1.0

INTRODUCTION

NRG Texas Power, LLC's (NRG) W.A. Parish Electric Generating Station, (the Site) is located in Thompsons, Texas (Figure 1-1). The Site is adjacent to Smithers Lake with the electricity generating portion on the southeastern shore and the solid waste disposal areas (SWDA) along the northeastern shore of the lake (Figure 1-2). The spent coal fuels or coal combustion residuals consist of fly ash, bottom ash, and flue gas desulfurization (FGD) scrubber sludge. The Site has six regulated coal combustion residual (CCR) management units that are subject to regulation under Title 40, Code of Federal Regulations, Part 257 (40 CFR §257) (a.k.a. the CCR Rule). These include four units within the Solid Waste Disposal Area (SWDA, Solid Waste Management Unit (SWMU) 001): Landfill cells 1C, 2A (which contains the Pug Mill), 2B, and 3, along with the Air Preheater Pond (SWMU 021), and the FGD Emergency Pond (E-Pond, SWMU 020).

This report was produced by Environmental Resource Management, Inc. (ERM), on behalf of NRG Texas Power, LLC, and focuses on the initial annual groundwater monitoring results for the E Pond in compliance with the CCR. The report summarizes the groundwater sampling activity at the Site over the last two years as required by §257.90. Consistent with the notification requirements of the Rule, this annual groundwater monitoring report will be posted to the operational record, notification will be made to the State of Texas, and the report will be placed on the publically accessible internet site (§257.105(h), §257.106(h), §257.107(h)). The report must be posted to the operational record no later than January 31, 2018. Table 1-1 cross references the reporting requirements under the CCR Rule with the contents of this report.

The FGD Emergency Pond (hereafter the "E Pond") is located within the main Plant Operations Area (Plant Area). The E Pond is approximately 200 feet by 110 feet and is about 0.5 acres in aerial extent. The pond receives storm water runoff from the FGD dewatering area and also blowdown from the FGD system. When the FGD system goes off line, this pond may also receive the contents of an FGD process vessel (Landy and Sargent, 2016).

TABLE 1-1: Regulatory Requirement Cross-Reference Table

Regulatory Citation in 40 CFR §257	Requirement (paraphrased)	Associated Section in this Report
§257.90(e)	Status of the groundwater monitoring program.	Section 2.0
§257.90(e)	Summarize key actions completed.	Section 2.2
§257.90(e)	Describe any problems encountered.	Section 2.0
§257.90(e)	Key activities for upcoming year.	Section 3.0
§257.90(e)(1)	Map, aerial image or diagram of CCR Unit and monitor wells	Figure 2.1
§257.90(e)(2)	Identification of new monitor wells installed or abandoned during the preceding year.	There were no new monitor wells installed or abandoned during the preceding year.
§257.90(e)(3)	Summary of groundwater data, wells sampled, date sampled, and whether sample was required under detection or assessment monitoring.	Tables 2-1 and 2-2, Appendix A
§257.90(e)(4)	Narrative discussion of any transition between monitoring programs.	Section 3.0

2.0

PROGRAM STATUS

Over the past two years, samples were collected from the certified monitor well network. The groundwater monitor well network consists of two upgradient monitor wells, MW-36, MW-60 and three downgradient monitor wells MW-37, MW-38, and MW-61. All of the monitor wells are screened in the uppermost transmissive zone at the Plant Area. The uppermost aquifer averages approximately 10 feet in thickness at the E Pond and consists of brown, silty sand with various percentages of silt and sand with trace clays. The sand is fine- to coarse-grained, loose, and exhibits high moisture content (wet to saturated). The uppermost transmissive zone is located below a confining layer of silty clay with some sandy clay, clay, and sandy silt average thickness of 15 to 25 ft. A clay rich unit is located immediately below the uppermost transmissive zone.

The well locations can be viewed on the site location map provided in Figure 2-1. No problems were encountered in the data collection or in well performance, and no action was required to resolve any issues. No new wells were installed or decommissioned after the certification of the well network.

2.1

GROUNDWATER FLOW RATE AND DIRECTION

Depth to groundwater measurements were made at each monitor well prior to each sampling event. Groundwater elevations, calculated by subtracting the depth to groundwater from the surveyed reference elevation for each well, were reviewed for each sampling event.

The hydraulic gradient for the sampling events was generally from the northeast to the southwest across the E Pond. The hydraulic gradient value for the October 2017 event was 0.0218 feet/foot (ft/ft). This range is consistent with other events. Based on the measured hydraulic gradient of 0.0218, an assumed porosity of 0.3, and an average measured hydraulic conductivity of 0.0056 ft/min (ERM, 2017), the velocity of groundwater in the uppermost transmissive zone beneath the E Pond is estimated to be approximately 214 feet per year. Potentiometric surface maps can be found in Figure 2-2.

2.2

SAMPLING SUMMARY

A summary of the total number of samples collected for each well is provided in Table 2-1 and 2-2. Table 2-1 displays the wells upgradient of the CCR Unit while Table 2-2 displays the wells downgradient of the CCR Unit.

During sampling events through July 2017 wells were sampled for the Appendix III and Appendix IV analytes. Samples collected in October 2017 were analyzed for Appendix III analytes only. A summary of the data collected is provided in Appendix A.

2.3

DATA QUALITY

ERM reviewed field and laboratory documentation to assess the validity, reliability, and usability of the analytical results. Samples collected during the sampling events were sent to TestAmerica Laboratories, Inc. (TestAmerica), located in Houston, Texas for analysis. TestAmerica - Houston made arrangements for samples to be transported to TestAmerica located in Corpus Christi, Texas for analysis of select constituents. Chain-of-Custody procedures were followed throughout the sample handling process. Data quality information reviewed for these results included field sampling forms, chain-of-custody documentation, holding times, lab methods, cooler temperatures, laboratory method blanks, laboratory control sample recoveries, field duplicate samples, matrix spikes / matrix spike duplicates, quantitation limits, and equipment blanks following the Texas Risk Reduction Program requirements (TRRP-13). The data quality review found the results to be valid, reliable, and useable for decision making purposes with the listed qualifiers. No analytical results were rejected.

3.0

RECOMMENDATIONS

As the initial sample dataset has been collected, statistical analysis to determine upper prediction limits for comparisons of future groundwater results will be reported in the 2018 Annual Groundwater Monitoring Report. The first round of sampling for Detection Monitoring will be conducted during the First Half of 2018.

NOTES:

1. Samples with FD in the Sample ID are blind field duplicates collected from the location in SYS_LOC_CODE column.

2. Results reported in milligrams per liter (mg/L) except for pH which is reported in standard units (pH units).

QUALIFIERS:

U - Result reported as not detected above the sample detection limit (SDL), or result qualified as not detected at an estimated SDL due to blank contamination.

J - Result reported as detected between the SDL and the Method Quantitation Limit (MQL) or result qualified as detected at an estimated concentration.

JH - Result qualified as detected at an estimated concentration with a high bias.

H - Sample analyzed outside hold time.

JL - Result qualified as detected at an estimated concentration with a low bias.

b - Blank contamination noted by laboratory.
