## Ch 14. Acids and Bases

## CU Jサ' $\forall \mathrm{I}!92$ suq Bs̨G々

## Acids and Bases

## 

## Acids and Bases

- Acids
- Sour taste
- Dissolve many metals
- Turn litmus paper red.
- Egs. Acetic acid (vinegar), citric acid (lemons)
- Bases
- Bitter taste, slippery feel
- Turn litmus paper blue.
- Egs. Drano, ammonia, caffeine

## Arrhenius Definition of Acids and Bases

## Based on $\mathrm{H}^{+}$or $\mathrm{OH}^{-}$Production in Water

- Acid: Substance that produces $\mathrm{H}^{+}$ions (protons) in aqueous solutions
- $\mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$
- $\mathrm{HNO}_{3}(\mathrm{aq}) \rightarrow \mathrm{H}^{+}(\mathrm{aq})+\mathrm{NO}_{3}^{-}(\mathrm{aq})$
- Base: Substance that produces $\mathrm{OH}^{-}$(hydroxide) ions aqueous solutions
- $\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$
- Defn is limited- restricted to reactions in water only

## Bronsted-Lowry Definition of Acids and Bases

## Based on Proton Transfer:

- Acids: Proton donors

$$
\mathrm{HCl} \rightarrow \mathrm{H}^{+}+\mathrm{Cl}^{-}
$$

- Bases: Proton acceptors
$\mathrm{NH}_{3}+\mathrm{H}^{+} \rightarrow \mathrm{NH}_{4}{ }^{+}$

## Bronsted-Lowry Acid

- An acid must have an acidic proton that can be donated.

## acidic proton

These 3 hydrogens
are not acidic.

## Bronsted-Lowry Base

- A base must have a lone pair to accept a proton.
- A base can be neutral or negatively charged.

Hydroxide ion
(a negatively charged
base, $\mathrm{B}^{--}$)
© 2013 Pearson Education, Inc.

Ammonia
(a neutral base, B:)

## Number of Acidic Protons on a Molecule

- An acid molecule can be monoprotic, diprotic, or triprotic (based on number of acidic protons).

Hydrochloric acid (monoprotic)

Sulfuric acid (diprotic)

Phosphoric acid (triprotic)

## Water Acts as Both Acid and Base (Amphoteric)

- Water can act as a base, accepting a proton from an acid $\rightarrow$ Forms hydronium ion $\mathrm{H}_{3} \mathrm{O}^{+}$.

- Water can act as an acid, donating a proton to a base $\rightarrow$ Forms hydroxide ion $\mathrm{OH}^{-}$

## The Proton in Water

- $\mathrm{A} \mathrm{H}^{+}$ion in water is not isolated! $\mathrm{A} \mathrm{H}^{+}$ion in water attracts the negative pole of water molecule so strongly that it forms a covalent bond to water.

$$
\mathrm{HCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \quad \underline{\mathrm{H}_{3} \mathrm{O}^{+}}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})
$$ hydronium ion (hydrated proton)

*Also written as: $\mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$

## Bronsted-Lowry Acid and Base Work Together

- An acid and base must always work together to transfer a proton!

In aqueous solutions of acids or bases, water acts as the base or acid "partner":
$-\mathrm{HCl}+\underline{\mathrm{H}_{2} \mathrm{O}} \rightarrow \mathrm{Cl}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \quad\left(\mathrm{HCl} \rightarrow \mathrm{Cl}^{-}+\mathrm{H}^{+}\right)$ acid base
$-\underset{\text { base }}{ } \mathrm{NH}_{3}+\frac{\mathrm{H}_{2} \mathrm{O}}{\text { acid }} \rightarrow \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-} \quad\left(\mathrm{NH}_{3} \rightarrow \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-}\right)$

## Acid-Base Reactions Don't Have to Involve Water

- A Bronsted-Lowry acid-base reaction does not always occur in water.

## List of Common Acids and Bases

| Strong Acids | Strong Bases: |
| :---: | :---: |
| HCl hydrochloric acid | Metal Hydroxides of |
| HBr hydrobromic acid | Group 1A cations |
| $\mathrm{HI} \quad$ hydroiodic acid | LiOH, $\mathrm{NaOH}, \mathrm{KOH}$, etc. |
| $\mathrm{HNO}_{3}$ nitric acid | and |
| $\mathrm{H}_{2} \mathrm{SO}_{4} \quad$ sulfuric acid | Heavier Group 2A cations: |
| $\mathrm{HClO}_{4}$ perchloric acid | $\mathrm{Ca}(\mathrm{OH})_{2}, \mathrm{Sr}(\mathrm{OH})_{2}, \mathrm{Ba}(\mathrm{OH})_{2}$ |
| Common Weak Acids | Common Weak Base |
| $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \text { or } \mathrm{CH}_{3} \mathrm{COOH}$ <br> acetic acid | $\mathrm{NH}_{3}$ ammonia |
| $\mathrm{H}_{2} \mathrm{CO}_{3}$ carbonic acid |  |

## Conjugate Acid-Base Pairs

## 

## Conjugate Acid-Base Pair

Conjugate acid-base pair: two substances whose formulas differ by only a hydrogen ion

- $\mathrm{NH}_{3}$ and $\mathrm{NH}_{4}^{+}$are a conjugate acid-base pair.
- $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{OH}^{-}$are a conjugate acid-base pair.

## Conjugate Acid-Base Pair

- $\mathrm{H}_{2} \mathrm{SO}_{4}$ and $\mathrm{HSO}_{4}^{-}$are a conjugate acid-base pair.
- $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{H}_{3} \mathrm{O}^{+}$are a conjugate acid-base pair.

## Conjugate Acid-Base Pair

## Example Problems

Which of the following represent conjugate acidbase pairs?
a. HF, F-
b. $\mathrm{NH}_{4}{ }^{+}, \mathrm{NH}_{3}$
c. $\mathrm{HCl}, \mathrm{H}_{2} \mathrm{O}$
d. $\mathrm{HClO}_{4}, \mathrm{ClO}_{4}^{-} \quad \checkmark$
e. $\mathrm{HCl}, \mathrm{ClO}^{-}$
f. $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}, \mathrm{HPO}_{4}{ }^{2-}$
g. $\mathrm{HNO}_{3}, \mathrm{NO}_{3}^{-}$

Reactions of Acids and Bases

## 

## Acid-Base Reaction: Neutralization

Neutralization: a reaction in which an acid and base react quantitatively with each other

## Acid-Base Reaction: Acid + Strong Base

When an acid and a strong base (metal hydroxide) react, they form water and a salt (ionic compound).

- $\mathrm{HCl}(\mathrm{aq})+\mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{NaCl}(\mathrm{aq})$

Net ionic eqn: $\mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$

## Acid-Base Reaction: Gas-Forming

When an acid and a bicarbonate $\left(\mathrm{HCO}_{3}^{-}\right)$or carbonate $\left(\mathrm{CO}_{3}{ }^{2-}\right)$ react, water and gas are formed.

- $\mathrm{HCl}(\mathrm{aq})+\mathrm{KHCO}_{3}(\mathrm{aq}) \rightarrow \mathrm{KCl}(\mathrm{aq})+\left[\mathrm{H}_{2} \mathrm{CO}_{3}(a q)\right] \rightarrow$

$$
\mathrm{KCl}+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

$$
\mathrm{H}^{+}(\mathrm{aq})+\mathrm{HCO}_{3}^{-}(\mathrm{aq}) \rightarrow\left[\mathrm{H}_{2} \mathrm{CO}_{3}(\mathrm{aq})\right] \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

- $2 \mathrm{HCl}(\mathrm{aq})+\mathrm{K}_{2} \mathrm{CO}_{3}(a q) \rightarrow 2 \mathrm{KCl}(\mathrm{aq})+\left[\mathrm{H}_{2} \mathrm{CO}_{3}(a q)\right] \rightarrow$

$$
2 \mathrm{KCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

$$
2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{CO}_{3}^{2-}(a q) \rightarrow\left[\mathrm{H}_{2} \mathrm{CO}_{3}(a q)\right] \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

## Reaction of Acids with Metals (Redox Rxn)

- Acids dissolve many metals: Acids oxidize metals, causing metals to go into solution.
- $2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Mg}(\mathrm{s}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+\mathrm{MgCl}_{2}(\mathrm{aq})$ acid metal $\mathrm{H}_{2}$ gas salt
- $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{Zn}(\mathrm{s}) \rightarrow \mathrm{H}_{2}(\mathrm{~g})+\mathrm{ZnSO}_{4}(\mathrm{aq})$
acid metal $\mathrm{H}_{2}$ gas salt

## Titration

- Titration: Determination of the concentration of a solution with an unknown concentration (analyte) by combining it with a standard solution of known concentration (titrant).

## Acid-Base Titration

- Equivalence point: the point where enough titrant has been added to react exactly with the analyte present

## mole $\mathrm{H}^{+}=$mole $\mathrm{OH}^{-}$

- Indicator for acid-base titration: Compound whose color is different in acid than in base
- Endpoint: the point at which the indicator's signal is triggered (The endpoint may or may not come exactly at equivalence point).

## Acid-Base Titration

## $\mathrm{CH}_{3} \mathrm{COOH}(a q)+\mathrm{NaOH}(a q) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{Na}^{+}(a q)+\mathrm{CH}_{3} \mathrm{COO}^{-}(a q)$

## Acid-Base Titration

- Acid-base titration problems are stoichiometry problems (solution stoichiometry).

Acid Strength

## VCIq 2rueuatip

## Acid Strength

- Strong acid: Completely ionized (dissociated).

$$
\mathrm{HCl}(a q) \longrightarrow \mathrm{H}^{+}(a q)+\mathrm{Cl}^{-}(a q)
$$

- Weak acid: Most of the acid molecules remain intact.
$\mathrm{CH}_{3} \mathrm{COOH}(a q) \rightarrow \mathrm{H}^{+}(a q)+\mathrm{CH}_{3} \mathrm{COO}^{-}(a q)$ equilibrium arrow

## Acid Strength

## The contents of the solution

## Strong acid:

 A strong acid is completely dissociated.

> Weak acid: In contrast, only a small fraction of the molecules of a weak acid are dissociated.

## Strong Acid Solutions

- Strong acids ionize completely:

$$
\mathrm{HCl} \rightarrow \mathrm{H}^{+}+\mathrm{Cl}^{-}
$$

So: $\underline{0.01 \mathrm{M} \mathrm{HCl}} \rightarrow \underline{0.01 \mathrm{M} \mathrm{H}^{+}}+\underline{0.01 \mathrm{M} \mathrm{Cl}^{-}}$

$$
\underline{0.5 \mathrm{M} \mathrm{HCl}} \rightarrow \quad \underline{0.5 \mathrm{M} \mathrm{H}^{+}}+\underline{0.5 \mathrm{M} \mathrm{Cl}^{-}}
$$

- Weak acids do not ionize completely:

## Acids as Electrolytes

Electrolyte: a solution of free ions, conducts electricity

Weak acid Weak electrolyte

Strong acid
Strong electrolyte

## List of Common Acids and Bases

| Strong Acids | Strong Bases: |
| :---: | :---: |
| HCl hydrochloric acid | Metal Hydroxides of |
| HBr hydrobromic acid | Group 1A cations |
| $\mathrm{HI} \quad$ hydroiodic acid | LiOH, $\mathrm{NaOH}, \mathrm{KOH}$, etc. |
| $\mathrm{HNO}_{3}$ nitric acid | and |
| $\mathrm{H}_{2} \mathrm{SO}_{4} \quad$ sulfuric acid | Heavier Group 2A cations: |
| $\mathrm{HClO}_{4}$ perchloric acid | $\mathrm{Ca}(\mathrm{OH})_{2}, \mathrm{Sr}(\mathrm{OH})_{2}, \mathrm{Ba}(\mathrm{OH})_{2}$ |
| Common Weak Acids | Common Weak Base |
| $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \text { or } \mathrm{CH}_{3} \mathrm{COOH}$ <br> acetic acid | $\mathrm{NH}_{3}$ ammonia |
| $\mathrm{H}_{2} \mathrm{CO}_{3}$ carbonic acid |  |

## Some Weak Acids and Weak Bases

## TABLE 14.4 Weak Acids

```
hydrofluoric sulfurous acid ( }\mp@subsup{\textrm{H}}{2}{}\mp@subsup{\textrm{SO}}{3}{}
    acid (HF) (diprotic)
acetic acid carbonic acid ( }\mp@subsup{\textrm{H}}{2}{}\mp@subsup{\textrm{CO}}{3}{}
    (HC2}\mp@subsup{\textrm{H}}{3}{}\mp@subsup{\textrm{O}}{2}{})\quad\mathrm{ (diprotic)
formic acid phosphoric acid ( }\mp@subsup{\textrm{H}}{3}{}\mp@subsup{\textrm{PO}}{4}{}\mathrm{ )
    (HCHO}) (triprotic
```

## TABLE 14.6 Some Weak Bases

$$
\begin{array}{ll}
\text { Base } & \text { Ionization Reaction } \\
\text { ammonia }\left(\mathrm{NH}_{3}\right) & \mathrm{NH}_{3}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{NH}_{4}^{+}(a q)+\mathrm{OH}^{-}(a q) \\
\text { pyridine }\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}\right) & \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}(a q)+\mathrm{H}_{2} \mathrm{O}(I) \rightleftharpoons \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NH}^{+}(a q)+\mathrm{OH}^{-}(a q) \\
\text { methylamine }\left(\mathrm{CH}_{3} \mathrm{NH}_{2}\right) & \mathrm{CH}_{3} \mathrm{NH}_{2}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{CH}_{3} \mathrm{NH}_{3}{ }^{+}(a q)+\mathrm{OH}^{-}(a q) \\
\text { ethylamine }\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}\right) & \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}(a q)+\mathrm{H}_{2} \mathrm{O}(I) \rightleftharpoons \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{3}^{+}(a q)+\mathrm{OH}^{-}(a q) \\
\text { bicarbonate ion }\left(\mathrm{HCO}_{3}^{-}\right)^{*} & \mathrm{HCO}_{3}^{-}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})
\end{array}
$$

# Ion-Product Constant for Water 

## |OU-bloqncf COUZזSUf tou MSfGL

## Water as an Acid and Base

- Water is amphoteric: can react as either an acid or base
- Water undergoes auto-ionization: $\mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}$
- For pure water, $25^{\circ} \mathrm{C}:\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-7} \mathrm{M}$
- Ion-product constant for water $\left(\mathrm{K}_{\mathrm{w}}\right)$

$$
\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-14} \text { at } 25^{\circ} \mathrm{C}
$$

*True for pure water and all aqueous solutions!

## Relationship between $\left[\mathrm{H}^{+}\right]$and $\left[\mathrm{OH}^{-}\right]$

We can relate $\left[\mathrm{H}^{+}\right]$and $\left[\mathrm{OH}^{-}\right]$through $\mathrm{K}_{\mathrm{w}}$ :

$$
K_{\mathrm{w}}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-14}
$$

for water and all aqueous solutions

## Definitions: Neutral, Acidic, Basic

- Neutral solution: $\left[\mathrm{H}^{+}\right]=\left[\mathrm{OH}^{-}\right]$
- Acidic solution: $\left[\mathrm{H}^{+}\right]>\left[\mathrm{OH}^{-}\right]$
- Basic solution: $\left[\mathrm{H}^{+}\right]<\left[\mathrm{OH}^{-}\right]$

In each case, however,

$$
\mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-14}
$$

for water and all aqueous solutions
pH and pOH

## bH suq bOH

## The pH Scale

$$
\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]
$$

- A compact way to represent solution acidity.

$$
\text { eg. } \mathrm{pH}=-\log \left(1.0 \times 10^{-7} \mathrm{M}\right)=7
$$

## Logarithmic Function

$$
\begin{array}{lll}
\mathrm{y}=\log \mathrm{x} & \rightarrow & 10^{\mathrm{y}}=\mathrm{x} \\
\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] & & \\
-\mathrm{pH}=\log \left[\mathrm{H}^{+}\right] & \rightarrow & 10^{-\mathrm{pH}}=\left[\mathrm{H}^{+}\right]
\end{array}
$$

- As $\left[\mathrm{H}^{+}\right]$increases, pH decreases.

## pH Range

pH 7
$\left[\mathrm{H}^{+}\right]=\left[\mathrm{OH}^{-}\right]$
Neutral $\mathrm{pH}<7$
$\left[\mathrm{H}^{+}\right]>\left[\mathrm{OH}^{-}\right]$
Acidic $\mathrm{pH}>7$
$\left[\mathrm{H}^{+}\right]<\left[\mathrm{OH}^{-}\right]$
Basic

- Lower the pH , more acidic the solution.
- Higher the pH , more basic the solution.

## pH Range

$$
10^{-\mathrm{pH}}=\left[\mathrm{H}^{+}\right]
$$

## Every time pH drops by 1 , there is $10 x$ increase in $\left[\mathrm{H}^{+}\right]$.

## Calculating pH and $\left[\mathrm{H}^{+}\right]$

- To get pH from $\left[\mathrm{H}^{+}\right]$: $\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]$
- To get $\left[\mathrm{H}^{+}\right]$from $\mathrm{pH}:$
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]$
$-\mathrm{pH}=\log \left[\mathrm{H}^{+}\right]$
Inverse $\log (-\mathrm{pH})=$ inverse $\log \left(\log \left[\mathrm{H}^{+}\right]\right)$
Inverse log $(-\mathrm{pH})=\left[\mathrm{H}^{+}\right]$
OR $10-\mathrm{pH}=\left[\mathrm{H}^{+}\right]$

## pOH

$$
\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]
$$

## Calculating pOH and $\left[\mathrm{OH}^{-}\right.$]

- To get pOH from $\left[\mathrm{OH}^{-}\right]:$ $\mathrm{pH}=-\log \left[\mathrm{OH}^{-}\right]$
- To get $\left[\mathrm{OH}^{-}\right]$from pOH :

Inverse $\log (-\mathrm{pOH})=\left[\mathrm{OH}^{-}\right]$
OR $10^{-\mathrm{pOH}}=\left[\mathrm{OH}^{-}\right]$

## Relationship Between pH and pOH

$$
\begin{aligned}
& 1.0 \times 10^{-14}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right] \\
& \log 1.0 \times 10^{-14}=\log \left[\mathrm{H}^{+}\right]+\log \left[\mathrm{OH}^{-}\right]
\end{aligned}
$$

$$
-14.00=-\log \left[\mathrm{H}^{+}\right]-\log \left[\mathrm{OH}^{-}\right]
$$

$$
14.00=\log \left[\mathrm{H}^{+}\right]+\log \left[\mathrm{OH}^{-}\right]
$$

## $14.00=\mathrm{pH}+\mathrm{pOH}$

## Equations for pH Calculation Problems

$$
\begin{array}{ll}
\text { 1. } \mathrm{pH}=-\log \left[\mathrm{H}^{+}\right] & \text {(analogous for } \mathrm{pOH}) \\
\text { 2. } \operatorname{Inv} \log [-\mathrm{pH}]=\left[\mathrm{H}^{+}\right] & \text {(analogous for }\left[\mathrm{OH}^{-}\right] \text {) } \\
\text { 3. } 1.0 \times 10^{-14}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right] \\
\text {4. } 14.00=\mathrm{pH}+\mathrm{pOH}
\end{array}
$$

## Determining pH in Laboratory

## Buffers

## BกItGİ

## Buffers

- Buffer: a solution that contains both an acid and a base, thus resists pH change
- Buffers contain significant amounts of both a weak acid and its conjugate base.
- The weak acid neutralizes added base. The conjugate base neutralizes added acid.
- Eg. of buffer: $\mathrm{CH}_{3} \mathrm{COOH}$ and $\mathrm{CH}_{3} \mathrm{COO}^{-}$
$\left(\mathrm{CH}_{3} \mathrm{COO}\right.$ comes from $\left.\mathrm{NaCH}_{3} \mathrm{COO}\right)$

## Water vs. Buffer
