

Back pain

Outline

- 
- A large, ornate metal key is positioned vertically on the left side of the slide. The key has a circular head and a long, slender shaft with a notched end. It is set against a textured, golden-brown background that resembles sand or gravel.
- ◆ Urgent Vs. Elective.
 - ◆ Diagnosis of four common spine disorders
 - Spinal Stenosis (*with and without instability*)
 - Disk degeneration
 - Herniated Disc
 - Arthritis (spondylosis)
 - ◆ Treatment of common spine disorders
 - Nonsurgical Vs. Surgical

Urgent Vs. Electives

Urgent

- Infection
- Tumor
- Trauma
- Caudal equina

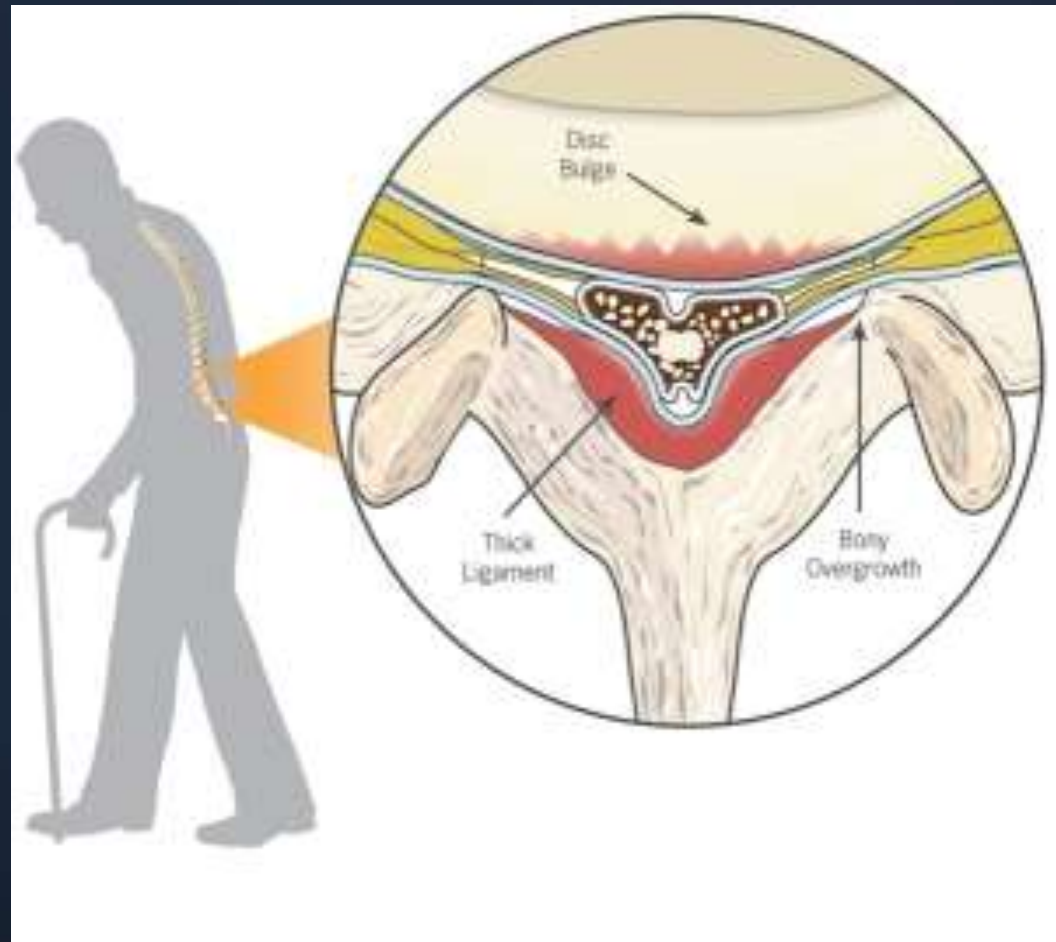

Electives

- Everything else.

1. SPINAL STENOSIS

Anatomy

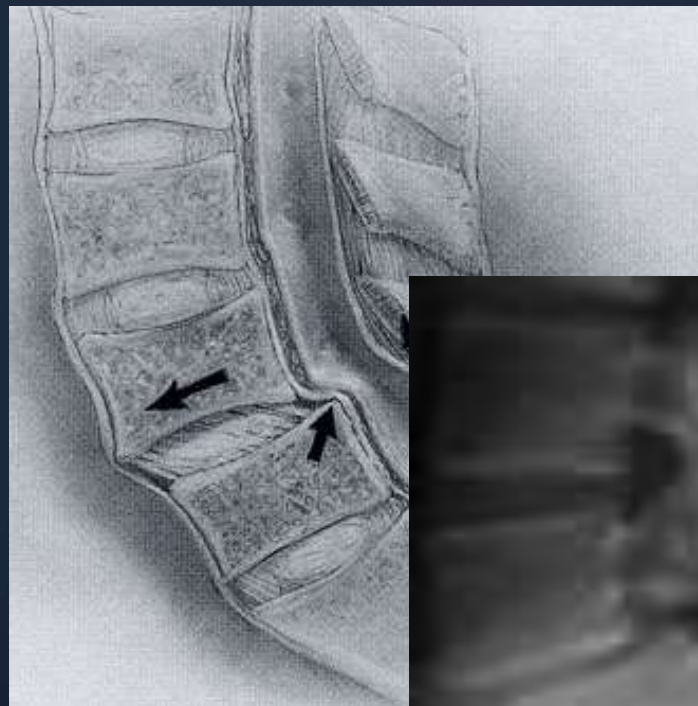

Stenosis with Spondylolisthesis

- ◆ Derivation from Greek

- Spondylos: “vertebra”
- Olisthein: “to slip”

- ◆ Myerding Grading System

- Grade 1 25%
- Grade 2 50%
- Grade 3 75%
- Grade 4 100%

Stenosis with scoliosis

- ◆ Rotatory instability

Pathophysiology

- ◆ Narrowing cauda equina to 63% of normal raises intrathecal pressure to 50 mmHg
- ◆ ↓ capillary flow
- ◆ ↓ electrical conduction
- ◆ ↑ edema within & along nerve roots

Olmarker K, Acta Orthop Scand 1991; 242:1-27

Clinical Presentation – Neurogenic Claudication

2. Disc Degeneration

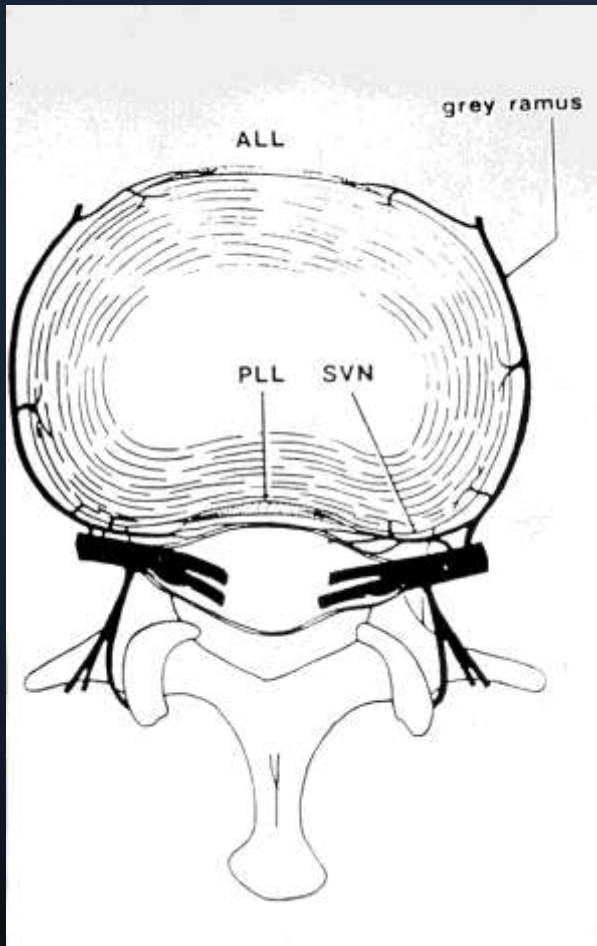

- ◆ Controversial
- ◆ Young patients
- ◆ Mostly mechanical back pain worsen with any activities
- ◆ Sitting intolerance
- ◆ More pain with flexion than extension
- ◆ ?Abnormal psychological profile

Discogenic pain

Discogenic Pain

MECHANICAL FAILURE

Disc Degeneration

- ◆ Black disc

Disc Degeneration

- ◆ Discogram

3. Herniated Disc

Herniated Disk

Clinical Presentation

- ◆ Young patients
- ◆ Radiculopathy (sciatic pain)
 - L4, L5, S1
- ◆ Leg pain more than back pain
- ◆ Increase with cough or straining
- ◆ Positive straight leg raise
- ◆ More pain with flexion than extension

Herniated disc

Normal MRI

MRI-HNP

Treat patient not x-ray !

◆ 67 Asymptomatic volunteers:

- MRI + Herniated disc
 - <60 yo = 20%
 - >60 yo = 36%
 - >80 yo = 90%

(Boden JBJS 1990)

◆ 98 Asymptomatic vol.

- 36% had normal disc at all levels

(Jensen NEJM 1994)

4. Arthritis of the Spine

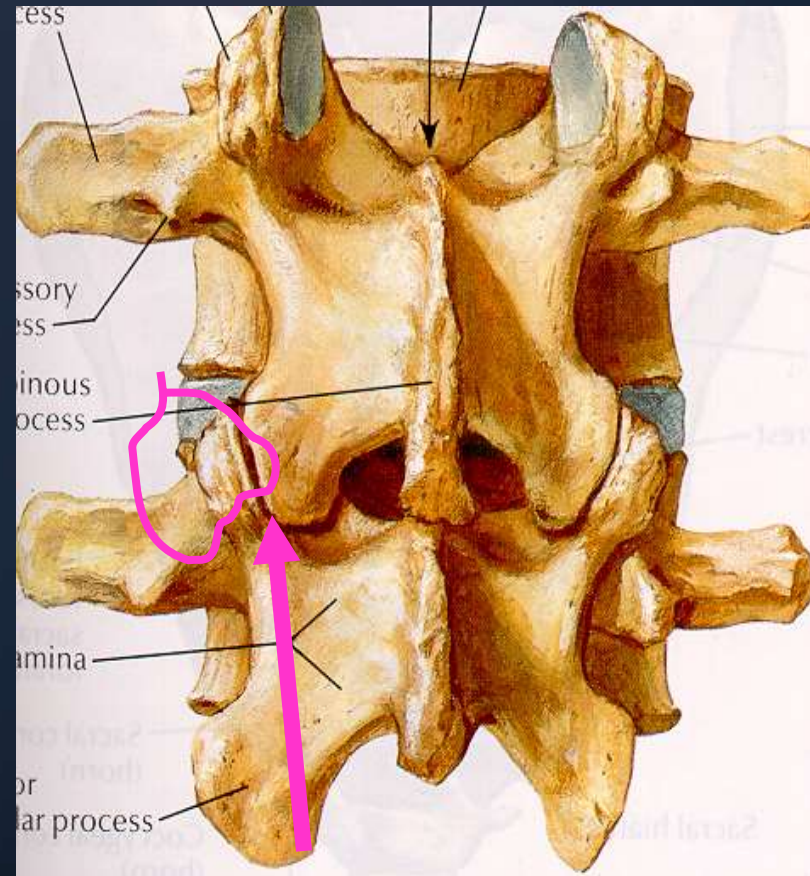

Pathoanatomy

- ◆ Begins w/ disc degeneration
- ◆ Disc space collapse
- ◆ OA of facet joints from abnormal loading
- ◆ Osteophytes @ facets and bodies
- ◆ Disc collapse, bulging ligamentum, and new bone shorten canal and decrease overall volume
- ◆ Scoliosis/spondy/ instab worsen stenosis

Inferior articular process

- Located posterior and medially
- Forms lateral wall of spinal canal
- Osteophytes cause central canal narrowing

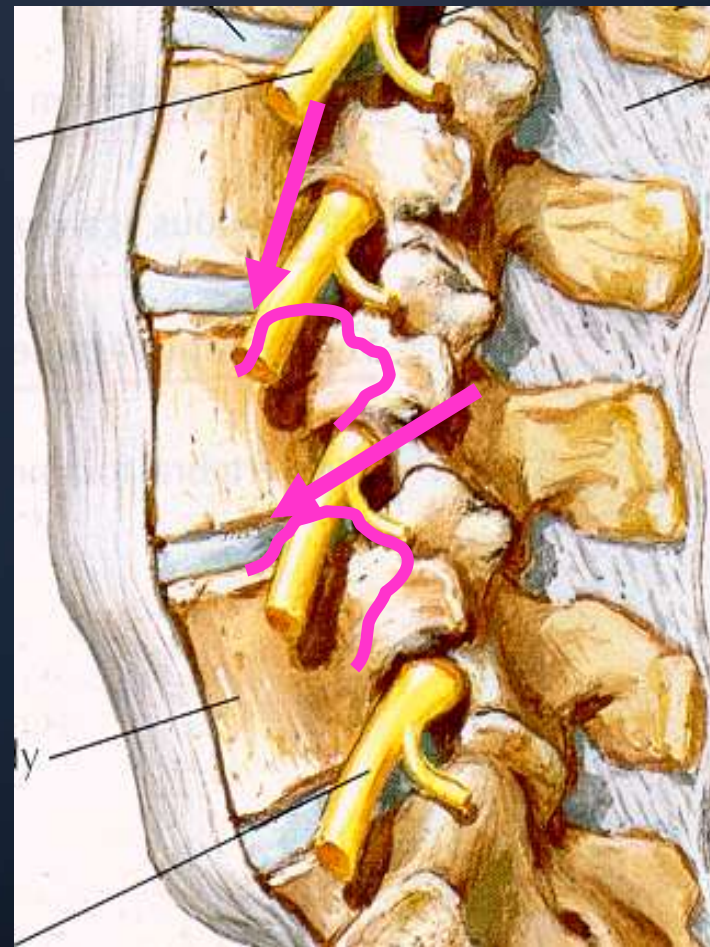

Superior articular process

-Located laterally and anteriorly

-Osteophytes cause narrowing of :

-lateral recess

-neural foramen

Clinical Presentation of Facets Arthropathy

- Morning Stiffness.
- Lower back Pain without radiculopathy
- Pain improves with activities during the day, returns in the evening.
- More pain with extension than flexion
- Aggravated by weather or humidity change

Arthritis of the Spine

- 
- ◆ Osteoarthritis
 - ◆ Spondyloarthropathy
 - Ankylosing spondylitis
 - Enteropathic (Crohn's)
 - Reiter's
 - Psoriatic
 - ◆ Rheumatoid

Radiographic findings: AS

- ◆ Vertebral scalloping
- ◆ Ankylosis/ Bamboo spine

Non-Surgical Treatment

(80-90% of patient)

- ◆ Bed rest (1-2 days)
- ◆ Traction(at least 25% of body weight)
- ◆ Acupuncture/trigger point injection
- ◆ TENS
- ◆ Corset/Braces
- ◆ Manipulation
- ◆ Medication
 - NSAID
 - Muscle relaxant

Physical Therapy

- ◆ Aerobic (LA firefighter-higher fitness, lower risk of subsequent back pain)
- ◆ Stretching (YMCA-80% improvement/6wks)
- ◆ Williams isometric flexion program
(stenosis, arthritis)
- ◆ McKenzie extension program (Discogenic)

Epidural Steroid Injections (ESI)

- ◆ May be helpful in acute flare-ups with significant radicular complaints and/or mild/moderate stenosis
- ◆ Useful in older pt population with many comorbidities (poor surgical candidates) after failing medical Rx and PT
- ◆ Complications - meningitis, nerve injury, epidural hematoma, arachnoiditis

Epidural Steroid Injections (ESI)

- ◆ Prospective, randomized, double-blind study in pts with radicular Sx (~ 50% had Dx of lumbar stenosis)
- ◆ No significant difference in symptomatic improvement between steroid and placebo injections at 24-hr and 1-year f/u
 - Cuckler JM et al, JBJS Am 1985; 67:63-66

Surgical Treatment

Is a Quality of Life Issue!

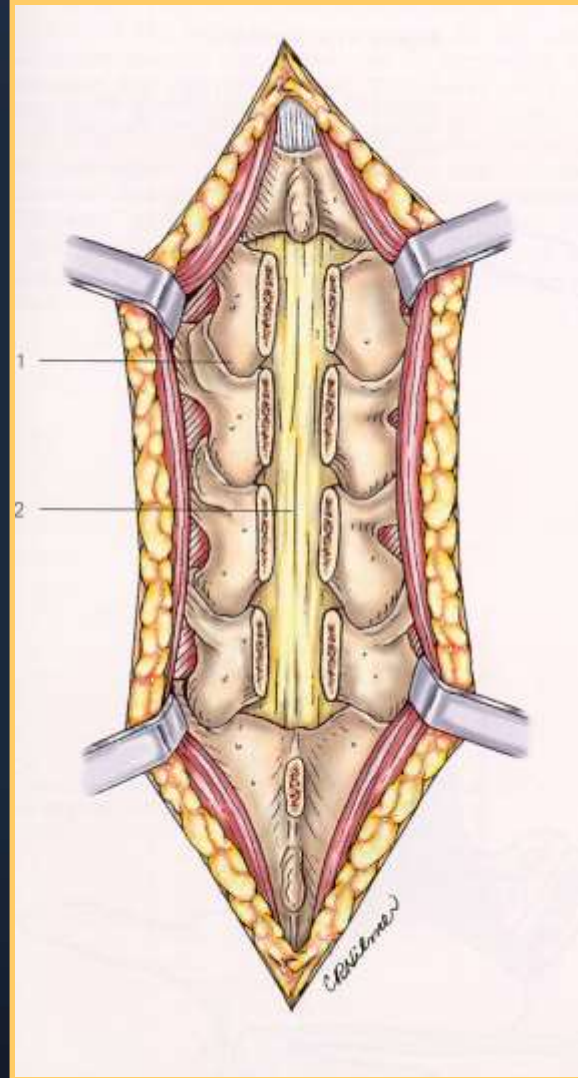

A. Decompression

B. Stabilization

For Stenosis

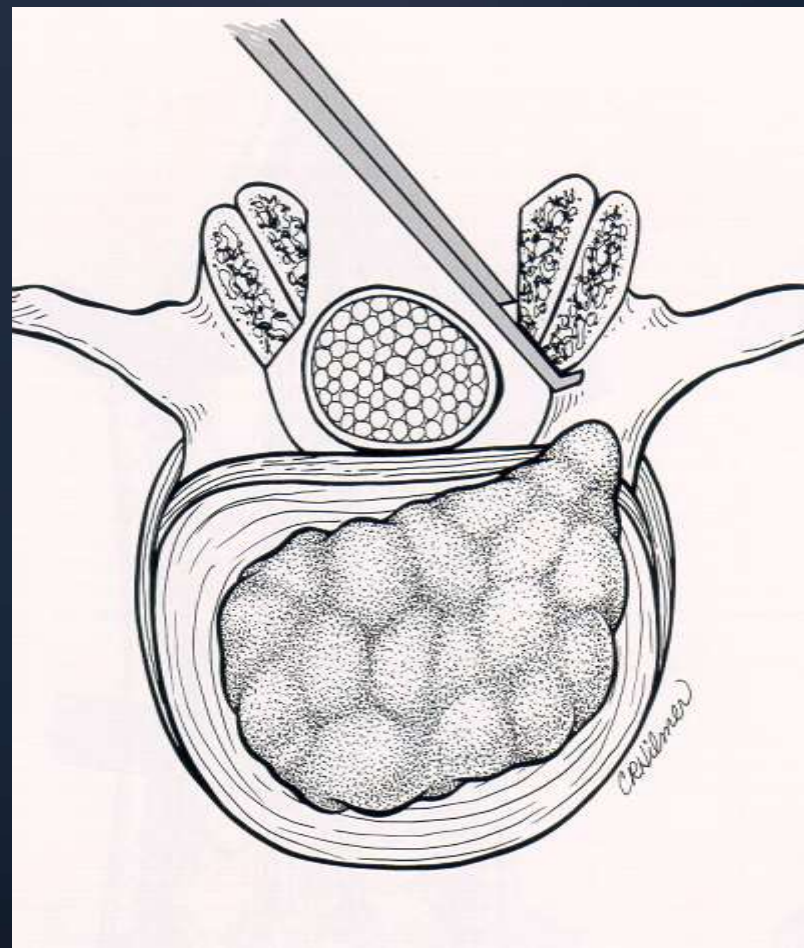

Decompressive Laminectomy

Surgical Decompression

Open technique

- ◆ Unilateral/bilateral laminotomy with foraminotomy – Focal lateral stenosis
- ◆ Up to 50% of facet joint usually may be removed w/ low risk of post-op instability

Unstable spine-Fusion

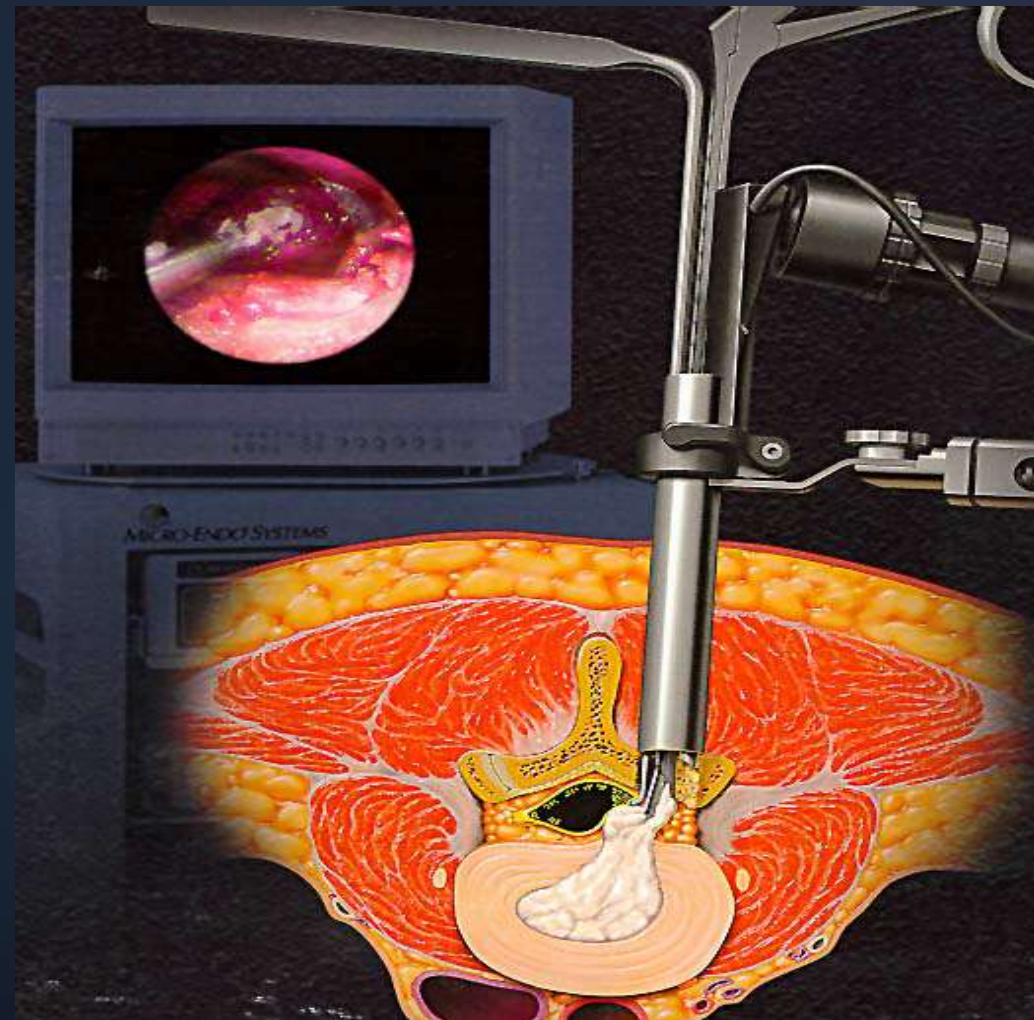

- ◆ Instability
 - Spondylolisthesis
 - Scoliosis
 - Severe disc degeneration

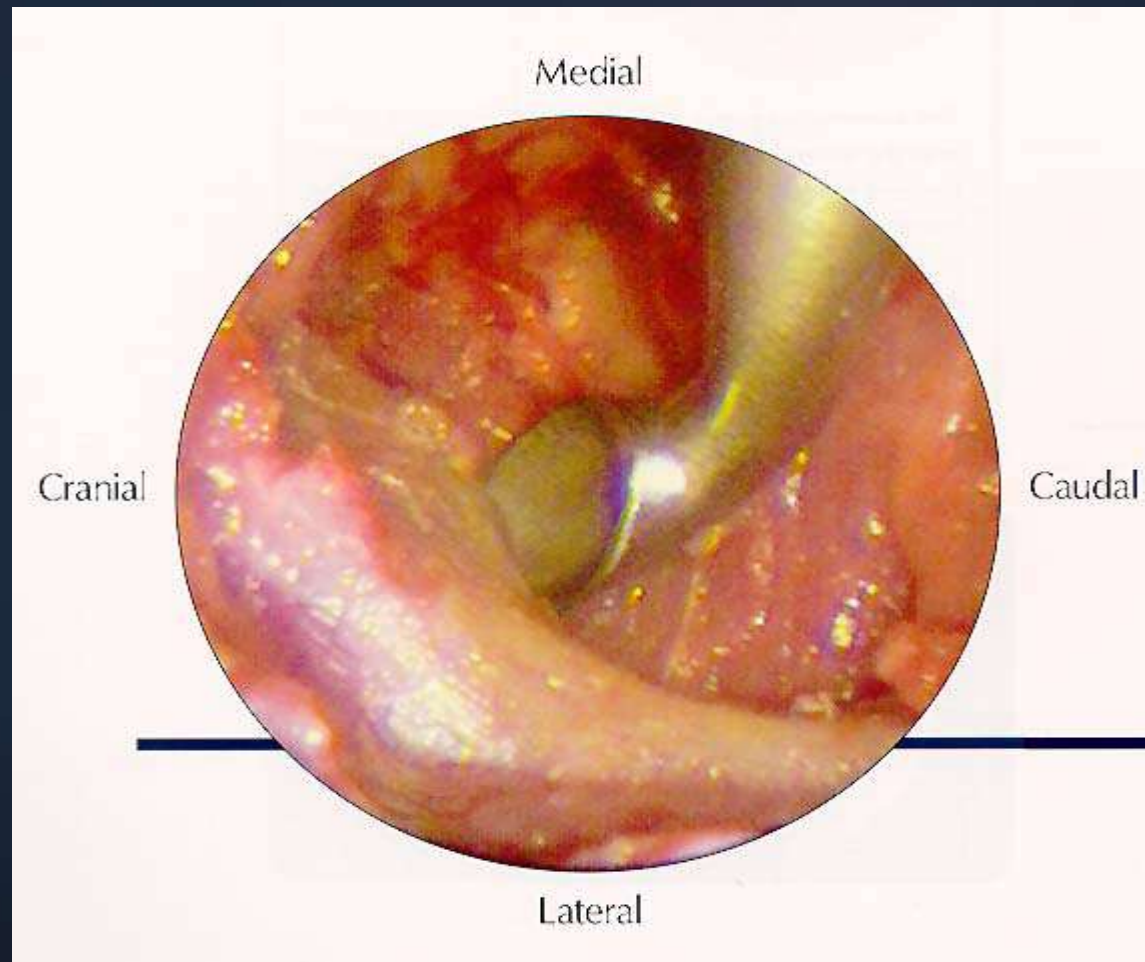

Minimal Invasive decompression

Minimal Invasive Access

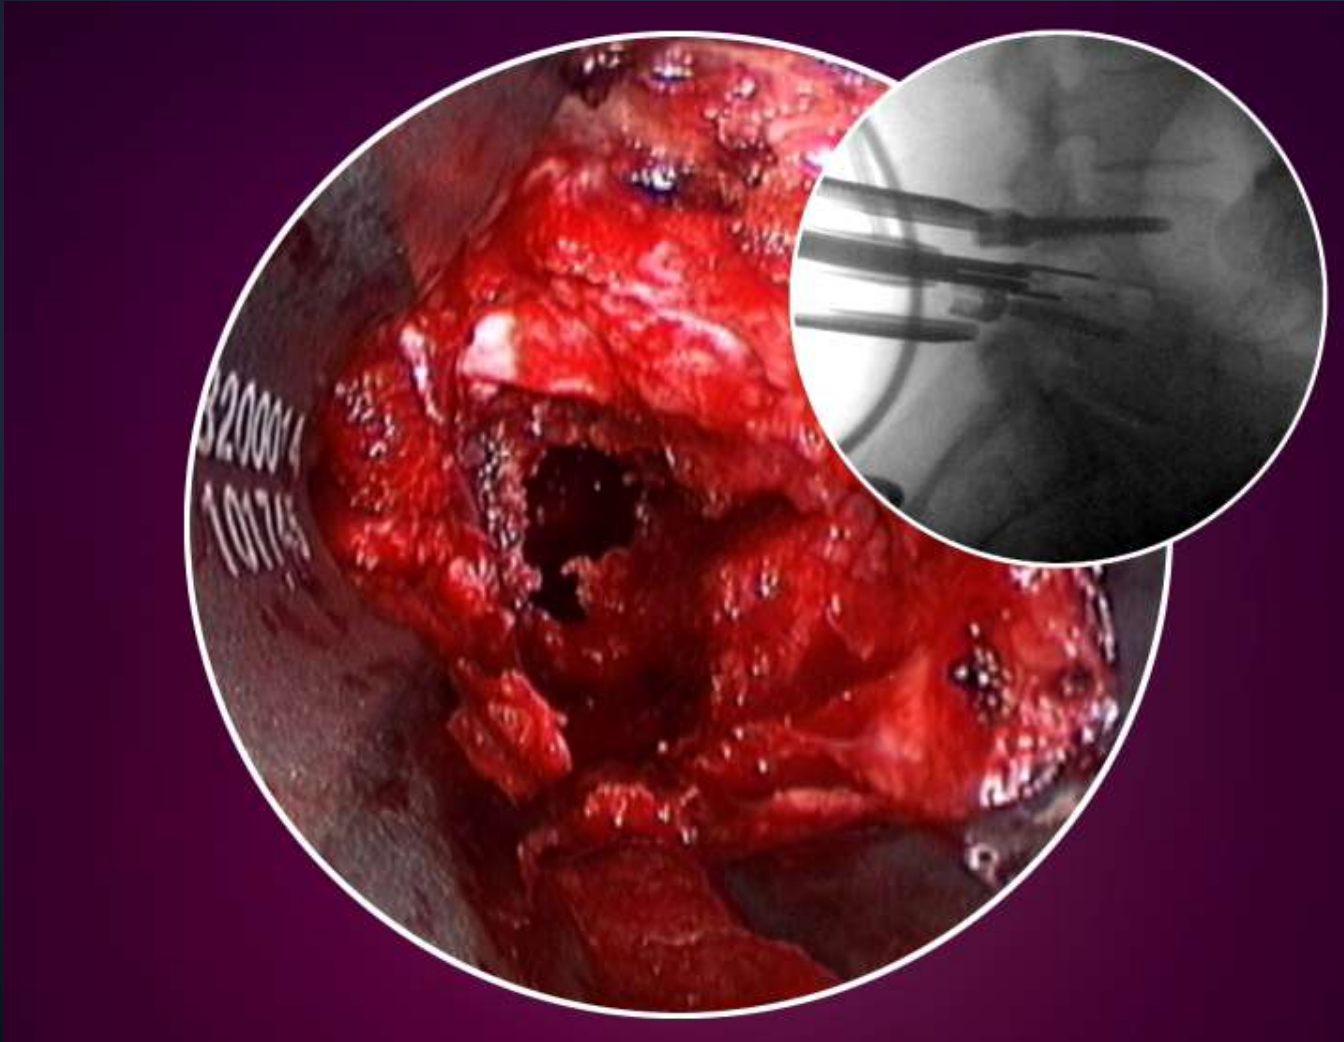

Minimal Invasive exposure

Minimal Invasive Decompression

Minimal Invasive cage placement

Result

Minimal Invasive-lateral transpsoas technique

Retroperitoneal Access

Position Confirmation

Implant Insertion

Disk Preparation

Minimal Invasive Technique

Motion Preservation-Artificial Disc for Patients w Disc Degeneration

Charite' (depuy)

Prodisc (synthes)

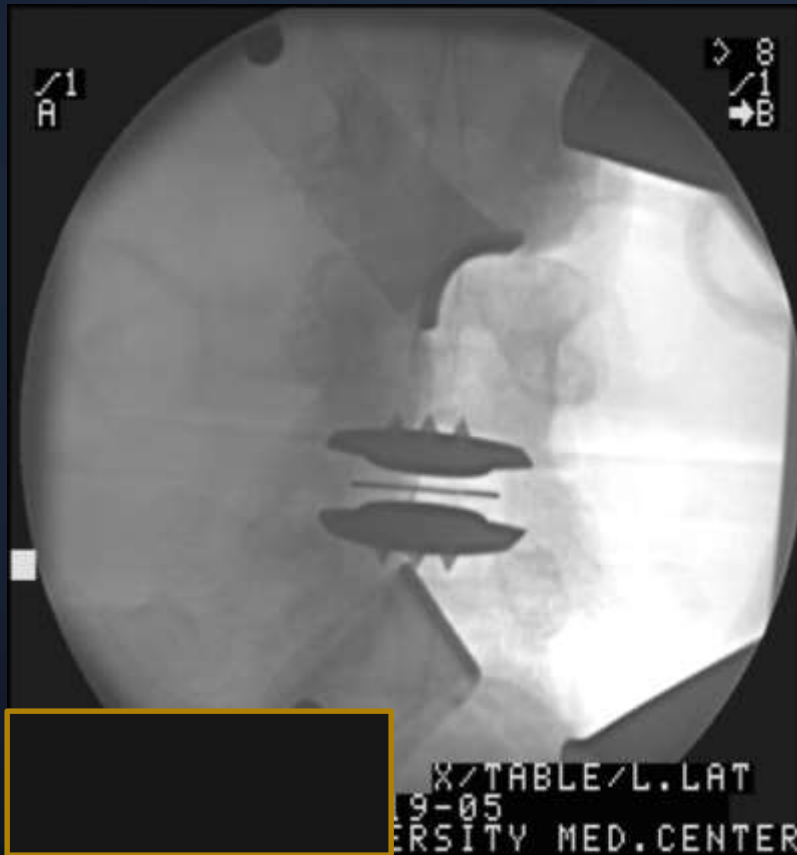

Maverick (Medtronic)

Flexicore (stryker)

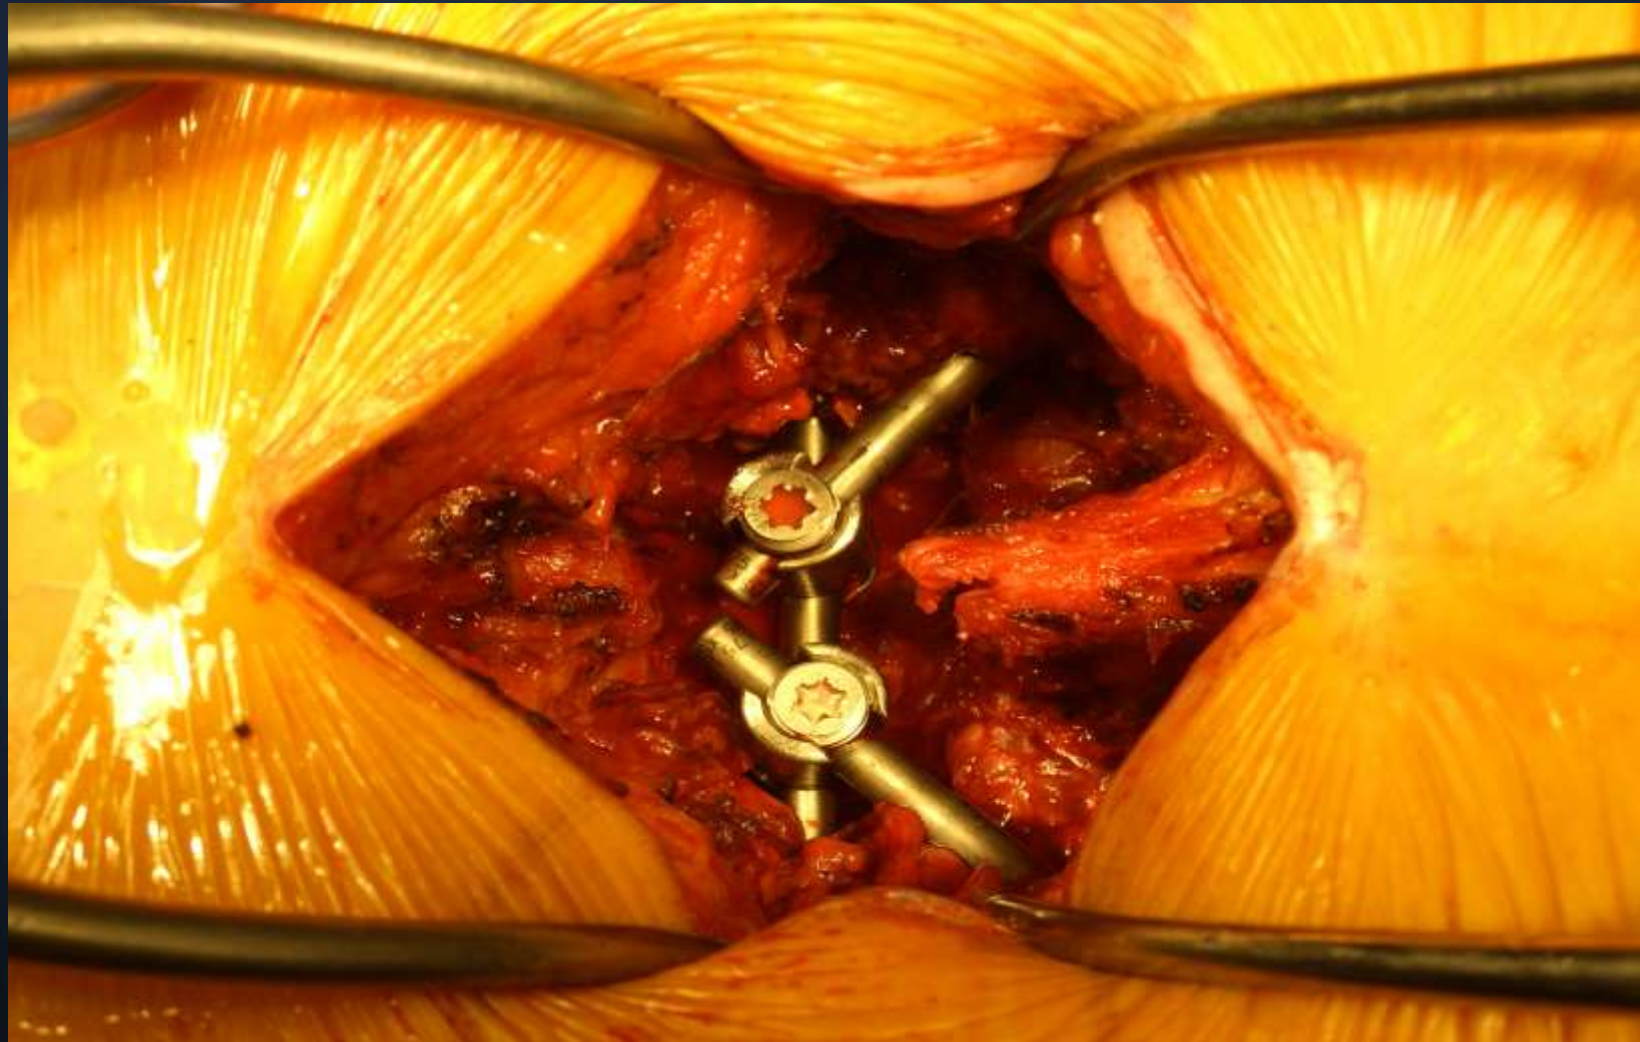

Intra-op: Artificial Disc

Posterior Dynamic Stabilization IDE

Facet Joint Replacement - IDE

Facet Joint Replacement

Fracture in osteoporosis

Age 50

Age 75

Kyphoplasty for fracture in Elderly

Minimally Invasive Fracture Reduction

Kyphoplasty

Chronic pain- Stimulator & pain pump

Conclusion

Patient selection and Making the correct diagnosis is the key to success.

Thank You
