

Automated Generation of PowerPoint Presentations Using R in Clinical Studies

Takeda Pharmaceutical Company, Ltd.
Nobuo Funao

MENU

- **Introduction**

- Procedures

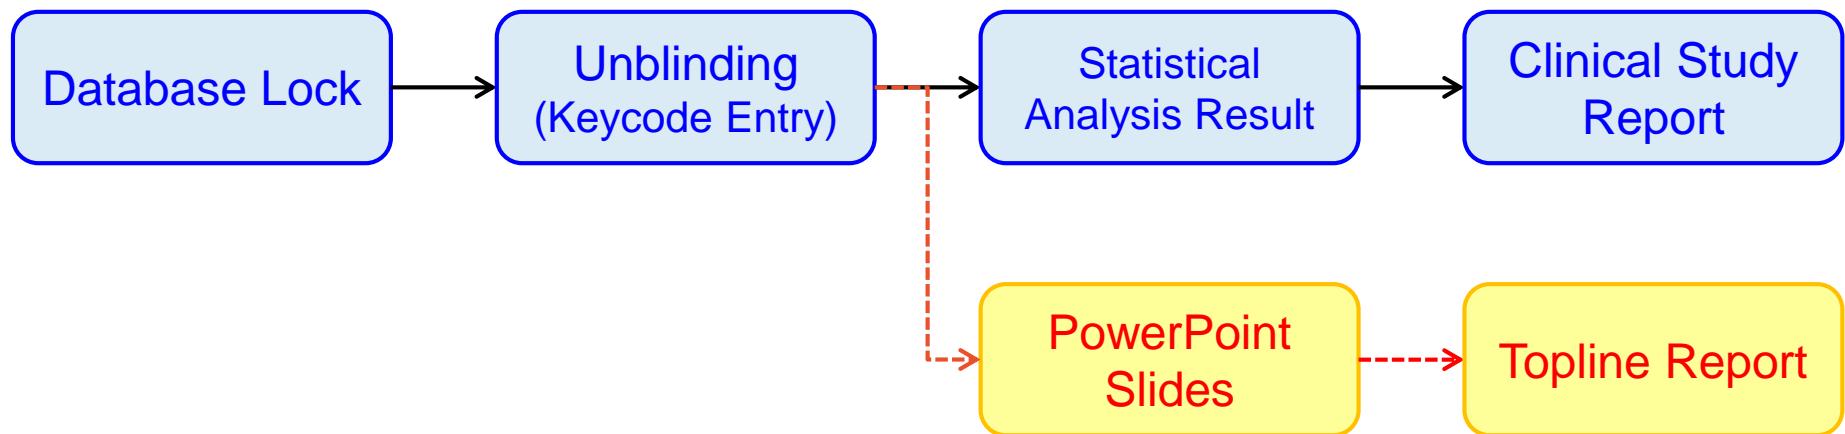

- Details

- ✓ Add Texts
- ✓ Add Figures
- ✓ Add Tables
- ✓ Miscellaneous

- Example:

Automated Generation of PowerPoint Presentations
from CDISC/ADaM Datasets

Closing Clinical Study

- In closing stage of a clinical study, we should provide a statistical analysis result (SAR) with tables and figures, and then create a clinical study report (CSR) based on the result.
- In the meantime, we should also create a PowerPoint slide deck (say, topline report) including a brief summary of the study and the analysis results to report our managers / directors.

Topline Report Deliverable

- **Until Now**

- Copy contents from SAR and paste them into slides
- Due to manual labor, the slides would have several errors (e.g., mispostings or writing errors)

- **From Now**

- Automatically generate a PowerPoint slide deck using any software / program (e.g., R or SAS)
- Much less errors than manually

How to Generate PowerPoint Slide Deck

- **SAS ODS Powerpoint / Layout**
 - Cannot read existing PowerPoint files
(i.e., we cannot use any PowerPoint template)
- **R2PPT**
 - R package
 - Few functions (especially for customizing tables)
 - ActiveXObject is needed
- **ReporteRs**
 - R package
 - Many functions
 - JRA and package "rJava" are needed (i.e., a little slow)

R Package "**officer**"

- The package creates Microsoft Word and PowerPoint documents with tables and figures.
- Functions of the package can add and remove tables, figures and paragraphs of text. Slides can be added or removed.
- Like R package "ReporteRs", but this package does NOT require any installation of Microsoft products or any Java components (e.g., JRA or package "rJava").

Setup

```
> install.packages(c("dplyr", "ggplot2", "magrittr",
+   "xtable", "flextable", "officer"), dep=T)
> library(dplyr)
> library(ggplot2)
> library(magrittr)
> library(knitr)
> library(xtable)
> library(flextable)
> library(officer)
```

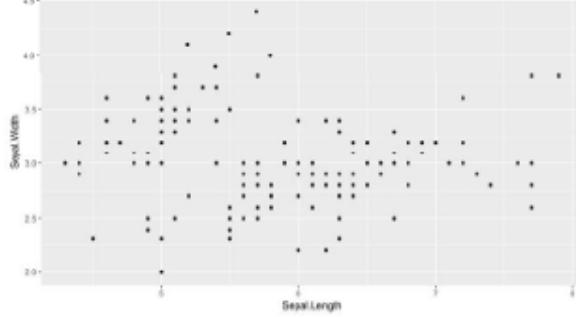

1. Install R
2. Install the above packages
3. Load their packages (Done!)

Example: Create PowerPoint Document

```
> myplot <- ggplot(data=iris, aes(Sepal.Length, Sepal.Width)) +
+     geom_point()
> myppt <- read_pptx()
> mylab <- layout_summary(myppt) [[1]]      # Slide Layout Name
> mytmp <- layout_summary(myppt) [[2]][1]    # Show Slide Master Name

> myppt <- myppt %>%
+   add_slide(layout="Title Slide", master=mytmp) %>%
+   ph_with_text(type="ctrTitle", str="Iris Data") %>%
+   ph_with_text(type="subTitle", str="Table & Figure") %>%
+   ph_with_text(type="dt",       str=format(Sys.Date())) %>%
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Scatter Plot") %>%
+   ph_with_gg(value=myplot) %>%
+   add_slide(layout="Two Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Table") %>%
+   ph_with_table(type="body", value=iris[1:5,], index=1) %>%
+   ph_with_text(type="body", str="Iris data", index=2)
> print(myppt, target="c:/temp/sample.pptx")
[1] "c:/temp/sample.pptx"
```

Example: Create PowerPoint Document

<p>Iris Data</p> <p>Table & Figure</p> <p>2018-04-11</p>	<p>Scatter Plot</p> 																														
<p>Table</p> <p>• Iris data</p> <table border="1" data-bbox="284 933 572 1260"><thead><tr><th>Sepal. Length</th><th>Sepal. Width</th><th>Petal. Length</th><th>Petal. Width</th><th>Species</th></tr></thead><tbody><tr><td>5.1</td><td>3.5</td><td>1.4</td><td>0.2</td><td>setosa</td></tr><tr><td>4.9</td><td>3.0</td><td>1.4</td><td>0.2</td><td>setosa</td></tr><tr><td>4.7</td><td>3.2</td><td>1.3</td><td>0.2</td><td>setosa</td></tr><tr><td>4.6</td><td>3.1</td><td>1.5</td><td>0.2</td><td>setosa</td></tr><tr><td>5.0</td><td>3.6</td><td>1.4</td><td>0.2</td><td>setosa</td></tr></tbody></table>	Sepal. Length	Sepal. Width	Petal. Length	Petal. Width	Species	5.1	3.5	1.4	0.2	setosa	4.9	3.0	1.4	0.2	setosa	4.7	3.2	1.3	0.2	setosa	4.6	3.1	1.5	0.2	setosa	5.0	3.6	1.4	0.2	setosa	
Sepal. Length	Sepal. Width	Petal. Length	Petal. Width	Species																											
5.1	3.5	1.4	0.2	setosa																											
4.9	3.0	1.4	0.2	setosa																											
4.7	3.2	1.3	0.2	setosa																											
4.6	3.1	1.5	0.2	setosa																											
5.0	3.6	1.4	0.2	setosa																											

Example: Create WORD Document

```
> myplot <- ggplot(data=iris, aes(Sepal.Length, Sepal.Width)) +  
+     geom_point()  
  
> mydoc  <- read_docx() %>%  
+   body_add_par(value="Table of contents", style="heading 1") %>%  
+   body_add_toc(level=2) %>%  
+   body_add_break() %>%  
+   body_add_par(value="Iris Data", style="heading 1") %>%  
+   body_add_par(value="Table", style="heading 2") %>%  
+   body_add_par("Sepal.Length vs. Sepal.Width", style="Normal") %>%  
+   body_add_table(value=iris[1:5,], style="table_template") %>%  
+   body_add_par(value="Scatter Plot", style="heading 2") %>%  
+   body_add_gg(value=myplot, style="centered")  
> print(mydoc, target="c:/temp/sample.docx")  
[1] "c:/temp/sample.docx"
```

Example: Create WORD Document

1. Table of contents

1. Table of contents	1
2. Iris Data	2
2.1. Table	2
2.2. Scatter Plot	2

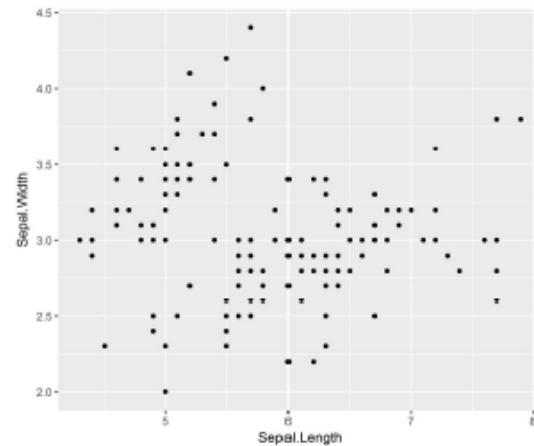

2. Iris Data

2.1.Table

Sepal.Length vs. Sepal.Width

Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species
5.1	3.5	1.4	0.2	setosa
4.9	3.0	1.4	0.2	setosa
4.7	3.2	1.3	0.2	setosa
4.6	3.1	1.5	0.2	setosa
5.0	3.6	1.4	0.2	setosa

2.2.Scatter Plot

Write
PowerPoint
File

1. Preparation

- Open a connection to a PowerPoint file without an existing PowerPoint file

```
> myppt <- read_pptx() # Create PowerPoint Object
> ( mylab <- layout_summary(myppt) [[1]] ) # Show Slide Layout Name
[1] "Title Slide"      "Title and Content" "Section Header"
[4] "Two Content"       "Comparison"        "Title Only"
[7] "Blank"
> ( mytmp <- layout_summary(myppt) [[2]][1] ) # Show Slide Master Name
[1] "Office Theme"
> myppt %>%
+   layout_properties(layout="Title and Content", master=mytmp) %>%
+   kable(digits=2) # Show Slide Properties

| master_name | name           | type    | id | ph_label          | offx | offy | cx | cy | |
|---|---|---|---|---|---|---|---|---|---|
| 5  |Office Theme |Title and Content |body  | 3  |Content Placeholder 2 | 0.50 | 1.75 | 9.00 | 4.95 |
| 10 |Office Theme |Title and Content |dt    | 4  |Date Placeholder 3  | 0.50 | 6.95 | 2.33 | 0.40 |
| 21 |Office Theme |Title and Content |ftr   | 5  |Footer Placeholder 4 | 3.42 | 6.95 | 3.17 | 0.40 |
| 25 |Office Theme |Title and Content |sldNum| 6  |Slide Number Placeholder 5 | 7.17 | 6.95 | 2.33 | 0.40 |
| 31 |Office Theme |Title and Content |title | 2  |Title 1             | 0.50 | 0.30 | 9.00 | 1.25 |
```

1. Preparation

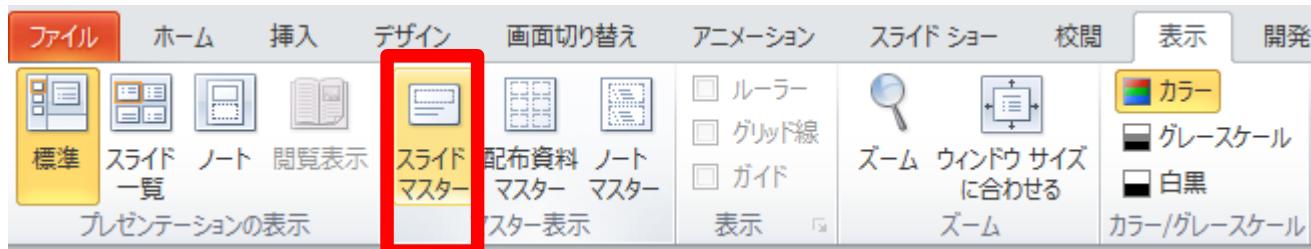

- Open a connection to a PowerPoint file with an existing PowerPoint file (e.g., C:\temp\nds.pptx)

```
> myppt <- read_pptx("C:/temp/nds.pptx")    # Create PowerPoint Object
> ( mylab <- layout_summary(myppt) [[1]] )      # Show Slide Layout Name
[1] "Title Slide"                  "Title and Vertical Text"
[3] "Vertical Title and Text"    "Title and Content"
[5] "Section Header"              "Two Content"
[7] "Comparison"                 "Title Only"
[9] "Blank"                      "Content with Caption"
[11] "Figure with Caption"
> ( mytmp <- layout_summary(myppt) [[2]][1] ) # Show Slide Master Name
[1] "Slide Template"
> for (i in 1:length(mylab)) {
+   layout_properties(myppt, mylab[i], master=mytmp) %>% kable(digits=2) %>% print()
+ }

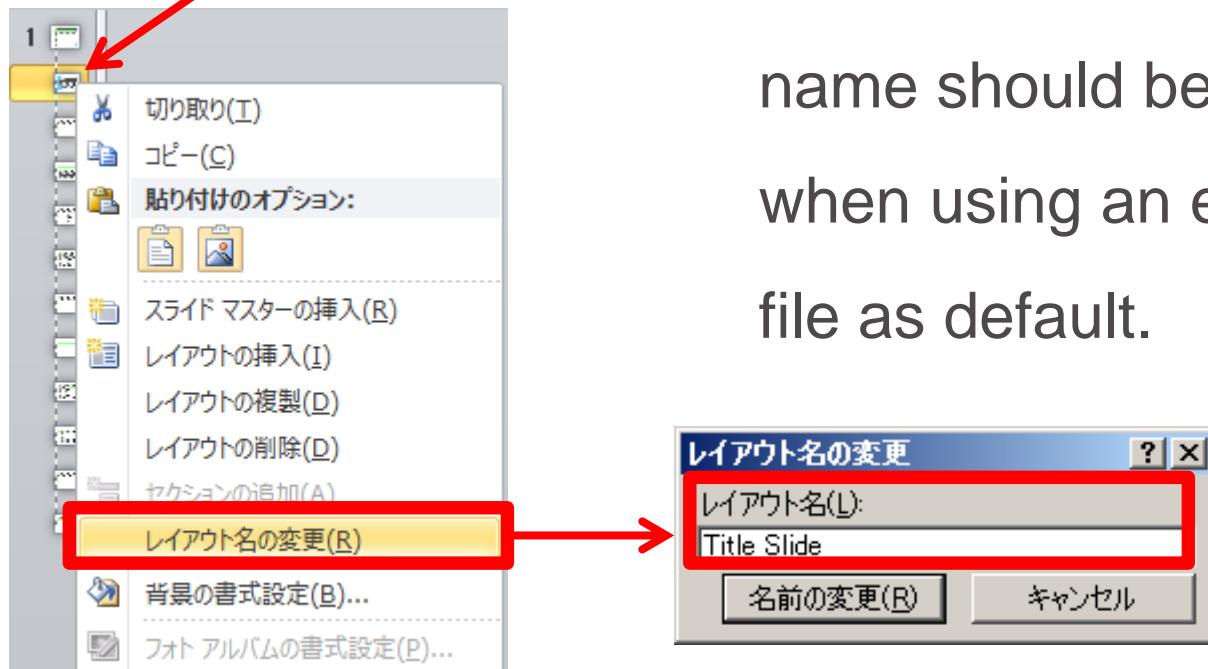

|   |master_name   |name       |type     |id   |ph_label      | offx| offy|   cx|   cy|
|---|:-----|:-----|:-----|:---|:-----|----:|----:|----:|----:|
|1  |Slide Template|Title Slide|body     |8223 |AutoShape 31 | 0.36| 2.59| 0.48| 0.42|
|2  |Slide Template|Title Slide|body     |8227 |AutoShape 35 | 0.36| 1.16| 0.48| 0.42|
|3  |Slide Template|Title Slide|body     |8224 |AutoShape 32 | 0.36| 0.44| 0.48| 0.42|
```

[Show Properties for All Templates]

1. Preparation - Note for Japanese User

- It is recommended that each layout name should be in English, when using an existing PowerPoint file as default.

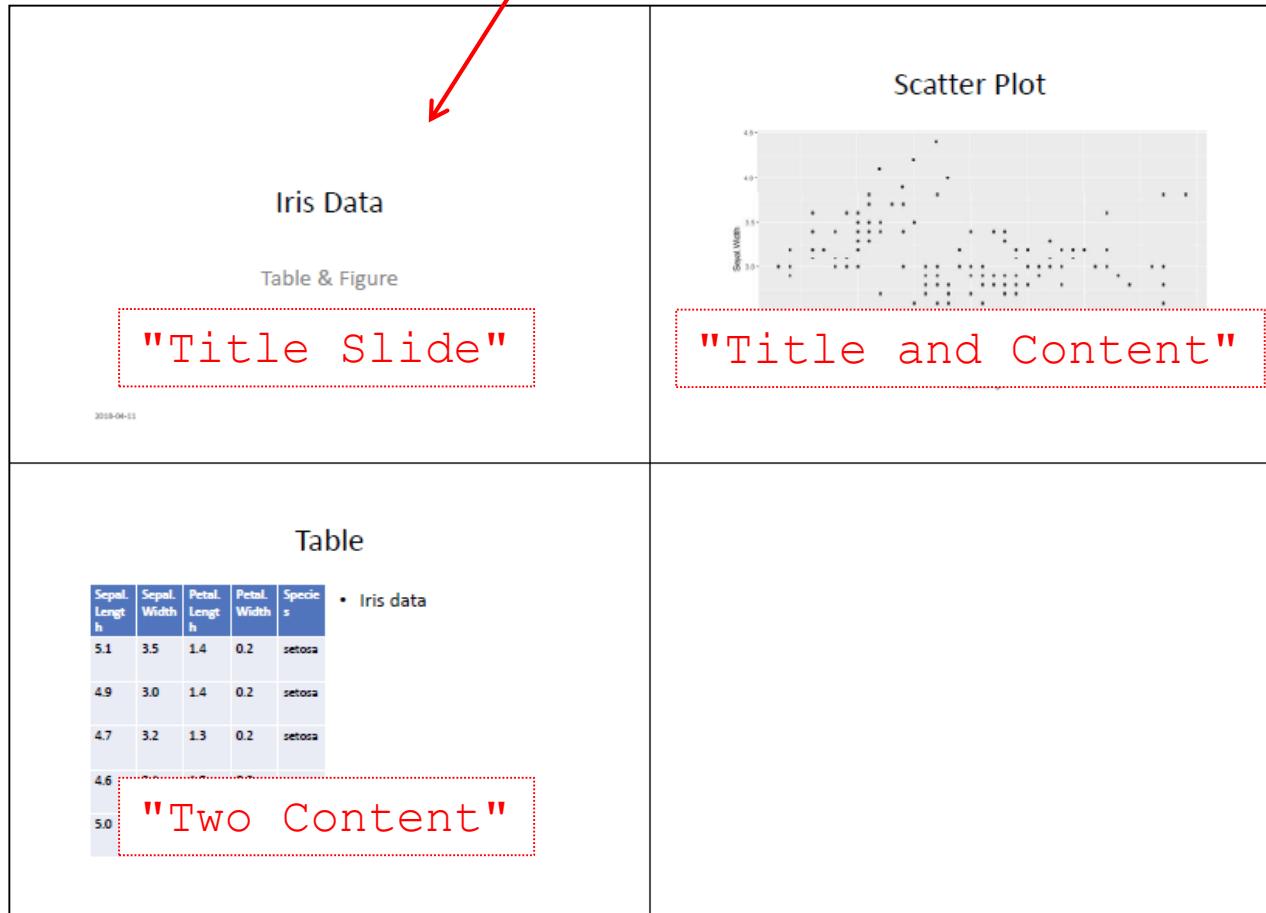

2. Create Contents and Slides

```
> myplot <- ggplot(data=iris, aes(Sepal.Length, Sepal.Width)) + geom_point()

> myppt <- myppt %>%
+
+ # Add "Title Slide" using an argument of "layout"
+ add_slide(layout="Title Slide", master=mytmp) %>%
+ ph_with_text(type="ctrTitle", str="Iris Data") %>%
+ ph_with_text(type="subTitle", str="Table & Figure") %>%
+ ph_with_text(type="dt", str=format(Sys.Date())) %>%
+
+ # Slide for Scatter Plot
+ add_slide(layout="Title and Content", master=mytmp) %>%
+ ph_with_text(type="title", str="Scatter Plot") %>%
+ ph_with_gg(value=myplot) %>%
+
+ # Slide for Text and Table
+ add_slide(layout="Two Content", master=mytmp) %>%
+ ph_with_text(type="title", str="Table") %>%
+ ph_with_table(type="body", value=iris[1:5,], index=1) %>%
+ ph_with_text(type="body", str="Iris data", index=2)
```

3. Write PowerPoint File

```
> print(myppt, target="c:/temp/sample.pptx")  
[1] "c:/temp/sample.pptx"
```

MENU

- Introduction
- Procedures
- **Details**
 - ✓ **Add Texts**
 - ✓ **Add Figures**
 - ✓ **Add Tables**
 - ✓ **Miscellaneous**
- Example:

Automated Generation of PowerPoint Presentations
from CDISC/ADaM Datasets

Add Texts

- Function `ph_with_text()` is used to add texts to a slide without any format.
 - `"type"` argument: placeholder type
 - `"index"` argument: placeholder index for "Two Content" slide

```
> myppt <- read_pptx()
> mylab <- layout_summary(myppt) [[1]]
> mytmp <- layout_summary(myppt) [[2]][1]

> myppt <- myppt %>%
+   add_slide(layout="Two Content", master=mytmp) %>%
+   ph_with_text(type="title", str="A title") %>%
+   ph_with_text(type="ftr",     str="A footnote") %>%
+   ph_with_text(type="dt",      str=format(Sys.Date())) %>%
+   ph_with_text(type="body",    str="A first text",   index=1) %>%
+   ph_with_text(type="body",    str="A second text", index=2)
> print(myppt, target="c:/temp/sample.pptx")
[1] "c:/temp/sample.pptx"
```

Add Texts

A title

- A first text
- A second text

Add Texts

- Function `ph_with_ul()` is used to add unordered lists to a slide with some format.
 - `"type"` argument: placeholder type
 - `"index"` argument: placeholder index for "Two Content" slide
 - `"str_list"` argument: list of texts
 - `"level_list"` argument: list of levels
 - `"style=fp_text(...)"` argument: text style ("font.size=0" to use the default size)
- The functions of `ph_add_par()` and `ph_add_text()` can be used to add texts more.

```
> myppt <- read_pptx()
> mytmp <- layout_summary(myppt) [[2]][1]
> myppt <- myppt %>%
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_text(type="title", str="A title") %>%
+   ph_with_ul(type="body", level_list=c(1,2), str_list=c("aaa","bbb"),
+              style=fp_text(font.size=0, color="red")) %>%
+   ph_add_par(type="body", level=3) %>%
+   ph_add_text(type="body", str="ccc", style=fp_text(color="blue"))
> print(myppt, target="c:/temp/sample.pptx")
[1] "c:/temp/sample.pptx"
```

Add Texts

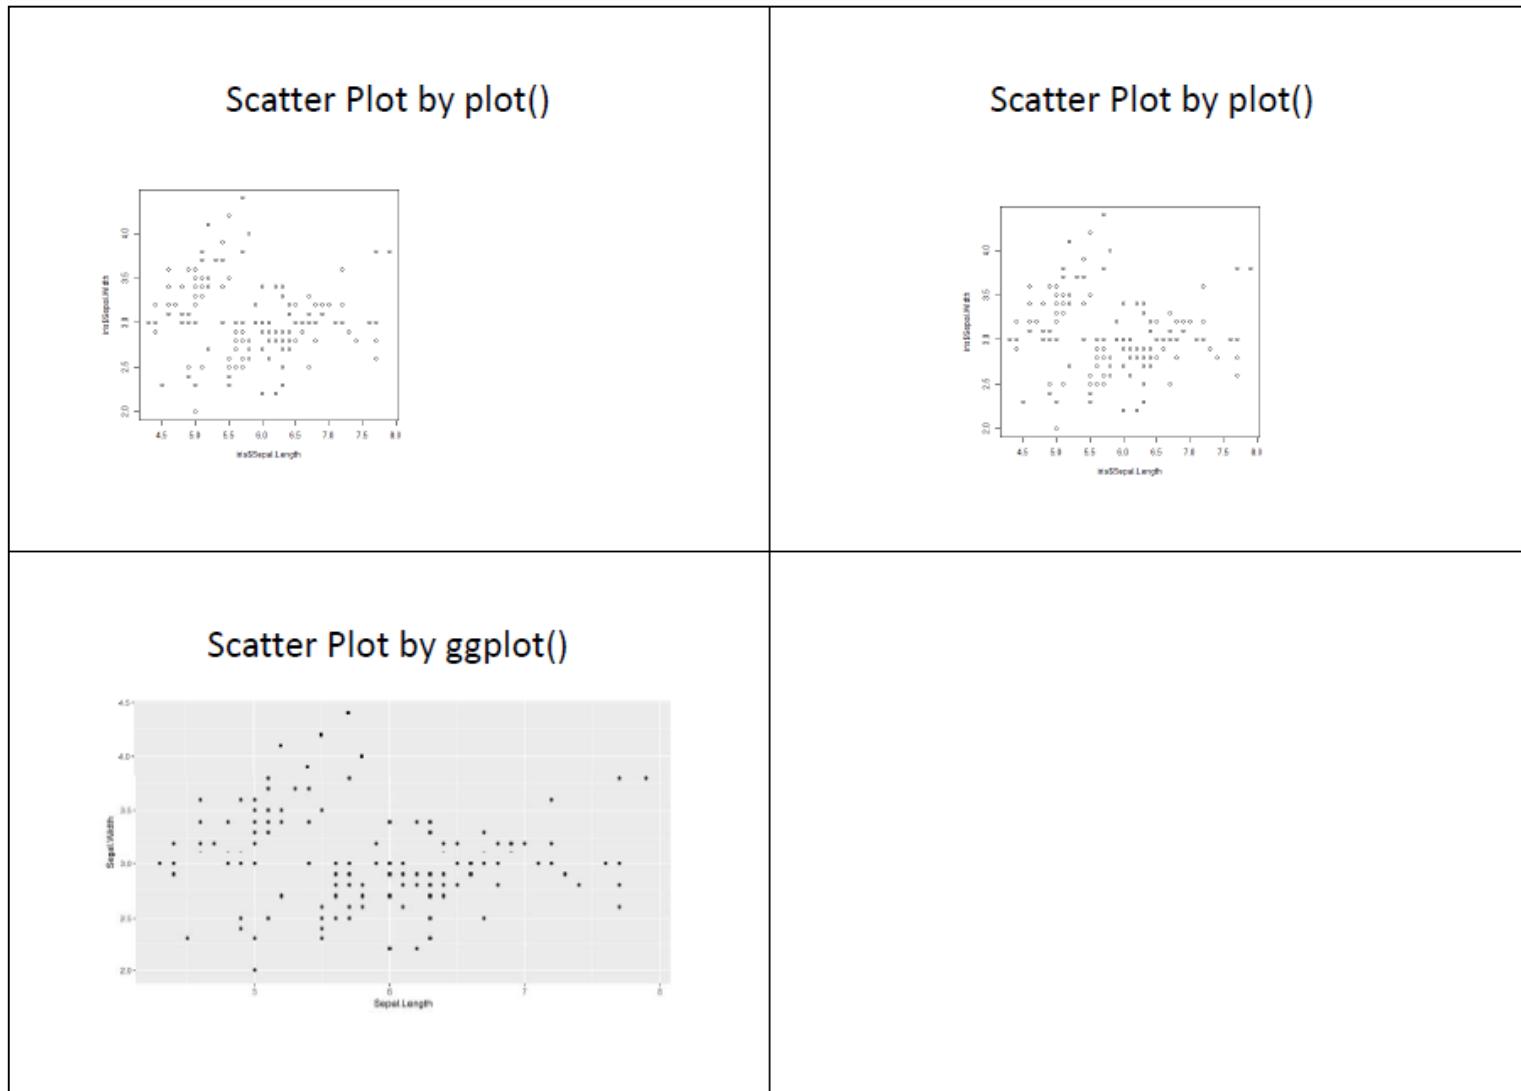

A title

- aaa
 - bbb
 - ccc

Add Figures (image file / ggplot object)

```
> png("C:/temp/myplot.png")
> plot(iris$Sepal.Length, iris$Sepal.Width)
> dev.off()
null device
      1
> myplot <- ggplot(data=iris, aes(Sepal.Length, Sepal.Width)) + geom_point()
> myppt <- read_pptx()
> mytmp <- layout_summary(myppt)[[2]][1]
> myppt <- myppt %>%
+   # Add Plot by ph_with_img()
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Scatter Plot by plot()") %>%
+   ph_with_img(type="body", src="C:/temp/myplot.png", width=5, height=5) %>%
+
+   # Add Plot by ph_with_img_at()
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Scatter Plot by plot()") %>%
+   ph_with_img_at(src="C:/temp/myplot.png", left=2, top=2, width=5, height=5) %>%
+
+   # Add Plot by ph_with_gg()
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Scatter Plot by ggplot()") %>%
+   ph_with_gg(value=myplot)> print(myppt, target="c:/temp/sample.pptx")
[1] "c:/temp/sample.pptx"
```

Add Figures (image file / ggplot object)

Add Tables

- Two functions of `ph_with_table()` and `ph_with_table_at()` are used to add a table into a slide

```
> myppt <- read_pptx()
> mytmp <- layout_summary(myppt) [[2]][1]

> myppt <- myppt %>%
+   add_slide(layout="Two Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Table 1") %>%
+   ph_with_table(type="body", value=iris[1:5,], index=1) %>%
+   ph_with_text(type="body", str="Iris data", index=2) %>%
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Table 2") %>%
+   ph_with_table_at(value=iris[1:5,], left=1, top=2, width=8, height=5)
> print(myppt, target="c:/temp/sample.pptx")
[1] "c:/temp/sample.pptx"
```

Add Tables

Table 1

Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species
5.1	3.5	1.4	0.2	setosa
4.9	3.0	1.4	0.2	setosa
4.7	3.2	1.3	0.2	setosa
4.6	3.1	1.5	0.2	setosa
5.0	3.6	1.4	0.2	setosa

- Iris data

Table 2

Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species
5.1	3.5	1.4	0.2	setosa
4.9	3.0	1.4	0.2	setosa
4.7	3.2	1.3	0.2	setosa
4.6	3.1	1.5	0.2	setosa
5.0	3.6	1.4	0.2	setosa

- There is no function to customize table in the "officer" package
- Next, "flextable" package will be introduced to customize

Add Tables - "flextable" Object

- A "flextable" ("flex"ible "table") is an object for reporting table from data.frame
- A "flextable" is containing three parts below*, header rows, body rows and footer rows

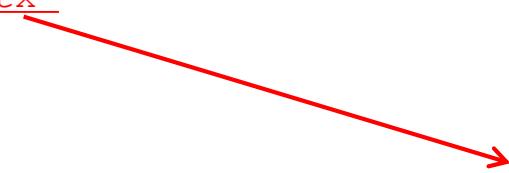

header part	row 1 - cell from 1 to 5				
	row 2 - cell from 1 to 2		row 2 cell from 3 to 5		
row 3 cell 1	row 3 cell 2	row 3 cell 3	row 3 cell 4	row 3 cell 5	
data[1,1]	data[1,2]	data[1,3]	data[1,4]	data[1,5]	
data[2,1]	data[2,2]	data[2,3]	data[2,4]	data[2,5]	
...	
data[n,1]	data[n,2]	data[n,3]	data[n,4]	data[n,5]	
Grouped footer 1.1		Grouped footer 1.2			
Grouped footer 2.1					

* : <https://davidgohel.github.io/flextable/articles/overview.html>

Add Tables - "flextable" Object

- Both **flextable()** and **regulartable()** functions produce a flextable. The first one is resource consuming.

```
> myft <- regulartable(iris[49:52,c(5,1,2)]) # Create "flextable" object
> myft <- theme_booktabs(myft)                  # Change "flextable" theme
> myft <- autofit(myft)                         # Adjust Cell Width and Height
>
> myppt <- read_pptx()
> mytmp <- layout_summary(myppt)[[2]][1]
> myppt <- myppt %>%
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_flextable(myft, type="body")
> print(myppt, target="c:/temp/sample.pptx")
[1] "c:/temp/sample.pptx"
```

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

Add Tables - "flextable" Object

Select Columns and Change Theme

- **"col_keys"** argument selects displayed columns (blank columns are added if some column names are not in the list of this argument)
- Several functions are defined to change theme of tables

```
> myft1 <- regulartable(iris[49:52, ],
+                         col_keys=c("Species", "XXX", "Sepal.Length", "Sepal.Width"))
> myft2 <- theme_booktabs(myft1)
> myft3 <- theme_box(myft1)
> myft4 <- theme_tron(myft1)
> myft5 <- theme_tron_legacy(myft1)
> myft6 <- theme_vanilla(myft1)
> myft7 <- theme_zebra(myft1)
> myft8 <- empty_blanks(myft7)      # Set Blank Columns as Transparent
```

myft1

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

myft3

Species		Sepal.Length	Sepal.Width
setosa		5.300	3.700
setosa		5.000	3.300
versicolor		7.000	3.200
versicolor		6.400	3.200

myft8

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

Add Tables - "flextable" Object

Merge Cells

- Three functions of **merge_h(i=rows)**, **merge_v(j=columns)**, and **merge_at(i=rows, j=columns)** merge rows, columns and cells.
- The **merge_none()** function deletes all merging information.

```
> myft  <- regulartable(iris[49:52, ],
+                         col_keys=c("Species","Sepal.Length","Sepal.Width"))
> myft1 <- merge_v(myft, j=c(1,3))
> myft1
> myft2 <- merge_v(myft, ~ Species)
> myft2
```

myft1

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
	5.000	3.300
versicolor	7.000	3.200
	6.400	

myft2

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
	5.000	3.300
versicolor	7.000	3.200
	6.400	3.200

Add Tables - "flextable" Object

Change Labels and Add Headers

- The `set_header_labels()` function replaces column labels of the bottom row of the header.
- The `add_header()` and `add_footer()` functions add a header and a footer, respectively.

```
> myft  <- regulartable(iris[49:52, ],
+                         col_keys=c("Species","Sepal.Length","Sepal.Width"))
> myft1 <- set_header_labels(myft, Species = "Species",
+                             Sepal.Length="Length", Sepal.Width="Width") %>%
+                           theme_vanilla()
> myft2 <- add_header(myft1, Species = "Species",
+                       Sepal.Length="Sepal", Sepal.Width="Sepal", top=T) %>%
+                         theme_vanilla() %>% autofit() %>%
+                           merge_h(part="header") %>% merge_v(part="header") %>%
+                           add_footer(Species="This is a footnote." ) %>%
+                           merge_at(i=1, j=1:3, part="footer")
```

myft1

Species	Length	Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

myft2

Species	Sepal	
	Length	Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

This is a footnote.

Add Tables - "flextable" Object

Adjust Cell Widths and Heights

- The `autofit()` function adjusts automatically cell widths and heights.
- Three functions of `width()`, `height()`, and `height_all()` adjust manually cell widths and heights, respectively.

```
> myft  <- regulartable(iris[49:52, ],
+                         col_keys=c("Species", "Sepal.Length", "Sepal.Width"))
> myft1 <- autofit(myft)
> myft2 <- width(myft, j=~ Species, width=2) %>%
+             height_all(height=0.5) %>%
+             height(i=2, height=1)
```

myft1

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

myft2

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

Add Tables - "flextable" Object Formatting

- The several functions below modify formatting properties of a flextable.
- The "**part**" argument should be "all", "body", "header" and "footer".

```
> myft1 <- regulartable(iris[49:52, ],
+                         col_keys=c("Species", "Sepal.Length", "Sepal.Width"))
> myft2 <- align(myft1, align="center", part="all") %>%          # Text Alignment
+                         bg(bg="cyan", part="body") %>%          # Background Color
+                         bold(part="header") %>%           # Bold
+                         color(color="red", part="header") %>%    # Font Color
+                         font(j="Species", fontname="Arial") %>%   # Font
+                         fontsize(part="all", size=14) %>%        # Font Size
+                         italic(i=~ Sepal.Length>6,            # Conditional format
+                                j=~ Sepal.Length+Sepal.Width, italic=T) %>% # Italic
+                         padding(padding=3, part="all") # Padding(space around a text in a cell)
```

myft1

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

myft2

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

Add Tables - "flextable" Object Borders

- The several functions below change properties of the horizontal or vertical borders for a flextable.

```
> # Create Border Properties Objects
> b0 <- fp_border(color="white", style="none")
> b1 <- fp_border(color="blue", style="solid", width=1)
> b2 <- fp_border(color="red", style="dotted", width=2) # style="dashed" is available

> myft  <- regulartable(iris[49:52,],
+                         col_keys=c("Species","Sepal.Length","Sepal.Width")) %>%
+                         add_footer(Species="This is a footnote." ) %>%
+                         merge_at(i=1, j=1:3, part="footer")
> myft1 <- border_remove(myft)                      # Remove All Borders
> myft2 <- hline(myft1, border=b1) %>%           # Set horizontal lines
+                         hline_top(border=b2, part="body") %>%      # Set first horizontal line
+                         hline_bottom(border=b0, part="footer") %>% # Set last horizontal line
+                         vline(border=b1, part="header") %>%       # Set vertical lines
+                         vline_left(border=b0, part="footer") %>%    # Set first vertical line
+                         vline_right(border=b0, part="footer") %>%   # Set last vertical line
```

Add Tables - "flextable" Object Borders

- The functions of `border_inner_h()`, `border_inner_v()` and `border_outer()` are useful to apply a border to inner/outer cells of one or all parts of a flextable if the border design is simple.

```
myft3 <- border_inner_h(myft1, border=b1, part="all") %>%
  border_inner_v(border=b2, part="all") %>%
  border_outer(border=b3, part="all")
```

myft1

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

This is a footnote.

myft2

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

This is a footnote.

myft3

Species	Sepal.Length	Sepal.Width
setosa	5.300	3.700
setosa	5.000	3.300
versicolor	7.000	3.200
versicolor	6.400	3.200

This is a footnote.

Miscellaneous: Some Objects for Properties

- **Create Border properties object**

```
fp_border(color="black", style="solid", width=1)
```

- **Create Text formatting properties object**

```
fp_text(color="black", font.size=10, bold=FALSE, italic=FALSE,  
underlined=FALSE, font.family="Arial", vertical.align="baseline",  
shading.color="transparent")
```

- **Create Cell formatting object**

```
fp_cell(border=fp_border(width=0), border.bottom, border.left, border.top,  
border.right, vertical.align="center", margin=0, margin.bottom,  
margin.top, margin.left, margin.right, background.color="transparent",  
text.direction="lrtb") # "lrtb"(left to right top to bottom), "tbrl", "btlr"
```

```
> b      <- fp_border(color="white", style="none")  
> myft  <- regulartable(iris[49:52,],  
+                      col_keys=c("Species", "Sepal.Length", "Sepal.Width"))  
> myft1 <- border_inner_h(myft, border=b, part="all") %>%  
+          border_inner_v(border=b, part="all")  
> b      <- update(b, color="blue", style="solid", width=1)  
> myft2 <- border_outer(myft1, border=b, part="all")
```

There is another function "fp_par" for creating paragraph formatting properties.

Miscellaneous: Slide selection and manipulation

- Four functions of `add_slide()`, `remove_slide()`, `on_slide()` and `ph_remove()` are used to select and manipulate a slide/content

```
> myppt <- read_pptx()
> mylab <- layout_summary(myppt) [[1]]
> mytmp <- layout_summary(myppt) [[2]][1]
> myppt <- myppt %>%
+   add_slide(layout="Title and Content", master=mytmp) %>%
+   add_slide(layout="Title Only",           master=mytmp) %>%
+   add_slide(layout="Two Content",         master=mytmp)      # Create 3 slides
> myppt <- myppt %>% remove_slide(index=1)                  # Remove Slide #1
> myppt <- myppt %>%
+   on_slide(index=1) %>%                                     # Focus on #1
+   ph_with_text(type="title", str="Dummy Title") %>%        # Add a text
+   on_slide(index=2) %>%                                     # Focus on #2
+   ph_with_table(type="body", value=iris[1:5,], index=1) %>% # Add a table
+   ph_with_text(type="body", str="Iris data", index=2) %>%    # Add a text
+   on_slide(index=1) %>%                                     # Focus on #1
+   ph_remove(type="title")                                    # Remove title
> print(myppt, target="c:/temp/sample.pptx")
```

Miscellaneous: "xtable" Object

- The `xtable_to_flextable()` function gets a flextable from a xtable object (e.g., a xtable object converted from a lm.object)

```
> result <- lm(Sepal.Length ~ Species, data=iris)
> mytable <- xtable(summary(result)$coefficients)
> myft1 <- xtable_to_flextable(mytable,
+                                hline.after=c(-1,0,1,nrow(mytable)))
> mytable <- table(sample(LETTERS[1:3],10, rep=T))
> myft2 <- xtable_to_flextable(xtable(mytable)) %>%
+      set_header_labels(rowname="Char.", V1="Freq.") %>% autofit()
```

myft1

**Automated Generation of PowerPoint Presentations
from CDISC/ADaM Datasets**

A Virtual Clinical Study

Target Population:	Subjects with history of gastric ulcer (GU)
Treatment:	ABC-XXX 1 mg or Placebo
Primary Endpoint:	Time to recurrence of GU
Secondary Endpoint:	Time to occurrence of duodenal ulcer (DU)
Other Endpoints:	Proportion of GU recurrence, Proportion of DU occurrence, Treatment-emergent adverse event (TEAE)
Demography / Baseline Characteristics:	Age, Gender, BMI, Helicobacter Pylori test, Caffeine consumption, Alcohol consumption, Smoking status
ADaM Datasets:	ADSL, ADTTE, ADAE (simple for illustrative purposes)

ADSL

Variable	Type	Label
STUDYID	Char	Study Identifier
USUBJID	Char	Unique Subject Identifier

- **AE SER** : Y (SAE), N (Non-SAE)
- **AREL** : Not Related, Related
- **ASEV** : Mild, Moderate, Severe

Analytical Methods for Primary Endpoint

- **Primary Analysis**

The cumulative incidences and the two-sided 95% confidence intervals (CIs) will be provided by treatment group using the Kaplan-Meier method.

A log-rank test will be used to test for treatment differences.

- Tables for the cumulative incidences with 95% CIs
- Kaplan-Meier Plot
- Using FAS

- **Other Analysis**

- Sensitivity Analysis (the same as above, but using PPS)
- Covariate Adjusted Analysis (Cox regression model with treatment and each demographic data as covariate)
- Subgroup Analysis

Purpose

- Automatically generate a PowerPoint slide deck using R
- The slides will include below:
 - Summary table of Demographics and Baseline Characteristics [Randomized Set, ADSL]
 - Table and Figure of Analysis Result for Primary Endpoint [FAS and PPS, ADTTE]
 - Table and Figure of Analysis Result for Secondary Endpoint [FAS, ADTTE]
 - Tables for Other Efficacy Endpoints [FAS, ADTTE]
 - Covariate Adjusted Analysis [FAS, ADTTE]
 - Subgroup Analysis [FAS, ADTTE]
 - Tables and Figures of TEAE, Drug-related TEAE, TEAE by Intensity and SAE [Safety Analysis Set, ADAE and ADSL]

R Program (1/3)

- Execute the following R program after reading the data, definition of R functions, creating R variables (omitted)

```
> # For Page Number
> myPageNumber <- 0
> pageNum <- function (x) {
+   if (missing(x)) { myPageNumber <- myPageNumber+1; return(as.character(myPageNumber)) }
+   else               { myPageNumber <- x;                      return(as.character(myPageNumber)) }
+ }

> # Create Slides
> myppt <- read_pptx("C:/temp/nds.pptx")
> mytmp <- layout_summary(myppt)[[2]][1]
> myppt <- myppt %>%
+   add_slide(layout="Title Slide", master=mytmp) %>%
+   ph_with_text(type="ctrTitle", str="ABC-XXX Phase 3 Study") %>%
+   ph_with_text(type="subTitle", str="Flash Result") %>%
+   ph_with_text(type="ftr",      str=format(Sys.Date())) %>%

+   add_slide(layout="Title and Content", master=mytmp) %>%
+   ph_with_text(type="title", str="Demographics and Baseline Characteristics") %>%
+   ph_with_flextable_at(value=DEMOG_TABLE1, left=0.5, top=1.3) %>%
+   ph_with_text(type="sldNum", str=pageNum(2)) %>%

Cumulative Incidence of GU [PPS]

- Superiority of ABC-XXX to Placebo was confirmed.

Cumulative Incidence of DU [FAS]

- Superiority of ABC-XXX to Placebo was not confirmed.

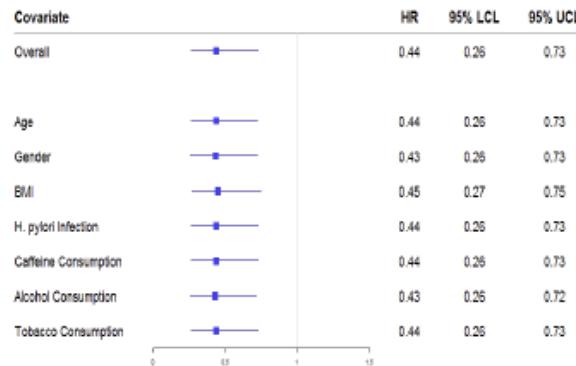

Output Slides (3/5)

Life Table of DU [FAS]

Group	Time	At Risk	Event	Censor	%	95% CI	
						Lower	Upper
ABC-XXX	0	100	0	0	0.0	0.0	0.0
	100	90	2	18	2.2	0.0	5.3

Covariate Adjusted Analysis

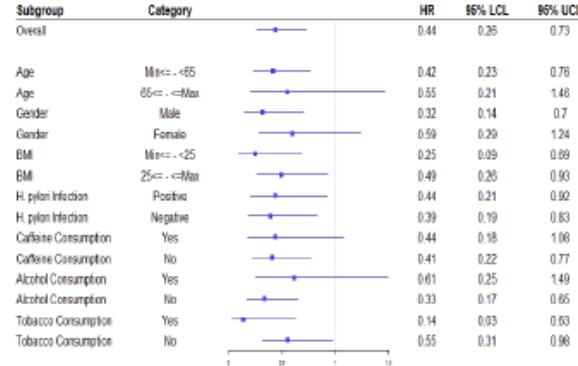

Proportion of GU/DU [FAS]

- The difference in proportions of GU was statistically significant.
- The difference in proportions of DU was not statistically significant.

Test	Group	Yes (%)	No	Total	95% CI	
					Lower	Upper
GU	ABC-XXX	23 (23.0)	77	100	15.2	32.5
	Placebo	44 (44.0)	56	100	34.1	54.3
DU	ABC-XXX	14 (14.0)	86	100	7.9	22.4
	Placebo	23 (23.0)	77	100	15.2	32.5
