

## Cells

Cytology = the study of cells

## What Are the Main Characteristics of organisms?

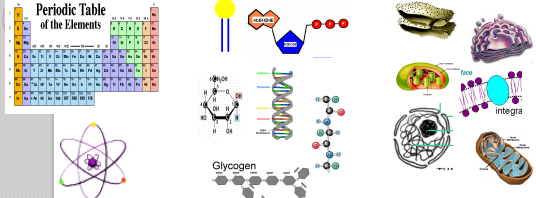

1. Made of **CELLS**
2. Require **ENERGY** (food)
3. **REPRODUCE** (species)
4. Maintain **HOMEOSTASIS**
5. **ORGANIZED**
6. **RESPOND** to environment
7. **GROW** and **DEVELOP**
8. **EXCHANGE** materials with surroundings (water, wastes, gases)

## Organization Levels of Life

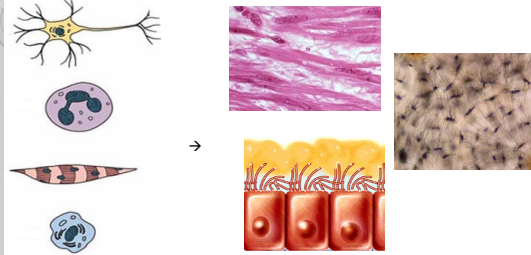

Atoms to Organisms

## Nonliving Levels

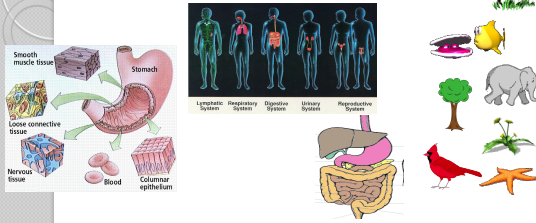

ATOMS → MOLECULES → ORGANELLES

## Living Levels

CELLS – life starts here → TISSUES – Similar cells working together

## More Living Levels

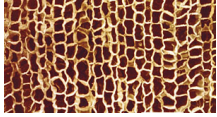

ORGANS → ORGAN SYSTEMS → ORGANISM

Different tissues working together → Different organs working together

## History of Cells

### First to View Cells

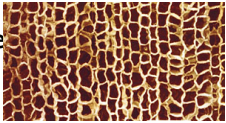

- In 1665, **Robert Hooke** used a microscope to examine a thin slice of **cork** (dead plant cell walls)
- What he saw looked like small boxes

8

### First to View Cells

- Hooke is responsible for **naming cells**
- Hooke called them **"CELLS"** because they looked like the **small rooms that monks lived in called Cells**

copyright cmasengale 9

### Anton van Leeuwenhoek

- In 1673, **Leeuwenhoek** (a Dutch microscope maker), was **first to view organism** (living things)
- Leeuwenhoek used a simple, handheld microscope to view **pond water & scrapings from his teeth**

10

### Beginning of the Cell Theory

- In 1838, a German botanist named **Matthias Schleiden** concluded that all **plants** were made of cells
- Schleiden is a **cofounder** of the cell theory

copyright cmasengale 11

### Beginning of the Cell Theory

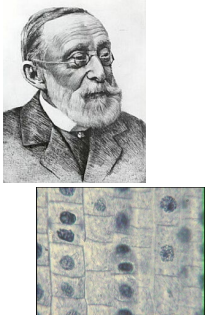

- In 1839, a German zoologist named **Theodore Schwann** concluded that all **animals** were made of cells
- Schwann also **cofounded** the cell theory

12

### Beginning of the Cell Theory

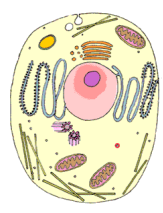

- In 1855, a German medical doctor named **Rudolph Virchow** observed, under the microscope, **cells dividing**
- He reasoned that **all cells come from other pre-existing cells** by cell division

13

### CELL THEORY

- All living things are made of **cells**
- Cells are the basic unit of structure and function in an organism (**basic unit of life**)
- Cells come from the **reproduction of existing cells** (cell division)

14

### Number of Cells

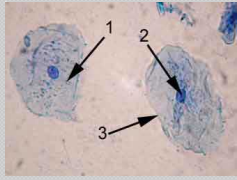

Although **ALL** living things are made of cells, organisms may be:

- Unicellular** – composed of one cell
- Multicellular** - composed of many cells that may organize into tissues, etc.

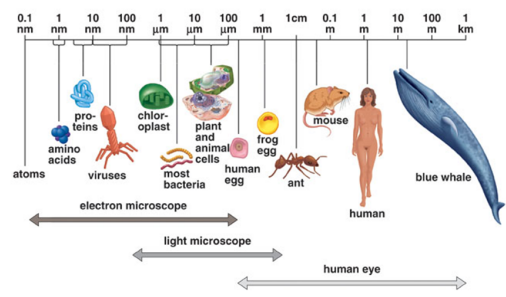

15

Three basic parts of a cell	Two types of cells
<ul style="list-style-type: none"> <li>1 cytoplasm</li> <li>2 nucleus</li> <li>3 cell membrane</li> </ul>	<ul style="list-style-type: none"> <li>Prokaryotic</li> <li>Eukaryotic</li> </ul>

the study of cells

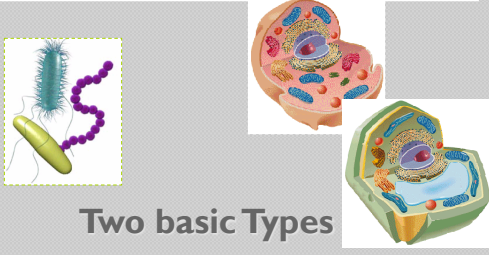

### CELL SIZE

Typical cells range from 5 – 50 micrometers (microns) in diameter

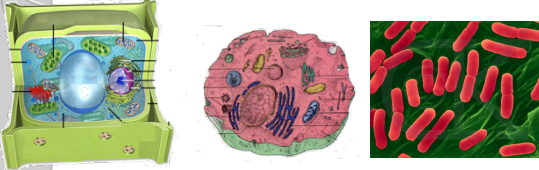

17

<b>Prokaryotic = bacteria</b> No nucleus	<b>Eukaryotic = plant and animal</b> "true" nucleus
---	--

### Two basic Types

### Which Cell Type is Larger?

Plant cell > Animal cell > bacteria

19

### Common Features in ALL cells:

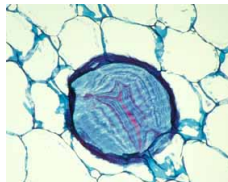

- All cells have:
  - Cell membrane
  - DNA
  - Cytoplasm
- Obtain energy and nutrients from their environment
- Cell function limits cell size (cell parts can not be too far away from cell membrane; nutrients/waste must enter and exit at membrane)

20

## SURFACE AREA AND VOLUME

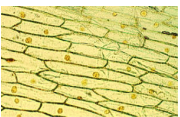

### Plasma membrane

- Surrounds cell
- Separates the contents of the cell from its environment
- Regulates the passage of molecules into and out of the cell.

### Active cells

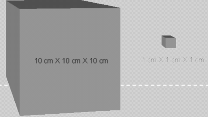

- An actively metabolizing cell needs a large surface area.
- Cells are limited in size because larger cells have a smaller surface to volume ratio.

### SURFACE:VOLUME

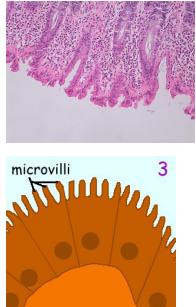

- larger cube has more surface area and more volume but less surface area for each cubic centimeter of volume.
- For any given geometric object (cubes, spheres, etc.), smaller objects have a greater surface to volume ratio (SA:V) than larger objects of the same shape.

SA:V of Large Cube	SA:V of Small Cube
<ul style="list-style-type: none"> <li>SA = # sides x side<sup>2</sup> = 6 x 10<sup>2</sup> = 600cm<sup>2</sup></li> <li>V = l x w x h = 10cm x 10cm x 10cm = 1000cm<sup>3</sup></li> <li>SA:V ratio = 600cm<sup>2</sup>/1000cm<sup>3</sup> = 0.6cm</li> </ul> <p>Most cells are very small and therefore have a high ratio of plasma membrane surface to cell volume.</p>	<ul style="list-style-type: none"> <li>SA = # sides x side<sup>2</sup> = 6 x 1<sup>2</sup> = 6cm<sup>2</sup></li> <li>V = l x w x h = 1cm x 1cm x 1cm = 1cm<sup>3</sup></li> <li>SA:V ratio = 6cm<sup>2</sup>/1cm<sup>3</sup> = 6cm</li> </ul> 

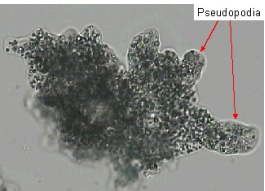

## Microvilli

- Cells that are specialized for absorption (ex: intestinal cells) have folds in the plasma membrane called **microvilli** that increase the surface area.

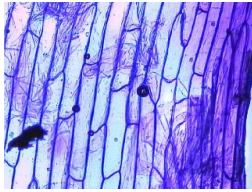

**Pseudopodia** are temporary extensions of the plasma membrane used for movement or to engulf particles.

Found in amoebas

## Cell Wall

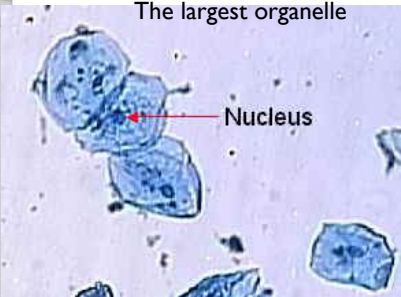

- The cell wall functions to support and protect the cell.
- Plants have cell walls composed of cellulose; fungi have walls composed of chitin.

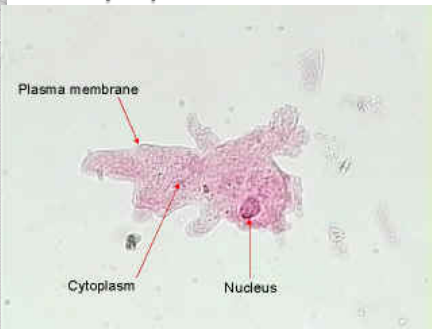

Onion cell walls

## Nucleus

The largest organelle

## Cytoplasm

### Prokaryotic Cells

- Small, simple (no membrane-bound organelles)
- Surrounded by **cell wall** and **cell membrane**
- Lack nucleus (nucleoid region)  
PRO = NO nucleus
- Single, circular, coiled chromosome (DNA) inside nucleoid region
- Cytoplasm
- Ribosome (to make proteins)
- Specialized projections on surface (cilia and flagella)

### Eukaryotic Cells

- Larger, complex (contain membrane-bound organelles)
- Cytoskeleton (network of protein fibers giving shape and organization to cell)
- Has a nucleus  
EU = TRUE NUCLEUS or "YOU" HAVE A NUCLEUS
- Cytoplasm
- Ribosome PLUS a whole lot more!!!
- Also has specialized structures (cilia and flagella)
- 2 types: Plant and Animal

### Two Main Types of Eukaryotic Cells

Plant Cell

Animal Cell

### Organelles

### What is an ORGANELLE?

- Organelle = membrane-enclosed structure performing specific functions for the cell
- **Organs for Cells!**

### Organelles

- **Very small (Microscopic)**
- Perform **various functions** for a cell
- Found in the **cytoplasm**
- May or may not be **membrane-bound**

### Animal Cell Organelles

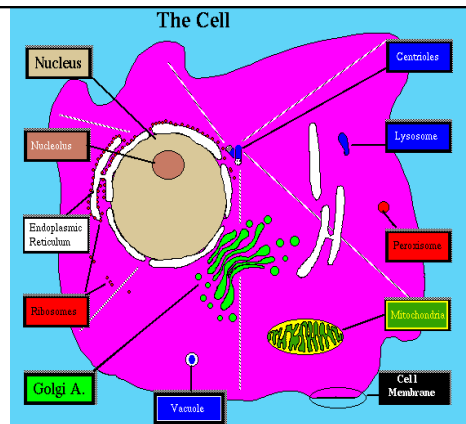

39

### Plant Cell Organelles

40

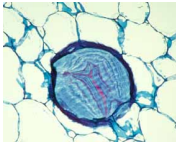

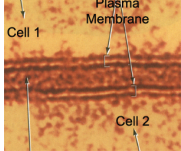

### Parts of a Eukaryotic Cell

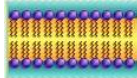

### Cell Membrane

- Flexible
- Like skin surrounding the cell
- Made of lipids and proteins
- Selectively permeable: controls movement of materials into and out of the cell

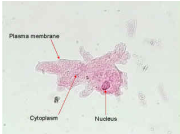

### Lipids & Proteins

- Lipid bilayer: hydrophilic heads point outwards; hydrophobic tails point inward
- Proteins move materials (lipids) into and out of the cell:
  - peripheral proteins: attach to the internal & external surface
  - integral proteins: found within lipid bilayer

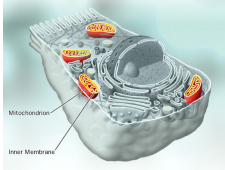

### Cytoplasm

- Cytoplasm: material found between cell membrane and nucleus
- Cytosol: gelatin-like fluid organelles are bathed in

### Mitochondria

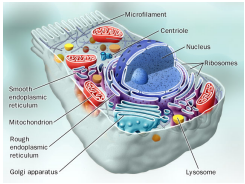

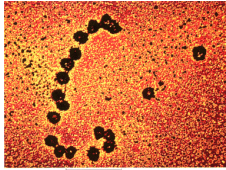

- The power plant
  - provides energy to the cell
- Chemical reactions transfer energy from organic compounds to ATP
- Cristae: internal, long folds; increase surface area so more reactions can occur

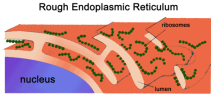

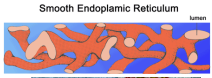

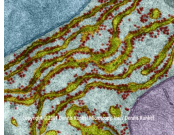

## Ribosomes

- Site of protein synthesis

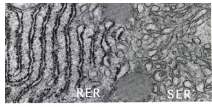

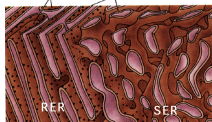

## Rough Endoplasmic Reticulum (RER)

- Network of tubes and sacs that serve as a highway for molecules to move along
- Lots of ribosomes on it

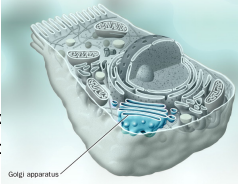

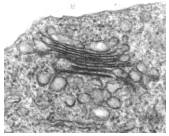

## Smooth Endoplasmic Reticulum (SER)

- Tubes and sacs that work as the cell's highway
- Not covered with proteins

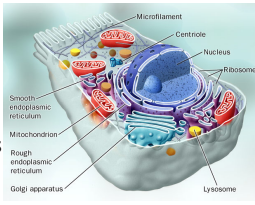

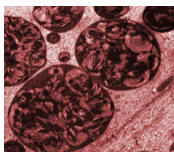

## Golgi Apparatus

- AKA Golgi Complex
- Process, package, and secrete proteins
- Series of flattened sacs

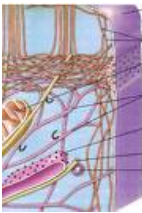

## Lysosomes

- Small sacs
- Enzymes digest organic molecules and old organelles
- "Clean up"
- Common in animal cells, rare in plant cells

## Cytoskeleton

- A network of long protein strands in the cytosol that help maintain cells shape and size
- Microfilaments: made of protein called actin; these are the smaller strands that contribute to cell movement and contraction of muscles
- Microtubules: larger, hollow tubules; include spindle fibers that assist in cell division

## Cilia

- Small beating hairs
- Means of movement
- Many

## Flagella

- Whip like structure
- Means of movement
- Few

## Nucleus

- Largest organelle
- Contains the cell's DNA
- Manages the cell's functions
- "the brain" of the cell

## Nuclear membrane or envelope

- Membrane that surrounds the nucleus
- Controls movement of materials into and out of the nucleus

## Nucleolus

- Part of the nucleus
- Site where ribosomes are synthesized

## Plant Cells

- Cell Wall
- Vacuoles
- Plastids: Chloroplast

## Cell wall

- Rigid wall around cell to provide support
- Made of cellulose
- Only in plant cells

## Vacuole

- Large storage sacs
- Larger in plants than animals
- Store wastes and in plants store glucose from photosynthesis

## Chloroplasts

- Only in plant cells
- Transforms sunlight into usable energy for the cell
- Chlorophyll is the green pigment that traps the sunlight
