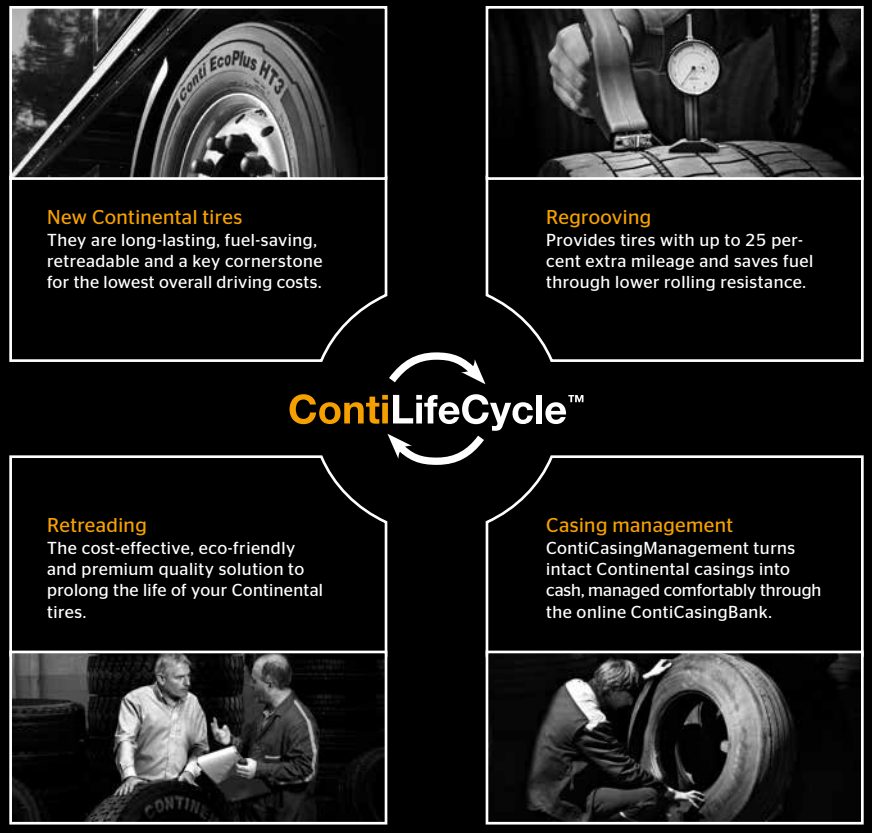
Continental
The Future in Motion

Commercial Vehicle Tires
Technical Data Book

Our concept for your lowest overall driving costs

We know that cost efficiency is the key. And this is precisely why Continental Truck Tires pay in the long-term, as their performance benefits extend beyond a tire's normal lifespan to be repeated again and again, thanks to the ContiLifeCycle.

The durability of Continental Truck Tires begins with the new tire and is considerably extended by options including professional regrooving, intelligent casing management (ContiCasingManagement) and our premium retread. The mutually harmonized components of the ContiLifeCycle make a considerable contribution to the reduction of tire costs and thus achieving the lowest overall driving costs.



Contents

Safety remarks

The extensive technical data and other information relating to tires and accessories on the following pages have been compiled to reflect as accurately and completely as possible the current state of development.

If this “Technical Data Book” is to be used as a basis for particularly important decisions, further data covering relevant standards such as ETRTO [1], DIN [2] and WdK [3] can also be used. Special information can, of course, also be obtained from us at the following address:

Continental Reifen Deutschland GmbH
P.O. Box 169
30001 Hannover
Germany

This service brochure is for information purposes only. All liability is excluded, whether for damage or for other legal reasons (see also page 2).

All designs are in compliance with DOT [4] regulations and are marked accordingly.

Since 1982 all tires have been standardized in accordance with ECE [5] directive 54 and thus also in accordance with the current EU [6] tire directives.

The data provided in this guide is based on average operating conditions as normally found in central Europe.

Please contact us with respect to operating conditions differing from the above, e.g. for uses outside Central Europe.

The tire sizes given in this guide are not always identical to the ones available in the size range.

Lower inflation pressure, greater loads or higher speeds than those recommended by the vehicle or tire manufacturer shorten the service life of the tire.

These instructions must be followed if vehicle safety – and that of those fitting tires – is to be guaranteed. This applies above all to instructions regarding tire pressure.

Failure to comply with these instructions could result in tire damage that may even lead to tire blow-outs under certain circumstances. This, in turn, could cause traffic accidents involving damage to property and/or personal injury (see also page 5).

1) ETRTO - The European Tire and Rim Technical Organisation, Brussels
2) DIN - Deutsches Institut für Normung, Berlin (German Institute for Standardization)
3) WdK - Wirtschaftsverband der deutschen Kautschuk-Industrie, Frankfurt/Main
4) DOT - Department of Transportation
5) ECE - Economic Commission for Europe (UN institution in Geneva)
6) EU - European Union, previously EEC

Operating instructions

(DIN 7804/7805 and ECE-R 54)

Load capacity and speed

When determining the minimum tire size necessary for the axle of a vehicle, the authorized weight and the maximum design speed of the vehicle should always be used as a basis. Trailers first coming into service on or after January 1, 1990 must be equipped with tires suited for maximum speeds of at least 100 km/h, unless the trailer is clearly marked for a lower speed. The so-called “tolerance catalogue” must also be taken into consideration here. Nominal load capacity = 100% load, as the load index also indicates*.

Reference speed

This is the speed assigned as per nominal load capacity of the tire. The load capacity can be exceeded when the vehicle, due to its construction, has a lower maximum speed and vice versa (see the tables on page 12 and 13).

Inflation pressure

The inflation pressures indicated in the tables are minimum values given for reference purposes. All inflation pressures apply to the “cold” tire, i.e. the state in which the tire is in after having stood outdoors for several hours, not exposed to intense sunlight.

M+S tires

May be fitted on commercial vehicles whose construction allows for a higher maximum speed than approved for the tire if the tire’s lower approved speed is clearly posted in the vehicle in the driver’s field of vision (e.g. sticker on the instrument panel).

Free Rolling Tires (FRT)

Trailer tires marked as Free Rolling Tires (FRT) are tires specifically designed for the equipment of trailers (non driven/ trailing axles). This is the axle position where they will deliver their best performance.

Mixed fitment

(radial/crossply) While it is permissible for a vehicle weighing more than 2.8 t to be fitted axlewise with tires of different construction, it is recommended that tires of the same type be fitted in all wheel positions.

Rims

Only the specified rims may be mounted on new commercial vehicles series. Tapered bead seat rims with a diameter of 16" or less should be equipped with safety shoulders (e.g. round hump) if tubeless radial tires are fitted on them. The rim sizes printed in bold type in the table on page 34 are optimal Continental sizes with respect to service life, wear pattern and durability.

Wheels

The load capacity must be adequate in all cases.

* See table on page 6

Tire designations

Load indices (LI)

LI	kg	LI	kg	LI	kg	LI	kg	LI	kg	LI	kg
19	77.5	50	190	81	462	112	1120	143	2725	174	6700

Tire designations

In the past the tire load capacity category was indicated solely by a PR number.

Now a numerical code – the load index (LI) – is used to exactly indicate the tire's load carrying capacity. See also page 6 and 8.

A speed symbol (SI) is used to designate the speed rating of the tire, as shown in the representation below.

The use of the LI and SI was prompted by the introduction of ECE * regulation no. 54 and the EU tire directive for Europe (in force as of January 1, 1993), according to which pneumatic tires intended for road use at speeds in excess of 80 km/h must carry an operational designation comprising LI (single/dual) and SI. Alongside the nominal operational designation a tire may also bear an additional operational designation, e.g. with a lower LI and an SI for higher speeds. These specifications have to be included.

Example:
315/70 R 22.5 152/148 L

An uncoded maximum load-capacity and tire-pressure data in lbs (1 lbs = 0.454 kg) and psi (pounds per square inch - 1 bar = 14.5 psi) may also be moulded into the tire.

These specifications form part of the designation according to US Safety Regulation FMVSS 119 **, which covers all new pneumatic tires for light trucks, trucks, buses and trailers intended for use on public highways as well as motorcycle tires. Canada and Israel also use this specification.

Date of manufacture

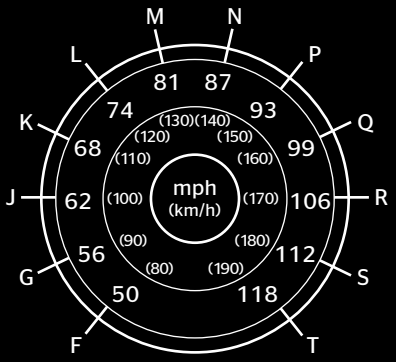
The last 4 digits of the DOT ID no. indicate the week and year of manufacture.

2005

e. g. DOT XXXX XXXX 0205

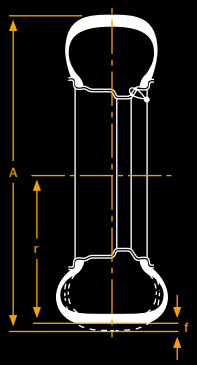
2nd week

Speed symbols (SI)

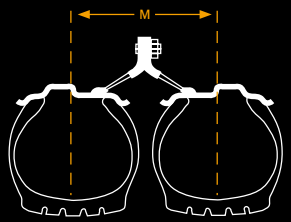


* ECE = ECONOMIC COMMISSION FOR EUROPE, UN institution in Geneva
** FMVSS = Federal Motor Vehicle Safety Standard

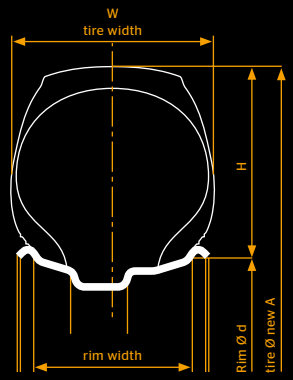
Tire designations



A = Outer diameter of the tire
r = static radius
f = deflection under load



M = Dual-tire spacing



W and Ø new when using the measuring rim

Vehicle tire group	Example of designation		Example comprises details of		
	Tire size [1]	Service description [2]	Tire width W	H:W %	Rim dia code d
Light truck	**185 R 14 C**	102/100 N	185 mm	~ 90	14
	195/75 R 16 C	107/105 N	195 mm	75	16
Truck	**12 R 22.5**	152/148 L	300 mm	~ 90	22.5
	315/80 R 22.5	156/150 L (154/150 M) [3]	315 mm	80	22.5
	12.00 R 20	154/150 K	300 mm	100	20
Trailer	**365/80 R 20**	160/~ K	365 mm	80	20
	385/65 R 22.5	160/~ K	385 mm	65	22.5
Bus	**275/70 R 22.5**	148/145 J	275 mm	70	22.5
	295/80 R 22.5	152/148 M	295 mm	80	22.5

1) "R" = radial design
"C" = light truck (van) tire with LI for single tires = 121 and below, see also page 5
2) Service description = load index for single/dual tires plus speed symbol (see also tables on following pages)
3) Supplementary service description

Units of measurement and definitions

(DIN 70020)

As a matter of principle, the technical data in the tables always complies with the international standards as specified by ISO and the ETRTO. Further details such as other tire sizes or designs, plus the static radius and the rolling circumference comply with DIN/WdK Guidelines.

Lengths
are given in millimetres (mm).

Rim width
The linear distance between the flanges of the rim.

Cross-section
Half the difference between the overall diameter and the nominal rim diameter.

Tire width
The section width of an inflated tire mounted on its theoretical rim and indicated in the tire size designation.

Outer diameter
The diameter of an inflated tire at the outermost surface of the tread.

Nominal rim diameter
It is a size code figure for reference purposes only, as indicated in the tire and rim size designation.

Inflation pressure
Tire inflation pressure is given in bar based on cold tires.

Outer diameter New *
is a nominal size which refers to the tread center.

Max. outer diameter in service
is the maximum diameter permitted in the tread center as a result of permanent growth during tire use. Dynamic deformations are not included.

Cross-section width New *
is a nominal size which refers to the smooth tire wall.

* Construction size

Max. operational width
is the maximum permitted width. This includes scuff ribs, decorative ribs, lettering and permanent growth during use. Dynamic deformations are not included.

Static radius
is the distance from the tire center to the ground level. Measurements are checked on fitted-tires inflated to the inflation pressure specified in DIN 70020 Part 5.

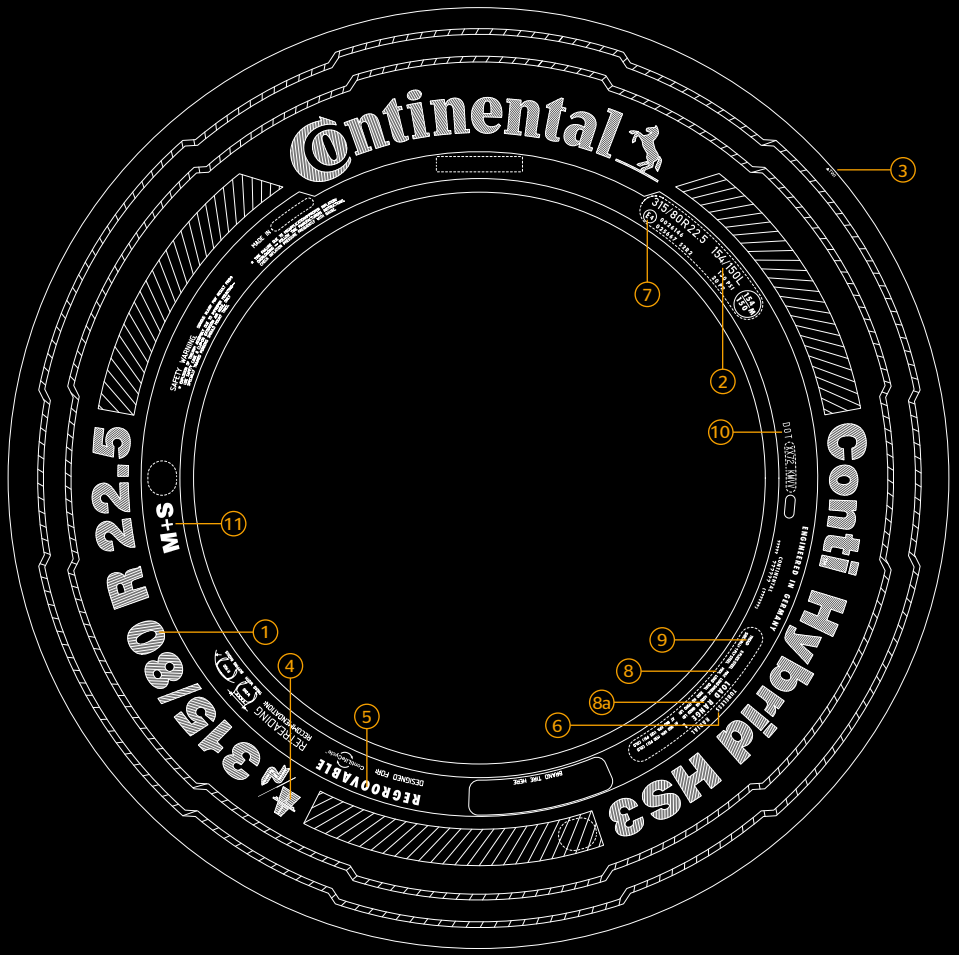
Rolling circumference
is the distance covered by each revolution of the tire.

Load capacities
are given in kgs (weight in the sense of mass)

Dual-tire spacing
Maintaining the minimum spacing distance ensures that the two tires in a dual fitment arrangement function without any infringement of the ETRTO standards providing the tires are not fitted with chains. In the course of development, a variety of designations for tire dimensions have been introduced, some of which are used concurrently. The following combination is most frequently used: tire width in mm, then H : W (height : width) in % and finally the codes for the tire construction – for example R for "radial" and "-" for "crossply" – and the nominal rim diameter as code. When planning vehicle wheel space, automotive designers must proceed on the basis of the maximum values for tire width and outer diameter, taking into account the tire's static and dynamic deformation. In this way they ensure that all standardly approved tires will fit in all cases. If this is not possible in exceptional cases, appropriate measures are to be taken to exclude any possible risk to safety.

Sidewall designations

The tire designation markings satisfy both the US standard (FMVSS 119) and the European standard (ECE-R 54).



Explanation

DOT = Department of Transportation

ETRTO = The European Tire and Rim Technical Organisation, Brussels

ECE = Economic Commission for Europe (UN Institution in Geneva)

FMVSS = Federal Motor Vehicle Safety Standard

(1) **Size designation**
315 = tire width in mm
80 = aspect ratio (section height to section width) = 80%
R = radial construction
22.5 = rim diameter (code)

(2) **Service description**
Consisting of
154 = load index for single fitment
150 = load index for dual fitment
L = code letter for speed rating

(3) **TWI**
Tread Wear Indicator

(4) **Recommended use**
only Continental Truck Tires

(5) **Regroovable**
The manufacturer has designed the tire for regrooving

(6) **Tubeless**
Tube Type

(7) E = tires complies with value set out in ECE-R 54
4 = country code for the country in which the approval number was issued (here: 4 = Netherlands)

(8) **US load designation**
For single/dual fitment and indication of max. inflation pressure in psi (1 bar = 14.5 psi)

(8a) **Load range**
In accordance with US standard

(9) Data as per US safety standard on inner construction or number of plies, in this case
Tread: under the tread there are five steel cord plies (including casing)
Sidewall: viewed from the side there is one steel cord ply (in this case the casing ply)

(10) **DOT**
= U.S. Department of Transportation (responsible for tire safety standards)

(11) **M+S**
Designation for winter use suitability (Mud & Snow)

(12) **Rotation**
(not valid for shown Conti Hybrid HS3)
Recommended direction of rotation

(13) **Single Point**
(not valid for shown Conti Hybrid HS3)
Alternative load and speed

Load capacities

1) Dual-tires = 2 x single load capacity
2) A sign indicating the max speed must be attached to trailers restricted to speeds below 100 km/h (62 mph).
3) Ask the tire manufacturer about these applications.

Tires with SI ratings P and Q under full load at speeds of over 140 km/h should be inflated an extra 0.1 bar for every excess 10 km/h. No excess loads are applicable over 65 km/h for tires on heavy trailers (with laden weight > 3.5 t).
The load/speed variation given on this page do not apply to the additional service description (the so called Single Point).

See general notes on page 5.

This table is only applicable in conjunction with air pressure multiplier on page 14.
If applied please check dual spacing (dual tire contact) and rim status.

Air pressure multiplier

for increased load capacity due to maximum design speed

Maximum speed in km/h (determined by vehicle type)	Air pressure multiplier for reference speed (speed index) of tire	
	G, J, K, L, M 90 km/h - 130 km/h	N, P, Q, R, S 140 km/h - 180 km/h
140		1
135		1
130	1	1
125	1	1
120	1	1
115	1	1.01
110	1	1.02
105	1	1.06
100	1	1.06
95	1	1.08
90	1	1.09
85	1	1.10
80	1	1.12
75	1.01	1.14
70	1.02	1.15
65	1.04	1.15
60	1.06	1.18
55	1.07	1.22
50	1.08	1.25
45	1.09	1.28
40	1.10	1.30
35	1.11	1.30
30	1.13	1.30
25	1.17	1.30
20	1.21	1.30
15	1.25	1.30
10	1.30	1.35
5	1.40	1.35
0	1.40	1.40

The multipliers cited are to be used for an operating pressure of up to 10 bar.

Example: In the case of a K-rated tire (110 km/h) and nominal inflated pressure of 7.5 bar, the inflation pressure can be increased to 8.85 bar if the vehicle's maximum design speed is set at 40 km/h (1.1 x 7.5 bar) to exploit an increased load capacity of 115% of nominal load capacity.

Load capacities of tires in special cases

(DIN 7804/7805)

Case	Type of service	Approved load capacity as % of the nominal load capacity in the tables
1	**Special-service vehicles:** Fire brigade vehicles with special superstructures, road flushers, road sweepers, garbage trucks, cherry-pickers, municipal service vehicles of a similar nature and other public utility vehicles.	110
2	**Commercial vehicles:** With special superstructures (concrete mixers, aircraft refuellers) used in local service with maximum service speeds not in excess of 60 km/h.	110
3	**Regular-service buses (M 3-Class II):** In urban service, with maximum service-related speeds of up to 60 km/h.	110
4	**Regular-service buses (M 3-Class I):** (see also DIN 7805) In urban and suburban service, if average speed does not exceed 40 km/h.	115
5	Tires on the **front axle of trucks** with facilities for snow removal (front-end snow plough/rotary snow plough and the like) at service-related speeds of 50 km/h 62 km/h	120 115
6	For internal use on aircraft refuellers at speeds of up to 30 km/h (inflation pressure + 15%, no reduction for dual fitment).	135
7	Caravans and other **passenger-car trailers** (only for C tires, see also WdK directive 195) for speeds of up to 100 km/h.	105

Please note: This chart is not applicable in conjunction with the charts on pages 12 or 13 in correspondence with the chart on page 14.

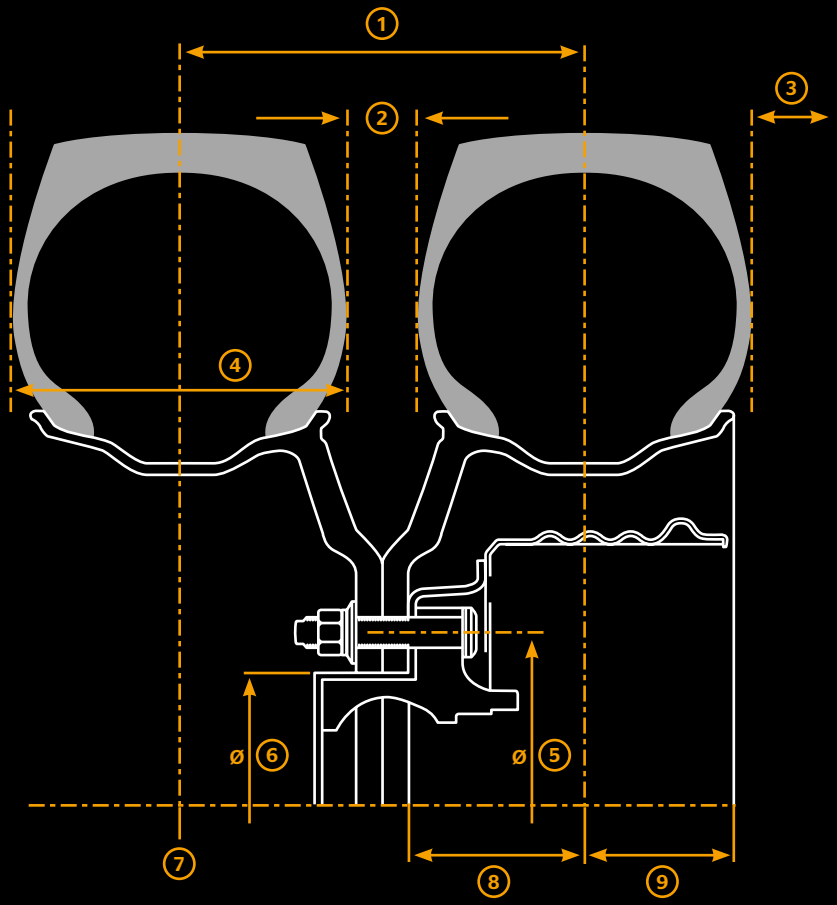
Wheels and rims

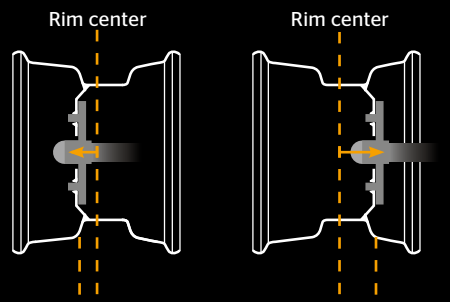


1. dual spacing
2. tire clearence
3. vehicle clearence
4. tire section width
5. bolt circle diameter
6. center hole diameter
7. tire center line
8. outset
9. backspace

Offset

The offset is the distance from the center of the wheel to the inside surface of the wheel disk on the hub. The wheel insertion depth can be positive, negative or zero.

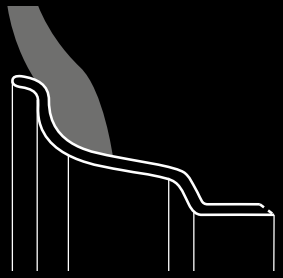
The insertion depth not only ensures adequate space for the brake drums, it also determines drive characteristics, tracking width, steering swivel, pin offset and wheel bearing guidance. In the case of dual tire fitment, the insertion depth also influences the distance between centers.



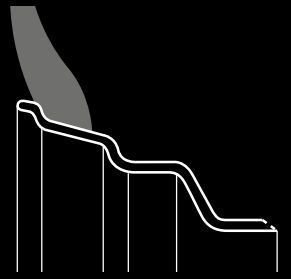
positive (Inset) negative (Outset)

There are three main types of rim for commercial vehicle tires:

One-piece well base rims for tubeless tires

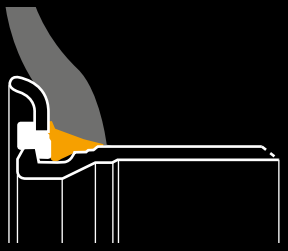


Standard and low-profile
light trucks 14"-17"



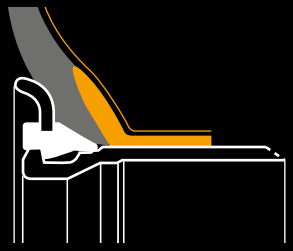
Standard and low-profile
17.5", 19.5", 22.5"

Multi-part flat base rims for tubeless tires



80-series tires
20"

Multi-part flat base rims for tires with inner tubes



High profile ratio
mainly 20"

Please contact rim manufacturers for detailed information regarding available rim sizes and variants.

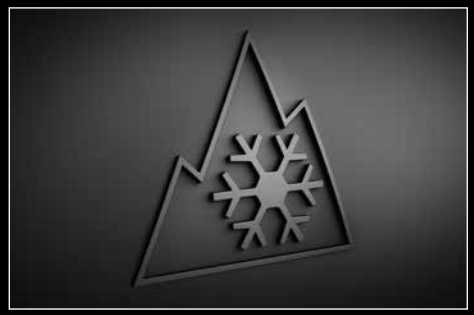
M+S and Three Peak Mountain Snow Flake (3PMSF) Designation



All Continental drive axle tires carry the M + S designation. In addition, some special steering axle and trailer tires are marked M + S. The best performance on mud, snow and ice is provided by tires showing the Three Peak Mountain Snowflake (3PMSF) symbol. All tires suitable for winter and marked M + S and/or 3PMSF are listed below.

"'Snow tire' means a tire [...] designed to achieve in snow conditions a performance better than a normal tire [...]."
Source: Economic Commission for Europe of the United Nations (UN/ECE), R117

Regrooving recommendations

All Continental tires on which regrooving is permitted have on both sidewalls, in accordance with ECE regulation 54, the word
REGROOVABLE

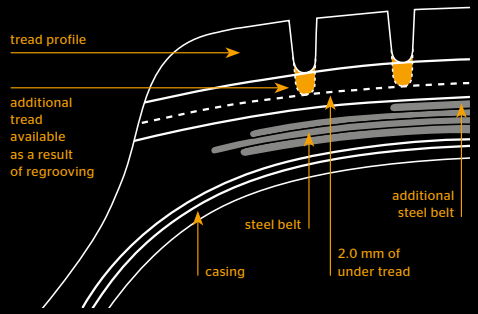
The additional tread depth of up to 4 mm gained by regrooving means a significant increase in performance.

As part of their design, all-steel truck tires have a so-called tread stock between the upper edge of the belt and the tread grooves. This tread stock is intended to prevent stones etc. penetrating into the steel belt and the casing.

Provided it is marked “REGROOVABLE“, a commercial vehicle tire may be regrooved down to a residual undertread thickness of 2 mm above the breaker or belt. All additional regulations of the respective country must be met.

Although tires can be retreaded after reaching the legal wear limit, regrooving is not advisable in every case. The tread stock thickness is reduced and stones etc. can more easily penetrate and damage the steel belts, leading to rust formation. This has a decidedly negative effect on the tire’s suitability for remolding.

The best time for regrooving is when the tread is worn down to about 3 mm. The tire must then be checked to make sure the wear is even all round. Attention should be paid to local or uneven wear patches.



Example:

Tire size	315/80 R 22.5
Original tread depth of new tire	20.0 mm
Additional tread as a result of regrooving	4.0 mm

Regrooving should be carried out by an expert, in order to avoid premature failure as well as any reduction in the tire’s suitability for retreading.

In some countries (e.g. Germany for KOM-100 coaches and Austria for coaches) regrooving of front axle tires for coaches is prohibited. In general, regrooving on front axle coach tires is not recommended.

All Continental tires on which regrooving is permitted are marked “regroovable“.

Regrooving recommendations

All Continental tires on which regrooving is permitted have on both sidewalls, in accordance with ECE regulation 54, the word
REGROOVABLE

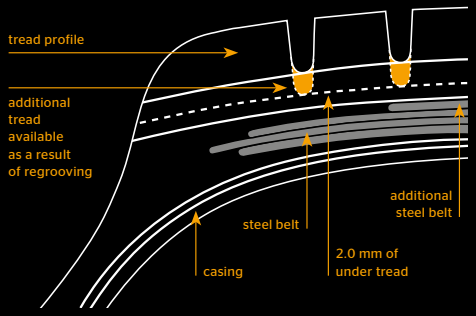
The additional tread depth of up to 4 mm gained by regrooving means a significant increase in performance.

As part of their design, all-steel truck tires have a so-called tread stock between the upper edge of the belt and the tread grooves. This tread stock is intended to prevent stones etc. penetrating into the steel belt and the casing.

Provided it is marked "REGROOVABLE", a commercial vehicle tire may be regrooved down to a residual undertread thickness of 2 mm above the breaker or belt. All additional regulations of the respective country must be met.

Although tires can be retreaded after reaching the legal wear limit, regrooving is not advisable in every case. The tread stock thickness is reduced and stones etc. can more easily penetrate and damage the steel belts, leading to rust formation. This has a decidedly negative effect on the tire's suitability for remolding.

The best time for regrooving is when the tread is worn down to about 3 mm. The tire must then be checked to make sure the wear is even all round. Attention should be paid to local or uneven wear patches.



Example:

Tire size	315/80 R 22.5
Original tread depth of new tire	20.0 mm
Additional tread as a result of regrooving	4.0 mm

Regrooving should be carried out by an expert, in order to avoid premature failure as well as any reduction in the tire's suitability for retreading.

In some countries (e.g. Germany for KOM-100 coaches and Austria for coaches) regrooving of front axle tires for coaches is prohibited. In general, regrooving on front axle coach tires is not recommended.

All Continental tires on which regrooving is permitted are marked "regroovable".

Maintenance and care

The prerequisite for successful maintenance and care is the correct choice of tire, in accordance with the recommendations of the tire manufacturer. Refer also previous sections on this subject.

Storage

Unused tires should be stored in cool, dry, dark and lightly ventilated rooms. Tires which are not fitted on rims should be stored standing up. Avoid contact with fuel, lubricants, solvents and chemicals.

Should tires, tubes and bead flaps need to be stored temporarily, they may age more quickly and develop cracks if they are exposed to intense sunlight or extreme heat. Effective air circulation accelerates this process.

Inner tubes may be particularly affected if their packaging is damaged.

Fitting the tire

Before taking off a tire, unscrew and remove the valve insert; then wait until all the air has escaped. If a tube-type tire is fitted with an angled valve as per DIN 7786-80 GD 80, unscrew the valve stem and wait until the escaping air ceases to make noise before removing the tire.

Particular care should be taken when fitting the tire. Only rust-free rims of the right size should be used. These should not be damaged or show any signs of wear and tear. The loose flange side should be examined with great care.

Always use new rubber tubeless valves or new inner tubes and flaps on new tires or new seals for tubeless metal valves.

Take special care after tire repairs: inner tubes stretch in use and may form dangerous folds when re-fitted. If in doubt, always fit new inner tubes in order to avoid tube failure.

It is particularly important with large tires that these should already fit on the rim flange with as little inflation pressure as possible. See also WdK-Guideline 104, where detailed fitting recommendations are given.

As a guide:
When fitting, do not exceed 150% of the maximum standard inflation pressure. Under no circumstances must 10 bar be exceeded. Use only recommended fitting tools and equipment.

Should the tire bead be jammed on the rim and the pressure be high, the bead may get damaged or even destroyed.

With tube type tires, check that valves still move freely after the filler nozzle has been removed. This is important for later inflation pressure checks under difficult conditions.

Fast-running wheels should be balanced statically and dynamically to ensure smooth running.

Fitting the wheel on to the vehicle

Vehicle axle data such as toe-in, king pin inclination and castor as well as axle alignment must be checked and if necessary adjusted to within tolerances.

Only then should the wheel be fitted.

When fitting make sure that the axle hub is perfectly centered. Extra care is necessary with large, heavy tires which do not have special centering.

If necessary, re-balance the wheel when it is fitted on the vehicle.

Always remember to check that the valves move freely and are easily accessible. Valve extensions are necessary for dual tires.

Checking the inflation pressure requires the free movement and easy access of the valves, even when they have become dirty during operation.

Valve caps, preferably high pressure type, must be fitted.

On rolling road testers where the vehicle performance is examined, restrictive testing regulations must be observed: depending on the roller diameter only short tests may be carried out and these must always below maximum speed.

If a vehicle has all the same type of tires e.g. radial tires, this will guarantee optimum driving characteristics and maximum driving stability.

The use of different tire designs on each axle should be a rare exception. Where vehicles are being used on the highway, minimum tread depths as specified in the latest national regulations must be observed. For motor vehicles, trailers or semitrailers it is essential that tires of the same construction are fitted to the same axle.

Minimum tread depth

The legal minimum tread depth is 1.0 mm and must cover the complete width and circumference of the tread. The depth should be measured in the tread groove with the tread wear indicator (the area with the indicator should not be taken).

Vehicle in operation

The inflation pressure must be correct. Otherwise poor vehicle handling and pronounced, irregular tread wear are inevitable.

If pressure is insufficient, the rolling resistance will increase and with it the fuel consumption. Hidden defects in the tire may also occur which later lead to tire failure.

Tire inflation pressures specified by vehicle and tire manufacturers are contained in the vehicle manual and, for example, on the vehicle mud guard. These may vary with different loads and service conditions, and must be adjusted before commencing a journey. Specified inflation pressures always apply to cold tires. An increase in inflation pressure during running is normal and must never be re-adjusted. Do not reduce pressure when the tires are hot.

Never use different inflation pressures for the same axle.

The spare wheel should be inflated to at least the maximum inflation pressure given in the vehicle manual. Remember to always include the spare wheel when checking inflation pressures.

A balanced, even style of driving reduces the strain on the tires. Every hasty reaction on the accelerator, brakes or steering shortens the life of the tires.

The same also applies of course to all other forms of peak strain such a severe scuffing of the tire along the curb or driving over obstacles that may be in the road. These can all result in damage to the tires construction.

Strain on the tire should be avoided. This has the same effect as insufficient pressure.

Do not exceed the tire's permitted maximum speed, otherwise tire damage is inevitable.

Maintenance and care of the vehicle's tires

The high quality standard of the tires and vehicle, which is achieved by the measures and recommendations stated above, can only be ensured by the regular checking of all factors.

For example, pressure checks and external inspections of the tires (including the sidewalls to the inside of the vehicle and between dual tires).

Pressure checking devices and small replacement parts such as valve inserts, caps and extensions should always be close at hand.

Tires age as a result of physical and chemical processes and this may impair their performance.

Tires, which are fitted to mainly stationary vehicles or those which are not used regularly, are particularly prone to premature ageing.

Unfavourable weather conditions also accelerate the ageing process as well as the storage conditions that were covered in the previous section.

An expert should always be called in to make a qualified judgment on the tires.

Regrooving of the tread pattern – usually when there are 2 or 3 millimetres of tread depth left – should be carried out only by qualified experts when the word "REGROOVABLE" is displayed on the tire sidewall.

Tire repairs

Tire damage may initially be just a question of damage to the outer rubber: however, this apparently superficial damage can eventually extend down to, or into, the tire's reinforcing materials (casing/belt). Therefore no time should be lost in taking the tire to a specialist for assessment as soon as any external damage is detected.

Damage to the reinforcing materials, for instance due to a nail puncture or a deep cut, is particularly dangerous because dirt and moisture may penetrate during the time between when the damage occurred and when it was detected. This may even result in more serious damage to the reinforcing materials. Damage to the inside of a tire can also cause a slow puncture.

The tire is then driven underinflated and consequently subjected to excessive strain. All these factors can make a tire non-repairable by the time the damage is finally discovered. If the tire is repaired regardless, even if it is repaired by a reputable tire specialist, it is possible that tire failure can still occur as a result of an overstrained area, other than that originally damaged.

This is why each tire must be carefully inspected by a tire expert before it is repaired. For only a specially trained person can decide whether it is possible to repair the tire and whether the tire will be capable of delivering safe performance after the repair. Repairs must be carried out by an authorized workshop, which is then responsible for inspecting the tire and for doing the job properly.

Repairs to the wheels are forbidden.

Terms and Explanations

Load/Speed Index
The nominal load carrying capacity of a tire is expressed as the Load Index (LI) and is expressed in kg. In addition to this, a reference speed is also determined in connection with the nominal load carrying capacity (refer to speed symbol and reference speed).

Speed symbol and reference speed (km/h)
Each speed symbol is assigned a reference speed in km/h or mph. The tire speed is assigned the nominal load carrying capacity of the tire.

PR
„Ply-rating" (also called „PR"), is an international designation for the solidity of the tire casing. In the past, the tire load-carrying class was only expressed by means of a PR number. The exact designation of load carrying capacity is nowadays expressed as a numerical code, namely the Load Index (or LI).

TT/TL
Tubeless – tires without inner tube
Tube Type – tires with inner tube

Minimum distance between rim centers
Adherence to the minimum distance between rim centers ensures the fault-free performance of two tires in accordance with the ETRTO Standard without chains, when mounted dually (refer also to page 5).

Maximum standard value in service
This is the maximum permissible width in accordance with the ETRTO Standard. Dynamic deformations are not included.

Design value
Width and external diameter as provided by the manufacturer

Stat. radius
Distance from the center of the wheel to the road surface

Rolling circumference
The distance covered on each revolution of the tire

Tire fitment
Describes single (S) or dual fitment (D)

Load carrying capacity in kg per axle at an inflation pressure in bar or psi
Axle load carrying capacities with single or dual fitment at an adjusted inflation pressure in bar and psi (1 bar ~ 14.5 psi)

Explanation of footnotes
