Effects of Rounded Corners on E-Tests

Empirical Model of Effects on E-Tests

Optimization Formulation and Results

- Layout factor x_k window: $L_k \leq x_k \leq U_k$

- E-test output with target T_i :

$$\min_{x_k} \sum_i w_i (y_i - T_i)^2 = \sum_i w_i (b_{i0} + b_i x + x^T B_i x - T_i)^2$$

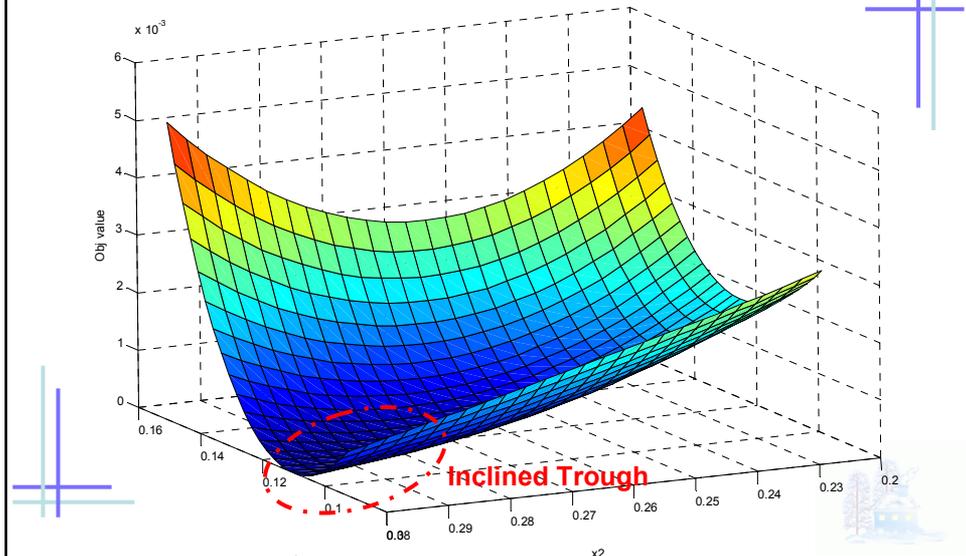

- Minimizing sensitivity of y_i to x_k changes:

$$\min_{x_k} \sum_{(i,k)} \left(\frac{\partial y_i}{\partial x_k} - 0 \right)^2$$

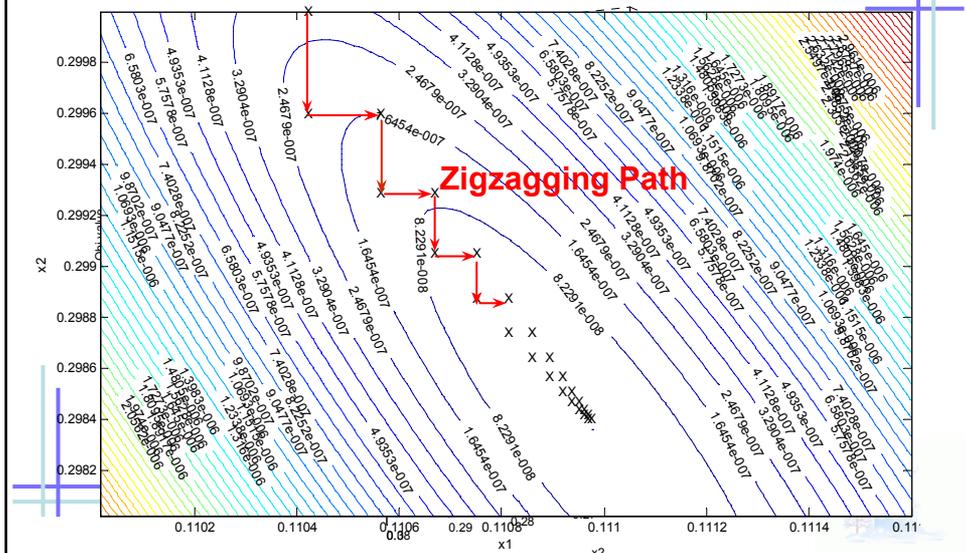

- E-test output with spec. windows:

$$L_j \leq y_j \leq U_j \Rightarrow L_j \leq b_{j0} + b_j x + x^T B_j x \leq U_j$$
