Introduction

- One key, two operations (encryption/decryption)
- Stream ciphers (e.g., RC4)
 - take a key and generate a stream of pseudorandom bits (bytes)
 - >>> XOR pseudorandom bits into data

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

Introduction

- One key, two operations (encryption/decryption)
- Stream ciphers (e.g., RC4)
 - take a key and generate a stream of pseudorandom bits (bytes)
 - Mathematical Second Sec
 - Shannon proved "XOR with one-time pad" unbreakable
 - RC4 unbreakable?

< 同 > < 三 > < 三 >

Introduction

- One key, two operations (encryption/decryption)
- Stream ciphers (e.g., RC4)
 - take a key and generate a stream of pseudorandom bits (bytes)
 - Mathematical Second Sec
 - Shannon proved "XOR with one-time pad" unbreakable
 - RC4 unbreakable?
- Block ciphers (e.g., DES, IDEA, AES)
 - take a key and fixed-size block to generate a fixed-size output
 - how to encrypt a large messages?
 - mode of operations: ECB, CBC, CFB, OFB...

Fall 2013 2 / 42

くぼう くほう くほう しゅ

• Block size is usually 64 or 128 bits

me small block size isn't secure as it is easy to build a table

Image: A match a ma

- Block size is usually 64 or 128 bits
 m small block size isn't secure as it is easy to build a table
- Input and output has 1:1 mapping (so it can be decrypted)

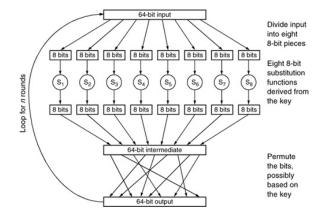

→ ∃ →

- Block size is usually 64 or 128 bits
 small block size isn't secure as it is easy to build a table
- Input and output has 1:1 mapping (so it can be decrypted)
- Output should look random, not correlation to input
 repeat n rounds to spread the effects of each bit in the input

- A IB (A IB)

- Block size is usually 64 or 128 bits
 m small block size isn't secure as it is easy to build a table
- Input and output has 1:1 mapping (so it can be decrypted)
- Output should look random, not correlation to input
 me repeat n rounds to spread the effects of each bit in the input
- Two operations:
 - substitution: replace one value (8bits) with another (1:1)
 - permutation: shuffle bits around

DES Overview

- A block cipher, 56-bit key with 8bit parity bits, 64-bit blocks
- Developed at IBM, published in 1977 by NIST
- DES is considered insecure because of its short key
 in 1998, EFF DES cracker breaks a DES key in 56 hours
 - in 1999, EFF and distributed.net reduced it to 22 hours 15 minutes
 - \blacksquare in 2008, FPGA-based RIVYERA reduced average to < 24 hours

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

DES Structure

Encryption

- initial permutation
- 16 48-bit per-round keys generated from the 56-bit key
- \blacksquare 16 DES rounds: 64-bit input + per-round key \rightarrow 64-bit output
- left and right halves of (64-bit) output swapped
- final permutation (inverse of the initial permutation)

▲ □ ▶ ▲ □ ▶ ▲ □

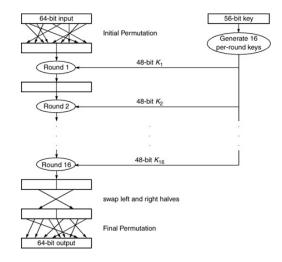

DES Structure

16	7	27	20	13	2	46	42	50	36	29	32

< 3 >

Initial and Final Permutations

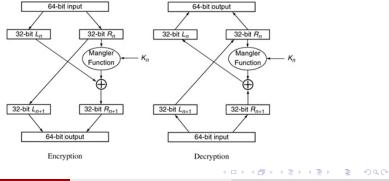

- Initial permutation
 - i-th byte into (9-i)th bits
 - even-numbered bits into byte 1-4, odd-numbered into byte 5-8
- Final permutation is the reverse of initial permutation
- No security value: decrypt innards \rightarrow decrypt DES

Fall 2013 11 / 42

DES Round

• Encryption:
$$L_{n+1} = R_n, R_{n+1} = L_n \oplus M(R_n, K_n)$$

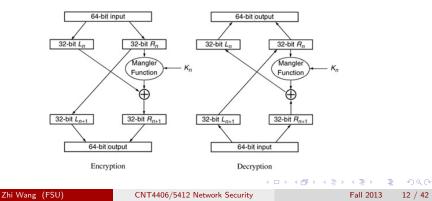

CNT4406/5412 Network Security

Fall 2013 12 / 42

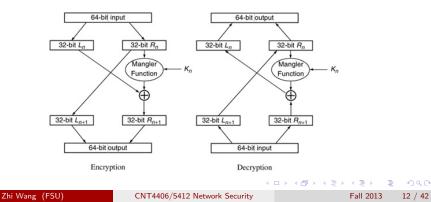

DES Round

- Encryption: $L_{n+1} = R_n, R_{n+1} = L_n \oplus M(R_n, K_n)$
- Decryption: $R_n = L_{n+1}, L_n = R_{n+1} \oplus M(R_n, K_n) = R_{n+1} \oplus M(L_{n+1}, K_n)$ mangler function doesn't have to be reversible!

DES Round

- Encryption: $L_{n+1} = R_n, R_{n+1} = L_n \oplus M(R_n, K_n)$
- Decryption: $R_n = L_{n+1}, L_n = R_{n+1} \oplus M(R_n, K_n) = R_{n+1} \oplus M(L_{n+1}, K_n)$ • mangler function doesn't have to be reversible!
- Two operations are identical with halves swapped

DES Round: Mangler Function

- 32-bit R_n + 48-bit $K_n \rightarrow$ 32-bit output
- Steps:
 - **w** generate eight 6-bit chunks from R_n

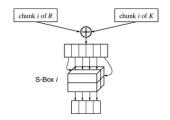

- divide 48-bit K_n into eight 6-bit chunks
- substitute $Chunk_{R_n}^i \oplus Chunk_{K_n}^i$, (s-box, 6bits \rightarrow 4bits)
- combine these 4-bit values into a 32-bit value
- permute the 32-bit value to get the output: 16, 7, 20, 21, 29, 12, ..., 30, 6, 22, 11, 4, 25

Fall 2013 18 / 42

Encrypting twice with the same key?

 im brute-force attack still needs to search only 2⁵⁶ keys

Fall 2013 18 / 42

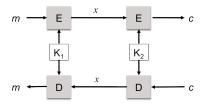

- Encrypting twice with the same key?

 brute-force attack still needs to search only 2⁵⁶ keys
- Encrypting twice with two keys?
 - \blacksquare a naive brute-force requires searching 2^{112} keys

- Encrypting twice with the same key?

 brute-force attack still needs to search only 2⁵⁶ keys
- Encrypting twice with two keys?
 - ➡ a naive brute-force requires searching 2¹¹² keys
 - in fact, only need to search about 2⁵⁷ keys: meet-in-the-middle attack (a known-plaintext attack)

Meet-in-the-middle Attack

Assume Trudy has a few pairs of <plaintext, ciphertext> encrypted by 2DES:

• make table A with 2^{56} entries of $\langle K_A, E(m_1, K_A) \rangle$ by exhaustively enumerating the DES key K_A , sort it by the second items

Meet-in-the-middle Attack

Assume Trudy has a few pairs of <plaintext, ciphertext> encrypted by 2DES:

- make table A with 2⁵⁶ entries of $\langle K_A, E(m_1, K_A) \rangle$ by exhaustively enumerating the DES key K_A , sort it by the second items
- make table *B* with 2⁵⁶ entries of $\langle K_B, D(c_1, K_B) \rangle$ by exhaustively enumerating the DES key K_B , sort it by the second item

Meet-in-the-middle Attack

Assume Trudy has a few pairs of <plaintext, ciphertext> encrypted by 2DES:

- make table A with 2⁵⁶ entries of $\langle K_A, E(m_1, K_A) \rangle$ by exhaustively enumerating the DES key K_A , sort it by the second items
- make table B with 2⁵⁶ entries of $\langle K_B, D(c_1, K_B) \rangle$ by exhaustively enumerating the DES key K_B , sort it by the second item
- search the sorted table with matching entries where $E(m_1, K_A) = D(c_1, K_B)$, such K_A and K_B is a candidate for 2-DES

<日

<</p>

Meet-in-the-middle Attack

Assume Trudy has a few pairs of <plaintext, ciphertext> encrypted by 2DES:

- make table A with 2⁵⁶ entries of $\langle K_A, E(m_1, K_A) \rangle$ by exhaustively enumerating the DES key K_A , sort it by the second items
- make table B with 2⁵⁶ entries of $\langle K_B, D(c_1, K_B) \rangle$ by exhaustively enumerating the DES key K_B , sort it by the second item
- search the sorted table with matching entries where $E(m_1, K_A) = D(c_1, K_B)$, such K_A and K_B is a candidate for 2-DES
- test the candidates with $< m_2, c_2 >$, then $< m_3, c_3 >$, ..., only the correct key pair will work for all of them

Meet-in-the-middle Attack...

It converges quickly when testing candidates against < m_i, c_i >
me each table contains 2⁵⁶ blocks out of 2⁶⁴ possible blocks
me each block has 1/256 chance of appearing in a table
me about 2⁴⁸ entries of Table A also appear in Table B
me if < K_A, K_B > is an imposer, the chance of E(m₂, K_A) = D(c₂, K_B) is about 1/2¹⁶
me each testing of < m_i, c_i > reduces the chance by a factor of 1/2⁶⁴
Computation complexity: O(2⁵⁶) assuming enough space is provided

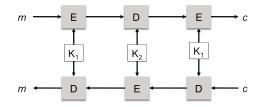

to sort table A and B in $O(2^{56})$

A D N A B N A B N A B N

Three reversible operations on 16-bit quantities

- ⊕
- + mod 2^{16}
- $\times \mod (2^{16} + 1)$
 - for each q, there is a p having $pq = 1 \mod (2^{16} + 1)$

イロト イポト イヨト イヨト

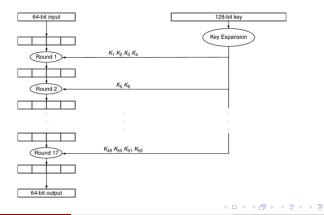

Three reversible operations on 16-bit quantities

- ⊕
- + mod 2^{16}
- × mod (2¹⁶ + 1)
 im for each q, there is a p having pq = 1 mod (2¹⁶ + 1)
 im Euclid's algorithm: gcd(x, y) = nx + vy let y = 2¹⁶ + 1 and x = q because y is a prime and q < y, gcd(q, y) = 1 using Euclid's algorithm, we can get n that 1 = nq + v(2¹⁶ + 1)

イロト 不得下 イヨト イヨト 二日

IDEA Structure

- Expand 128-bit key into 52 16-bit keys
- 17 rounds, odd rounds use 4 keys, even rounds use 2 keys
- All operations on 16-bit quantities

Fall 2013 24 / 42

Key Expansion

Encryption: repeat the following steps 6 times
 if rotate the 128-bit key by 25 × i mod 128 times
 output 8 16-bit keys from the key

output last 4 16-bit keys starting at bit 23

Fall 2013 25 / 42

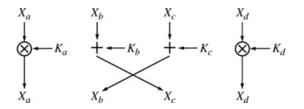

Key Expansion

- Encryption: repeat the following steps 6 times
 left rotate the 128-bit key by 25 × i mod 128 times
 output 8 16-bit keys from the key
 - output last 4 16-bit keys starting at bit 23
- Decryption
 - me generate the same keys, but use them backwards
 - inverse the odd-round keys, but keep the even-round keys

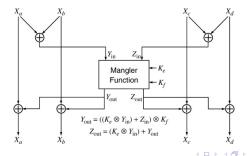

Odd Rounds

- Treat 64-bit input as 4 16-bit quantities (X_a, X_b, X_c, X_d)
- Use 4 16-bit keys (K_a, K_b, K_c, K_d)
- $X'_{a} = X_{a} \times K_{a}, X'_{b} = X_{c} + K_{c}, X'_{c} = X_{b} + K_{b}, X'_{d} = X_{d}K_{d}$
- Use the inverse of the keys to reverse the round

Even Rounds

• Encryption $Y_{in} = X_a \oplus X_b, Z_{in} = X_c \oplus X_d, Y_{out} = ((K_e \times Y_{in}) + Z_{in}) \times K_f, Z_{out} = (K_e \times Y_{in}) + Y_{out}$ $X'_a = X_a \oplus Y_{out}, X'_b = X_b \oplus Y_{out}, X'_c = X_c \oplus Z_{out}, X'_d = X_d \oplus Z_{out}$

Message Authentication

- Encryption provides confidentiality for a message
- How to use encryption to authenticate a message?
 prove the message was created by someone with the key
 prove it base 't been modified except by someone with the key
 - prove it hasn't been modified except by someone with the key

.

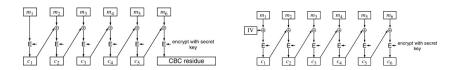

Message Integrity with CBC Residue

- Encrypt message using CBC mode with IV set to 0
- The final ciphertext block is called CBC residue, transmit it with the plaintext
 - CBC residue depends on all previous blocks
 - \implies only someone with the key can generate the correct CBC residue (except with a probability of $\frac{1}{2^{64}}$)

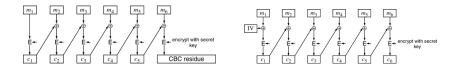

< ∃ ►

Encryption alone doesn't guarantee integrity
 decryption just transfers the ciphertext to some message

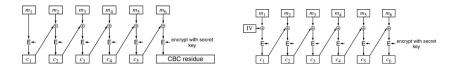

Fall 2013 40 / 42

- Encryption alone doesn't guarantee integrity
 decryption just transfers the ciphertext to some message
- CBC encryption plus CBC residue doesn't work
 imjust repeat the final ciphertext block as the CBC residue

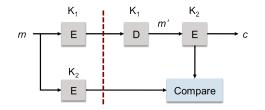

- Encryption alone doesn't guarantee integrity
 decryption just transfers the ciphertext to some message
- CBC encryption plus CBC residue doesn't work
 imjust repeat the final ciphertext block as the CBC residue
- CBC encryption of plaintext plus CBC residue doesn't work
 the final ciphertext block is always K0, why?

→ ∃ →

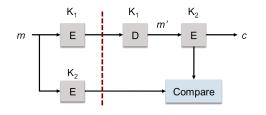

Encrypt message with K₁, compute CBC residue with K₂
 guarantee privacy and integrity, expensively

Fall 2013 41 / 42

< ∃ ►

- Encrypt message with K₁, compute CBC residue with K₂
 guarantee privacy and integrity, expensively
- Variations of the scheme
 - ••• transform K_1 into K_2 (K_1 and K_2 are related)
 - weak (cheaper) cryptographic checksum
 - we use cryptographic hash instead of CBC residue

Fall 2013 41 / 42

Summary

- Stream cipher and block cipher
- DES, 3DES, and IDEA
- Modes of operation: ECB, CBC, CFB, OFB
- Message integrity
- Next class: cryptographic hash function
