

# BlackLine Reconciliation Templates

BlackLine Reconciliation Templates provide a best practice approach to ensuring the accuracy, quality, and completeness of your account reconciliations. Our standard Reconciliation Templates, as detailed in this guide, are available out of the box to support the most common reconciliation types and can be further adapted to meet your organization's evolving goals and requirements.

### Accruable Items

The Accruable Items template is used to manage reconciliation items expensed and accrued in the current accounting period and paid in a future accounting period. Examples include accrued property tax, general expenses, or services. You can establish categories of accrued items in one account, and related activity for each category will display on the account reconciliation.

### **Accrual Items**

The accruable item activity history is stored together with each accruable item. The expected balance is automatically calculated for each item based on the sum of activity from prior and current periods. If desired, future periods can be loaded in advance and will be automatically included in the calculated balance in the appropriate future periods.

### Populated with the Accounts template format and is the level at which your organization wishes to sign off on reconciliations. This is the most essential import to populate BlackLine, and the one customers most often automate.

# Schedule List

The Schedule List template is useful for any reconciliation that has a schedule for reconciling items and is generally used when a summarized view of all reconciliation activity is needed. This template is similar to the Accruable Items template, with additional summarization and organization levels that allow users to summarize multiple accrual schedules and further classify detailed activity.

Summary views can be created by assigning client-defined categories to the detailed activity that is input every period. Users can select the number of periods' worth of activity (e.g., 1 period, 1 quarter, multiple periods, etc.) they want to see in the summary table, including "to-date" activity.

The Schedule List template is commonly used for bonus accruals, fixed assets, allowance for doubtful accounts, warranty reserve accounts, and deferred expenses.

#### **Show All Detail**

Users can toggle between the summary view and a detailed view of individual line items within each accrual that roll up to the totals. These items can be loaded into BlackLine by the end user either individually or in bulk, or can be imported through the Open Items import template by the System Administrator. If desired, this process can also be fully automated.

### 3

### Show By Sub-Type Summary

The Show By Sub-Type Summary link provides a roll forward view of accrual data. In this example, the accrual data is organized by bonus type, by period, and by accrual activity type, in this case Expense and Payment. The activity type field can be configured for any type of accrual classification needed, and the user enters the desired number of periods to include in their view.

## Amortizable

The Amortizable template is used to monitor expenditures or revenues in one accounting period that are recognized over several future periods. This reconciliation template allows you to record payments or revenues for amortizable or deferred items and establish a monthly schedule of the expenses or revenues to record over the life of the prepaid or deferred item. BlackLine automatically creates a straight line schedule for the amortization or deferral amounts over future periods. Non-straight line schedules are also easily created in this template.

The Amortizable template can be used for:

- **Prepaid Property Taxes** These items, typically paid once a year or on a quarterly basis, need to be expensed over the period defined by the taxing authority.
- Prepaid Licenses This pertains to items such as vehicle license fees or fees charged by a governmental agency on an annual basis (e.g., CPA license fee, Surface Water Discharge permit).
- Prepaid Heavy Vehicle Tax In some cases, fees charged by the IRS apply to future periods. An example is the Heavy Vehicle Use Tax that is paid when you file your Form 2290.
- Deferred Revenue To record the recipient of prepayments for product goods and services. The prepayments
  are recorded as unearned revenue revenue that has not yet been earned but represents products or services
  that are owed to a customer.

The Partial Amortization feature allows organizations to calculate amortization schedules on a daily basis (rather than on a full calendar, straight line basis), to allow for partial period calculations. When enabled, the BlackLine system allocates the balance partially in the first and last months of the schedule and evenly distributes the remaining amount across the months in between.

1

The amortization schedules are stored together with each prepaid item, and a built-in roll forward schedule displays balances and activity for all items in a single screen.

# 2 Balance

The expected balance is automatically calculated for each item and is automatically updated each period. If the sum of expected balances ties to the GL Balance in total, the account will be auto-certified.

# Associated Accounts

The Associated Accounts template enables the comparison of sets of imported account balances and supports nonexclusive grouping as well as existing reconciliation functions.

This template can be used for the:

- Comparison of IFRS balances to GAAP balances
- Comparison of regulatory balances to statutory balances
- Comparison of a set of account balances to a single account balance

### **Bank Account**

Bank Account reconciliation templates are used for cash accounts, checking accounts, or any cash type account that involves reconciling items such as deposits, payments, bank fees, and other items that may be financial in nature and have timing differences from month to month. The template's Bank Items control enables preparers to enter and categorize these items.

The Bank Account template can be used for:

- Checking account reconciliations
- Savings account reconciliations. Activity in this account would be similar to those in a checking account (e.g., deposits, withdrawals, fees, interest), but would typically have a lower volume of transactions.

#### **Bank Items**

Line items within a Bank Account reconciliation are summarized by Bank Items, categories created by the System Administrator and/or end users.

2

### Line Item Detail Users can drill down to view

details for each line item within the Bank Items summary (e.g., individual Deposits in Transit).

#### **Bank Balance**

The Bank Balance is populated via automated or semiautomated import, and can also be keyed in by users. If imported automatically or semi-automatically, organizations can take advantage of the bank auto-certification rule.

# Calculated Balance

The Calculated Balance template is used when a detailed calculation is required to support the general ledger balance in an account. The reconciliation prompts users to enter the calculated amount and provide an explanation for the basis of the calculation and the balance in the general ledger. Then, users are able to list any reconciling items.

Accounts that most commonly use the Calculated Balance reconciliation are:

- Allowance for Doubtful Accounts Typically, these accounts require an external calculation to determine the amount of the allowance that should be recorded. The General Ledger balance is then compared to that calculation.
- Accrued Payroll In the case of Accrued Payroll accounts, a calculation processed at the end of every
  accounting period determines the payroll expense to be entered for amounts earned by, but not yet paid to,
  employees. As with Allowance for Doubtful Accounts, the calculated balance is compared to the GL balance
  to ensure all entries have been properly recorded.

**Basis of Calculation** 

The basis for the calculation appears on the face page and can be rolled forward to new reconciliations. **Supporting Items** 

2

Additional reconciling items can be manually input by Preparers or automatically imported and are accessible on the face of the reconciliation.

#### **Supporting Documents**

Calculations can be attached as Supporting Documents to enable quick and easy access to additional detail.

### General List

This commonly used BlackLine reconciliation template is designed to be flexible to support any type of account. With the General List template, users can enter items that make up the ending balance in a Balance Sheet account. It can also be used to accumulate information for an Income or Expense account.

Examples of accounts that can use the General List template include:

- Petty Cash Though this is an account that deals directly with cash, the most appropriate type of reconciliation simply lists the details of who has how much money.
- Inventory Account Items that are held for resale or for future use that are in an Inventory account.
- Deposits Amounts paid to a vendor or supplier that you expect to be refunded at some future date.
- Prepaid Expenses not Amortizable
   For example, Prepaid Rent that is paid to a landlord on July 31 for rent due on August 1.
- Common Stock Amounts originally paid in to the company when shares of stock were sold.

- Retained Earnings An accumulation of all the profits and losses of the company since it was formed (accumulated profits will have a credit balance, accumulated losses will have a debit balance).
- Miscellaneous Income Items that do not normally fit in to your routine business operations and that must be explained in detail.
- Gain on Sale of Assets Identify specific assets sold and the proceeds on each sale.
- Repairs and Maintenance Greater than \$10,000 (or any limit your accountant or manager wants to see). Identify significant expenditures that may not be recurring in your normal operations.

- Legal Expense Identify the lawyers used by the company during the year and the litigation that may need to be reviewed during an audit.
- Bad Debt Expense and Write Offs – Keep track of customers that failed to pay the company.

#### Supporting Items

Line items within a reconciliation can be populated automatically via the Items template format, semi-automatically through the Excel-based import template by the System Administrator, semi-automatically through Excel (in bulk) by the Preparer, or manually by the Preparer. Items may also be imported from queries or Matching, if desired. If imported automatically or with the Excel-based templates through the System Administration role, clients can take advantage of the auto-certification rules. GL Balance

2

The GL Balance field is populated with the Accounts template format and is the level at which clients wish to sign off on reconciliations. This is the most essential import to populate BlackLine and the one that clients most often automate.

# Subledger Match

This reconciliation template is used when you have a separate subledger process that should be matched to your general ledger balance. The subledger may be part of an integrated accounting software system, or it may be a standalone system that is manually recorded each month. The template prompts you for the balance in your subledger and the balance in your general ledger, then it allows you to list any reconciling items.

The Subledger Match reconciliation template is commonly used for:

- Accounts Receivable If you have a separate billing system, you probably have a report called the Aged Trial Balance that you will match to your general ledger.
- Accounts Payable Most payables systems are integrated with the general ledger, but entries in the general ledger need to be verified to ensure no journal entries were posted to the Accounts Payable account in error.
- **Fixed Assets** All capital expenditures are recorded in the PPE cost accounts and are depreciated based on company policy using a Fixed Asset subledger compared to the total in all Fixed Asset GL accounts.

### Supporting Items

Line items can be populated automatically via the Items template format, semi-automatically through the Excel-based import template by the System Administrator, semi-automatically through Excel (in bulk) by the Preparer, or manually by the Preparer. Items may also be imported from queries or Matching, if desired. If imported automatically or with the Excel-based templates through the System Administrator role, auto-certification rules can be applied.

### Subledger Balance

The Subledger Balance can also be imported automatically, semiautomatically, or manually. Autocertification rules can be applied when this field is automatically or semi-automatically imported.

### Suspense

Suspense accounts are used to temporarily record transactions before they are allocated to their proper account. BlackLine's Suspense Template provides a means to automate and control the reconciliation and reporting of these suspense items from a predefined source.

With this template, organizations can:

- Periodically import item count and aging and business justification details, if desired.
- Define the categories for aging and business justifications.
- Lock down key fields (e.g., item count, aging) to ensure preparers work within the required items that the ERP system provides at period end. This reduces the amount of monitoring that must be done on a large portion of the Balance Sheet.
- Identify high-risk items across multiple suspense accounts at one time.

In the insurance industry, suspense accounts hold unfunded remittances, serving as a holding account for monies received that cannot be released (e.g., in-transit policies, disputed claims, monies held due to legal issues or timing of day-to-day operations). These accounts often make up a large proportion of an insurance company's liabilities and have specific SOX control requirements – accounts must be analyzed by type of product, aging category, and business justification.

#### Suspense Items

The Suspense Items provides a summary of open items by Item Total and Age Type. The total of Suspense items is compared to the GL balance.

### **Business Justified Items**

The lower section of the reconciliation provides a means to document the detail of those items labeled with an Age Type designated high risk. They appear on the reconciliation and are summarized by the Business Justification Type. The subtotal of those items is compared to the high risk total.

#### **ERP Drill Down**

The ERP Drill Down feature enables users to access account transaction details directly on the face of the reconciliation, so there is no need to navigate between BlackLine and the organization's ERP and/or other third party systems. BlackLine does not circumvent the security of your ERP system, so users without access to the ERP, or a particular account, will not be able to see anything even when this feature is activated.

#### Hyperlink

This control enables users to add a hyperlink to a document stored in another system as supporting documentation for a reconciliation in BlackLine. The document itself is not stored in the BlackLine document repository, but a link to the document is stored so that the document can be easily accessed within the BlackLine system.

#### **Integrated Spreadsheets**

The Integrated Spreadsheet control can be added to any BlackLine Reconciliation Template. This feature enables the creation of highly customized reconciliations to accommodate the most challenging scenarios and eliminates the need for supporting spreadsheet documents. Approvers and reviewers are presented with a fully functional spreadsheet on the face of the reconciliation and have quick and easy access to view all calculations.

#### **Related Account Balances**

The Related Account Balances functionality allows users to view the GL balance and link to other accounts which have been linked to their reconciliation. Users can view a grid of all open items which belong to the related accounts, and these related accounts, once added, will carry forward to future periods automatically.
