 256
 - Module Summary 257

Module 6.3 :: Cognitive and Observational Learning 258

- Cognitive Perspectives on Learning 259
 - Latent Learning 259
 - S-O-R Theory of Learning 260
 - Quick Quiz 6.3a 260
- Observational Learning 260
 - Processes Supporting Observational Learning 261
 - Myths in Mind: Teaching Is Uniquely Human* 262
 - Imitation and Observational Learning 263
 - Working the Scientific Literacy Model: Linking Media Exposure to Behaviour* 263
 - Mirror Neurons 266
 - Biopsychosocial Perspectives: Violence, Video Games, and Culture* 266
 - Quick Quiz 6.3b 267
- Module Summary 267
- Work the Scientific Literacy Model* 268

6 LEARNING 225

Module 6.1 :: Classical Conditioning: Learning by Association 226

- Pavlov's Dogs: Classical Conditioning of Salivation 227
- Classical Conditioning and the Brain 229

- Quick Quiz 6.1a 230
- Processes of Classical Conditioning 230
 - Acquisition, Extinction, and Spontaneous Recovery 230
 - Stimulus Generalization and Discrimination 231
 - Quick Quiz 6.1b 232
- Applications of Classical Conditioning 232
 - Conditioned Emotional Responses 232
 - Evolutionary Role for Fear Conditioning 234
 - Conditioned Taste Aversions 235
 - Working the Scientific Literacy Model: Conditioning and Negative Political Advertising* 236
 - Quick Quiz 6.1c 239
- Learning without Awareness 239
 - Drug Use and Tolerance 239
 - Sexual Arousal 240
 - The Paradox of "Diet" Beverages 240
 - Quick Quiz 6.1d 241
- Module Summary 242

Module 6.2 :: Operant Conditioning: Learning through Consequences 243

- Processes of Operant Conditioning 244
 - Reinforcement and Punishment 244
 - Positive and Negative Reinforcement and Punishment 246
 - Primary and Secondary Reinforcers 247
 - Discrimination and Generalization 249
 - Delayed Reinforcement and Extinction 249
 - Reward Devaluation 249
 - Quick Quiz 6.2a 250

7 MEMORY 269

Module 7.1 :: Memory Systems 270

- The Atkinson-Shiffrin Model 271
 - Sensory Memory 272
 - Short-Term Memory and the Magical Number 7 273

- Long-Term Memory 274
 - Working the Scientific Literacy Model: Distinguishing Short-Term from Long-Term Memory Stores* 275
 - Quick Quiz 7.1a 277
- The Working Memory Model: An Active STM System 278
 - The Phonological Loop 278
 - The Visuospatial Sketchpad 278
 - The Episodic Buffer 279
 - The Central Executive 279
 - Quick Quiz 7.1b 280
- Long-Term Memory Systems: Declarative and Nondeclarative Memories 280
 - Declarative Memory 280
 - Nondeclarative Memory 281
 - Quick Quiz 7.1c 282

- The Cognitive Neuroscience of Memory 282
 - Memory at the Neural Level 282
 - Memory, the Brain, and Amnesia 283
 - Quick Quiz 7.1d 285
- Module Summary 286

Module 7.2 :: Encoding and Retrieving Memories 287

- Encoding and Retrieval 288
 - Rehearsal: The Basics of Encoding 288
 - Levels of Processing 289
 - Retrieval 290
 - Working the Scientific Literacy Model: Context-Dependent Memory* 290
 - State-Dependent Learning 292
 - Mood-Dependent Learning 293
 - Quick Quiz 7.2a 293
- Emotional Memories 293
 - Flashbulb Memories 295
 - Myths in Mind: The Accuracy of Flashbulb Memories* 296
 - Quick Quiz 7.2b 296
- Forgetting and Remembering 296
 - The Forgetting Curve: How Soon We Forget ... 296
 - Mnemonics: Improving Your Memory Skills 297
 - Quick Quiz 7.2c 299
- Module Summary 300

Module 7.3 :: Constructing and Reconstructing Memories 301

- How Memories Are Organized and Constructed 302
 - The Schema: An Active Organization Process 302
 - Working the Scientific Literacy Model: How Schemas Influence Memory* 302
 - Biopsychosocial Perspectives: Your Earliest Memories* 304
 - Quick Quiz 7.3a 305
- Memory Reconstruction 305
 - The Perils of Eyewitness Testimony 305
 - Psych @ Court: Is Eyewitness Testimony Reliable?* 307
 - Imagination and False Memories 307
 - Creating False Memories in the Laboratory 308
 - The Danger of False Remembering 309
 - Quick Quiz 7.3b 310
- Module Summary 311
- Work the Scientific Literacy Model* 312

- Working the Scientific Literacy Model: Categories and the Brain* 317
 - Categorization and Experience 319
 - Quick Quiz 8.1a 320
- Culture and Categories 320
 - Biopsychosocial Perspectives: Culture and Categorical Thinking* 320
 - Myths in Mind: How Many Words for Snow?* 322
 - Quick Quiz 8.1b 322
- Module Summary 323

Module 8.2 :: Problem Solving, Judgment, and Decision Making 324

- Defining and Solving Problems 325
 - Problem-Solving Strategies and Techniques 325
 - Cognitive Obstacles 326
 - Quick Quiz 8.2a 326
- Judgment and Decision Making 327
 - Representativeness and Availability 327
 - Anchoring Effects 329
 - Framing Effects 330
 - Belief Perseverance and Confirmation Bias 330
 - Working the Scientific Literacy Model: Maximizing and Satisficing in Complex Decisions* 332
 - Psych @ Decision Making and Neuromarketing* 333
 - Quick Quiz 8.2b 334
- Module Summary 335

Module 8.3 :: Language and Communication 336

- What Is Language? 337
 - Early Studies of Language 337
 - Properties of Language 338
 - Phonemes and Morphemes: The Basic Ingredients of Language 339
 - Syntax: The Language Recipe 340
 - Pragmatics: The Finishing Touches 340
 - Quick Quiz 8.3a 341
- The Development of Language 341
 - Infants, Sound Perception, and Language Acquisition 341
 - Producing Spoken Language 342
 - Sensitive Periods for Language 342
 - The Bilingual Brain 344
 - Quick Quiz 8.3b 344
 - Genes, Evolution, and Language 344
 - Working the Scientific Literacy Model: Genes and Language* 345
 - Can Animals Use Language? 346
 - Quick Quiz 8.3c 348
- Module Summary 349
- Work the Scientific Literacy Model* 350

8

THOUGHT AND LANGUAGE 313

Module 8.1 :: The Organization of Knowledge 314

- Concepts and Categories 315
 - Classical Categories: Definitions and Rules 315
- Prototypes: Categorization by Comparison 316
- Networks and Hierarchies 316

9

INTELLIGENCE TESTING 351

Module 9.1 :: Measuring Intelligence 352

- Different Approaches to Intelligence Testing 353

Intelligence and Perception: Galton's Anthropometric Approach 353

Intelligence and Thinking: The Stanford-Binet Test 354

The Wechsler Adult Intelligence Scale 355

Raven's Progressive Matrices 355

Quick Quiz 9.1a 356

The Chequered Past of Intelligence Testing 357

IQ Testing and the Eugenics Movement 357

The Race and IQ Controversy 358

Problems with the Racial Superiority Interpretation 359

Working the Scientific Literacy Model: Beliefs about Intelligence 360

Quick Quiz 9.1b 362

Module Summary 363

Module 9.2 :: Understanding Intelligence 364

Intelligence as a Single, General Ability 365

Spearman's General Intelligence 365

Does g Tell Us the Whole Story? 366

Quick Quiz 9.2a 367

Intelligence as Multiple, Specific Abilities 367

The Hierarchical Model of Intelligence 368

Working the Scientific Literacy Model: Testing for Fluid and Crystallized Intelligence 369

Sternberg's Triarchic Theory of Intelligence 371

Gardner's Theory of Multiple Intelligences 371

Myths in Mind: Learning Styles 372

Psych @ The NFL Draft 373

Quick Quiz 9.2b 374

The Battle of the Sexes 374

Do Males and Females Have Unique Cognitive Skills? 375

Quick Quiz 9.2c 376

Module Summary 376

Module 9.3 :: Biological, Environmental, and Behavioural Influences on Intelligence 377

Biological Influences on Intelligence 378

The Genetics of Intelligence: Twin and Adoption Studies 378

The Heritability of Intelligence 378

Behavioural Genomics 380

Working the Scientific Literacy Model: Brain Size and Intelligence 381

Quick Quiz 9.3a 382

Environmental Influences on Intelligence 383

Birth Order 383

Socioeconomic Status 383

Nutrition 384

Stress 384

Education 384

The Flynn Effect: Is Everyone Getting Smarter? 385

Myths in Mind: Can the Media Make Babies Smarter? 386

Quick Quiz 9.3b 386

Behavioural Influences on Intelligence 387

Brain Training Programs 387

Nootropic Drugs 387

Meditation 388

Quick Quiz 9.3c 388

Module Summary 389

Work the Scientific Literacy Model 390

LIFESPAN DEVELOPMENT 391

Module 10.1 :: Physical Development from Conception through Infancy 392

Methods for Measuring Developmental Trends 393

Patterns of Development: Stages and Continuity 393

The Importance of Sensitive Periods 393

Quick Quiz 10.1a 394

Zygotes to Infants: From One Cell to Billions 394

Fertilization and Gestation 394

Fetal Brain Development 395

Nutrition, Teratogens, and Fetal Development 396

Working the Scientific Literacy Model: The Long-Term Effects of Premature Birth 397

Quick Quiz 10.1b 399

Myths in Mind: Vaccinations and Autism 399

Sensory and Motor Development in Infancy 399

Motor Development in the First Year 400

Quick Quiz 10.1c 403

Module Summary 404

Module 10.2 :: Infancy and Childhood: Cognitive and Emotional Development 405

Cognitive Changes: Piaget's Cognitive Development Theory 406

The Sensorimotor Stage: Living in the Material World 407

The Preoperational Stage: Quantity and Numbers 407

The Concrete Operational Stage: Using Logical Thought 408

The Formal Operational Stage: Abstract and Hypothetical Thought 408

Working the Scientific Literacy Model: Evaluating Piaget 409

Complementary Approaches to Piaget 410

Quick Quiz 10.2a 411

Social Development: Attachment, Personality, and Reading Others 411

Types of Attachment 411

Self Awareness 414

Prosocial Behaviour 415

Quick Quiz 10.2b 417

Parenting 417

Module Summary 419

Module 10.3 :: Adolescence 420

Physical Changes in Adolescence 421

Emotional Challenges in Adolescence 422

Quick Quiz 10.3a 423

Working the Scientific Literacy Model: Adolescent Risk and Decision Making 424

Cognitive Development: Moral Reasoning vs. Emotions 425

Kohlberg's Moral Development: Learning Right from Wrong 425

Biopsychosocial Perspectives: Emotion and Disgust 427

- Social Development: Identity and Relationships 427
 - Who Am I? Identity Formation During Adolescence 428
 - Peer Groups 428
 - Romantic Relationships 429
 - Quick Quiz 10.3b 429
- Module Summary 430

Module 10.4 :: Adulthood and Aging 431

- Emerging Adults: Moving from Adolescence to Adulthood 432
- Physical Changes in Adulthood 432
 - Quick Quiz 10.4a 433
 - Working the Scientific Literacy Model: Aging and Cognitive Change 434
 - Psych @ The Driver's Seat 435
- Psychosocial Development across the Lifespan 435
- Social Development: Intimacy and Generativity 437
 - Love and Marriage 437
 - Parenting 439
 - Career 439
 - Emotional Changes 439
 - Quick Quiz 10.4b 440
- Module Summary 441
- Work the Scientific Literacy Model 442

11 MOTIVATION AND EMOTION 443

Module 11.1 :: Hunger and Eating 444

- Physiological Aspects of Hunger 445
 - Quick Quiz 11.1a 447
- Psychological Aspects of Hunger 447
 - Attention and Eating 448
 - Eating and the Social Context 448
 - Quick Quiz 11.1b 449
- Disorders of Eating 450
 - Obesity 450
 - Anorexia and Bulimia 450
 - Working the Scientific Literacy Model: The Effect of Media Depictions of Beauty on Body Image 452
 - Quick Quiz 11.1c 453
- Module Summary 454

Module 11.2 :: Sex 455

- Human Sexual Behaviour: Psychological Influences 456
 - Psychological Measures of Sexual Motivation 456
 - Myths in Mind: Sex after Sixty? 457
 - Quick Quiz 11.2a 458
- Human Sexual Behaviour: Physiological Influences 458
 - Physiological Measures of Sex 458
 - Sexual Orientation: Biology and Environment 459
 - Quick Quiz 11.2b 461
- Human Sexual Behaviour: Cultural Influences 461

- Sex and Technology 462
- Working the Scientific Literacy Model: Does Sex Sell? 463

From the Authors

A well-rounded university education requires a healthy dose of science. This means not just a memorized list of scientific terms and famous names, but rather the abilities and disposition that allow students to encounter, understand, and evaluate scientific as well as nonscientific claims. This is true regardless of an individual's personal and career goals. As this text and MyPsychLab program emphasize, the science of psychology reaches across disciplinary boundaries and addresses numerous complex issues affecting individuals and society. To effectively use what they learn about psychology, students need to carry with them a scientific perspective. *An Introduction to Psychological Science* is written from the perspective of scientific literacy—the ability not only to define scientific terminology, but also to understand how it functions, to critically evaluate it, and to apply it to personal and societal matters.

Psychological science is in a privileged position to help students hone their scientific literacy. It is both a rigorous scientific discipline and a field that studies the most complex of all phenomena: the behavioural, cognitive, and biological basis of behaviour. With this focus on behaviour, one can rightly argue that psychology resides at the hub or core of numerous other scientific disciplines; it also shares connections with neuroscience, education, and public health, to name a few linkages. From this perspective, the knowledge acquired by studying psychological science should transfer and apply to many other fields. This is great news when you consider that psychology is one of few science courses that many undergraduates will ever take.

To make scientific literacy the core of our text and MyPsychLab, we developed content and features with the model shown in the graphic as a guide. The competencies that surround the scientific literacy core represent different knowledge or skill sets we want to work toward during the course. The multidirectional nature of the arrows connecting the four supporting themes for scientific literacy demonstrates the interrelatedness of the competencies, which span both core-level skills, such as knowing general information (e.g., terms, concepts), and more advanced skills, such as knowing how to explain phenomena from a scientific perspective, critical thinking, and application of material.

We used this model in developing all aspects of this program, the topics included in the book, the execution of the writing, the learning objectives we established, the quizzes, and other features. We believe a scientific literacy perspective and model will prove useful in addressing two course needs we often hear from instructors—to provide students with a systematic way to categorize the overwhelming amount of information they are confronted with, and to cultivate their curiosity and help them understand the relevance, practicality, and immense appeal of psychological science.

We thank the many instructors and students who have helped us craft this model and apply it to our discipline, and we look forward to your feedback. Please feel free to contact us and share your experiences with the Canadian edition of *An Introduction to Psychological Science*.

Content and Features

Students in the general psychology course are inundated with many disparate pieces of information at a time when they are still developing the skills and strategies for organizing and making sense of that information. How do the scientific literacy model and supporting features in *An Introduction to Psychological Science* address this issue?

Knowledge Gathering

What do we know about this?

Introductory psychology courses cover a vast amount of content drawn from diverse specialty areas. The organization of the material is central to helping students absorb this content.

Module 3.1 Genetic and Evolutionary Perspectives on Behaviour

KNOW	UNDERSTAND	APPLY	ANALYZE
Learning Objective: After reading this module you should...	Explain the scientific literacy model and its components.	Apply the scientific literacy model to a specific case study.	Analyze the scientific literacy model and its components.

Psychologist Martin Haselton has given new meaning to the phrase 'genes in the brain' by referring to genes in a broader sense. He has coined the term 'evolutionary psychology' to describe the study of the biological and psychological processes that have shaped human behavior. He argues that many of our most complex behaviors are the result of evolutionary processes that have shaped our brains and bodies over millions of years.

Of course, evolutionary psychologists are quick to point out that the genes we inherit are 'plastic'—their responses to neural activity. These plastic responses—of not more choice—accepts evolutionary psychologists' right to point out that both biology, learning, culture, and other social factors play a role in shaping our behavior. In fact, the genes we inherit are not the only factors that influence our behavior. In fact, the genes we inherit are just one of many factors that influence our behavior. In fact, the genes we inherit are just one of many factors that influence our behavior.

Focus Questions

- How is human behaviour influenced by genetic factors?
- How has evolution played a role in modern-day human behaviour?

Modules

Chapters are divided into modules to make it easier for students to organize content as well as to self-test and review their learning at regular intervals. It also transforms lengthy chapters into nice "bite-sized" chunks of information that students can read in a single sitting (e.g., between classes). For instructors, the modular content makes it easy to customize delivery based on their preferred syllabus.

Learning Objectives

Learning Objectives organized around an updated Bloom's taxonomy aim to guide students to higher-level understanding. Summaries of the key points related to these objectives are provided at the end of each module. Objectives are listed at four levels of increasing complexity: **know**, **understand**, **apply**, and **analyze**.

Module Summary

How do you know you've read this module you should...

KNOW	UNDERSTAND	APPLY	ANALYZE
Learning Objective: After reading this module you should...	Explain the scientific literacy model and its components.	Apply the scientific literacy model to a specific case study.	Analyze the scientific literacy model and its components.

KNOW

- The key terminology related to genes, inheritance, and evolutionary psychology:
 - inheritance (p. 76)
 - gene (p. 76)
 - allele (p. 76)
 - dominant allele (p. 76)
 - recessive allele (p. 76)
 - heterozygous (p. 76)
 - homozygous (p. 76)
 - genotype (p. 76)
 - phenotype (p. 76)
 - environment (p. 76)
 - epigenetics (p. 76)
 - neural plasticity (p. 76)
 - phenotypic plasticity (p. 76)

UNDERSTAND

- How genes and evolutionary processes reveal relationships between genes and behaviour. Both methods measure genetic, environmental, and experiential contributions to behaviour. Twin studies typically compare monozygotic twins (genetically identical) and dizygotic twins (genetically different) raised in the same environment to estimate heritability. Adoption studies compare adopted children to their adoptive and biological parents. These designs allow researchers to measure heritability in a number of ways.
- If a trait increases the degree to which individual differences in a trait (in a given population) are due to genetic factors, heritability is high. Heritability estimates range from 0% to 100% of individual differences. Many human characteristics, including intelligence and personality, have heritability estimates typically ranging between 40-80%.

APPLY

- Your knowledge of genes and behaviour to develop hypotheses about why a trait may be adaptive. The passing of genes in an evolutionary psychologist's journal and several of the following questions (what you answer on page 82):
 - How evolutionary psychologists show that men are more interested in a mate's physical attractiveness and youth, whereas women are more interested in qualities that contribute to offspring survival, such as intelligence and wealth? If it is the case, why do you think men would express more jealousy over sexual infidelity or women?
 - Researchers (Carter et al., 2008) asked volunteers to rate how often they would be in a sexual relationship with a man and then they plotted the results in the graph shown in Figure 3.11. Do their results indicate your hypothesis?

ANALYZE

- Explain that evolution has favored a specific gene that controls a single trait or behaviour. As you learned in this module, most psychological traits, as well as disorders such as Alzheimer's disease, involve multiple genes, some of which may not even yet be discovered. (See the 'More to Find Out' on page 78.)
- Explain the role of cognitive use differences that are related to genes. The Biopsychosocial Perspectives focus on page 80 introduced research showing that genes have an advantage when it comes to a specific mental rotation task. Given that this is a relatively complex task, it is interesting to see that the genetic advantage is associated with better performance on the task, and the male advantage has been found cross-culturally, across populations that the difference has a genetic basis. It leaves changes we will return to later and discussion of sex-based differences in cognitive abilities (see Module 9.3).

Figure 3.11 Men and Women's Reactions to Infidelity. Men had sexual jealousy more concerning than do women, regardless of how a question is framed.

Module Summaries

The major terms, concepts, and applications of the modules are reviewed in the Module Summaries. The summaries also return to and address the original Learning Objectives from the beginning of the module and include application questions (with answers in the back of the book).

Another major set of forebrain structures comprises the **limbic system**, an *integrated network involved in emotion and memory* (Maclean, 1952; see Figure 3.25). One key structure in the limbic system is the **amygdala**, which *facilitates memory formation for emotional events, mediates fear responses, and appears to play a role in recognizing and interpreting emotional stimuli, including facial expressions*. In addition, the amygdala connects with structures in the nervous system that are

Key Terms

Key Terms are defined within the narrative, helping students place them in context, and are then listed again within the Module Summaries. A complete glossary is also included at the end of the text.

Quick Quizzes

Quizzes appear at the conclusion of major sections of the module (typically two to four quizzes per module). These quizzes contain multiple-choice questions that enable students to assess their comprehension and better prepare for exams. Like the Learning Objectives, the Quick Quizzes assess understanding at the four levels of Bloom's taxonomy and are marked accordingly.

Quick Quiz 3.1a
Heredity and Behaviour

- The chemical units that provide instructions on how specific proteins are to be produced are called _____.
A chromosomes C genes
B genes D outcomes
- A person who is homozygous for a trait _____.
A always has two dominant copies of a gene.
B always has two recessive copies of a gene.
C has identical copies of the gene.
D has different copies of the gene.
- If a researcher wanted to identify how someone's life experiences could affect the expression of different genes and thus put that person at risk for developing depression, the *most* likely use which of the following methods?
A Behavioural genetics
B A comparison of monozygotic and dizygotic twins in different parts of the world
C An adoption study
D Epigenetics
- Imagine you hear a report about a heritability study that claims that 76% of 500 genetic variants of the following is a more accurate way of stating that?
A Fifty percent of individual differences of trait X within a population are due to genetic factors.
B Only half of a population has the trait.
C The trait is hereditary.
D More than 50% of individuals of trait X within a population are due to genetic factors.

Answers can be found on page ANS-1.

Active Illustration

For key figures and illustrations, animations are provided within the eText to deliver greater clarity and understanding. For example, readers are much more apt to understand the structures of the brain when they can click on a diagram of it and see a fully rotating illustration. The Pearson eText for the Canadian edition of *An Introduction to Psychological Science* is designed with alternative delivery models in mind. Highly visual, clearly laid out, and with integrated video and media, it is optimal for online reading and interaction. Students can access their textbook anytime, anywhere, and any way they want, including listening online or downloading it to their iPads.

FIG. 3.10 Drug Effects of the Synapse. Drugs can act as agonists by facilitating the effects of a neurotransmitter, or as antagonists by blocking these effects. Click on this figure in your eText to see more details.

HORMONES AND THE ENDOCRINE SYSTEM
Neurotransmitters are not the body's only chemical messengers. **Hormones** are chemicals secreted by the glands of the endocrine system. Generally, neurotransmitters work almost immediately within the microscopic space of the synapse, whereas hormones are secreted into the bloodstream and travel throughout the body. Thus, the effects of hormones are much slower than those of neurotransmitters. With help from the nervous system, the endocrine system contributes to homeostasis—the balance of energy, metabolism, body temperature, and other basic functions that keep the body working properly (see Figure 3.10).

Module 11.1) In other words, the brain triggers activity in the endocrine system which then influences the brain's activity via hormones. This cycle continues as our brain and body attempt to maintain the appropriate energy levels for dealing with the environment.

The brain area that is critical for this brain-endocrine relationship is the **hypothalamus**, a brain structure that regulates basic biological needs and motivational systems. The hypothalamus releases specialized chemicals called releasing factors that stimulate the **pituitary gland**—the master gland of the endocrine system that produces hormones and sends commands about hormone production to the other glands of the endocrine system. These hormones can be released by glands throughout the body before finding their way to the brain via the bloodstream.

How we respond to stress illustrates nicely how the nervous and endocrine systems influence each other. In psychological terms, stress is loosely defined as an imbalance between perceived demands and the perceived resources available to meet those demands. Such an imbalance might occur if you suddenly realize your midterms exam is tomorrow at 8:00 a.m. Your resources—time and energy—may not be enough to meet the demand of succeeding on the exam. The hypothalamus, however, sees chemical stress in motion that physically prepares the body for stress. It signals the pituitary gland to release a hormone into the bloodstream that in turn stimulates the **adrenal glands**, a pair of endocrine glands located adjacent to the kidneys that release stress hormones, such as cortisol and epinephrine. Cortisol and epinephrine help mobilize the body during stress, thus providing enough energy for you to deal with the sudden increase in activity necessary to respond to the endocrine messengers (see Module 14.2).

Another important chemical is **endorphin**, a hormone produced by the pituitary gland and the hypothalamus.

Study and Review

MyPsychLab

MyPsychLab icons in the margin call out important information students can access online—for example, videos, simulations, and hands-on experiments.

Scientific Explanation

How can science explain it?

This element of scientific literacy encompasses a basic understanding of research methodology and thinking about problems within a scientific framework. *An Introduction to Psychological Science* integrates and reinforces key research methodology concepts throughout the book. This interweaving of methodology encourages students to continue practising their scientific thinking skills. Learning science is more than accumulating facts; students learn to ask questions, construct explanations, test those explanations, and communicate their ideas to others.

Application

Module Opening Vignettes

Each module opens with a short vignette emphasizing the personal and societal relevance of certain topics to be covered. The vignette concludes with Focus Questions preparing the reader to think about the content found within the module.

Module 3.1 Genetic and Evolutionary Perspectives on Behaviour

LEARNING OBJECTIVES	KNOW	UNDERSTAND	APPLY	ANALYZE
The key terminology associated with genetic and evolutionary psychology	How traits and abilities evolve over generations	How knowledge of genes and evolutionary psychology can be applied to real-world situations	How knowledge of genes and evolutionary psychology can be applied to real-world situations	How knowledge of genes and evolutionary psychology can be applied to real-world situations

Focus Questions

- How is human behaviour influenced by genetic factors?
- How has evolution played a role in modern-day human behaviour?

Biopsychosocial Perspectives

To emphasize the complexity of scientific explanations, students are reminded throughout each chapter that behaviour includes biology, individual thoughts and experiences, and the influence of social and cultural factors.

BIOPSYCHOSOCIAL PERSPECTIVES

Hunters and Gatherers: Men, Women, and Spatial Memory

Evolutionary psychologists claim that the brain consists of a set of cognitive adaptations for solving problems related to survival and reproductive fitness. They also hypothesize that male and female brains will differ in some ways because males and females have had to solve a different set of problems in order to survive and reproduce. Specifically, due to their size and strength, males were traditionally responsible for tracking and killing animals. These responsibilities would require males to travel over long distances without becoming lost. Females, due to the fact that they cared for children, remained closer to home and instead spent time foraging for berries and edible plants. Males' responsibilities would favour individuals with good spatial skills; females' responsibilities would favour memory for the location of objects (e.g., plants). The question, then, is whether the abilities that were adaptive for males and females over the course of our species' evolution are still present today. Put another way, will modern males and females show performance differences on different tests of spatial abilities that are consistent with their historic roles as hunter (males) and gatherer (females)?

One sex difference that has been reported involves solving the mental rotation task seen in Figure 3.9.

Instructions

- Take a close look at standard object #1 in Figure 3.9. One of the three objects to the right of it is the same. Which one matches the standard? Repeat this with standard object #2 and the three comparison shapes to the right of it.
- Many researchers find that, on average, males and females differ in their ability to perform this task. Do you think that

Myths in Mind

Many commonly held beliefs people have about behaviour before taking a psychology course are half-truths or outright falsehoods. This feature sets the record straight in a concise and informative way. The selected examples are likely to have personal relevance to many readers and deal with important scientific issues.

MYTHS IN MIND

We Are Born with All the Brain Cells We Will Ever Have

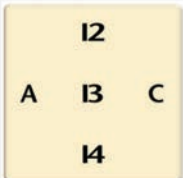

For decades, neuroscience taught us that nerves do not regenerate; in other words, scientists believed that we are born with all of the brain cells we will ever have. This conclusion made perfect sense because no one had ever seen new neurons form in adults, and severe neurological damage is often permanent.

MyPsychLab Simulations

MyPsychLab Simulations allow students to participate in experiments online to reinforce what they are learning in class and in their book. More than 50 experiments, surveys, and inventories are available through this online tool (available at MyPsychLab).

EXPERIMENT: AMBIGUOUS FIGURES

INTRODUCTION | INSTRUCTIONS | EXPERIMENT | RESULTS | DISCUSSION | REFERENCE

A

B

C

Ambiguous figures provide a dramatic illustration of the influence our experiences, beliefs, and expectations can exert on perception. Ambiguous figures are stimuli that can be interpreted in more than one way. For instance, the figure in the picture to our left can either be seen as a "12" or as the number "13." Whether you see it as a "12" or a "13" is dependent upon your own experiences, but it can also be guided by the context in which you observe the stimulus. In one case, you are more likely to see it as a "12" if we surround the ambiguous stimulus with other letters, whereas, you are most likely to see it as "13" if we surround it with numbers (Chambers, 1992). Therefore, perception may be altered by the context in which the stimulus is introduced.

How can science explain it?

In recent years, an increasing number of instructors have begun to focus on telling students how psychological science fits within the scientific community. Psychology serves, in essence, as a hub science. Through this emphasis on scientific literacy in psychology, students begin to see the practicality and relevance of psychology and become more literate in the fields that our hub science supports.

Critical Thinking

Can we critically evaluate the evidence?

Working the Scientific Literacy Model

Working the Scientific Literacy Model, introduced in Chapter 1, and then featured in each module in the remaining chapters, fully integrates the model of scientific literacy. Core concepts are highlighted and students are walked through the steps of knowledge gathering, approaching the problem from a scientific standpoint, using critical thinking, and revealing applications.

WORKING THE SCIENTIFIC LITERACY MODEL
Pain and Substance P

This is not a simple process. Instead, there are a number of different neural systems and neurotransmitters involved with our response to pain stimuli (see Module 4.4). In fact, neurons, neurotransmitters, and hormones have all been implicated in some part of the pain response. One neurotransmitter that has been discussed previously is known as **Substance P**, a neurotransmitter involved in the experience of pain.

What do we know about Substance P?

Substance P was first discovered in 1951 when pain results from the brain and rest of a horse that bleed its nasal mucosa in contact (Van Esde & Gaskell, 1951). However, it was not until 1973 that the substance was associated with the transmission of pain (Bjorklund & Sjogren, 1973). Lundberg and others noted that Substance P was found in the dorsal horn of the spinal cord in the rat in response to information from the brain (Chen et al., 1972), as well as in several different brain areas related to the pain response (Peters, 2002). So, when tissue on the skin surface is damaged, sensory neurons carry messages to the spinal cord and then up to the brain. In fact, these CNS structures release Substance P going into the perception of pain.

How can science explain what Substance P does?

Pain is an evolutionary adaptation. It makes sense to have pathways specialized for the perception of pain. This is an important message telling you to stop doing something that is harming your body. Compelling evidence for the role of Substance P comes from an examination of the brain using imaging techniques. These researchers use a device called a positron emission tomography (PET) scanner to examine the brain called the prefrontal cortex (PFC & Clark, 2002). The brain region receives pain, and temperature-related input from the spinal cord and sends it to different areas of the cerebral cortex, the wrinkled outer surface of the brain involved with many sophisticated processes. It also receives input from the cerebellum and axons in the spinal cord on the way to the rest of the body. The fact that a neural area known as associated with pain perception also contains receptors for Substance P suggests that the neurotransmitter is likely involved with pain responses.

However, this is not the only part of the brain containing Substance P receptors. They are also found in the amygdala (which responds to fear and arousal) and the hypothalamus (which is related to fight-flight responses and the release of different hormones). Why would this be the case? One possibility is that pain is not simply a physical sensation. A large body of research now suggests that when we feel pain it is a combination of pain sensation and an emotional response. Sometimes the pain does not allow us to do our job or we are not only in a great deal of pain but also being treated (using many other emotions).

Can we critically evaluate this research?

Evidence in favor of the role of Substance P in pain perception comes from a group of patients with a rare condition called congenital insensitivity to pain. These individuals lack the ability to generate pain, and as a result childhood acquire significant damage to the skin, joints, eyes, and other body regions. Because they lack a pain response, these individuals do not take action to prevent physical damage to the body. Research in the field (primarily conducted by someone named Dr. Phary) found that some individuals with this condition had Substance P receptors in the peripheral nerves (Phary et al., 1999). Studies such as this provide strong evidence for the neurotransmitter's role in pain perception.

More examination in the lines of pain and emotions there is a great deal of evidence linking receptors and pain. For example, social pain resulting from being rejected or receiving similar brain scans as physical pain (Damen et al., 2012; Baetzel et al., 2008). There is also evidence that patients with chronic pain conditions are also more likely to suffer from depression (Joshi & Datta, 2012). Interestingly, some investigators have found that drugs that influence the levels of Substance P in the brain have antidepressant properties (Amit, 2004). However, these researchers are quick to note that such drugs could also potentially influence other neurotransmitter systems. Therefore, more research is needed to study this link.

Why is this relevant?

Millions of people suffer from chronic pain. In addition to comprehending the well-being

Many departments are focusing to an increasing extent on the development of critical thinking, as these skills are highly sought after in society and the workforce. Critical thinking is generally defined as the ability to apply knowledge, use information in new ways, analyze situations and concepts, and evaluate decisions. To develop critical thinking, the module objectives and quizzes are built around an updated Bloom's taxonomy. Objectives are listed at four levels of increasing complexity: **know**, **understand**, **apply**, and **analyze**. The following features also help students organize, analyze, and synthesize information. Collectively, these features encourage students to connect different levels of understanding with specific objectives and quiz questions.

Work the Scientific Literacy Model

At the end of every chapter, students have an opportunity to "Work the Scientific Literacy Model" themselves. The Work the Model feature walks students through content from the chapter, providing study tips and reminders for key content areas. Students are asked to critically evaluate what they have learned by accessing a video clip, either through MyPsychLab, the Layar app, the QR code on the page, or YouTube. They are then provided with a question prompting them to apply relevant content to the scenario depicted in the video. These questions can be assigned as either a classroom discussion or a writing assignment.

Work the Scientific Literacy Model :: Understanding Brain Functions

1 What do we know about structures of the brain?

Table 2.1 lists a lot of the major brain regions, structures, and their functions. As you review this material, try to come up with strategies to describe each one. For example, look for structures commonly linked with each other are the hypothalamus and the hippocampus. Although the hypothalamus and the hippocampus are both part of the limbic system, they have very different functions. The hypothalamus serves as a sort of thermostat, maintaining the appropriate body temperature, and it can affect other such as aggression and sex. The hippocampus is critical for learning and memory, particularly the formation of new memories. Can you think of a memory device that might help you keep these two brain structures separate? One suggestion for the hypothalamus is that it is the seat of the "master clock." This is certainly a great way to remember it, but you need to keep in mind where certain buildings are located. This area is usually the type of clock that makes a functioning hypothalamus. As you study, try to come up with your own memory device to help recall the different brain structures and their functions.

2 How can science help explain brain structure and function?

As discussed on page 121, in the very early days of brain research, scientists tried to understand the brain by using tools that were not very advanced. However, as technology advanced, researchers are able to do detailed pictures of the brain and can measure the neural activity of major structures such as the hypothalamus and the hippocampus while the subject is working. Because they have developed a variety of methods for studying the brain, each of which offers unique insights into the brain, the pages 121-122 for detailed descriptions of methods for measuring and observing brain activity: electroencephalography (EEG), magnetic resonance imaging (MRI), functional MRI (fMRI), magnetoencephalography (MEG), and transcranial magnetic stimulation (TMS).

3 Can we critically evaluate claims about brain function?

Modern methods have helped us understand a great deal about brain structure and function, but many misunderstandings persist. In **Myths in Mind** on page 95, we addressed the question of whether humans are born with all of the neural cells we will ever have in the part of the brain that is responsible for the hippocampus. Some areas within the hippocampus have the capacity to generate new cells throughout life.

Also, in our discussion of language specialization on page 114, we discussed how the regions to which people are "right-brained" or "left-brained" is often misapplied to the specific tasks. Certain areas are often described as "right-brained," whereas logical and analytical types are frequently "left-brained." In reality, most cognitive functions are spread throughout multiple brain regions.

To wrap up, try to think about these kinds of generalizations in relation to the "Myths in Mind" section. In the paper, the author makes it a point to properly evaluate the information before making a claim.

4 Why is this relevant?

Which the accompanying video excerpt?

As the brain functions to control the body, it is also the seat of the mind. It is by thinking the job done in the service of your "self." As you review this material, try to come up with strategies to describe each one. For example, look for structures commonly linked with each other are the hypothalamus and the hippocampus. Although the hypothalamus and the hippocampus are both part of the limbic system, they have very different functions. The hypothalamus serves as a sort of thermostat, maintaining the appropriate body temperature, and it can affect other such as aggression and sex. The hippocampus is critical for learning and memory, particularly the formation of new memories. Can you think of a memory device that might help you keep these two brain structures separate? One suggestion for the hypothalamus is that it is the seat of the "master clock." This is certainly a great way to remember it, but you need to keep in mind where certain buildings are located. This area is usually the type of clock that makes a functioning hypothalamus. As you study, try to come up with your own memory device to help recall the different brain structures and their functions.

MyPsychLab Visit **Work the Scientific Literacy Model**. Watch the accompanying video in MyPsychLab or on your phone using the Layar app or QR code. If you encounter any technical issues, contact your instructor for help. You can find the video clip and additional content in MyPsychLab. Answer any questions that accompany the video clip to test your understanding.

Scientific Explanati

Study Plan

Through MyPsychLab (www.pearsonmylabmastering.com), students have access to a *personalized study plan*, based on Bloom's taxonomy, that arranges content from basic level thinking (such as remembering and understanding) to more complex critical thinking (such as applying and analyzing). This layered approach sharpens critical thinking skills, and helps students succeed in the course and beyond.

your mastery of each level of the Post-Test.

Application

Why is this relevant?

Psychology is a highly relevant, modern science. To be scientifically literate, students should relate psychological concepts to their own lives, making decisions based on knowledge, sound methodology, and skilled interpretation of information.

MyPsychLab Video Series

Links are provided throughout the eText to relevant episodes of the MyPsychLab Video series—a comprehensive, current, and cutting-edge series featuring 17 original 30-minute videos covering the most recent research, science, and applications and utilizing the most up-to-date film and animation technology.

Why is this relevant?

PSYCH @
The Artist's Studio

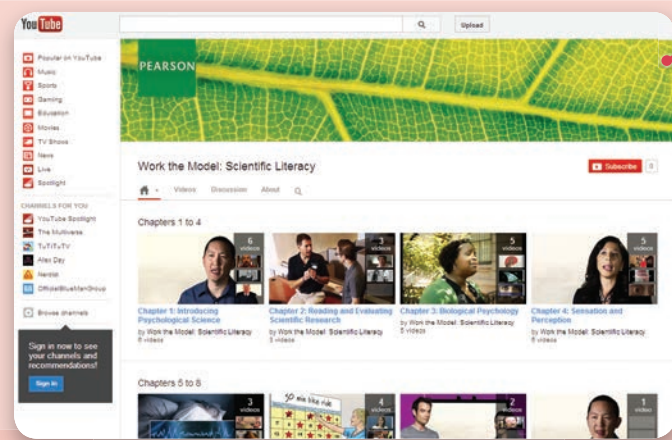

Although we often think of painters as being eccentric people prone to cutting off their ears, they are actually very clever amateur vision scientists. Rembrandt (1606–1669) varied the texture and colour details of different parts of portraits in order to guide the viewer's gaze toward the clearest object. The result is that more detailed regions of a painting attract attention and receive more eye fixations than less detailed regions (DiPaola, Riebe, & Enns, 2011).

In addition to manipulating a viewer's eye movements, painters also use a variety of depth cues to transform their two-dimensional painting into a three-dimensional perception. This use of *pictorial depth cues* is quite challenging, which is why some paintings seem vibrant and multilayered (like nature) while others seem flat and artificial. So what are some strategies that artists use to influence our visual perception?

To understand how artists work, view the painting by Gustave Caillebotte shown in Figure 4.26. In this painting, you will notice that the artist used numerous cues to depict depth:

Psych @

The “Psych @” feature reveals an everyday, personally relevant application of psychological science. The content of these features is geared toward issues and concerns that many university students care about.

YouTube Scientific Literacy Site

YouTube has become one of the most popular social media resources for both instructors and students. The challenge, of course, is to find clips that are relevant to key content areas. To help instructors access valuable open-source content and further bring to light the relevance of the discipline of psychology, a YouTube channel, found at

www.youtube.com/workthemodel

has been developed to accompany *An Introduction to Psychological Science*. The book provides relevant video links for instructor and student access, in addition to the videos that frame the end-of-chapter “Work the Scientific Literacy Model” activity.

What's New in the Canadian Edition?

When we started writing the Canadian edition of this textbook, we assumed we'd just add the letter "u" a few hundred times and insert some pictures of Sidney Crosby. We did add several thousand u's and one photo of Crosby—but, as we began to write the different chapters, we became amazed at how important Canadian researchers have been to the study of psychological science. In boxing, there is the phrase "punching above your weight." It is used when a smaller fighter's punches feel like they are coming from a larger, stronger fighter. Canadian psychology is like that. Despite the fact that we are a relatively small country (in terms of population and the number of research institutions), we have made incredibly important contributions to a number of areas of psychology. The work of Canadian researchers served as the foundation for many areas of neuroscience, perception, memory, social, and health research. So, although we rewrote large chunks of the book, the Canadian content isn't just added as a bonus. The Canadian content is actually an essential part of psychological science *in general*. As a result, we ended up adding over 1400 *new* references to the U.S. edition of this book. These include the following additions:

- highlighting the importance that Canadian research has had on the development of modern psychology;
- adding research conducted by Canadian researchers from all 10 provinces;
- incorporating research related to cultural psychology and the experiences of first- and second-generation immigrants to Canada;
- discussing bilingualism and its effects on culture, cognition, and the brain;
- providing a thorough discussion of Canadian legal decisions (including references to specific Supreme Court rulings) related to issues such as sexting, hypnosis, and recovered memories;
- discussing Canadian statistics and laws related to drug use and possession;
- providing Statistics Canada and Health Canada materials for a number of topics including smoking, obesity, work stress, gambling, and clinical conditions;
- clarifying the ethical requirements for conducting research at Canadian universities and hospitals;
- incorporating discussions of social issues that are central to many Canadians' lives such as environmental issues, the increased role of technology in our lives, and the influence that marketers and corporations try to have over us all.

We have also made an effort to make psychology less "abstract" than it is often portrayed in textbooks. Throughout this book, we use examples from the real world in order to demonstrate that the concepts the students are learning about affect *their own* behaviour. Although we include some traditional examples such as how to improve study habits, we go beyond that. For example, we use the concepts learned in different chapters to highlight tricks used by advertisers (including those used in negative political advertising). We also point out interesting things to look for in social interactions, such as the tendency of heterosexual males to stand up straighter in the presence of women in order to appear more powerful (discussed in Evolutionary Insights into Human Behaviour in Module 3.1). Our hope is that these engaging examples will allow the students to see the world in a slightly different way.

In addition to these examples, we *also try to show the students how they can use psychology to change the world that they live in*. An example found in many chapters is that of changing people's environmental behaviours and their attitudes toward issues such as climate change. Our hope is that by seeing how psychological science can be used to change behaviours for the better, students will be motivated to take the information from this book outside of the classroom to create the types of changes that our world desperately needs.

When you begin any course, it is like starting a journey. We hope you enjoy your journey through the Canadian edition of *An Introduction to Psychological Science* as much as we enjoyed writing it.

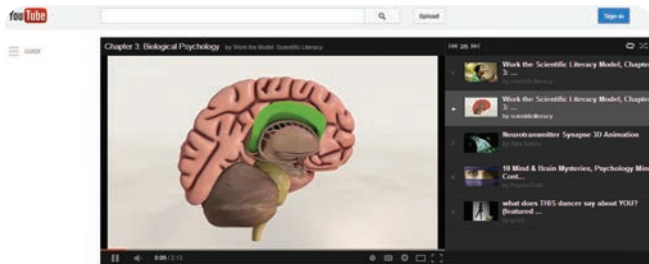

For Instructors

SCIENTIFIC LITERACY is a key course goal for many introductory psychology instructors.

Learning science is an active process. How do we help instructors model scientific literacy in the classroom and online in a way that meets the needs of today's students?

ORGANIZATION

Instructors consistently tell us one of the main challenges they face when teaching the introductory psychology course is organizing engaging, current, and relevant materials to span the breadth of content covered. How do we help organize and access valuable course materials?

YouTube Scientific Literacy Site

As mentioned earlier, a YouTube channel, found at www.youtube.com/workthamodel, provides a wealth of videos to help engage students and enhance their learning. The ready access provided to these videos, with content spanning the breadth of psychological science, means that instructors no longer have to search for just the right video links to material that meshes with the text's content.

LECTURE GUIDE

I. MODULE 1.1: THE SCIENCE OF PSYCHOLOGY (Text p. 2)

A Return to Table of Contents

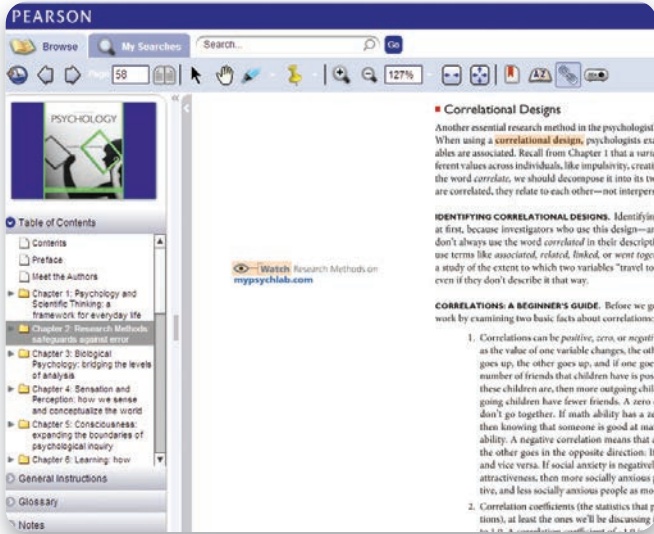

Learning Objectives

- ✓ **Know** the key terminology of this module.
 - See bold, italicized terms below.
- ✓ **Understand** the steps of the scientific method.
 - The basic model is in figure 1.1. Basically, scientific theories generate hypotheses. If a hypothesis is confirmed, new hypotheses may stem from it, and the original theory receives added support. If a hypothesis is rejected, the original hypothesis may be modified and retested, or the original theory may be modified or rejected.
- ✓ **Understand** the concept of scientific literacy.
 - Scientific literacy refers to the process of how we thinking about and understand scientific information (figure 1.3). Working the model involves answering a set of questions:
 - What do we know about the phenomenon?
 - How can science explain it?
 - Can we critically evaluate the evidence?
 - Why is this relevant?
- ✓ **Apply** the biopsychosocial model to behavior.
 - Psychologists examine behavior through three main perspectives: biological (e.g., brain and genetics), psychological (e.g., thinking, learning, and emotion), and sociocultural (e.g., family, gender, and social context).
- ✓ **Apply** the steps in critical thinking.
 - It is important learn how to use and apply these steps, versus just memorizing them. Remember, critical thinking involves (1) being curious, (2) examining evidence, (3) examining assumptions and biases, (4) avoiding emotional thinking, (5) tolerating ambiguity, and (6) considering alternative viewpoints.
- ✓ **Analyze** the use of the term scientific theory.
 - The term theory is often used interchangeably with opinion in casual talk, but not in science. A scientific theory is an explanation for a broad range of observations, integrating numerous findings into a coherent whole.

Instructor's Resource Manual

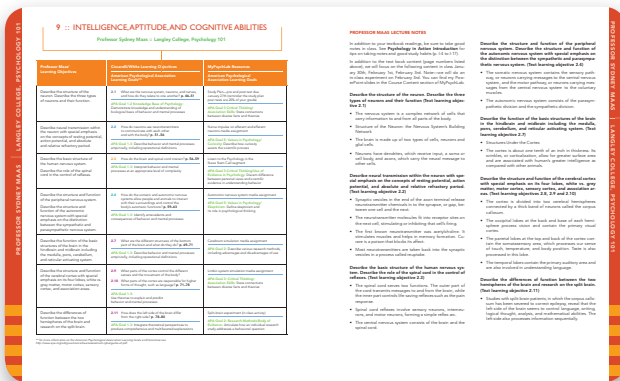

The Instructor's Resource Manual includes suggestions for preparing for the course, sample syllabi, and current trends and strategies for successful teaching. Each chapter offers integrated teaching outlines, lists the key terms for each chapter for quick reference, and provides an extensive bank of lecture launchers, handouts, and activities, as well as suggestions for integrating third-party videos and web resources. This resource saves prep work and helps professors use their classroom time more efficiently.

ORGANIZATION

Pearson eText

The Canadian edition of *An Introduction to Psychological Science* is designed with alternative delivery models in mind. Highly visual, clearly laid out, and with integrated video and media, it is optimal for online reading and interaction. Instructors and students can access their textbook anytime, anywhere, and any way they want, including listening online or downloading it to an iPad.

Create a Custom Text

For courses with enrollments of at least 25 students, instructors can create their own textbook by combining chapters from best-selling Pearson textbooks or reading selections in a customized sequence. To begin building a custom text, visit

www.pearsoncustomlibrary.com

Instructors can also work with a dedicated Pearson Custom editor to create the ideal text—publishing original content or mixing and matching Pearson content. Contact a Pearson publisher's representative to get started.

PRESENTATION

Instructors consistently tell us making their classroom lectures and online instruction exciting and dynamic is a top priority so they can engage students and bring psychology to life. We have been listening and have responded by creating state-of-the-art presentation resources, putting the most powerful presentation resources at your fingertips.

For maximum flexibility, each half-hour episode features several brief clips that bring psychology to life:

- **The Big Picture** introduces the topic of the episode and provides the hook to draw students fully into the topic.
- **The Basics** uses the power of video to present foundational topics, especially those that students find difficult to understand.
- **Special Topics** dives deeper into high-interest and cutting-edge topics, showing research in action.
- **In the Real World** focuses on applications of psychological research.
- **What's in It for Me?** clips show students the relevance of psychological research to their own lives.

ClassPrep

Finding, sorting, organizing, and presenting instructor resources is faster and easier than ever before with ClassPrep, which is available in MyPsychLab. This fully searchable database contains hundreds of our best teacher resources, such as lecture launchers and discussion topics, in-class and out-of-class activities and assignments, handouts, and video clips, photos, illustrations, charts, graphs, and animations. Instructors can search or browse by topic, and readily sort their results by type, such as photo, document, or animation. Instructors can create personalized folders to organize and store the content that they like, or can download resources if they prefer. In addition, instructors can upload their own content and present directly from ClassPrep, or make it available online directly to their students. Also available—a ClassPrep app that allows access to all favourite resources via any mobile device.

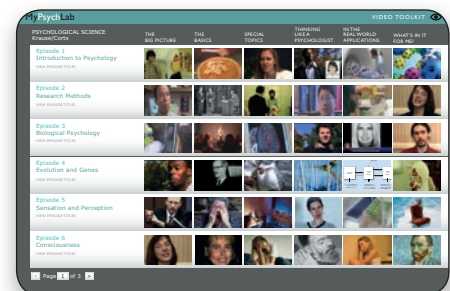

PowerPoint Presentations

Engaging PowerPoint slides bring the powerful Krause/Corts/Smith/Dolderman design right into the classroom, drawing students into the lecture with interesting information and rich visuals. The slides are built around the learning objectives in each module and offer key material that is provided in the text. In addition, interactive presentations with “clicker” questions are provided for instructors using classroom response systems.

MyPsychLab Video Series

The MyPsychLab Video series is a comprehensive, current, and cutting-edge series featuring 17 original 30-minute videos covering the most recent research, science, and applications and utilizing the most up-to-date film and animation technology. Questions are provided within MyPsychLab so that instructors can assign relevant clips from the series as homework; they may also use the series in the classroom to illustrate the many fascinating topics in the field of psychology as part of their lectures. Guided by the Design, Development, and Review team—a diverse group of introductory psychology instructors—each episode is organized around the major topics covered in the introductory psychology course syllabus. Find out more about the MyPsychLab Video Series: www.pearsonhighered.com/showcase/mypsychlab_videos/

ASSESSMENT

Instructors consistently tell us that assessing student progress is a critical component to their course and one of the most time-consuming tasks. Vetted, good-quality, easy-to-use assessment tools are essential. We have been listening and we have responded by creating the absolutely best assessment content available on the market today.

Test Bank

The Test Bank (Test Item File) contains more than 3000 questions, many of which were class-tested in multiple classes at both 2-year and 4-year institutions prior to publication. All questions have been thoroughly reviewed and analyzed line by line by a developmental editor and a copy editor to ensure clarity, accuracy, and delivery of the highest-quality assessment tool. All conceptual and applied multiple-choice questions include rationales for each correct answer and the key distracter, which serve both as an added guarantee of quality and as a time-saver when students challenge the keyed answer for a specific item.

In addition to this high-quality Test Bank, a second bank containing more than 2000 questions is available for instructors looking for more variation.

The Test Bank also comes with **Pearson MyTest**, a powerful assessment generation program that helps instructors easily create and print quizzes and exams. Questions and tests can be authored online, providing instructors with the ultimate in flexibility and the ability to efficiently manage assessments wherever and whenever they want. Instructors can easily access existing questions and then edit, create, and store them using simple drag-and-drop and Word-like controls. The data for each question identifies its difficulty level and the text page number where the relevant content appears. In addition, each question maps to the text's major section and learning objective. For more information, go to www.PearsonMyTest.com.

1) In order to be scientific, it must be possible to test a hypotheses.

Correct: *A testable hypothesis is one that can be confirmed or rejected (you do not prove a hypothesis), and a scientific hypothesis must be testable.*

Diff: 1
Type: FIB
Page Reference: 3
Skill: Conceptual
Objective: Understand the steps of the scientific method.

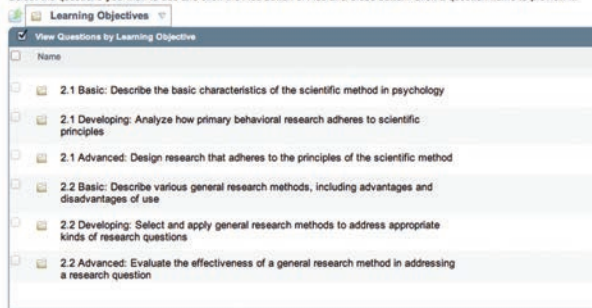

2) For psychologists, critical thinking means that we apply scientific methods carefully, examine our assumptions and biases, and tolerate ambiguity when the evidence is inconclusive.

Correct: *Critical thinking involves exercising curiosity and skepticism when evaluating the claims of others, and with our own assumptions and beliefs.*

Diff: 2
Type: FIB
Page Reference: 9
Skill: Conceptual
Objective: Apply the steps in critical thinking

MyPsychLab

Educators know it. Students know it. It's that inspired moment when something that was difficult to understand suddenly makes perfect sense. MyPsychLab was designed and refined with a single purpose in mind—to help educators create that moment of understanding with their students.

MyPsychLab offers students useful and engaging self-assessment tools, and it provides instructors with flexibility in assessing and tracking student progress. For instructors, MyPsychLab is a powerful tool for assessing student performance and adapting course content to students' changing needs, without requiring instructors to invest additional time or resources to do so.

Instructors and students have been using MyPsychLab for more than 10 years. To date, more than 600 000 students have used MyPsychLab. During that time, three white papers on the efficacy of MyPsychLab have been published. Both the white papers and user feedback show compelling results: MyPsychLab helps students succeed and improve their test scores. One of the key ways MyPsychLab improves student outcomes is by providing continuous assessment as part of the learning process. Over the years, both instructor and student feedback have guided numerous improvements to this system, making MyPsychLab even more flexible and effective.

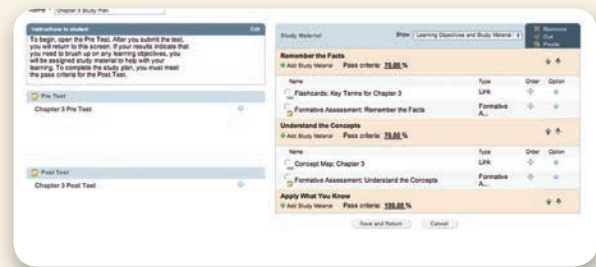

Pearson is committed to helping instructors and students succeed with MyPsychLab. To that end, we offer a Psychology Faculty Advisor Program designed to provide peer-to-peer support for new users of MyPsychLab. Experienced Faculty Advisors help instructors understand how MyPsychLab can improve student performance. To learn more about the Faculty Advisor Program, please contact your local Pearson representative.

MyPsychLab includes the following features:

MyPsychLab Video Series

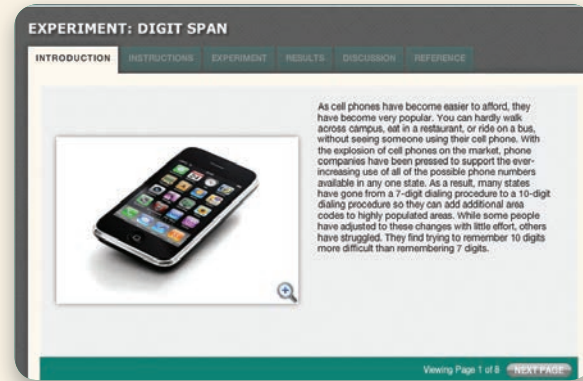

The MyPsychLab Video Series is a comprehensive and cutting-edge series featuring 17 original 30-minute videos covering the most recent research and utilizing the most up-to-date film and animation technology. Multiple choice and short answer essay questions are provided within MyPsychLab so episodes can be assigned as homework.

MyPsychLab Study Plan

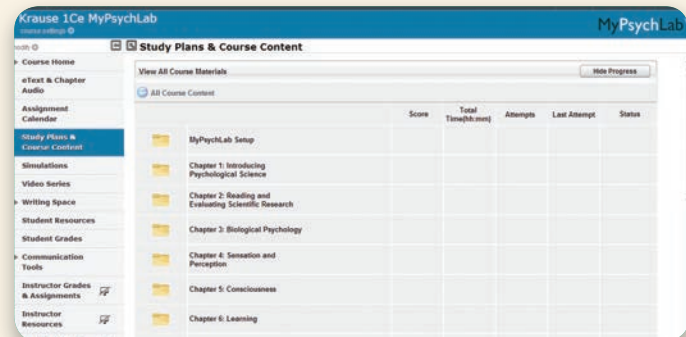

Students have access to a personalized study plan, based on Bloom's taxonomy, that arranges content from less complex thinking (such as remembering and understanding) to more complex critical thinking (such as applying and analyzing). This layered approach promotes better critical thinking skills and helps students succeed in the course and beyond.

ASSESSMENT

MyPsychLab Simulations

Online simulations help students understand scientific principles and practise through active learning. Over thirty experiments, inventories, and surveys are available through MyPsychLab.

For access to all instructor supplements for *An Introduction to Psychological Science*, go to vig.pearsoned.ca and follow the directions to register (or log in if you already have a Pearson user name and password). Once you have registered and your status as an instructor is verified, you will be emailed a log-in name and password. Use your log-in name and password to access the catalogue. Click on the “Browse by Discipline” link, click on “psychology” and then “introductory psychology,” and finally select the Krause/Corts/Smith/Dolderman, *An Introduction to Psychological Science*, text. Under the description of each supplement is a link that allows you to download and save the supplement to your desktop.

For technical support for any of your Pearson products, you and your students can contact <http://247.pearsoned.com>.

Acknowledgments

We cannot fathom completing a project like this without the help and support of many individuals. Through every bit of this process have been our families and we thank you for your love, patience, and support. Although our children will be disappointed that this book is not about princesses, Spiderman, or sea creatures, we hope that they'll read and enjoy this book one day. Our extended families, particularly Peggy Salter, also provided immense support and helped our children feel loved even when we had to work late to finish this book. In addition, our departments have been wonderfully understanding and helpful, offering advice with their various specializations, providing examples and tips, reviewing drafts, and tolerating our occasional absences.

The Canadian edition of this textbook involved a small army of helpful people. Our Developmental Editor, Johanna Schlaepfer, was incredibly supportive and patient throughout this entire process. We cannot thank her enough. We are also indebted to Matthew Christian, the Acquisitions Editor, who got this project started and helped motivate and organize us throughout the writing of this textbook. Duncan Mackinnon, the Pearson Sales Representative for Manitoba and Saskatchewan, also helped with the initial stages of this book and provided useful information about the level of writing and analysis that were missing from the Canadian introductory psychology textbook market. Marissa Lok, Nidhi Chopra, and their production teams worked tirelessly in order to turn our Word, Excel, and PowerPoint files into a beautiful textbook. Susan Bindernagel's copyediting and encouragement were also much appreciated. We would also like to thank the entire Pearson sales team for promoting this book as well as the supplements team for editing the MyPsychLab and other online materials.

The Canadian edition of this book benefitted from conversations with a number of colleagues. Amy Desroches was immensely helpful in making suggestions for Canadian content for the language module (Module 8.3). Beverley Fehr provided useful articles and suggestions for the new section on love (Module 11.3). Doug Williams provided us with a number of helpful ideas that ended up influencing parts of Chapters 6 (Learning) and 14 (Health, Stress, and Coping); he gets bonus points for doing this while at a Winnipeg Jets game (Washington won . . . stupid Ovechkin). Lars Gustav Fjordlund provided insights that helped us add new content to the module on drugs (Module 5.3). Danielle Gaucher made a number of useful content and editorial suggestions throughout the writing of this book. Michelle Di Nella, Steve's research assistant/teaching assistant/lab coordinator/former graduate student/friend, typed up and organized over 1300 references. We cannot thank her enough for her patience and work ethic. We also thank Jen Kornelsen, Steve's research collaborator and friend, who provided a tremendous amount of support throughout this project and who was always willing to listen to different ideas (and jokes) that we had for this book. Finally, we extend a heartfelt thanks to Safa Ali, for her tireless support, and tremendous amount of research and editing work, particularly for Chapters 10 (Lifespan Development), 15 (Psychological Disorders), and 16 (Therapies), for which her wisdom and insight were invaluable.

Finally, the many reviewers and students who carefully read over earlier versions of each chapter have been immensely helpful. We are very grateful that you shared your expertise in the field of psychology, and in teaching, to help bring this book to life.
