Oxford University Press is a department of the University of Oxford.

It furthers the University's objective of excellence in research, scholarship,
and education by publishing worldwide in

Oxford New York

Auckland Bangkok Buenos Aires Cape Town Chennai

Dar es Salaam Delhi Hong Kong Istanbul Karachi Kolkata

Kuala Lumpur Madrid Melbourne Mexico City Mumbai

São Paulo Shanghai Taipei Tokyo Toronto

Oxford is a registered trade mark of Oxford University Press
in the UK and in certain other countries

Published in the United States

by Oxford University Press Inc., New York

Contents

Preface	v
Acknowledgements	ix
List of abbreviations	xxxii

Part 1 Basic concepts of life

Chapter 1 The basic molecular themes of life	3
Unity of life at the molecular level	3
Living cells obey the laws of physics and chemistry: the energy cycle in life	3
• ATP (adenosine triphosphate) is the universal energy currency in life	4
Types of molecule found in living cells	4
• Small molecules	5
• The macromolecular constituents of cells	5
Proteins	5
• Catalysis of reactions by enzyme proteins is central to the existence of life	5
Evolution of proteins	7
• Development of new genes	7
DNA (deoxyribonucleic acid)	7
• DNA can direct its own replication	8
<i>Junk DNA</i>	9
Molecular recognition by proteins	10
Noncovalent or weak chemical bonds	10
How did it all start?	10
• The RNA world	11
The new 'omics' phase of biochemistry and molecular biology	12
Summary	13
Further reading	14

Chapter 2 Cells and viruses	15
Cells are the units of all living systems	15
Classification of organisms	15
• Prokaryotic cells	15
<i>Cell division in prokaryotes</i>	16
• Eukaryotic cells	17
<i>Eukaryotic cell growth and division</i>	20
Stem cells	20
• Mitosis and cell division in eukaryotic cells	21
• Meiosis	21
Viruses	23
• Genetic material of viruses	24
• Some examples of viruses of special interest	24
• Retroviruses	25
Summary	25
Further reading	26
Problems	26

Chapter 3 Energy considerations in biochemistry	27
• What determines whether a chemical reaction is possible?	27
• Reversible and irreversible reactions and ΔG values	28
• The importance of irreversible reactions in the strategy of metabolism	29
• Why is this metabolic strategy used in the cell?	29
• How are ΔG values obtained?	30
• Standard free-energy values and equilibrium constants	30
• Given that a reaction has a negative ΔG value, what determines whether it actually takes place at a perceptible rate in the cell?	30
How is food breakdown in cells coupled to drive energy-requiring reactions?	31
• The high-energy phosphate compound	32
<i>What is a 'high-energy phosphate compound'?</i>	32

- What are the structural features of high-energy phosphate compounds? 33
- What transports the $-e^-$ around the cell? 35
- How does ATP perform chemical work? 35
 - Calculation of ΔG value 36
- How does ATP drive other types of work? 37
- A note on the relationship between AMP, ADP, and ATP 37

Covalent and noncovalent bonds 37

- What causes weak bond formation and breakage? 39
- The vital role of weak bonds in molecular recognition 39

Appendix: Buffers and pK_a values 39

- pK_a values and their relationship to buffers 40

Summary 42

Further reading 42

Problems 42

Part 2 Structure and function of proteins and membranes

Chapter 4 The structure of proteins 47

The primary structure of proteins 47

- What is a native protein? 48
- What are the basic considerations which determine the folded structure of a protein? 48
- Structures of the 20 amino acids 49
 - Hydrophobic amino acids* 49
 - Hydrophilic amino acids* 50
 - Amino acids for special purposes* 50
 - Ionization of amino acids* 51
 - Symbols for amino acids* 51

The different levels of protein structure—primary, secondary, tertiary, and quaternary 52

- Secondary structure of proteins 52
 - The α helix* 52
 - The β -pleated sheet* 53
 - Connecting loops* 54
- Tertiary structure of proteins 54
 - How do the three motifs—the α helix, the β -pleated sheet, and connecting loops—make up a protein?* 54
 - What forces hold the tertiary structure in position?* 55
 - Where do the disulphide or S—S covalent bonds come into protein structure?* 55
- Quaternary structure of proteins 56

Protein homologies and evolution 57

Protein domains 57

- Domain shuffling 57
 - The problem of protein folding* 58
- Membrane proteins 58
- Conjugated proteins 58

Extracellular matrix proteins 58

- Structure of collagens 59
 - Box 4.1 Genetic diseases of collagen 61
- Structure of elastin 61
- Structure of proteoglycans 61
- Adhesion proteins of the extracellular matrix 63
- Integrins are important signalling proteins 64
- Myoglobin and haemoglobin—an illustration of how protein structure is related to function 64
 - Myoglobin 65
 - Structure of haemoglobin 65
 - Binding of oxygen to haemoglobin 66
 - How is the sigmoidal oxygen saturation curve achieved?* 66
 - Theoretical models to explain protein allostereism 67
 - Mechanism of the allosteric change in haemoglobin 67
 - The essential role of 2:3-bisphosphoglycerate (BPG) in haemoglobin function 68
 - Effect of pH on oxygen binding to haemoglobin 69
 - Role of pH changes in oxygen and CO_2 transport* 69
 - Box 4.2 Sickle cell anaemia and thalassaemias 70
 - pH buffering in the blood* 71
- Summary 71
- Further reading 72
- Problems 72

Chapter 5 Methods in protein investigation 74

Purification of proteins 74

- Column chromatography 75
- SDS polyacrylamide gel electrophoresis 76
 - Immunological detection of proteins* 77

Methods of protein sequencing 78

- The role of databases in protein sequencing 78
- Deduction of amino acid sequences of proteins from the base sequence of genes 79

Determination of the three-dimensional structure of proteins	79	General properties of enzymes	95
• X-ray diffraction	79	• Nomenclature of enzymes	95
• Nuclear magnetic resonance	80	• Isozymes	95
• Homology modelling	80	• Enzyme cofactors and activators	95
• An exercise in obtaining a 3-D structure from a protein database	80	• Effect of pH on enzymes	96
		• Effect of temperature on enzymes	96
		• Effect of inhibitors on enzymes	97
Analysis of proteins by mass spectrometry	80	<i>Reversible and irreversible inhibitors</i>	97
• Introduction	80	<i>Competitive and noncompetitive inhibitors</i>	97
<i>Mass spectrometers consist of three principal components</i>	80		
• Ionization methods for protein and peptide MS	80	What are the structural features of enzyme proteins that confer catalytic activity on them?	98
• Types of mass analyser	81	• Mechanism of the chymotrypsin reaction	98
<i>Quadrupole (Q)</i>	81	• The catalytic triad of the active centre	98
<i>Time of flight (TOF)</i>	81	• The reactions at the catalytic centre of chymotrypsin	99
<i>Ion-trap</i>	81	• What is the function of the aspartate residue of the catalytic triad?	101
• Types of mass spectrometer	81	• Other serine proteases	101
<i>Single-analyser mass spectrometers</i>	81	• A brief description of other types of protease	101
<i>Tandem mass spectrometers (MS/MS)</i>	81		
• Identification of proteins using MS for peptide mass analysis ('fingerprinting') and database searching	81	Summary	102
		Further reading	103
		Problems	104
Identification of proteins by limited sequencing and database searching	82		
• Sequencing a protein by MS	83	Chapter 7 The cell membrane and membrane proteins	105
• Molecular-weight determination of proteins	83	Basic lipid architecture of membranes	105
• Analysis of posttranslational modification of proteins	83	• The polar lipid constituents of cell membranes	105
		<i>Glycerophospholipids</i>	106
		• What are the polar groups attached to the phosphatidic acid?	107
Proteomics and MS	83	<i>Sphingolipids</i>	108
Bioinformatics and databases	84	• Membrane lipid nomenclature	109
• A bioinformatics overview	84	• Why are there so many different types of membrane lipid?	110
Database website addresses	85	• The fatty acid components of membrane lipids	110
		• What is cholesterol doing in membranes?	111
Appendix: An example of how the structure of a protein can be obtained from the protein data bank (PDB)	85	• The self-sealing character of the lipid bilayer	111
Summary	87	• Permeability characteristics of the lipid bilayer	112
Further reading	88		
Problems	89	Membrane proteins and membrane design	112
		Structures of integral membrane proteins	112
		• Anchoring of peripheral membrane proteins to membranes	114
		• Glycoproteins	114
Chapter 6 Enzymes	90		
Enzyme catalysis	90		
• The nature of enzyme catalysis	91		
• The induced-fit mechanism of enzyme catalysis	92		
Enzyme kinetics	93		
• Hyperbolic kinetics of a 'classical' enzyme	93		
• Allosteric enzymes	95		

Functions of membranes

- Transport of substances in and out of the cell 115
 - Active transport* 115
 - Calculation of energy required for transport 115
 - Mechanism of the Na⁺/K⁺ pump* 115
 - Box 7.1 Cardiac glycosides 116
 - Symport systems* 117
 - Antiport systems* 117
 - Uniport systems* 117
 - Passive transport or facilitated diffusion* 118
- Gated ion channels 118
- Mechanism of the selectivity of the potassium channel 118
- Nerve-impulse transmission 120
 - Box 7.2 Cholinesterase inhibitors and Alzheimer's disease 121
 - The acetylcholine-gated Na⁺/K⁺ channel or acetylcholine receptor* 121
 - How does acetylcholine binding to a membrane receptor result in a nerve impulse?* 121
 - How is the initial signal propagated along nerve axons?* 122
 - Mechanism for ensuring that the nerve impulse only goes forward* 124
 - Mechanism of control of the voltage-gated Na⁺ and K⁺ channels* 124
- Myelinated neurons permit more rapid nerve-impulse transmission 125
 - Why doesn't the Na⁺/K⁺ pump conflict with the propagation of action potentials?* 125
- Role of the cell membrane in maintaining the shape of the cell 125
- Cell–cell interactions—tight junctions, gap junctions, and cellular adhesive proteins 126
 - Box 7.3 Membrane-targeted antibiotics 127
- Summary** 127
- Further reading** 128
- Problems** 129

Chapter 8 Muscle contraction, the cytoskeleton, and molecular motors 130

- Muscle contraction** 130
 - A reminder of conformational changes in proteins 130
- Types of muscle cell and their energy supply** 130
 - Structure of skeletal striated muscle 131
 - Structure of the myofibril* 131
 - How does the sarcomere shorten?* 131
 - Structure and action of thick and thin filaments* 132
 - How does the myosin head convert the energy of ATP hydrolysis into mechanical force on the actin filament? 133
 - Mechanism of the conformational changes in the myosin head* 133
 - Box 8.1 Muscular dystrophy 134

How is contraction in voluntary striated muscle controlled? 136

- How does Ca²⁺ trigger contraction? 136
 - Box 8.2 Malignant hyperthermia 138

How does smooth muscle differ in structure and control from striated muscle? 138

- Control of smooth muscle contractions 138
 - How does Ca²⁺ control smooth muscle contraction?* 138

The cytoskeleton 139

- Molecular motors and movements in cells 139

The role of actin and myosin in nonmuscle cells 139

- Structural role of actin and its involvement in cell movement 140
 - Mechanism of contraction in nonmuscle cells* 140
- The role of actin and myosin in intracellular transport of vesicles 141

Microtubules, cell movement, and intracellular transport 141

- Microtubules and intracellular transport 142
 - Molecular motors: kinesins and dyneins* 142
 - Role of microtubules in cell movement* 143
 - Role of microtubules in mitosis* 143

Intermediate filaments 143

- Box 8.3 Effects of drugs on the cytoskeleton 144

Summary 144

Further reading 145

Problems 146

Part 3 Metabolism

Chapter 9 Food digestion, absorption, distribution to the tissues, and appetite control 151

Chemistry of foodstuffs 151

Digestion and absorption 152

- Anatomy of the digestive tract 152
- What are the energy considerations in digestion and absorption? 152
- A major problem in digestion—why doesn't the body digest itself? 153
 - Zymogen or proenzyme production* 153
 - Protection of intestinal epithelial cells by mucous* 153

Digestion of proteins	153	<i>G-1-P is converted to the activated form, UDPG</i>	170
• HCl production in the stomach	153	<i>Adding branches to glycogen</i>	170
• Pepsin, the proteolytic enzyme of the stomach	153	• Breakdown of glycogen to release glucose into the blood	171
• Completion of protein digestion in the small intestine	154	<i>Removing branches from glycogen</i>	172
• Activation of the pancreatic proenzymes	154	• Key issues in the interconversion of glucose and glycogen	173
• Absorption of amino acids into the bloodstream	155	• Why does liver have glucokinase and the other tissues hexokinase?	173
Digestion of carbohydrates	155	• What happens to other sugars absorbed from the intestine?	173
• Digestion of starch	156	<i>Galactose metabolism</i>	174
• Digestion of lactose	156	Box 10.1 Uridyl transferase deficiency and galactosaemia	175
• Absorption of monosaccharides	157	Amino acid traffic in the body (in terms of fuel logistics)	176
Digestion and absorption of fat	157	Fat and cholesterol traffic in the body	176
• Resynthesis of TAG in intestinal cells	158	• Uptake of fat from chylomicrons into cells	176
• Chylomicrons	158	• Logistics of fat and cholesterol movement in the body	176
• Digestion of other components of food	159	• An overview	176
• Outline of fuel distribution and utilization by the different tissues of the body	160	• Utilization of cholesterol in the body	177
Storage of food components in the body	160	• Lipoproteins involved in fat and cholesterol movement in the body	178
• How are the different food components stored in cells?	160	• Apolipoproteins	179
<i>Glucose storage as glycogen</i>	160	• Mechanism of TAG and cholesterol transport from the liver and the reverse cholesterol transport in the body	179
<i>Storage of fat in the body</i>	160	<i>The role of HDL in cholesterol transport</i>	179
<i>Are amino acids stored by the body?</i>	161	<i>How does cholesterol exit cells to be picked up by HDL?</i>	179
• Characteristics of different tissues in terms of energy metabolism	161	Cholesterol homeostasis in cells	180
• Overall control of fuel distribution in the body by hormones	163	Box 10.2 Inhibitors of cholesterol synthesis	181
• Postprandial condition	163	• Release of FFA from adipose cells	181
• Fasting condition	163	• How are FFA carried in the blood?	181
• Prolonged fasting or starvation	163	Summary	182
• The emergency situation—fight or flight	164	Further reading	182
Regulation of food intake: appetite control	164	Problems	183
• Hormones which control appetite	164		
• How do these hormones control appetite?	164		
• Can hormones be used therapeutically to control obesity?	165	Chapter 11 Principles of energy release from food	184
Summary	165	Biological oxidation and hydrogen-transfer systems	184
Further reading	166	<i>NAD⁺—an important electron carrier</i>	185
Problems	167	<i>FAD and FMN are also electron carriers</i>	186
		Energy release from glucose	186
Chapter 10 Biochemical mechanisms involved in transport, storage, and mobilization of dietary components	168	• The main stages of glucose oxidation	186
Glucose traffic in the body	168	• Stage 1 in the release of energy from glucose; glycolysis	186
• Mechanism of glycogen synthesis	168	<i>Anaerobic glycolysis</i>	186
<i>How is energy injected into the process?</i>	169	• Stage 2 of glucose oxidation: the citric acid cycle	188
		<i>How is pyruvate fed into the citric acid cycle?</i>	188
		<i>What is coenzyme A?</i>	188
		<i>Oxidative decarboxylation of pyruvate</i>	189

• Stage 3 of glucose oxidation: electron transport to oxygen	189	<i>Citrate → isocitrate</i>	206
• The electron transport chain—a hierarchy of electron carriers	189	<i>Isocitrate dehydrogenase</i>	207
<i>Redox potentials</i>	189	<i>The C₂ part of the cycle</i>	207
<i>Determination of redox potentials</i>	190	<i>Generation of GTP coupled to splitting of succinyl-CoA</i>	208
<i>Electrons are transported in a stepwise fashion</i>	190	<i>Conversion of succinate to oxaloacetate</i>	208
Calculation of the relationship between the ΔG° value and the E'_{\circ} value	191	• What determines the direction of the citric acid cycle?	209
Energy release from oxidation of fat	191	• Stoichiometry of the cycle	209
Energy release from oxidation of amino acids	192	• Topping up the citric acid cycle	210
The interconvertibility of fuels	192	<i>Biotin is the cofactor for CO₂ activation</i>	210
Box 11.1 A survey of vitamins	194	Stage 3—the electron transport chain that conveys electrons from NADH and FADH₂ to oxygen	211
Summary	194	• The electron transport chain	211
Problems	195	<i>Where does it take place?</i>	211
		<i>Nature of the electron carriers in the chain</i>	211
		<i>Arrangement of the electron carriers</i>	212
		• Oxidative phosphorylation—the generation of ATP coupled to electron transport	213
		<i>The chemiosmotic theory of oxidative phosphorylation</i>	214
		• How are protons ejected?	214
		<i>The Q cycle in complex III ejects protons from mitochondria</i>	215
		<i>Complex IV also creates a proton gradient</i>	216
		• ATP synthesis by ATP synthase is driven by the proton gradient	216
		• Structure of ATP synthase	217
		<i>The F₁ unit and its role in the conversion of ADP + P_i to ATP</i>	217
		<i>Activities of the enzyme catalytic centres on the F₁ subunit</i>	217
		<i>Structure of the F_o unit and its role</i>	219
		• Mechanism by which proton flow causes rotation of F _o	219
		• Transport of ADP into mitochondria and ATP out	221
		• The balance sheet of ATP production by electron transport	222
		• Yield of ATP from the oxidation of a molecule of glucose to CO ₂ and H ₂ O	222
		• Is ATP production the only use that is made of the potential energy in the proton-motive force?	222
		Box 12.1 Inhibitors of oxidative phosphorylation	223
		Summary	223
		Further reading	224
		Problems	224
Chapter 12 Glycolysis, the citric acid cycle, and the electron transport system: reactions involved in these pathways	196		
Stage 1—glycolysis	196		
• Glucose or glycogen?	196		
• Why use ATP here at the beginning of glycolysis?	197		
<i>Why is glucose-6-phosphate converted to fructose-6-phosphate?</i>	197		
<i>Splitting fructose bisphosphate to two C₃ compounds</i>	197		
• A note on the ΔG° and ΔG values for the aldolase reaction	198		
• Interconversion of dihydroxyacetone phosphate and glyceraldehyde-3-phosphate	199		
• Glyceraldehyde-3-phosphate dehydrogenase— an oxidation linked to ATP synthesis	199		
• The final steps in glycolysis	200		
• The ATP balance sheet from glycolysis	202		
• Reoxidation of cytoplasmic NADH from glycolysis by electron shuttle systems	202		
<i>The glycerol phosphate shuttle</i>	202		
<i>The malate–aspartate shuttle</i>	202		
• Transport of pyruvate into the mitochondria	203		
Conversion of pyruvate to acetyl-CoA—a preliminary step before the citric acid cycle	203		
• Components involved in the pyruvate dehydrogenase reaction	204		
Stage 2—the citric acid cycle	205		
• The citric acid cycle as a water-splitting machine	205		
• A simplified version of the citric acid cycle	205		
• Mechanisms of the citric acid cycle reactions	206		
<i>The synthesis of citrate</i>	206		
<i>Conversion of citrate to α-ketoglutarate</i>	206		
		Chapter 13 Energy release from fat	226
		Mechanism of acetyl-CoA formation from fatty acids	227
		• ‘Activation’ of fatty acids by formation of fatty acyl-CoA derivatives	227
		• Transport of fatty acyl-CoA derivatives into mitochondria	227

• Conversion of fatty acyl-CoA to acetyl-CoA molecules inside the mitochondrion by β -oxidation	228		
• Energy yield from fatty acid oxidation	228		
Oxidation of unsaturated fat	229		
Is the acetyl-CoA derived from fat breakdown always directly fed into the citric acid cycle?	229		
• How is acetoacetate made from acetyl-CoA?	229		
<i>Utilization of acetoacetate</i>	229		
Oxidation of odd-numbered carbon-chain fatty acids	230		
Peroxisomal oxidation of fatty acids	231		
• Where to now?	231		
Summary	231		
Further reading	232		
Problems	232		
<hr/>			
Chapter 14 The synthesis of fat and related compounds	233		
Mechanism of fat synthesis	233		
• General principles of the process	233		
• Synthesis of malonyl-CoA	233		
• The acyl carrier protein (ACP) and the β -ketoacyl synthase	234		
• Mechanism of fatty acyl-CoA synthesis	234		
• Organization of the fatty acid synthesis process	234		
• The reductive steps in fatty acid synthesis	235		
<i>What is NADP⁺?</i>	236		
• Where does fatty acid synthesis take place?	236		
Synthesis of unsaturated fatty acids	237		
Box 14.1 Omega fatty acids and diet	238		
Synthesis of TAG and membrane lipids from fatty acids	238		
Synthesis of new membrane lipid bilayer	238		
• Synthesis of glycerophospholipids	239		
• Synthesis of new membrane lipid bilayer	241		
Synthesis of prostaglandins and related compounds	242		
• The prostaglandins and thromboxanes	242		
Box 14.2 Nonsteroidal anti-inflammatory drugs (NSAIDs)	243		
• Leukotrienes	244		
• Synthesis of cholesterol	244		
• Conversion of cholesterol to steroid hormones	244		
Summary	245		
Further reading	245		
Problems	245		
<hr/>			
Chapter 15 Synthesis of glucose (gluconeogenesis)			247
• Mechanism of glucose synthesis from pyruvate			247
• What are the sources of pyruvate used by the liver for gluconeogenesis?			248
• Synthesis of glucose from glycerol			250
• Effects of ethanol metabolism on gluconeogenesis			251
<i>Effect of ethanol metabolism on the NADH/NAD⁺ ratio in the liver cell</i>			251
• Synthesis of glucose via the glyoxylate cycle			252
Summary			253
Further reading			253
Problems			253
<hr/>			
Chapter 16 Strategies for metabolic control and their application to carbohydrate and fat metabolism			255
Why are controls necessary?			255
• The potential danger of futile cycles in metabolism			256
How are enzyme activities controlled?			257
• Metabolic control by varying the amounts of enzymes is not instantaneous			257
• Metabolic control by regulation of the activities of enzymes in the cell			257
• Which enzymes in metabolic pathways are regulated?			257
• The nature of control enzymes			258
Allosteric control of enzymes			258
• The mechanism of allosteric control of enzymes			258
<i>What causes the sigmoidal response of reaction velocity to substrate concentration?</i>			259
• Reversibility of allosteric control			259
• Allosteric control is a tremendously powerful metabolic concept			259
<i>Allosteric enzymes often have multiple allosteric modulators</i>			260
Control of enzyme activity by phosphorylation			260
• Protein kinases and phosphatases			260
• Control by phosphorylation usually depends on chemical signals from other cells			261
General aspects of the hormonal control of metabolism			261
• How do glucagon, epinephrine, and insulin work?			261
• What is a second messenger?			261
• The second messenger for glucagon and epinephrine is cyclic AMP (cAMP)			262

Control of carbohydrate metabolism	263	Summary	283
• Control of glucose uptake into cells	263	Further reading	284
• Control of glycogen metabolism	264	Problems	284
<i>Control of glycogen breakdown in muscle</i>	264		
• Mechanism of muscle phosphorylase activation by cAMP	265		
• Control of glycogen breakdown in the liver	266	Chapter 18 Raising electrons of water back up the energy scale—photosynthesis	285
• Reversal of phosphorylase activation in muscle and liver	266	• Overview	285
• Control of glycogen synthase	267	• Site of photosynthesis—the chloroplast	286
<i>cAMP causes inactivation of glycogen synthase</i>	267		
<i>Mechanism of insulin activation of glycogen synthase</i>	267	The light-dependent reactions of photosynthesis	286
<i>How does insulin inactivate GSK3?</i>	267	• The photosynthetic apparatus and its organization in the thylakoid membrane	286
• Control of glycolysis and gluconeogenesis	268	• How is light energy captured?	287
<i>Allosteric controls</i>	268	• Mechanism of light-dependent reduction of NADP ⁺	288
<i>Hormonal control of glycolysis and gluconeogenesis</i>	269	• Photosystem II	288

Part 4 Information storage and utilization

Chapter 22 DNA and genomes	341	Initiation and regulation of DNA replication in eukaryotes	357
What are nucleic acids?	341	Unwinding the DNA double helix and supercoiling	358
The primary structure of DNA	341	• How are positive supercoils removed ahead of the replicative fork?	359
• What are the bases in DNA?	342	The basic enzymic reaction catalysed by DNA polymerases	361
• Attachment of the bases to deoxyribose	342	How does a new strand get started?	362
• The physical properties of the polynucleotide components	342	The polarity problem in DNA replication	362
• Structure of the polynucleotide of DNA	342	• Mechanism of Okazaki fragment synthesis	363
• Why deoxyribose? Why not ribose?	343	• Enzyme complex at the replicative fork in <i>E. coli</i>	364
• The DNA double helix	344	<i>The DNA sliding clamp and the clamp loading mechanism</i>	364
<i>Complementary base pairing</i>	344	• Processing the Okazaki fragments	364
• DNA chains are antiparallel; what does this mean?	346	How is fidelity achieved in DNA replication?	366
How is the DNA packed into a nucleus?	348	• Exonucleolytic proofreading	368
• How does the described structure of DNA correlate with the compact eukaryotic chromosomes visible in the light microscope?	349	• Methyl-directed mismatch repair	368
• The mitochondrial genome	350	Repair of DNA damage in <i>E. coli</i>	369
What is a gene in molecular terms?	350	<i>Repair of double-strand breaks</i>	370
• Some variations on the 'standard' gene	351	The machinery in the eukaryotic replicative fork	371
• Size and organization of genomes	351	• The problem of replicating the ends of eukaryotic chromosomes	371
<i>Organization of the human genome</i>	351	<i>How is telomeric DNA synthesized?</i>	373
• Repetitive DNA sequences	351	<i>Telomere shortening correlates with ageing</i>	373
• Transposon movement	352	DNA damage repair in eukaryotes	373
• Noncoding RNAs are challenging the basic dogma of molecular genetics	352	Is the mechanism described above the only way in which DNA is synthesized?	374
<i>Discovery of microgenes for small noncoding RNAs</i>	352	• DNA synthesis by reverse transcription	374
• RNA interference (RNAi)	353	Homologous recombination	375
• Where are we now?	353	• Mechanism of homologous recombination in <i>E. coli</i>	375
Summary	353	<i>Formation of cross-over junctions by single-strand invasion</i>	376
Further reading	354	<i>Separation of the duplexes</i>	376
Problems	355	• Recombination in eukaryotes	377
		Summary	377
		Further reading	377
		Problems	378
Chapter 23 DNA synthesis, repair, and recombination	356	Chapter 24 Gene transcription and control	380
Overall principle of DNA replication	356	Messenger RNA	380
Control of initiation of DNA replication in <i>E. coli</i>	357	• The structure of RNA	380
		• How is mRNA synthesized?	380
		• Some general properties of mRNA	381

• Some essential terminology	381	Gene transcription in mitochondria	400
• A note on where we go from here	382	Genes that do not code for proteins	401
Gene transcription in <i>E. coli</i>	382	• The structure of DNA-binding proteins	401
• What do we mean by the 5' end of a gene?	383	<i>Helix–turn–helix proteins</i>	401
• Phases of gene transcription	383	<i>Leucine zipper proteins</i>	402
<i>Initiation of transcription in <i>E. coli</i></i>	383	<i>Helix–loop–helix proteins</i>	402
<i>Separating the DNA strands</i>	384	<i>Zinc finger proteins</i>	403
<i>Termination of transcription</i>	384	Summary	403
• The rate of gene transcription initiation in prokaryotes	384	Further reading	404
• Control of transcription by different sigma factors	385	Problems	406
• Gene control in <i>E. coli</i> : the <i>lac</i> operon	385		
• Structure of the <i>E. coli lac</i> operon	386		
Gene transcription in eukaryotic cells	387	Chapter 25 Protein synthesis and controlled protein breakdown	408
• Capping the RNA transcribed by RNA polymerase II	387	Essential basis of the process of protein synthesis	409
• Split genes	387	• The genetic code	409
<i>Mechanism of splicing</i>	387	• How are the codons translated?	410
Ribozymes and self-splicing of RNA	389	• Transfer RNA	410
• What is the biological status of introns?	390	• The wobble mechanism	411
<i>What is the origin of split genes?</i>	390	• How are amino acids attached to tRNA molecules?	411
<i>Alternative splicing or two (or more) proteins for the price of one gene</i>	390	<i>Proofreading by aminoacyl-tRNA ligases</i>	412
Mechanism of initiation of eukaryotic gene transcription and its control	390	Ribosomes	413
• Unpacking of the DNA for transcription	390	Initiation of translation	414
• A general overview of the differences in the initiation and control of gene transcription in prokaryotes and eukaryotes	391	• Initiation of translation in <i>E. coli</i>	414
• Types of eukaryotic genes and their controlling regions	392	Once initiation is achieved, elongation is the next step	416
<i>Type II eukaryotic gene promoters</i>	392	• Cytoplasmic elongation factors in <i>E. coli</i>	416
<i>Enhancers</i>	393	• Mechanism of elongation in <i>E. coli</i>	416
<i>Transcription factors (activators)</i>	393	• How is accuracy of translation achieved?	416
• Most transcription factors themselves are regulated	394	Mechanism of translocation on the <i>E. coli</i> ribosome	418
• How do transcription factors promote transcriptional initiation?	394	Box 25.1 Effects of antibiotics and toxins on protein synthesis	418
<i>The role of chromatin in eukaryotic gene control</i>	394	Termination of protein synthesis in <i>E. coli</i>	419
<i>How do transcription factors open up gene promoters?</i>	394	• Physical structure of the ribosome	419
• How is transcription initiated on the opened promoter?	396	• What is a polysome?	420
Discovery of the mediator	397	Protein synthesis in eukaryotes	420
The RNA polymerase II of eukaryotic cells	398	Protein synthesis in mitochondria	420
• Termination of transcription in eukaryotic cells	399	Folding up of the polypeptide chain	421
• Switching off the gene	399	• Chaperones (heat-shock proteins)	421
mRNA stability and the control of gene expression	399	<i>Mechanism of action of molecular chaperones</i>	422
• Determinants of mRNA stability and their role in gene expression control	399	• Enzymes involved in protein folding	423
<i>Role of the polyA tail</i>	399	Prion diseases and protein folding	424
<i>Structural stability determinants of mRNAs</i>	399		

Translational control mechanisms

- Regulation of globin synthesis
- Translational control of proteins involved in protein synthesis and tumorigenesis

Programmed destruction of protein by proteasomes

- The structure of proteasomes
- Selection of proteins for destruction in the ubiquitination system
- What determines when proteins are ubiquitinated?
- The role of proteasomes in the immune system

Summary

Further reading

Problems

Chapter 26 Protein targeting—how proteins are delivered to their cellular destinations

A preliminary overview of the field

- Structure and function of the ER and Golgi apparatus

The importance of the GTP/GDP switch mechanism in protein targeting

How are proteins translocated through the ER membrane?

- Mechanism of cotranslational transport through the ER membrane
- Folding of the polypeptides inside the ER
- Glycosylation of proteins in the ER lumen and Golgi apparatus
- Vesicles involved in protein translocation from the ER and Golgi

Lysosomes and the mechanism of their formation by receptor-mediated endocytosis

How are proteins sorted, packaged, and dispatched by the Golgi apparatus?

- Proteins to be returned to the ER
 - Proteins destined for lysosomes
 - Proteins to be secreted from the cell
- Box 26.1 Lysosomal storage disorders

Mechanism of COP-coated vesicle formation

- How does a vesicle find its target membrane?

Synthesis of integral membrane proteins and their transport

- How is the membrane protein given the correct orientation?

424 Posttranslational transport of proteins into organelles

- The structure of the nuclear pore complex
- Targeting of nuclear proteins
- Nuclear import and export
- Mitochondrial import and export
- The peroxisome pathway
- Nuclear import of signals
- Mechanism of nuclear cytoplasmic transport and the role of guanine nucleotide binding proteins
- Regulation of nuclear transport by cell signals and tyrosine kinase control

428 Summary

431 Problems

432 Chapter 27 Signal transduction

432 Overview

- Organization of this chapter

435 What are the signalling molecules?

- Neurotransmitters
- Hormones
- Cytokines and growth factors
- Growth factors, cytokines and the cell cycle*
- Vitamin D₃ and retinoic acid

437 Intracellular receptor-mediated responses

- Box 27.1 The glucocorticoid receptor and anti-inflammatory drugs

438 Classification of types of membrane receptor signalling systems

- Binding domains of signal transduction proteins
- Terminating signals

439 Examples of signal transduction pathways

439 Signal transduction pathways from tyrosine kinase receptors

- The Ras pathway
- Mechanism of the Ras signalling pathway
- Concept of the GTP/GDP switch mechanism, illustrated by the Ras pathway*
- The MAP kinase cascade in the Ras pathway*
- Nomenclature of the protein kinases of the Ras pathway*
- Concept of the role of protein phosphatases, illustrated by the Ras pathway*

Problems	480	Further reading	503
		Problems	504
<hr/>			
Chapter 28 Manipulating DNA and genes	482	 Part 5 The immune system, cell cycle, apoptosis, and cancer	
<hr/>			
Basic methodologies	483	Chapter 29 The immune system	509
• Some preliminary considerations	483	Overview	509
• Cutting DNA with restriction endonucleases	483	• The problem of autoimmune reactions	510
• Separating DNA pieces	484	• The cells involved in the immune system	510
• Visualizing the separated pieces	484	• There are two arms to the adaptive immune response	510
• Detection of specific DNA fragments by nucleic acid hybridization probes	484	• Where is the immune system located in the body?	511
• Southern blotting	484	Antibody-based or humoral immunity	511
Sequencing DNA	485	• Structure of antibodies	511
• Outline of the dideoxy DNA-sequencing technique	485	• What are the functions of antibodies?	511
<i>How is this interpreted as a base sequence?</i>	486	• The different classes of antibodies	512
<i>Automated DNA sequencing</i>	487	• Generation of antibody diversity	512

Activation of B cells to produce antibodies

- Deletion of potentially self-reacting B cells in the bone marrow
- The theory of clonal selection
- B cells must be activated before they can develop into antibody-secreting cells
 - Role of helper T cells*
 - Activation of helper T cells*
 - Activation of B cells by activated helper T cells*
- Role of the MHC proteins in presenting peptides on the outside of cells
- Affinity maturation of antibodies
- Memory cells

T cells and cell-mediated immunity

- Mechanism of action of cytotoxic (killer T) cells
 - CD proteins reinforce the selectivity of T cell receptors for the two classes of MHC protein*

Why does the human immune system reject transplanted human cells?

Monoclonal antibodies

Summary

Further reading

Problems

Chapter 30 Cell-cycle control, apoptosis, and cancer

The eukaryotic cell cycle

- Why the cell cycle must have controls

Cell-cycle controls

- Cytokines and growth factor control in the cell cycle
- Cell-cycle checkpoints
- Cell-cycle controls depend on the synthesis and destruction of cyclins
- Controls in G₁ are complex
- The G₁ checkpoint
- How is DNA damage detected?

- Progression to S phase
- Progression to M phase
- Mitosis phase

Apoptosis

- An overview of what initiates apoptosis
- Mechanism of stress-damage-induced apoptosis*
- The role of caspases in apoptosis*
- Death receptor-mediated activation of apoptosis*

Cancer

- General concepts
 - Most normal cells can divide only a limited number of times*
 - Cancer cells have no limitation on the number of cell divisions they can make*
 - Types of abnormal cell multiplication*
- Malignant Darwinism: cancer development involves an evolutionary progression of mutations
 - Development of colorectal cancer*
- Mutations cause cancer
- Tumour promoters
- The types of genetic change involved in cancer
- Oncogenes
- How are oncogenes acquired?
 - A note on nomenclature of viral oncogenes*
- Tumour-suppression genes
- Mechanism of protection by the p53 gene
- Mechanism of protection by the retinoblastoma gene
- Molecular biology advances have potential for development of new cancer therapies
