

## Global Warming

- Scientists have measured an average $0.6^{\circ} \mathrm{C}$ rise in atmospheric temperature since 1860 .
- During the same period atmospheric $\mathrm{CO}_{2}$ levels have risen $25 \%$.
- Are the two trends causal?

## The Source of Increased $\mathrm{CO}_{2}$

- The primary source of the increased $\mathrm{CO}_{2}$ levels are combustion reactions of fossil fuels we use to get energy.
$\checkmark 1860$ corresponds to the beginning of the Industrial Revolution in the U.S. and Europe.

$$
\mathrm{CH}_{4}(g)+2 \mathrm{O}_{2}(g) \rightarrow \mathrm{CO}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(g) \quad 2 \mathrm{C}_{8} \mathrm{H}_{18}(\mathrm{l})+25 \mathrm{O}_{2}(g) \rightarrow 16 \mathrm{CO}_{2}(g)+18 \mathrm{H}_{2} \mathrm{O}(g)
$$

## Quantities in Chemical Reactions

- The amount of every substance used and made in a chemical reaction is related to the amounts of all the other substances in the reaction.
$\checkmark$ Law of Conservation of Mass.
$\checkmark$ Balancing equations by balancing atoms.
- The study of the numerical relationship between chemical quantities in a chemical reaction is called stoichiometry.

## Making Pancakes

- The number of pancakes you can make depends on the amount of the ingredients you use.

1 cup flour +2 eggs $+1 / 2$ tsp baking powder $\rightarrow 5$ pancakes

- This relationship can be expressed mathematically. 1 cup flour $\equiv 2$ eggs $\equiv 1 / 2$ tsp baking powder $\equiv 5$ pancakes

## Making Pancakes, Continued

- If you want to make more or less than 5 pancakes, you can use the number of eggs you have to determine the number of pancakes you can make.
$\checkmark$ Assuming you have enough flour and baking powder.

8 eggs $\times \frac{5 \text { pancakes }}{2 \text { eggs }}=20$ pancakes
8 eggs

# Making Molecules Mole-to-Mole Conversions 

- The balanced equation is the "recipe" for a chemical reaction.
- The equation $3 \mathrm{H}_{2}(g)+\mathrm{N}_{2}(g) \rightarrow 2 \mathrm{NH}_{3}(g)$ tells us that 3 molecules of $\mathrm{H}_{2}$ react with exactly 1 molecule of $\mathrm{N}_{2}$ and make exactly 2 molecules of $\mathrm{NH}_{3}$ or: 3 molecules $\mathrm{H}_{2} \equiv 1$ molecule $\mathrm{N}_{2} \equiv 2$ molecules $\mathrm{NH}_{3}$
- Since we count molecules by moles:

3 moles $\mathrm{H}_{2} \equiv 1$ mole $\mathrm{N}_{2} \equiv 2$ moles $\mathrm{NH}_{3}$

## Example 8.1-How Many Moles of NaCl Result

 from the Complete Reaction of 3.4 Mol of $\mathrm{Cl}_{2}$ ?$$
2 \mathrm{Na}(s)+\mathrm{Cl}_{2}(g) \rightarrow 2 \mathrm{NaCl}
$$

| Given: Find: | $\begin{aligned} & 3.4 \mathrm{~mol} \mathrm{Cl}_{2} \\ & \mathrm{~mol} \mathrm{NaCl} \end{aligned}$ |
| :---: | :---: |
| Solution Map: <br> Relationships: | $\begin{aligned} & \underset{\frac{2 \mathrm{~mol} \mathrm{NaCl}}{1 \mathrm{~mol} \mathrm{Cl}_{2}}}{\underset{\mathrm{~mol} \mathrm{Cl}}{2}} \underset{\mathrm{~mol} \mathrm{NaCl}}{\longrightarrow} \\ & 1 \mathrm{~mol} \mathrm{Cl}_{2} \equiv 2 \mathrm{NaCl} \end{aligned}$ |
| Solution: | $\begin{aligned} & 3.4 \mathrm{molCl}_{2} \times \frac{2 \mathrm{~mol} \mathrm{NaCl}}{1 \mathrm{molCl}_{2}} \\ & =6.8 \mathrm{~mol} \mathrm{NaCl} \end{aligned}$ |
| Check: | Since the reaction makes 2 molecules of NaCl for every 1 mole of $\mathrm{Cl}_{2}$, the number makes sense. |

## Example 8.1:

- Sodium chloride, NaCl , forms by the following reaction between sodium and chlorine. How many moles of NaCl result from the complete reaction of 3.4 mol of $\mathrm{Cl}_{2}$ ? Assume there is more than enough Na .

$$
2 \mathrm{Na}(s)+\mathrm{Cl}_{2}(g) \rightarrow 2 \mathrm{NaCl}(s)
$$

## Example:

How many moles of NaCl result from the complete reaction of 3.4 mol of $\mathrm{Cl}_{2}$ in the reaction below?
$2 \mathrm{Na}(s)+\mathrm{Cl}_{2}(g) \rightarrow 2 \mathrm{NaCl}(s)$

- Write down the given quantity and its units.

Given: $\quad 3.4 \mathrm{~mol} \mathrm{Cl}_{2}$

```
Example:
How many moles of NaCl
result from the complete
reaction of 3.4 mol of Cl2 in
the reaction below?
2 Na(s)+ Cl2 (g) ->2 NaCl(s)
```

Information:
Given: $3.4 \mathrm{~mol} \mathrm{Cl}_{2}$

- Write down the quantity to find and/or its units. Find: ? moles NaCl

| Example: | Information: |
| :--- | :--- |
| How many moles of NaCl | Given: $3.4 \mathrm{~mol} \mathrm{Cl}_{2}$ |
| result from the complete |  |
| reaction of 3.4 mol of $\mathrm{Cl}_{2}$ in |  |
| the reaction below? | Find: ? moles NaCl |
| $2 \mathrm{Na}(s)+\mathrm{Cl}_{2}(g) \rightarrow 2 \mathrm{NaCl}(s)$ |  |

## - Collect needed conversion factors:

According to the equation:
1 mole $\mathrm{Cl}_{2} \equiv 2$ moles NaCl

Example:
How many moles of NaCl result from the complete reaction of 3.4 mol of $\mathrm{Cl}_{2}$ in the reaction below?
$2 \mathrm{Na}(s)+\mathrm{Cl}_{2}(g) \rightarrow 2 \mathrm{NaCl}(s)$

Information:
Given: $3.4 \mathrm{~mol} \mathrm{Cl}_{2}$
Find: ? moles NaCl
Conversion Factor:
$1 \mathrm{~mol} \mathrm{Cl}_{2} \equiv 2 \mathrm{~mol} \mathrm{NaCl}$

- Write a solution map for converting the units:

| Example: | Information: |
| :--- | :--- |
| How many moles of NaCl | Given: 3.4 $\mathrm{mol} \mathrm{Cl}_{2}$ |
| result from the complete | Find: ? moles NaCl |
| reaction of 3.4 mol of $\mathrm{Cl}_{2}$ in | Conversion Factor: |
| the reaction below? | 1 mol Cl $\mathrm{Cl}_{2}=2 \mathrm{~mol} \mathrm{NaCl}$ |
| $2 \mathrm{Na}(s)+\mathrm{Cl}_{2}(g) \rightarrow 2 \mathrm{NaCl}(s)$ | Solution Map: $\mathrm{mol} \mathrm{Cl}_{2} \rightarrow \mathrm{~mol} \mathrm{NaCl}$ |

- Apply the solution map:

$$
\begin{aligned}
3.4 \mathrm{~mol} \mathrm{Cl}_{2} & \times \frac{2 \mathrm{~mol} \mathrm{NaCl}}{1 \mathrm{~mol} \mathrm{Cl}_{2}}=\text { moles } \mathrm{NaCl} \\
& =6.8 \mathrm{~mol} \mathrm{NaCl}
\end{aligned}
$$

- Significant figures and round:

Example:
How many moles of NaCl
result from the complete reaction of 3.4 mol of $\mathrm{Cl}_{2}$ in the reaction below?
$2 \mathrm{Na}(s)+\mathrm{Cl}_{2}(g) \rightarrow 2 \mathrm{NaCl}(s)$

## Information:

Given: $3.4 \mathrm{~mol} \mathrm{Cl}_{2}$
Find: ? moles NaCl
Conversion Factor:
$1 \mathrm{~mol} \mathrm{Cl}_{2} \equiv 2 \mathrm{~mol} \mathrm{NaCl}$
Solution Map: $\mathrm{mol} \mathrm{Cl}_{2} \rightarrow \mathrm{~mol} \mathrm{NaCl}$

- Check the solution:

$$
3.4 \mathrm{~mol} \mathrm{Cl}_{2} \equiv 6.8 \mathrm{~mol} \mathrm{NaCl}
$$

The units of the answer, moles NaCl , are correct.
The magnitude of the answer makes sense because the equation tells us you make twice as many moles of NaCl as the moles of $\mathrm{Cl}_{2}$.

## Practice

- According to the following equation, how many moles of water are made in the combustion of 0.10 moles of glucose?

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2} \rightarrow 6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}
$$

How Many Moles of Water Are Made in the Combustion of 0.10 Moles of Glucose?

| Given: Find: | $\begin{aligned} & 0.10 \text { moles } \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \\ & \text { moles } \mathrm{H}_{2} \mathrm{O} \end{aligned}$ |
| :---: | :---: |
| Solution Map: <br> Relationships: | $\begin{gathered} \mathrm{mol} \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \Longrightarrow \mathrm{~mol} \mathrm{H}_{2} \mathrm{OH} \\ \frac{6 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}}{1 \mathrm{molC}_{6} \mathrm{H}_{12} \mathrm{O}_{6}} \\ \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2} \rightarrow 6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O} \quad \therefore 1 \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \equiv 6 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O} \end{gathered}$ |
| Solution:$0.10 \mathrm{mote}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \times \frac{6 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}}{1 \mathrm{~mole}_{6} \mathrm{H}_{12} \mathrm{O}_{6}}=0.6 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}$ |  |
| Check: | $0.6 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}=0.60 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}$ <br> Since 6 x moles of $\mathrm{H}_{2} \mathrm{O}$ as $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$, the number makes sense. |

## Making Molecules Mass-to-Mass Conversions

- We know there is a relationship between the mass and number of moles of a chemical.

1 mole $=$ Molar Mass in grams.

- The molar mass of the chemicals in the reaction and the balanced chemical equation allow us to convert from the amount of any chemical in the reaction to the amount of any other.

Example 8.2-How Many Grams of Glucose Can Be Synthesized from 58.5 g of $\mathrm{CO}_{2}$ in Photosynthesis?

- Photosynthesis:

$$
6 \mathrm{CO}_{2}(g)+6 \mathrm{H}_{2} \mathrm{O}(g) \rightarrow \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(s)+6 \mathrm{O}_{2}(g)
$$

- The equation for the reaction gives the mole relationship between amount of $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ and $\mathrm{CO}_{2}$, but we need to know the mass relationship, so the solution map will be:

## Example 8.2-How Many Grams of Glucose Can Be

| Check: | Since $6 x$ moles of $\mathrm{CO}_{2}$ as $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$, but the molar mass of $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ is $4 \mathrm{x} \mathrm{CO}_{2}$, the number makes sense. |

## Example 8.2:

- In photosynthesis, plants convert carbon dioxide and water into glucose $\left(\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}\right)$, according to the following reaction. How many grams of glucose can be synthesized from 58.5 g of $\mathrm{CO}_{2}$ ? Assume there is more than enough water to react with all the $\mathrm{CO}_{2}$.

## More Making Pancakes

- We know that:

1 cup flour +2 eggs $+1 / 2$ tsp baking powder $\rightarrow 5$ pancakes

- But what would happen if we had 3 cups of flour, 10 eggs, and 4 tsp of baking powder?

\end{aligned}
$$

4 tsp baking powder $\times \frac{5 \text { pancakes }}{1 / 2 \text { tsp baking powder }}=40$ pancakes

## More Making Pancakes, Continued

- Each ingredient could potentially make a different number of pancakes.
- But all the ingredients have to work together!
- We only have enough flour to make 15 pancakes, so once we make 15 pancakes, the flour runs out no matter how much of the other ingredients we have.

## More Making Pancakes, Continued

- The flour limits the amount of pancakes we can make. In chemical reactions we call this the limiting reactant.
$\checkmark$ Also known as limiting reagent.
- The maximum number of pancakes we can make depends on this ingredient. In chemical reactions, we call this the theoretical yield.
$\checkmark$ It also determines the amounts of the other ingredients we will use!

## More Making Pancakes

- Let's now assume that as we are making pancakes, we spill some of the batter, burn a pancake, drop one on the floor, or other uncontrollable events happen so that we only make 11 pancakes. The actual amount of product made in a chemical reaction is called the actual yield.
- We can determine the efficiency of making pancakes by calculating the percentage of the maximum number of pancakes we actually make. In chemical reactions, we call this the percent yield.
$\frac{\text { Actual Yield }}{\text { Theoretical Yield }} \times 100 \%=$ Percent Yield $\frac{11 \text { pancakes }}{15 \text { pancakes }} \times 100 \%=73 \%$

## Theoretical and Actual Yield

- As we did with the pancakes, in order to determine the theoretical yield, we should use reaction stoichiometry to determine the amount of product each of our reactants could make.
- The theoretical yield will always be the least possible amount of product.
$\checkmark$ The theoretical yield will always come from the limiting reactant.
- Because of both controllable and uncontrollable factors, the actual yield of product will always be less than the theoretical yield.

## Measuring Amounts in the Lab

- In the lab, our balances do not measure amounts in moles, unfortunately, they measure amounts in grams.
- This means we must add two steps to each of our calculations: first convert the amount of each reactant to moles, then convert the amount of product into grams.

## Enthalpy Change

- We previously described processes as exothermic if they released heat, or endothermic if they absorbed heat.
- The enthalpy of reaction is the amount of thermal energy that flows through a process.
$\checkmark$ At constant pressure.
$\checkmark \Delta \mathrm{H}_{\mathrm{rxn}}$

## Sign of Enthalpy Change

- For exothermic reactions, the sign of the enthalpy change is negative when:
$\checkmark$ Thermal energy is produced by the reaction.
$\checkmark$ The surroundings get hotter.
$\checkmark \Delta \mathrm{H}=-$
$\checkmark$ For the reaction $\mathrm{CH}_{4}(s)+2 \mathrm{O}_{2}(g) \rightarrow \mathrm{CO}_{2}(g)+2 \mathrm{H}_{2} \mathrm{O}(l)$, the $\Delta \mathrm{H}_{\mathrm{rxn}}=-802.3 \mathrm{~kJ}$ per mol of $\mathrm{CH}_{4}$.
- For endothermic reactions, the sign of the enthalpy change is positive when:
$\checkmark$ Thermal energy is absorbed by the reaction.
$\checkmark$ The surroundings get colder.
$\checkmark \Delta \mathrm{H}=+$
$\checkmark$ For the reaction $\mathrm{N}_{2}(s)+\mathrm{O}_{2}(g) \rightarrow 2 \mathrm{NO}(g)$, the

$$
\Delta \mathrm{H}_{\mathrm{rxn}}=+182.6 \mathrm{~kJ} \text { per mol of } \mathrm{N}_{2} .
$$

## Enthalpy and Stoichiometry

- The amount of energy change in a reaction depends on the amount of reactants.
$\checkmark$ You get twice as much heat out when you burn twice as much $\mathrm{CH}_{4}$.
- Writing a reaction implies that amount of energy changes for the stoichiometric amount given in the equation.
For the reaction $\mathrm{C}_{3} \mathrm{H}_{8}(l)+5 \mathrm{O}_{2}(g) \rightarrow 3 \mathrm{CO}_{2}(g)+4 \mathrm{H}_{2} \mathrm{O}(g)$

$$
\Delta \mathrm{H}_{\mathrm{rxn}}=-2044 \mathrm{~kJ}
$$

So $1 \mathrm{~mol} \mathrm{C}_{3} \mathrm{H}_{8} \equiv 5 \mathrm{~mol} \mathrm{O}_{2} \equiv 3 \mathrm{~mol} \mathrm{CO}_{2} \equiv 4 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O} \equiv$ -2044 kJ.
