Chapter 6:
Mechanical Properties II

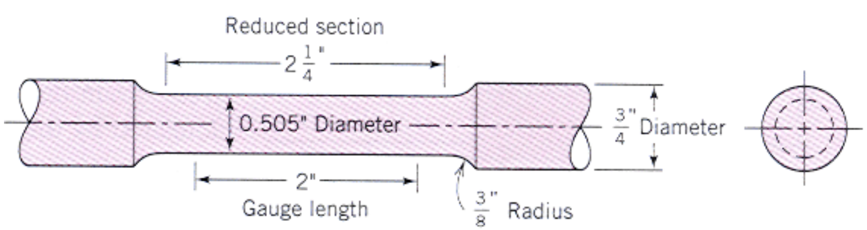
Outline

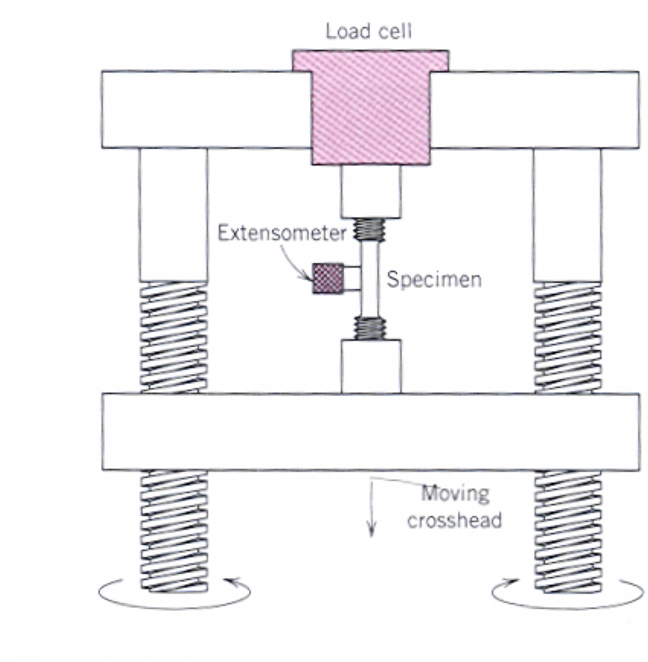
- Elastic recovery during plastic deformation
- Compressive, shear, and torsional deformation
- Hardness
- Variability of material properties
- Design/safety factors

Concepts of stress and strain

- **Tension tests**
  - **engineering stress** $$\sigma = \frac{F}{A_0}$$
  - **engineering strain**

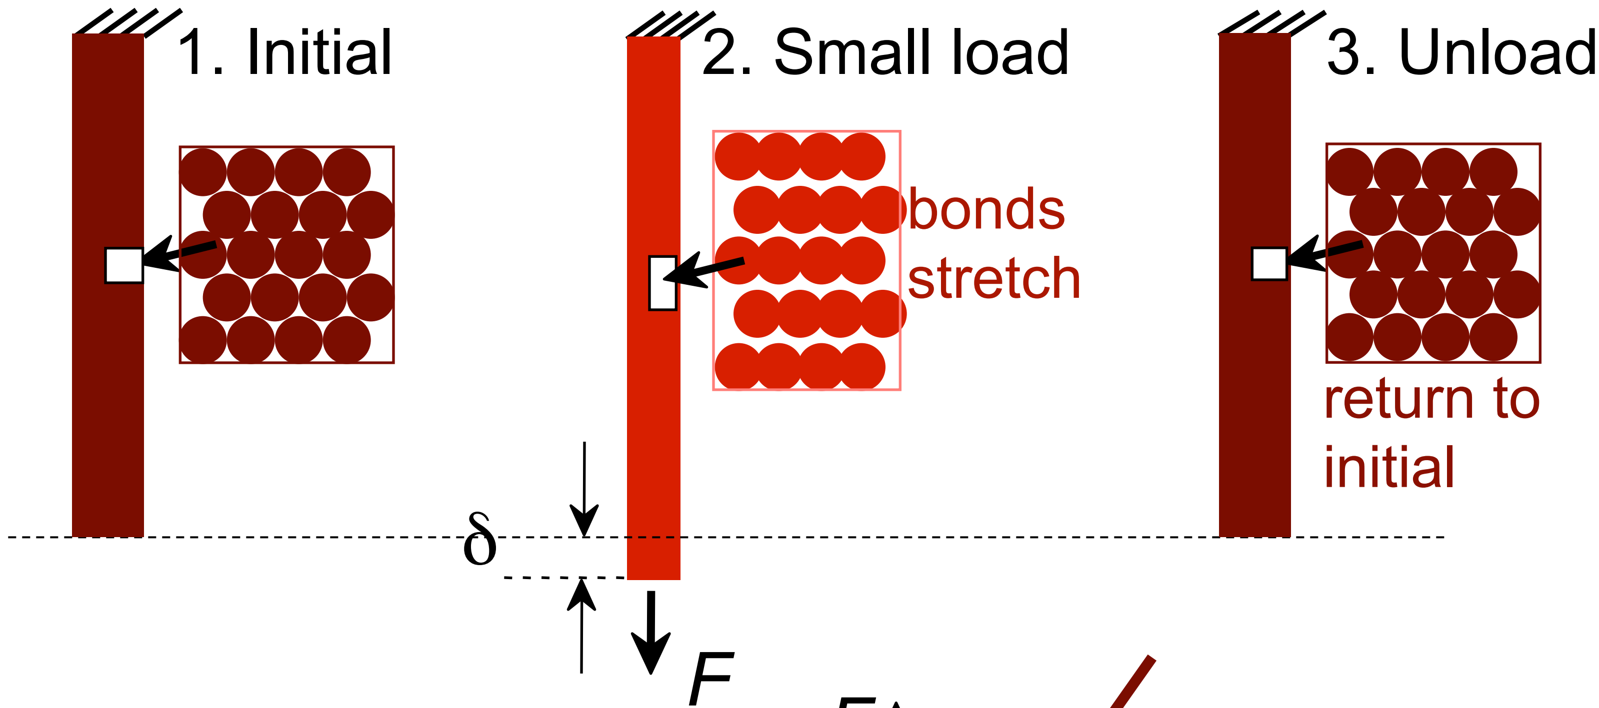
$$\varepsilon = \frac{l_i - l_0}{l_0} = \frac{\Delta l}{l_0}$$



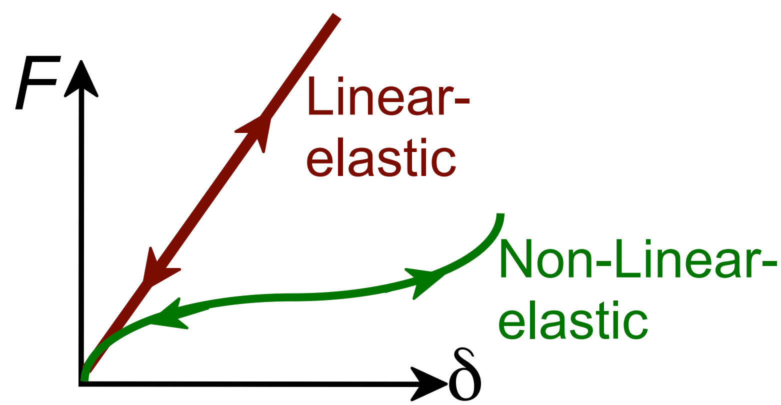


- **Compression tests**

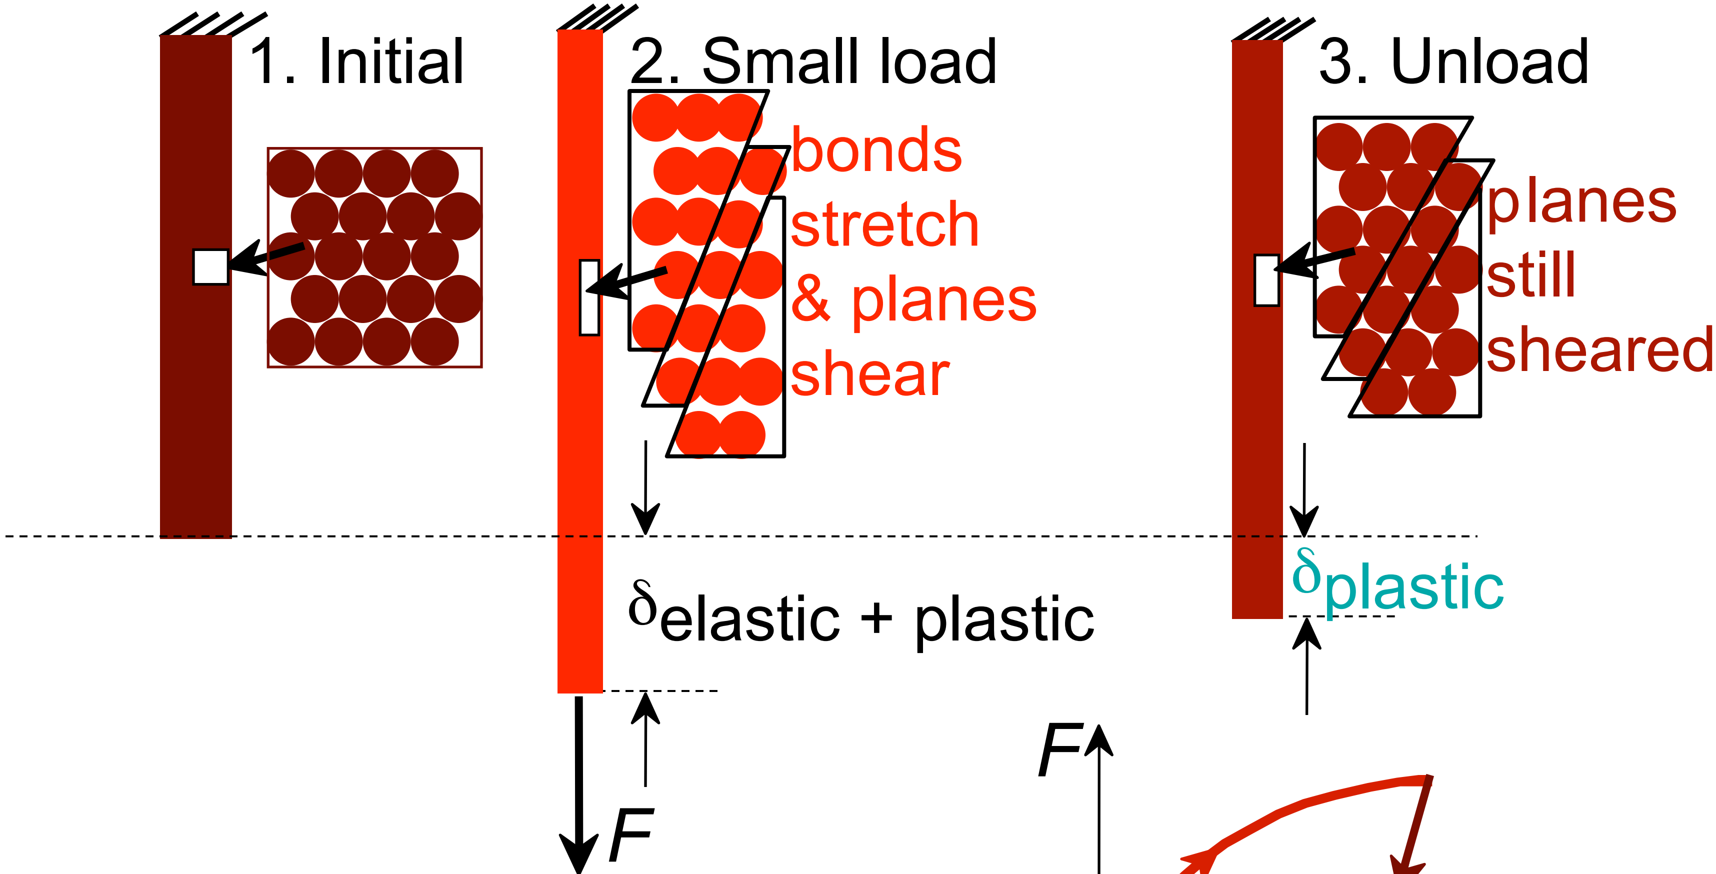
Elastic Deformation



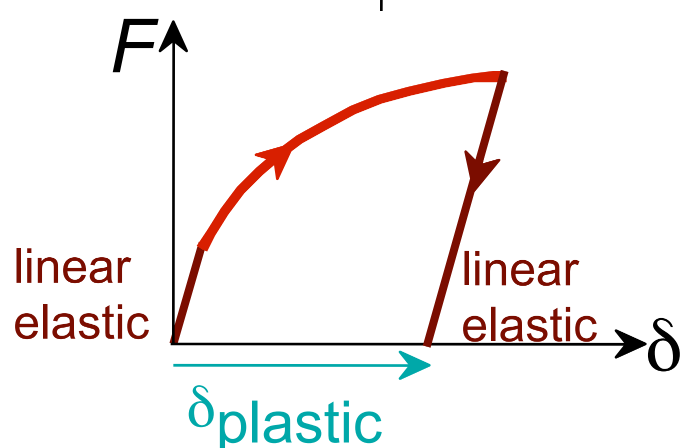
Elastic means reversible!



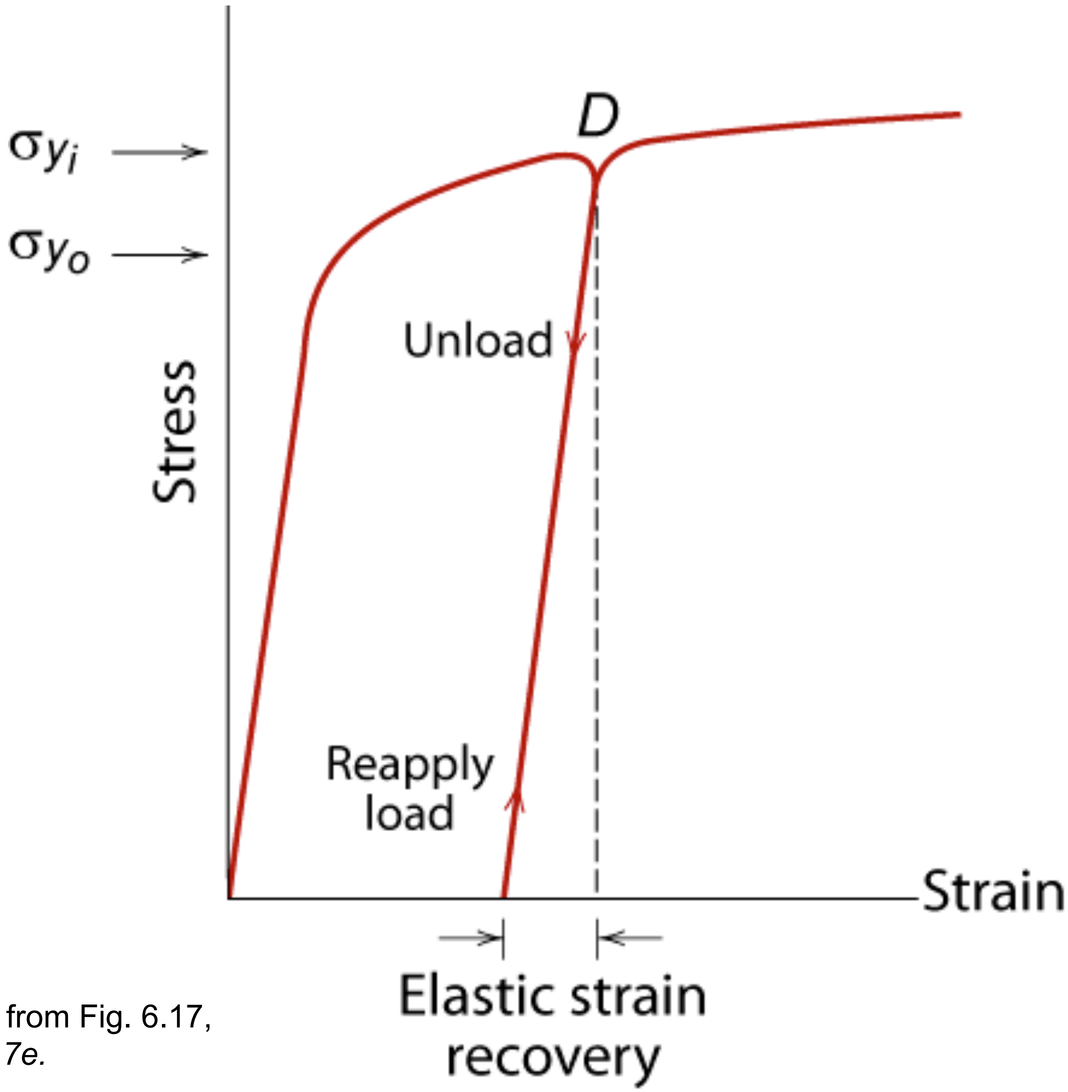
Plastic Deformation (Metals)



Plastic means permanent!



Elastic Strain Recovery

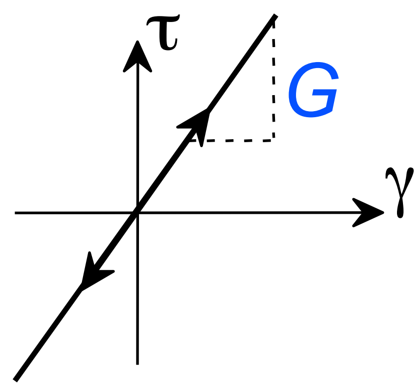


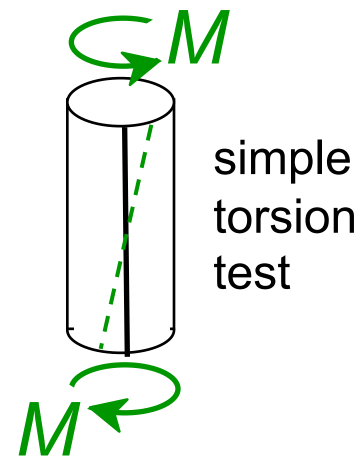
Adapted from Fig. 6.17,
Callister 7e.

Other Elastic Properties

- **Elastic Shear modulus, *G*:**

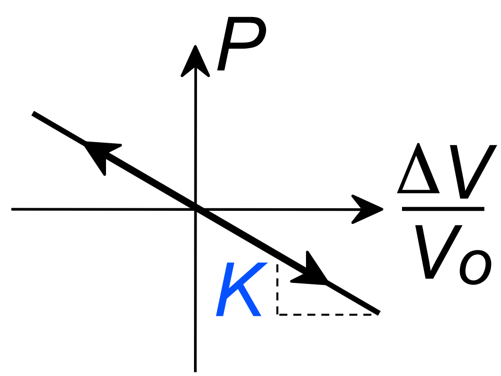
$$\tau = G\,\gamma$$

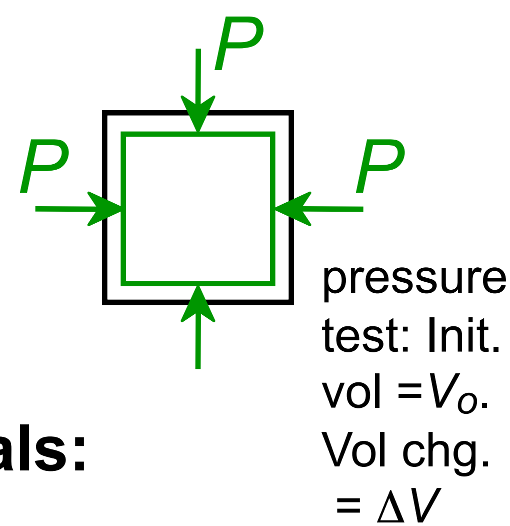




- **Elastic Bulk modulus, K:**

$$P = -K\frac{\Delta V}{V_o}$$





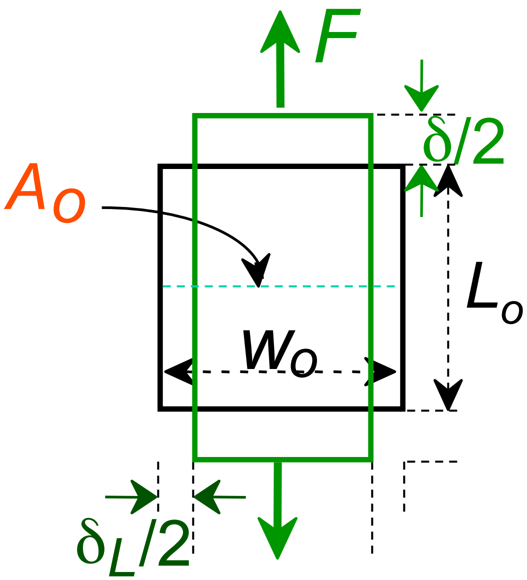
- **Special relations for isotropic materials:**

$$G = \frac{E}{2(1+\nu)} \qquad K = \frac{E}{3(1-2\nu)}$$

Useful Linear Elastic Relationships

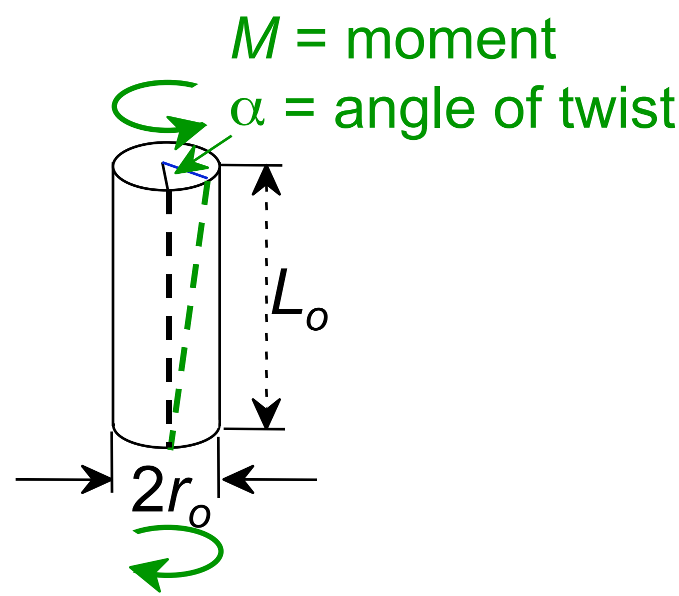
- **Simple tension:**

$$\delta = \frac{FL_o}{EA_o} \qquad \delta_L = -\nu \frac{Fw_o}{EA_o}$$



- **Simple torsion:**

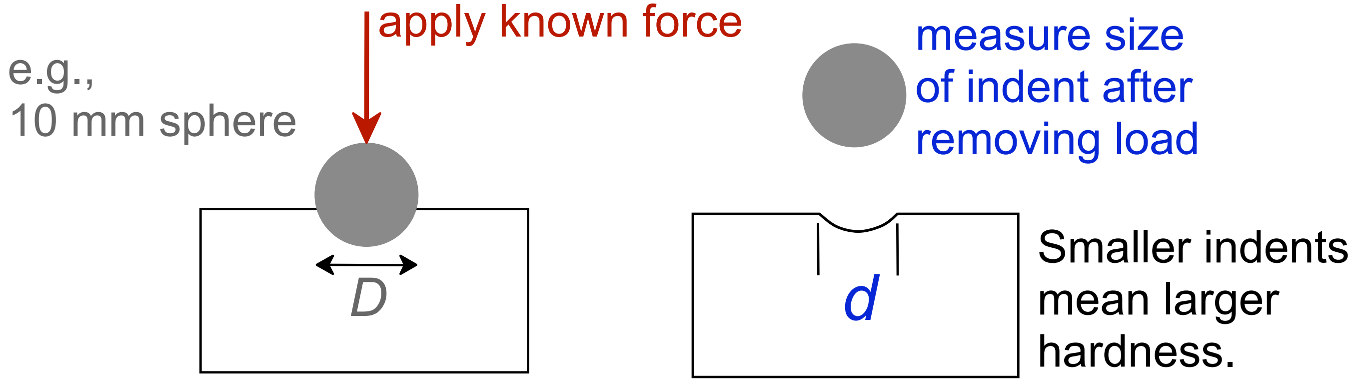
$$\alpha = \frac{2ML_o}{\pi r_o^4 G}$$

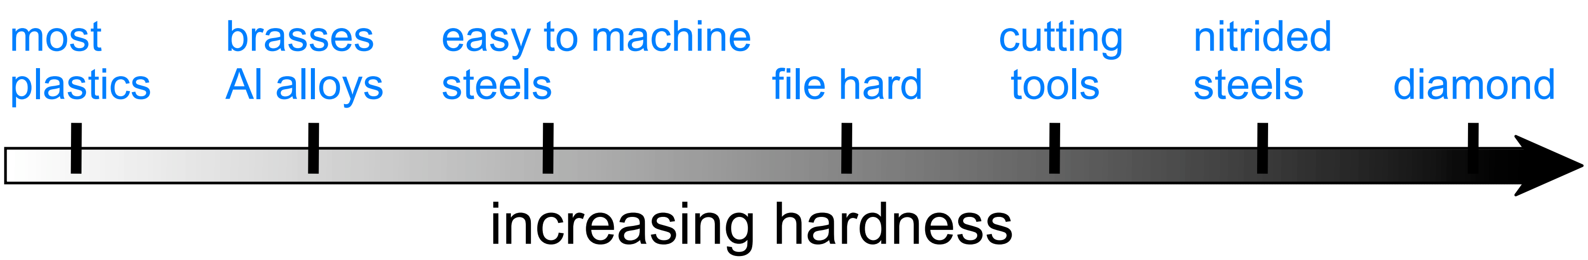


- Material, geometric, and loading parameters all contribute to deflection.
- Larger elastic moduli minimize elastic deflection.

Hardness

- Resistance to permanently indenting the surface.
- Large hardness means:
  --resistance to plastic deformation or cracking in compression.
  --better wear properties.





Hardness: Measurement

- Rockwell
  - No major sample damage
  - Each scale runs to 130 but only useful in range 20-100.
  - Minor load 10 kg
  - Major load 60 (A), 100 (B) & 150 (C) kg
    - A = diamond, B = 1/16 in. ball, C = diamond

- HB = Brinell Hardness
  - *TS* (psia) = 500 x HB
  - *TS* (MPa) = 3.45 x HB

Hardness: Measurement

Table 6.5 **Hardness Testing Techniques**

		Shape of Indentation			
Test	***Indenter***	***Side View***	***Top View***	***Load***	***Formula for Hardness Number***[a]
Brinell	10-mm sphere of steel or tungsten carbide			P	$HB = \frac{2P}{\pi D[D - \sqrt{D^2 - d^2}]}$
Vickers microhardness	Diamond pyramid			P	$HV = 1.854P/d_1^2$
Knoop microhardness	Diamond pyramid			P	$HK = 14.2P/l^2$
Rockwell and Superficial Rockwell	{ Diamond cone $\frac{1}{16}$, $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{2}$ in. diameter steel spheres			60 kg 100 kg } Rockwell 150 kg 15 kg 30 kg } Superficial Rockwell 45 kg	

[a] For the hardness formulas given, P (the applied load) is in kg, while D, d, d_1, and l are all in mm.

Hardness tests (*continued*)

- **Rockwell and superficial rockwell**
- **20<hardness<100**

Table 6.5a Rockwell Hardness Scales

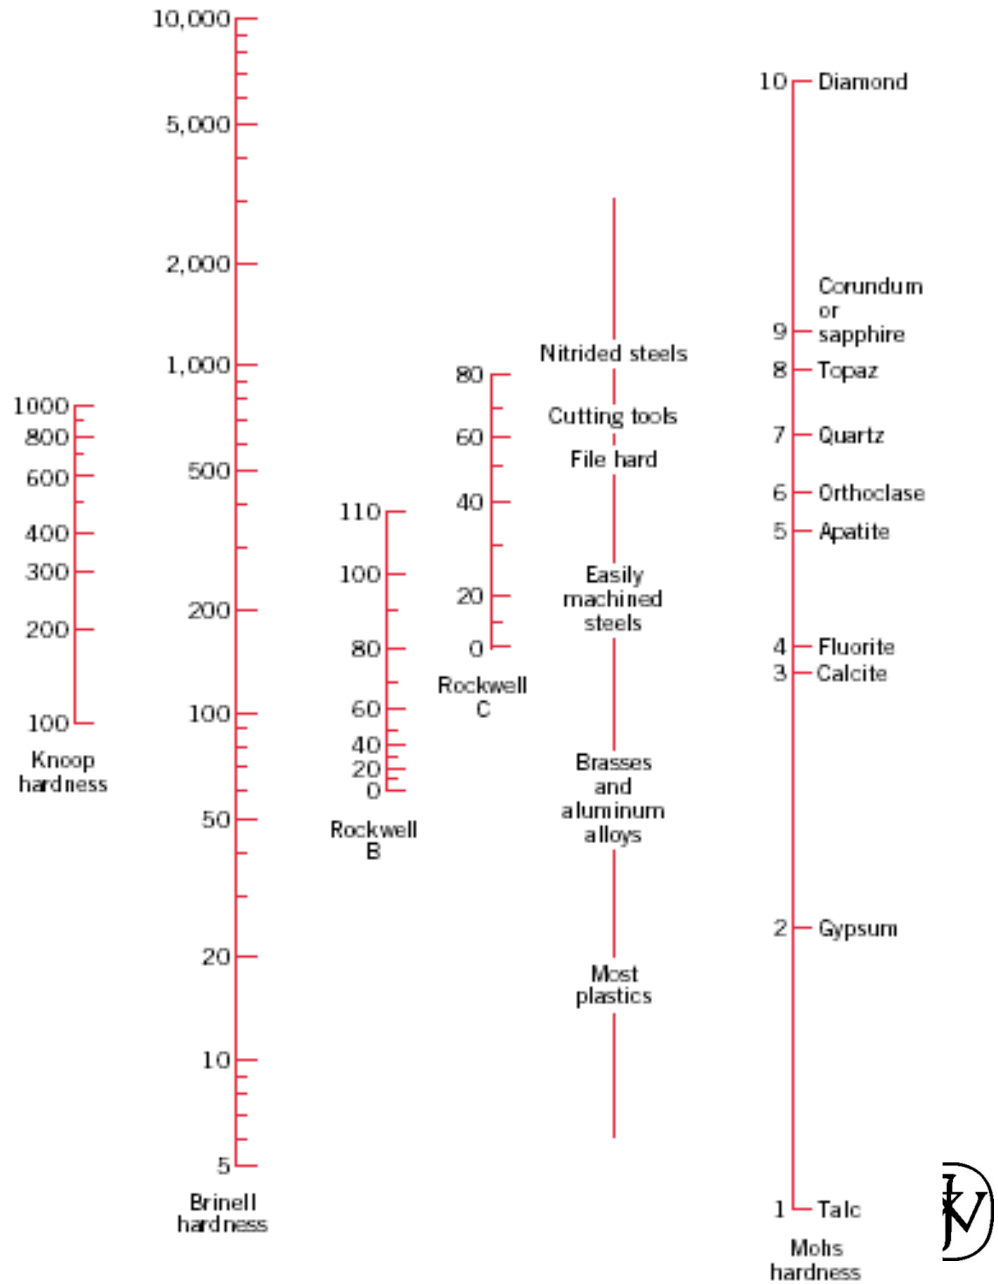
Scale Symbol	*Indenter*	*Major Load (kg)*
A	Diamond	60
B	$\frac{1}{16}$ in. ball	100
C	Diamond	150
D	Diamond	100
E	$\frac{1}{8}$ in. ball	100
F	$\frac{1}{16}$ in. ball	60
G	$\frac{1}{16}$ in. ball	150
H	$\frac{1}{8}$ in. ball	60
K	$\frac{1}{8}$ in. ball	150

Table 6.5b Superficial Rockwell Hardness Scales

Scale Symbol	*Indenter*	*Major Load (kg)*
15N	Diamond	15
30N	Diamond	30
45N	Diamond	45
15T	$\frac{1}{16}$ in. ball	15
30T	$\frac{1}{16}$ in. ball	30
45T	$\frac{1}{16}$ in. ball	45
15W	$\frac{1}{8}$ in. ball	15
30W	$\frac{1}{8}$ in. ball	30
45W	$\frac{1}{8}$ in. ball	45

Hardness tests

- **Brinell: 10-mm sphere of steel or tungsten carbide**
- **Knoop and Vickers microhardness**
- **Hardness conversion**

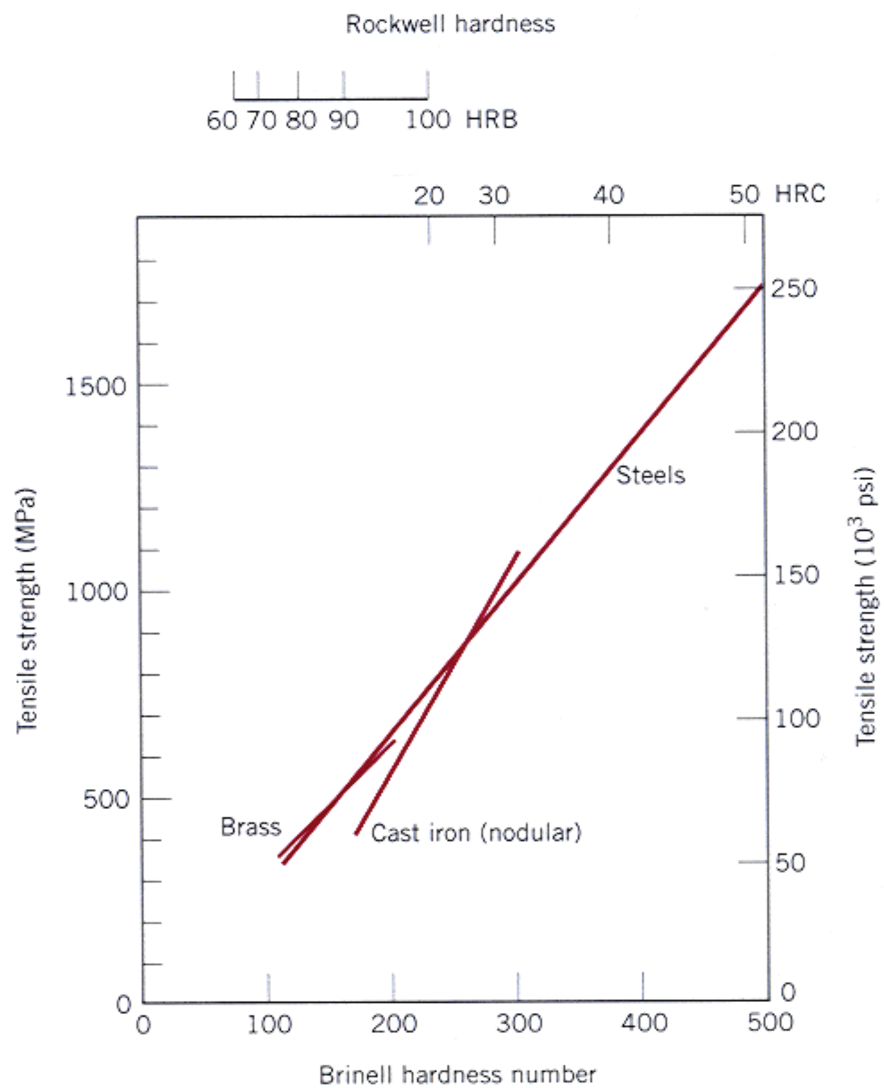


Correlation between hardness and tensile strength

- **Relations between hardness and tensile strength for steel, brass, and cast iron.**
- **For most steels:**

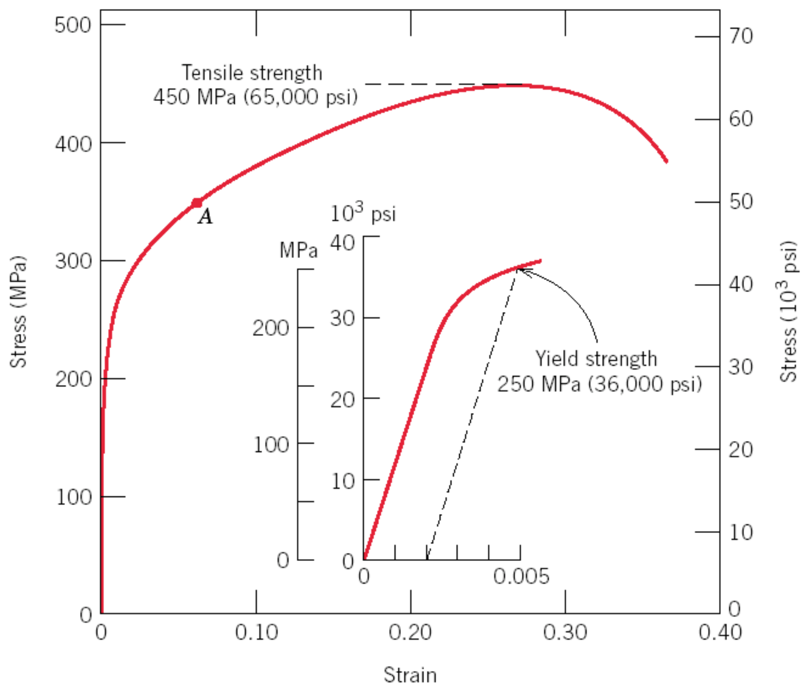
  TS (MPa)=3.45xHB

  TS (psi)=500xHB



Example

- **Estimate the Brinell and Rockwell hardness for brass**



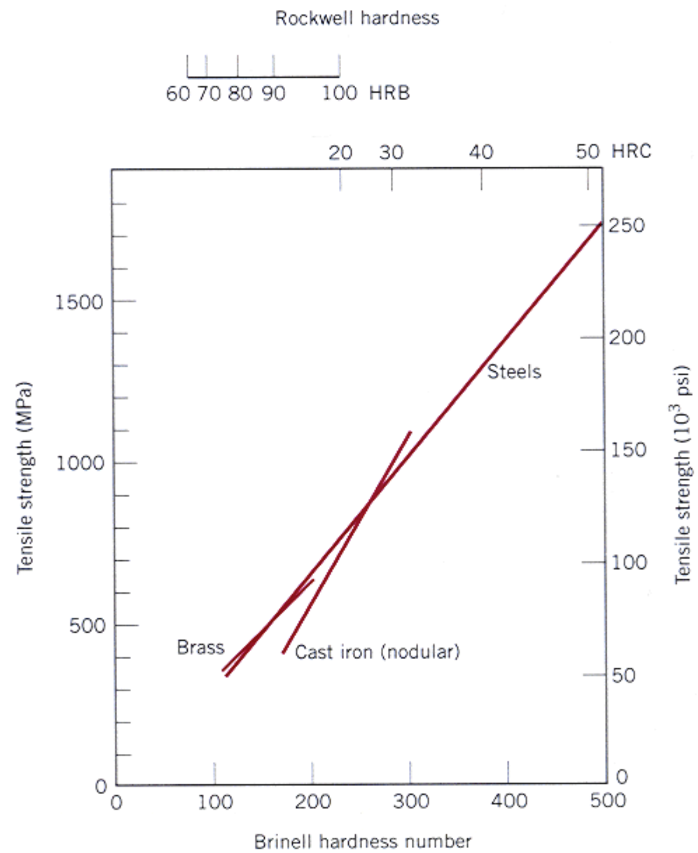


FIGURE 6.12 The stress–strain behavior for the brass specimen

Errors and Measurements (lab)

Error in a scientific measurement usually does not mean a mistake or blunder. Instead, the terms "error" and "uncertainty" both refer to unavoidable imprecision in measurements.

Error analysis may seem tedious; however, without proper error analysis, no valid scientific conclusions can be drawn.

Variability in Material Properties

- Elastic modulus is material property
- Critical properties depend largely on sample flaws (defects, etc.). Large sample to sample variability.
- Statistics
  - Mean

$$\overline{x} = \frac{\sum^{n} x_n}{n}$$

  - Standard Deviation

$$s = \left[\frac{\sum^{n} (x_i - \overline{x})^2}{n-1} \right]^{\frac{1}{2}}$$

where *n* is the number of data points

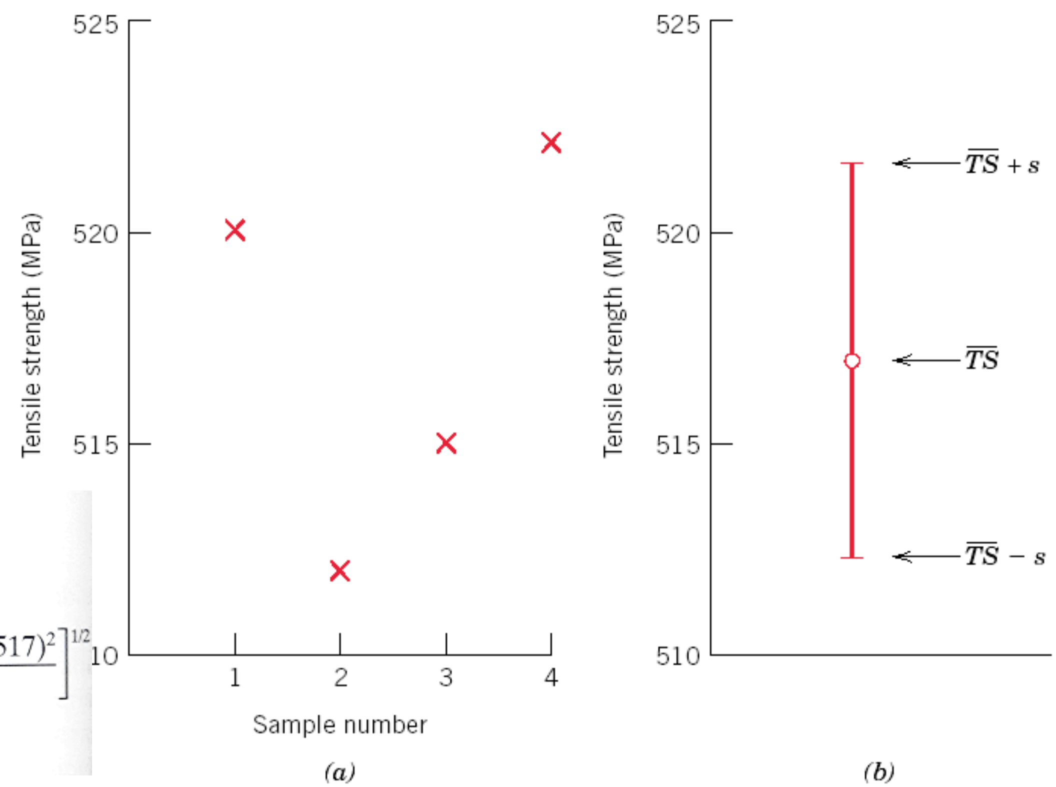
Example

- **Determine the average and standard deviation of tensile strength**

Sample Number	Tensile Strength (MPa)
1	520
2	512
3	515
4	522

$$\overline{TS} = \frac{\sum_{i=1}^{4} (TS)_i}{4} = \frac{520 + 512 + 515 + 522}{4} = 517 \text{ MPa}$$

$$s = \left[\frac{\sum_{i=1}^{4} \{(TS)_i - \overline{TS}\}^2}{4 - 1} \right]^{1/2} = \left[\frac{(520 - 517)^2 + (512 - 517)^2 + (515 - 517)^2 + (522 - 517)^2}{4 - 1} \right]^{1/2} = 4.6 \text{ MPa}$$



Design or Safety Factors

- Design uncertainties mean we do not push the limit.
- Factor of safety, *N*

$$\sigma_{working} = \frac{\sigma_y}{N}$$

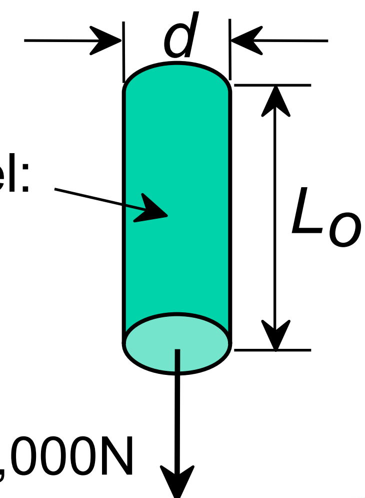
Often *N* is between 1.2 and 4

- Example: Calculate a diameter, *d*, to ensure that yield does not occur in the 1045 carbon steel rod below. Use a factor of safety of 5.

$$\sigma_{working} = \frac{\sigma_y}{N}$$

$$\frac{220{,}000N}{\pi\left(d^2/4\right)} \qquad 5$$

1045 plain carbon steel:
σ_y = 310 MPa
TS = 565 MPa



F = 220,000N

d = 0.067 m = 6.7 cm

Summary

- Stress and strain: These are size-independent measures of load and displacement, respectively.
- Elastic behavior: This reversible behavior often shows a linear relation between stress and strain. To minimize deformation, select a material with a large elastic modulus (*E* or *G*).
- Plastic behavior: This permanent deformation behavior occurs when the tensile (or compressive) uniaxial stress reaches σ_y.
- Toughness: The energy needed to break a unit volume of material.
- Ductility: The plastic strain at failure.
- Hardness: Resistance to permanently indenting the surface.
- Safety: Design uncertainties mean we do not push the limit
