AB Allen-Bradley

Compact ${ }^{\text {TM }}$ High Speed Counter Module
(Catalog Number 1769-HSC)

Because of the variety of uses for the products described in this publication, those responsible for the application and use of this control equipment must satisfy themselves that all necessary steps have been taken to assure that each application and use meets all performance and safety requirements, including any applicable laws, regulations, codes and standards.

The illustrations, charts, sample programs and layout examples shown in this guide are intended solely for purposes of example. Since there are many variables and requirements associated with any particular installation, Allen-Bradley does not assume responsibility or liability (to include intellectual property liability) for actual use based upon the examples shown in this publication.

Allen-Bradley publication SGI-1.1, Safety Guidelines for the Application, Installation and Maintenance of Solid-State Control (available from your local Allen-Bradley office), describes some important differences between solid-state equipment and electromechanical devices that should be taken into consideration when applying products such as those described in this publication.

Reproduction of the contents of this copyrighted publication, in whole or part, without written permission of Rockwell Automation, is prohibited.

Throughout this manual we use notes to make you aware of safety considerations:

## ATTENTION

Identifies information about practices or circumstances that can lead to personal injury or death, property damage or economic loss

Attention statements help you to:

- identify a hazard
- avoid a hazard
- recognize the consequences

## IMPORTANT Identifies information that is critical for successful application and understanding of the product.

- related publications
- conventions used in this manual
- Rockwell Automation support

# Who Should Use This Manual 

Use this manual if you are responsible for designing, installing, programming, or troubleshooting control systems that use Allen-Bradley Compact ${ }^{\text {TM }}$ I/O and/or Micrologix ${ }^{\text {TM }} 1500$ or CompactLogix ${ }^{\mathrm{TM}}$ controllers.

As much as possible, we organized this manual to explain, in a task-by-task manner, how to install, configure, program, operate and troubleshoot a control system using the 1769 High Speed Counter modules.

If you would like a manual, you can:

- download a free electronic version from the internet at www.theautomationbookstore.com
- purchase a printed manual by:
- contacting your local distributor or Rockwell Automation representative
- visiting www.theautomationbookstore.com and placing your order
- calling 1.800.963.9548 (USA/Canada) or 001.330.725.1574 (Outside USA/Canada)

Conventions Used in This Manual

The following conventions are used throughout this manual:

- Bulleted lists (like this one) provide information not procedural steps.
- Numbered lists provide sequential steps or hierarchical information.
- Italic type is used for emphasis.
- Text in this font indicates words or phrases you should type.

## Rockwell Automation Support

Rockwell Automation offers support services worldwide, with over 75 Sales/Support Offices, 512 authorized distributors and 260 authorized Systems Integrators located throughout the United States alone, plus Rockwell Automation representatives in every major country in the world.

## Local Product Support

Contact your local Rockwell Automation representative for:

- sales and order support
- product technical training
- warranty support
- support service agreement

## Technical Product Assistance

If you need to contact Rockwell Automation for technical assistance, please review the information in Chapter 5, Diagnostics and Troubleshooting first. Then call your local Rockwell Automation representative.

## Your Questions or Comments on the Manual

If you find a problem with this manual, please notify us. If you have any suggestions for how this manual could be made more useful to you, please contact us at the address below:

## Module Overview

This chapter contains the following:

- module overview
- hardware features

## Module Overview

The 1769-HSC is an intelligent counter module with its own microprocessor and I/O that is capable of reacting to high speed input signals. The module can interface with up to 2 channels of quadrature or 4 channels of pulse/count inputs. The signals received at the inputs are filtered, decoded, and counted. They are also processed to generate rate and time-between-pulses (pulse interval) data. Count and rate values can then be used to activate outputs based on user-defined ranges.

The module counts pulses at up to 1 MHz from devices such as proximity switches, pulse generators, turbine flowmeters, and quadrature encoders. The module has four on-board high speed switching outputs. These outputs can be under user program or direct module control, based on the count value or frequency.

The module is compatible with MicroLogix ${ }^{\text {TM }} 1500^{(1)}$ packaged controllers, CompactLogix ${ }^{\text {TM }}{ }^{(2)}$ modular PLCs, and the Series $\mathrm{B}^{(3)}$ 1769-ADN DeviceNet Adapter.

## Counters

The module is capable of counting pulses in either direction (forward/reverse, up/down, etc.). A maximum of four pulse counters (or 2 quadrature counters) are available. Each 32-bit counter can count to $\pm 2$ billion as a ring or linear counter. In addition to providing a count value, the module provides a rate value up to $\pm 1 \mathrm{MHz}$, dependent upon the type of input. The rate value (as modified by scalar) is the input frequency to the counter. When the count value is increasing, the rate value is positive. When the count value is decreasing, the rate value is negative.
(1) 1764-LSP and 1764-LRP Series C, Firmware revision 6.0 and higher.
(2) Firmware versions prior to 11.0 require the use of Generic Profiles.
(3) Available Spring 2002.

Counters can also be reset or preset to any value between user-defined minimum and maximum values. Preset can be accomplished from the user program or at a $Z$ input event. The $Z$ input can also generate a capture value and/or freeze (gate) the counters.

## Inputs

The module features six high-speed differential inputs labeled $\pm \mathrm{A} 0$, $\pm \mathrm{B} 0, \pm \mathrm{Z} 0, \pm \mathrm{A} 1, \pm \mathrm{B} 1$, and $\pm \mathrm{Z} 1$. These inputs support 2 quadrature encoders with $A B Z$ inputs and/or up to 4 discrete count inputs. In addition, $\mathrm{x} 1, \mathrm{x} 2$, and x 4 encoder configurations are provided to fully use the capabilities of high resolution quadrature encoders. The inputs can be wired for standard differential line driver output devices, as well as single-ended devices such as limit switches, photo eyes, and proximity sensors. Inputs are optically isolated from the bus and from one another, and have an operational range of 2.6 to 30 V dc.

## Outputs

Sixteen outputs are available: four on-board (real) and twelve virtual bits. All 16 outputs can be individually controlled by the module or by the user control program.

The 4 on-board (real) outputs are dc sourcing, powered by a user-supplied ( 5 to 30 V dc) power source. These outputs are electronically protected from current overloads and short circuit conditions. Overcurrent status is monitored and fed back to the user program. Output states are determined by a combination of output data, configuration data, ranges, and overcurrent status.

See Output Control on page 2-23 for a description of how the module determines output status.

## Hardware Features

The module's hardware features are illustrated below. Refer to Chapter 3 for detailed information on installation and wiring.

Figure 1.1 Hardware Features

| Item | Description |
| :--- | :--- |
| 1 | bus lever |
| 2 a | upper panel mounting tab |
| 2 b | lower panel mounting tab |
| 3 | module status LEDs (6 Input, 4 Output, 1 Fuse, 1 OK) |
| 4 | module door with terminal identification label |
| $5 a$ | movable bus connector (bus interface) with female pins |
| 5 b | stationary bus connector (bus interface) with male pins |
| 6 | nameplate label |
| 7 a | upper tongue-and-groove slots |
| 7 b | lower tongue-and-groove slots |
| 8 aa | upper DIN rail latch |
| 8 b | lower DIN rail latch |
| 9 | write-on label for user identification tags |
| 10 | removable terminal block (RTB) with finger-safe cover |
| $10 a$ | RTB upper retaining screw |
| 10 b | RTB lower retaining screw |

## LEDs

The front panel has a total of twelve indicator LEDs, as shown in Figure 1.1 on page $1-3$.

Table 1.1 Diagnostic Indicators

| LED | Color | Indicates |
| :---: | :---: | :---: |
| O OUT | Amber | ON/OFF logic status of output 0 |
| 1 OUT | Amber | ON/OFF logic status of output 1 |
| $20 U T$ | Amber | ON/OFF logic status of output 2 |
| 3 OUT | Amber | ON/OFF logic status of output 3 |
| FUSE | Red | Overcurrent |
| OK | Off | No power is applied. |
|  | Red (briefly) | Performing self-test. |
|  | Solid Green | OK, normal operating condition. |
|  | Flashing Green | OK, module in Program or Fault mode. |
|  | Solid Red or Amber | Hardware error. Cycle power to the module. If problem persists, replace the module. |
|  | Flashing Red | Recoverable fault. Reconfigure, reset, or perform error recovery. See section on page 5-5, Non-Critical vs. Critical Module Errors. The OK LED flashes red for all of the error codes in Table 5.6. |
| A0 | Amber | ON/OFF status of input A0 |
| A1 | Amber | ON/OFF status of input A1 |
| B0 | Amber | ON/OFF status of input B0 |
| B1 | Amber | ON/OFF status of input B1 |
| Z0 | Amber | ON/OFF status of input ZO |
| Z1 | Amber | ON/OFF status of input Z1 |
| $\begin{aligned} & \overline{\text { ALL }} \\ & \text { ON } \end{aligned}$ | Possible causes for all LEDs to be on: <br> - Bus Error has occurred: Controller hard fault. Cycle power. <br> - During Flash Upgrade of Controller: Normal. Do not cycle power during the Flash Upgrade. <br> - All LEDs will flash on briefly during power-up. This is normal. |  |

## Module Operation

This chapter contains information about:

- counter defaults
- module operation block diagrams
- number of counters
- input filtering
- input operational mode
- modifying count value or input signals
- counter types
- rate/timer functionality
- output control
- safe state control

## Counter Defaults

When the module powers-up, all Output Array and Configuration Array values are set to their default values (see Chapter 4 or Appendix D for default values). All Input Array values are cleared. None of the module data is retentive through a power cycle.

In effect, this means that power cycling clears the module:

- stored counts and configurations are lost
- faults and flags are cleared
- outputs are off

## Module Operation Block Diagrams

To provide an overview of the module operation, the block diagrams indicate relationships between module functions and configuration parameters.

## Inputs

The following diagram illustrates how the inputs function.

## Outputs

The following diagram illustrates how the outputs function.

## Number of Counters

## Summary of Available Counter Configurations

The module has six input points: A0, B0, Z0, A1, B1, and Z1. Through these inputs, the module can function with $1,2,3$, or 4 counters depending upon the number of counters and the operational mode configuration of the input points.

The table below summarizes the input configurations available for all counters, based on the number of counters.

| Number of <br> Counters | Counter | Operational Mode | Gate or Preset <br> Functionality |
| :--- | :--- | :--- | :--- |
| 1 Counter | 0 | Any | All |
|  | 1 through 3 | Not available | All |
|  | 0 | Any | All |
|  | 1 | Any | All |
|  | 2 and 3 | Not Available | All |
| 3 Counters | 0 | Any | None |
|  | 1 | Pulse/Internal Direction |  |
|  | 2 | Pulse/Internal Direction | Not available |
|  | 0 | Pulse/Internal Direction | All |
|  | 3 | Pulse/Internal Direction | All |
|  | 1 | Pulse/Internal Direction | None |
|  | 2 | Pulse/Internal Direction | None |
|  | 3 |  |  |

The counter options and operating modes are summarized in Figure 2.1.

Figure 2.1 Summary of Available Counters
AO
AO
(1) The number of counters is defined by the NumberOfCounters bits in word 0 of the Configuration Array.

# Input Filtering 

In many industrial environments, high frequency noise can be inadvertently coupled to the sensor wires. The module can help reject some noise by means of built-in filters. Inputs are filtered by means of user-selectable, low-pass filters ${ }^{(1)}$ set up during module configuration.

The available nominal pulse width filters are:
Table 2.1 Available Filters

| Input | Filter |
| :--- | :--- |
| A0, A1, B0, B1, Z0, Z1 | $5 \mathrm{~ms}, 500 \mu \mathrm{~s}, 10 \mu \mathrm{~s}$, no filter |

The filters are selected for each input in the Filter Selection word of the Module Configuration Array.

## TIP

The input state bits (InputStateA0 through InputStateZ1) reflect the filter's inputs, but are NOT affected by the signal inhibit or invert operations described on page 2-7.

## Table 2.2 Filter Pulse Width and Frequency

| Nominal Filter Settings |  | Maximum Guaranteed Blocked Pulse <br> Width |  | Minimum Guaranteed Pass Pulse Width |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Pulse Width | Equivalent <br> Frequency ${ }^{(\mathbf{1})}$ | Pulse Width | Equivalent <br> Frequency ${ }^{(1)}$ | Pulse Width | Equivalent <br> Frequency |
| no filter | 1 MHz | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | 250 ns | 2 MHz |
| $10 \mu \mathrm{~s}$ | 50 kHz | $7.4 \mu \mathrm{~s}$ | 67.5 kHz | $25 \mu \mathrm{~s}$ | 20 kHz |
| $500 \mu \mathrm{~s}$ | 1 kHz | $370 \mu \mathrm{~s}$ | 1.35 kHz | 1.25 ms | 400 Hz |
| 5 ms | 100 Hz | 3.7 ms | 135 Hz | 12.5 ms | 40 Hz |

(1) Equivalent frequency assumes a perfect $50 \%$ duty cycle and are for reference purposes only. Hence, the no-filter setting is guaranteed to pass 4 MHz even though the module's maximum is 1 MHz . This allows the sensor and wiring to attenuate the pulse to $25 \%$ duty cycle while the module maintains pulse recognition.

## IMPORTANT

The built-in filters are simple, averaging, low-pass filters. They are designed to block noise pulses of width equal to the values presented in Table 2.2. Applying full amplitude, $50 \%$ duty cycle signals that are of frequency above the selected filter's threshold frequency may result in an average value signal of sufficient amplitude to turn the input on. A transition from no input to the full amplitude, $50 \%$ duty cycle signal (or back to no signal) may result in inadvertent input transitions.

[^1]
## Operational Mode Selection

A count channel's operational mode configuration selection determines how the A and B inputs cause a counter channel to increment or decrement. The six available mode selections are:

- Pulse/External Direction Input
- Pulse/Internal Direction Input
- Up and Down Pulse Input
- X1 Quadrature Encoder Input
- X2 Quadrature Encoder Input
- X4 Quadrature Encoder Input

IMPORTANT
The operational mode selection is limited by the number of counters selected.

- With 2 counters selected, Counters 0 and 1 can be assigned any operational mode.
- With 3 counters selected, Counter 0 can be assigned any mode, but Counters 1 and 2 can only be configured as pulse/internal direction.
- With 4 counters selected, all counters must be configured for the pulse/internal direction mode.

See the Figure 2.1 on page $2-5$ for the operational modes available for the counters, based on the number of counters configured.

## Direction Inhibit and Direction Invert Output Control Bits

These bits apply to all of the counter modes.

## TIP

When set, the Direction Inhibit bit disables any physical input from affecting count direction.

When set, the Direction Invert bit changes the direction of the counter in all operational modes.

When Direction Inhibit is set, then Direction Invert is the direction.

## Pulse/External Direction Mode Selection

In this mode, the B input controls the direction of the counter, as shown in Figure 2.2 on page 2-8. If the B input is low ( 0 ), the counter increments on the rising edges of input A. If the input B is high (1), the counter decrements on the rising edges of input A .

## TIP

Two Output Control bits allow you to modify the operation of the B input from your control program or during configuration. The Direction Inhibit bit, when set (1), disables the operation of the B input.

The Direction Invert bit, when set (1), reverses the operation of the B input, but only if the Direction Inhibit bit is not set. If the Direction Inhibit bit is set, then the Direction Invert bit controls counter direction.

When the Direction Inhibit bit is set (1):

- and Direction Invert $=0$, count direction is up (forward)
- and Direction Invert $=1$, count direction is down (reversed)

Figure 2.2 Pulse/External Direction Mode (Direction Inhibit = 0, Direction Invert = 0)

Table 2.3 Pulse External Direction Counting

| Direction Inhibit Bit | Direction Invert Bit | Input A (Count) | Input B (Direction) | Change in Count Value |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | $\uparrow$ | 0 or open | +1 |
|  |  | $\uparrow$ | 1 | -1 |
|  |  | 0, 1, $\downarrow$ | don't care | 0 |
| 0 | 1 | $\uparrow$ | 0 or open | -1 |
|  |  | $\uparrow$ | 1 | +1 |
|  |  | $0,1, \downarrow$ | don't care | 0 |
| 1 | 0 | $\uparrow$ | 0 or open | +1 |
|  |  | $\uparrow$ | 1 | +1 |
|  |  | 0, 1, $\downarrow$ | don't care | 0 |
| 1 | 1 | $\uparrow$ | 0 or open | -1 |
|  |  | $\uparrow$ | 1 | -1 |
|  |  | $0,1, \downarrow$ | don't care | 0 |

See Direction Inhibit and Direction Invert Output Control Bits page 2-7 for more information.

## Pulse/Internal Direction Mode Selection

When the Pulse/Internal Direction mode is selected, the status of the Direction Invert bit, as controlled by the user program, determines the direction of the counter. The counter increments on the rising edge of the module's A input when the Direction Invert bit is reset (0). The counter decrements on the rising edge of the A input when the Direction Invert bit is set (1).

Table 2.4 Pulse Internal Direction Counting - Counters 0 and 1

| Direction <br> Inhibit Bit | Direction <br> Invert Bit | Input A <br> (Count) | Input B | Change in <br> Count Value |
| :--- | :--- | :--- | :--- | :--- |
| don't care |  | $\uparrow$ | don't care | +1 |
|  |  | $0,1, \downarrow$ | don't care | 0 |
| don't care |  | $\uparrow$ | don't care | -1 |
|  |  | $0,1, \downarrow$ | don't care | 0 |

Table 2.5 Pulse Internal Direction Counting - Counters 2 and 3

| Direction <br> Inhibit Bit | Direction <br> Invert Bit | Input A | Input B <br> (Count) | Change in <br> Count Value |
| :--- | :--- | :--- | :--- | :--- |
| don't care |  | don't care | $\uparrow$ | +1 |
|  |  | $0,1, \downarrow$ | 0 |  |
| don't care | ( | don't care | $\uparrow$ | -1 |
|  |  | don't care | $0,1, \downarrow$ | 0 |

## Up and Down Pulses Mode Selection

In this mode, the counter channel increments on the rising edge of pulses applied to input A and decrements on the rising edge of pulses applied to input B. When set, the Direction Inhibit bit causes both A and $B$ to increment. When set, the Direction Invert bit causes B to increment and A to decrement. When the Direction Invert and Direction Inhibit bits are both set, both A and B decrement.

## TIP

When both inputs transition simultaneously or near simultaneously, the net result is no change to the count value.

Figure 2.3 Up and Down Pulse Mode (Direction Inhibit = 0, Direction Invert =0)

Table 2.6 Up and Down Counting

| Direction Inhibit Bit | Direction Invert Bit | Input A (Count) | Input B (Direction) | Change in Count Value |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | $\uparrow$ | 0, 1, $\downarrow$ | +1 |
|  |  | 0, 1, $\downarrow$ | $\uparrow$ | -1 |
|  |  | $\uparrow$ | $\uparrow$ | 0 |
| 0 | 1 | $\uparrow$ | 0, 1, $\downarrow$ | -1 |
|  |  | $0,1, \downarrow$ | $\uparrow$ | +1 |
|  |  | $\uparrow$ | $\uparrow$ | 0 |
| 1 | 0 | $\uparrow$ | 0, 1, $\downarrow$ | +1 |
|  |  | 0, 1, $\downarrow$ | $\uparrow$ | +1 |
|  |  | $\uparrow$ | $\uparrow$ | 0 |
| 1 | 1 | $\uparrow$ | 0, 1, $\downarrow$ | -1 |
|  |  | 0, 1, $\downarrow$ | $\uparrow$ | -1 |
|  |  | $\uparrow$ | $\uparrow$ | 0 |

## X1 Quadrature Encoder Mode Selection

In this mode, when a quadrature encoder is attached to inputs A and B , the count direction is determined by the phase relation of inputs A and B. If A leads B, the counter increments. If B leads A, the counter decrements. In other words, when B is low, the count increments on the rising edge of input A and decrements on the falling edge of input A. If B is high, all rising transitions on input A are ignored. The counter changes value only on one edge of input A as shown in Figure 2.4.

When both A and B transition at the same time, instead of in the defined $90^{\circ}$ phase separation, the quadrature signal is invalid.

See also: Direction Inhibit and Direction Invert Output Control Bits on page 2-7 and their effect on Quadrature signals on page 2-13.

Figure 2.4 Quadrature Encoder Modes (Direction Inhibit = 0, Direction Invert = 0)

Forward Rotation
Reverse Rotation

## X2 Quadrature Encoder Mode Selection

The X2 Quadrature Encoder mode operates much like the X1 Quadrature Encoder except that the resolution is doubled as shown in Figure 2.4 on page 2-12.

## X4 Quadrature Encoder Mode Selection

The X4 Quadrature Encoder mode operates much like the X1 Quadrature Encoder except that the resolution is quadrupled as shown in Figure 2.4 on page 2-12.

The following diagram shows how Direction Inhibit and Direction Invert affect the counter.

Figure 2.5 Operation Using Various Direction Inhibit and Direction Invert Settings

## Input Frequency

## Counter Types

Maximum input frequency is determined by the input configuration as shown in the table below.

| Input Configuration | Input Frequency |
| :--- | :--- |
| X4 Quadrature Encoder | 250 kHz |
| X2 Quadrature Encoder | 500 kHz |
| All Other Configurations | 1 MHz |

See Table 2.2 for additional details.

Each of the four possible counters can be configured to stop counting and set a flag at its limits (linear counter) or to roll over and set a flag at its limits (ring counter). A counter's limits are programmed by the Ctr $n$ MaxCount and $\operatorname{Ctr} n$ MinCount words in the Module Configuration Array. Both types are described below.

## Linear Counter

The figure below describes linear counter operation. In linear operation, the current count ( $\mathrm{Ctr}[n]$.CurrentCount) value remains between, or equal to, the user-programmed minimum count ( $\mathrm{Ctr} n$ MinCount) and maximum count ( $\operatorname{Ctr} n$ MaxCount) values. If the $\operatorname{Ctr}[n]$.CurrentCount value would go above (>) or below (<) these values, the counter stops counting, and an overflow/underflow bit is set. The overflow/underflow bits can be reset using the $\operatorname{Ctr} n$ ResetCounterOverflow and Ctr $n$ ResetCounterUnderflow bits.

Figure 2.6 Linear Counter Diagram

Pulses are not accumulated in an overflow/underflow state. The counter begins counting again when pulses are applied in the proper direction. For example, if you exceed the maximum by 1,000 counts, you do not need to apply 1,000 counts in the opposite direction before the counter begins counting down. The first pulse in the opposite direction decrements the counter.

## Ring Counter

Figure 2.7 demonstrates ring counter operation. In ring counter operation, the current count ( $\operatorname{Ctr}[n]$.CurrentCount) value changes between user-programmable minimum count ( $\mathrm{Ctr} n$ MinCount) and maximum count ( $\mathrm{Ctr} n$ MaxCount) values. If, when counting up, the counter reaches the $\operatorname{Ctr} n$ MaxCount value, it rolls over to the Ctr $n$ MinCount value upon receiving the next count and sets the overflow bit. If, when counting down, the counter reaches the $\mathrm{C} \operatorname{tr} n$ MinCount value, it rolls under to the $\operatorname{Ctr} n$ MaxCount value upon receiving the next count and sets the underflow bit. These bits can be reset using the Ctr $n$ ResetCounterOverflow and Ctr $n$ ResetCounterUnderflow bits.

Figure 2.7 Ring Counter Diagram

## Modifying Count Value

The count value ( $\operatorname{Ctr}[n]$.CurrentCount) can be stored, reset, or preset using the Z input, CtrReset bit in the Configuration Array, control bits in the Output Array, or written over using a Direct Write command.

Table 2.7 Available Z Functions

| Setting | For function |
| :--- | :--- |
| Store ${ }^{(1)}$ | on rising edge of $Z$, store count in the Stored Count input word |
| Hold | while $Z=1$, hold counter at its current value |
| Preset/Reset | on rising edge of $Z$, preset the count value to the value in the <br> preset word |

(1) If both a store and preset function are configured, the stored count is captured before the preset operation takes place.

## IMPORTANT

Because only the Z inputs are used for external gating and presetting, these functions are not available for Counters 2 and 3, which do not have $Z$ inputs. All options are always available for Counters 0 and 1 , regardless of input operational mode.

## Counter Enable/Disable

The counter may be enabled or disabled using the $\mathrm{Ctr} n$ En control bit. Be aware that disabling the counter does not inhibit any current count loading functions (e.g. preset or direct write) or any Z function.

## Z Input Functions

## Store

The $Z$ input can be used to capture the current count value even when the counter is counting at full 1 MHz speed.

Gate
The Z inputs can be used to gate (hold) the counter at its current value regardless of incoming A or B inputs. A gating function is typically one that allows pulses to reach the counter (gate open) or not (gate closed).

## Z Preset

Preset can be programmed to occur based on the actions of the $Z$ input signal.

## Inhibit and Invert

The Z input signals may be inverted and/or inhibited, depending on the user configuration of the Ctr $n$ ZInvert and $\mathrm{Ctr} n$ ZInhibit output control bits. If the signal is inhibited, the invert bit is the Z signal for the actions described above.

For an explanation of those bits, see Z Inv - Z Invert (CtrnZInvert) on page 4-25 and $Z$ Inh - $Z$ Inhibit (CtrnZInhibit) on page 4-25.

## Direct Write

You can arbitrarily change the current count value (Ctr[ $n]$.CurrentCount) to the direct write control value (Range12To15[ $n$ ].HiLimOrDirWr). This ability applies to ranges 12 through 15. The direct write value takes effect when the Load Direct Write bit (Range12To15[ $n]$ ].LoadDirectWrite) transitions from 0 to 1 .

If you attempt to preset and load direct write to a counter at the same time, only the preset ( $\mathrm{Ctr} n$ Preset) will take effect.

## Preset/Reset

Preset sets the counter to a zero or non-zero value you define. Reset the counter by setting this value ( $\operatorname{Ctr} n$ Preset) to zero.

## Counter Reset

The CtrReset bit in the Configuration Array, when set, causes the following to occur when the system transitions to Run or the Inhibit Module bit transitions to 0 :

- All counters are disabled and reset to zero.
- The Output Array is reset to default values until the ModConfig bit is set (1). The default value for the Output Array is all zeros.
- The Input Array counter Status Flags (Overflow, Underflow, RisingEdgeZ, RateValid, PresetWarning) are reset.
- The Input Array counter values (Current Count ${ }^{(1)}$, StoredCount, CurrentRate and PulseInterval) are also reset to zero.
- All counts are lost and all outputs are turned off.

## IMPORTANT

For the most predictable results, you may want to clear the output image of the processor BEFORE performing a counter reset (CtrReset) to the 1769-HSC module.

This is because CtrReset does not change the processor's output image. CtrReset sets the 1769-HSC module's Output Array to all zero's. If any bit is set to 1 in the processor's output image, when sent to the module, it will be seen as a state transition and be acted upon.

## Soft Preset

Preset can be programmed to occur by setting the appropriate output control bits via your control program. Setting the Ctr $n$ SoftPreset bit in the Output Array causes the counter to be preset, changing the count to the value in $\operatorname{Ctr} n$ Preset.

[^2]
## Z Preset

Preset can be programmed to occur based on the actions of the $Z$ input signal.

## Autopreset

If the module is configured such that CtrnMaxCount $<$ $\operatorname{Ctr}[n]$.CurrentCount or $\mathrm{Ctr} n \mathrm{MinCount}>\operatorname{Ctr}[n]$.CurrentCount, then the module will automatically change $\operatorname{Ctr}[n]$.CurrentCount to the Ctr $n$ Preset value and set the $\mathrm{C} \operatorname{tr} n$ PresetWarning bit.

# Rate/Timer Functionality 

To ensure maximum accuracy, the module offers two different methods to calculate the rate:

- Per Pulse = 1 /Pulse Interval
- Cyclic $=$ Number of Pulses/User-Defined Time Interval

You select the method used, depending upon the pulse speed as defined below. These are continuously available regardless of input operational mode.

## Pulse Interval Rate Calculation Method

The pulse interval rate method is very accurate for slower rates, i.e. when the pulse interval (or time between pulses) is large compared to the system clock timer ( $1 \mu \mathrm{~s}$ ). A timer is used to measure the time between two successive pulses. The inverse of this value is the pulse interval rate. The pulse interval rate cannot be read directly from the module. It needs to be calculated. The calculation can be performed in the user control program.

This method is not as accurate for higher pulse rates. When the pulse interval shrinks, two factors can distort the per pulse calculation. If the pulse interval is close to the measuring timer's clock frequency, 1 MHz , the granularity of the time increments has a greater effect on rate inaccuracy. In addition, the rate may be calculated many times over the course of a single backplane scan. As a result, the rate data
obtained at a backplane scan is only that of the very last pair of pulses and disregards the other rate calculations that may have occurred during that interval. This can result in rate inaccuracy if the pulses are unevenly spaced.

## Cyclic Rate Calculation Method (Current Rate)

The module continuously calculates rates for each of its four possible counters, regardless of operational mode (e.g. up/down count). The 32 -bit signed integer rate from each counter is reported in the $\operatorname{Ctr}[n]$.CurrentRate words of the Input Array.

In this method, the rates are calculated at the end of a counter's configured cycle time. This is configured via the Ctr $n$ CyclicRateUpdateTime configuration word/menu. Valid entries are +1 to 32767 milliseconds. The number of net counts, net change in $\operatorname{Ctr}[n]$.CurrentCount, during that period is converted into a rate value, providing an average pulse rate.

The generalized rate calculation is: Rate $=\Delta$ count/ $\Delta$ time .

IMPORTANT
The rate calculation is based on net counts. If a counter goes up 500 counts and down 300 counts, the net count is +200 . Therefore, changes in direction and speed affect the $\operatorname{Ctr}[n]$.CurrentRate value.

The cyclic method is better suited to high pulse rates.

## Hysteresis Detection and Configuration

Because physical vibration can cause an encoder to generate pulses which you may not wish to consider as valid motion, a hysteresis value is used to eliminate a certain number of pulses in either direction as vibration-generated. These pulses are not used to calculate the $\operatorname{Ctr}[n]$.CurrentRate value. You program the minimum number of counts that are considered to be valid motion, using the Ctr $n$ Hysteresis configuration word/menu. If the change in counts over the update time cycle is less than that minimum number of programmed counts, the $\operatorname{Ctr}[n]$.CurrentRate is reported as zero.

NOTE: This concept is not used to alter actual count values.

IMPORTANT
Hysteresis does not depend on the direction(s) of the change in count. Therefore, creeping, a slow change in count in one direction only, can also be reported as zero frequency when it falls below the hysteresis threshold.

## Scalar

You can configure the $\mathrm{Ctr} n \mathrm{~S}$ calar value to scale or convert the raw rate value to application-specific information, such as RPM
(Revolutions Per Minute). Setting Ctr $n$ Scalar to 1 leaves the rate value in cycles per second (Hertz).

The actual rate equation is:

Current Rate $=\frac{1000 \times \Delta \text { count }}{\text { CyclicRateUpdateTime } \times \text { Scalar }}$

## TIP

$>$

To configure the $\mathrm{Ctr}[n]$.CurrentRate value to show an RPM value, set $\operatorname{Ctr} n$ Scalar to (counts per revolution)/60.

For example, where Ctr0CyclicRateUpdateTime $=80$, the encoder has 360 counts per revolution, and the change in $\mathrm{Ctr}[0]$.CurrentCount is 96:

```
Scalar \(=\frac{360 \text { counts/revolution }}{60 \mathrm{sec} / \mathrm{min}}\)
RPM \(=\frac{1000 \text { Cyclic Rate Update Time } / \text { sec } \times 96 \text { counts }}{80 \text { Cyclic Rate Update Time } \times \frac{360 \text { counts } / \text { revolution }}{60 \text { sec } / \mathrm{min}}}=200\) RPM
```

## Rate Valid

The $\operatorname{Ctr}[n]$.RateValid bit indicates calculation integrity. When the bit is set, it indicates that the accompanying $\operatorname{Ctr}[n]$.CurrentRate value is accurate. The $\operatorname{Ctr}[n]$.RateValid bit is reset when the overflow or underflow events have occurred, i.e. at rising edges of $\operatorname{Ctr}[n]$.Overflow or $\operatorname{Ctr}[n]$. Underflow bits. It also happens when the count is abruptly modified via a preset (Ctr $n$ SoftPreset, $\mathrm{Ctr} n$ CtrPresetWarning or Z based preset event) or direct write (Range12To15[n].LoadDirectWrite). When this occurs, the $\operatorname{Ctr}[n]$.CurrentRate value is frozen at the last known good value so that effects of erroneous rates will not propagate to range comparisons. The value remains frozen until the current cycle time plus one more cycle time are elapsed (this may be up to twice the $\operatorname{Ctr} n$ CyclicRateUpdateTime). If the overflow/underflow occurrence lasts for more than one cycle time, the value is frozen that entire time plus up to two more cycle times.

Ensure that another overflow/underflow, etc. does not happen during this recovery time. The rate will remain invalid until a full update time has occurred with no such events. If the $\operatorname{Ctr}[n]$.RateValid bit is seldom or never set, the $\mathrm{Ctr} n$ MinCount and $\mathrm{Ctr} n$ MaxCount values may be configured too close to each other.

## Rate Method Selection

By knowing when to use each method, an optimal rate determination can be made.

Fractional rates are not reported by the module, but can be calculated from $\operatorname{Ctr}[n]$.PulseInterval in your control program.

The following information is provided to assist you in choosing the appropriate calculation method. In general you should consider the effect of having the count off by $\pm 1$ in each method at frequencies of interest to see if the resulting inaccuracy is acceptable.

## Per Pulse Method Example

If the frequency of interest has 100 counts (of the $1 \mu \mathrm{~s}$ clock) between pulses, an error of 1 count results in a $1-\mathrm{in}-100$, or $1 \%$, error. If there are 1000 counts between pulses, then the error is $1-\mathrm{in}-1000$, or $0.1 \%$. Error for a variety of pulse values is shown below.

Table 2.8 Per Pulse Errors

| Actual 1 $\boldsymbol{\mu} \mathbf{s}$ <br> Internal <br> Pulses ${ }^{(\mathbf{1})}$ | Reported <br> Pulses | Real <br> Frequency | Reported <br> Frequency | \% Error |
| :--- | :--- | :--- | :--- | :--- |
| 2 | 1 | 500 kHz | 1 MHz | $100 \%$ |
| 9 | 10 | 111 kHz | 100 kHz | $11.1 \%$ |
| 101 | 100 | 9.901 kHz | 10.000 kHz | $1.00 \%$ |
| 1001 | 1000 | 999 Hz | 1000 Hz | $0.10 \%$ |
| 9,999 | 10,000 | 100.01 Hz | 100.00 Hz | $0.010 \%$ |
| 99,999 | 100,000 | 10.00010 Hz | 10.00000 Hz | $0.001 \%$ |

(1) 1.9999 can be rounded to 2 and so on.

## Cyclic Method

Since the update time is programmable, there is more flexibility in choosing the correct fit when using the Cyclic Method.

Error estimates are shown below for a variety of update times.
Table 2.9 Maximum Cyclic Rate Errors

| CyclicRate | Frequency |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Update <br> Time x <br> Scalar | 100 Hz | 1 kHz | 10 kHz | 100 kHz | 1 MHz |
| 1 | n/a | n/a | 20.02\% | 2.011\% | 0.210\% |
| 10 | n/a | 20.11\% | 2.020\% | 0.210\% | 0.030\% |
| 100 | 20.01\% | 2.110\% | 0.220\% | 0.031\% | 0.012\% |
| 1000 | 3.010\% | 0.310\% | 0.040\% | 0.013\% | 0.010\% |
| 10,000 | 1.210\% | 0.130\% | 0.022\% | 0.011\% | 0.010\% |

See also: Rate Accuracy graph on page A-3.

All 16 outputs can be controlled by any of the 4 counters or by the user's control program, via the output mask function. Output states are determined by count, rate, ranges, mask configuration data, overcurrent status, and safe state settings and conditions.

The 16 outputs are made up of 4 real (physical) outputs and 12 virtual outputs. The status of the real and virtual outputs is available to the user program. The real outputs are electronically protected from overloads.

IMPORTANT
To turn outputs on, you must use both the Output On Mask and the Output Off Mask.

## Masks

## Output On Mask

Using the Output On Mask, all of the module's outputs can be turned on directly by the user control program, like discrete outputs. A bit which is set in the mask turns on the corresponding real or virtual output.

## Output Off Mask

The Output Off Mask has veto power over any output. It can turn any or all of the module's outputs off. When a bit in this mask is set to 0 , the output will be turned off. Each bit is logically ANDed with the Output On Mask and masks of active and enabled ranges. If the bit in this mask is set to 1 , the output may be turned on or off by the ranges, or the Output On Mask. The final result is available as the Readback. $n$ bit.

## Ranges

Up to 16 dynamically configurable ranges are available. Ranges activate outputs based on the current count value or the current rate value. Each range is programmed with a type, counter number, two limit values, an invert bit, and an output mask.

Each range is programmed with high and low limits for the chosen value. The range's invert bit indicates whether the range is active between or outside the range limits. When the chosen value fulfills the configuration parameters, the range is active as indicated in the Input Array. When a range is active and enabled (RangeEn. $n=1$ ), the range turns on all outputs indicated by the Range Output Mask except those that are prevented from being enabled by the other factors such as Output Off Mask or Overcurrent. The status of a range is provided by the range active status word, where 1 equals range active and zero equals inactive.

Ranges can be disabled while the module is running using the RangeEn. $n$ bit in the output file. However, even a disabled range will report when it is active or not. For example, an unprogrammed range has limits of 0 , and points to the $\mathrm{Ctr}[0]$.CurrentCount value. If this value is 0 , that range is reported as active.

## Count Range

In a non-inverted count range, the outputs are active if the count value is within the user-defined range. In an inverted count range, the outputs are active if the count value is outside the user-defined range. Valid limits for the range are -2 billion and +2 billion regardless of programmed minimum and maximum values.

The example shows all ranges referring to one counter. The module is capable of individually assigning each range to any counter. Each counter can also have a combination of count and rate ranges.

Figure 2.8 Count Range Example

Table 2.10 Count Range Example Values

|  |  |  |  |  |  | $\begin{gathered} \text { Outputs }^{(2)} \\ \text { (Range[n].OutputControl word) } \end{gathered}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\underset{\sim}{\underset{\sim}{x}}$ |  |  |  |  |  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |

| 2 | 01 | 0 | -1000 | +4500 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| 3 | 01 | 0 | -4000 | +3000 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 2 |
| 4 | 01 | 0 | -9000 | +9000 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 and 3 |

(1) For Range Type, $0=$ count range and $1=$ rate range.
(2) Bits 0 through 3 are real outputs. Bits 4 through 15 are virtual outputs.

## Rate Range

In a non-inverted rate range, the outputs are active if the rate measurement is within the user-defined range. In an inverted rate range, the outputs are active if the rate measurement is outside the user-defined range. The input rate can be up to 1 MHz in either direction.

The example shows all ranges referring to one counter. The module is capable of individually assigning each range to any counter. Each counter can also have a combination of count and rate ranges.

Figure 2.9 Rate Range Example

[^3]
## Overcurrent

If the module detects a real output point overcurrent condition, it reports it to the input file and turns off that output. You can also program the module to latch each of the four real outputs off, emulating a physical fuse, or to automatically reset. The 12 virtual outputs do not have this function.

When the OvercurrentLatchOff bit is set and an overcurrent situation occurs, even momentarily, the associated real output is latched off until the ResetBlownFuse bit transitions from 0 to 1.

If the OvercurrentLatchOff bit is reset and an overcurrent situation occurs, the output turns off for 1 second and is then retried (auto-reset). The module continues to attempt to turn the output back on until the overcurrent situation is no longer detected and the output is successfully turned back on.

## IMPORTANT

The outputs will be on momentarily while they are retried. The length of time they are on depends on the magnitude of the load.

## Safe State Control

The $1769-H S C$ module combines the Hold Last State and User-Defined Safe State options with a safe state run alternative that allows the module to continue to control outputs under program or fault states ${ }^{(1)}$. These options are described below.

Only the physical outputs are affected by safe state settings and conditions. Virtual outputs, inputs, and counting are not affected by program or fault states.

## Hold Last State (HLS)

This condition applies depending on the mode of the controller. When the hold last state option is set, the module holds the outputs at the state they were at just before the control system transitioned from Run to Program or Run to Fault.

HLS sets the module according to the values configured for Program Mode (described on page 4-9) and Output Fault Mode (described on page 4-10).

[^4]
## User-Defined Safe State (UDSS)

In this configuration, the module sets the outputs to a user-defined safe state when the control system transitions from Run to Program or Run to Fault.

UDSS sets the module according to the values configured for Output Program Value (described on page 4-10) and Output Fault Value (described on page 4-11).

## Program State Run (PSR)

Program State Run allows you to specify that the output should continue to be controlled by the module as if it were in the Run state. That is, events on the module or changes in the Output image will affect the physical outputs without regard to the Program_HLS or UDSS state indicated. When this bit is set, the corresponding Out $n$ ProgramMode and Out $n$ ProgramValue bits are ignored.

PSR sets the module according to the value configured for Output Program State Run (described on page 4-9).

| ATTENTION | Selecting this option will allow outputs to change <br> state while ladder logic is not running. You must take <br> care to assure that this does not pose a risk of injury <br> or equipment damage when selecting this option. |
| :--- | :--- |
| IMPORTANT | The prescan initiated by some controllers could have <br> an effect on the outputs. To overcome any changes in <br> physical output states that may be caused by this, <br> retentive output instructions (eg. latch, unlatch etc.) <br> should be used when bit manipulations are done on <br> the Output image of this module in ladder logic. |
| This applies to a wide range of bits when Program <br> State Run is selected, since presetting a counter, <br> enabling a range, changing a mask, and changing <br> Module Configuration Array settings can cause ranges <br> and outputs to change state. |  |

## Fault State Run (FSR)

Similar to Program State Run, Fault State Run allows you to specify, on a bit basis, that the output should continue to be controlled by the module as if it were Run state. That is, events on the module or changes in the Output image will affect the physical outputs without regard to the Program_HLS or UDSS state indicated. When this bit is set, the corresponding Program Mode and Program Value bits are ignored.

FSR sets the module according to the value configured for Output Fault State Run (described on page 4-10).

## ATTENTION

Selecting this option will allow outputs to change state while ladder logic is not running. You must take care to assure that this does not pose a risk of injury or equipment damage when selecting this option.

The prescan initiated by some controllers could have an effect on the outputs. To overcome any changes in physical output states that may be caused by this, retentive output instructions (eg. latch, unlatch etc.) should be used when bit manipulations are done on the Output image of this module in ladder logic.

This applies to a wide range of bits when Fault State Run is selected, since presetting a counter, enabling a range, changing a mask, and changing Configuration Array settings can cause ranges and outputs to change state.

## Program to Fault Enable (PFE)

The ProgToFaultEn bit allows you to select which data value (Program Value or Fault Value) to apply to the output when the Output State Logic state Prog_HLS changes to indicate Fault_HLS.

If PFE is 0 , the module leaves the Program value applied. If PFE is set to 1 , the Fault value is applied.

## TIP

The module's Default Safe State configuration is all zero's, resulting in the following:

- Program State = UDSS
- Program Value = OFF
- Program State Run = No
- Fault State = UDSS
- Fault Value = OFF
- Fault State Run = No
- $\mathrm{PFE}=$ leave program value applied.

## Output Control Example

The following example illustrates the module's output control flow. The following conditions are reflected in Table 2.12:

- Range 0 is enabled and active
- Range 1 is disabled
- Range 2 is enabled but not active
- an overcurrent condition exists on real output 3
- OvercurrentLatchOff is set
- the system is in Run mode

The table below illustrates the step-by-step logical operations that are performed to determine the final output state. For example, Range 1 values do not affect the output because Range 1 is disabled, and the Output Off Mask causes some of the outputs to change to zero because it takes priority over the range masks.

The output parameters shown in the table have been discussed in the previous sections.

Table 2.12 Output Control Example

| Output Parameter | Mask Information |  |  |  |  |  |  |  |  | Logical Operation | Result ${ }^{(1)}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Range 0 | 00001 | 01110 | 1 | 1 | 1 | 0 |  | 0 | 1 | OR |  | 0 | 01 | 0 | 1 | 1 | 0 | 1 | 1 | 0 |  | 0 | 0 | 0 | 1 |
| Range 1 | 0010 | 1111 | 1 | 1 | 1 | 0 |  | 0 | 0 | OR |  | 0 | 01 | 0 | 1 | 1 | 0 | 1 | 1 | 0 |  | 0 | 0 | 0 | 1 |
| Range 2 | 0100 | 0000 | 0 | 0 | 0 | 1 |  | 1 | 0 | OR |  | 0 | 01 | 0 | 1 | 1 | 0 | 1 | 1 | 0 |  | 0 | 0 | 0 | 1 |
| Output On Mask | 0100 | 1010 | 1 | 0 | 0 | 1 |  | 0 | 0 | OR |  | 1 | 01 | 1 | 1 | 1 | 0 | 1 | 1 | 1 |  | 1 | 0 | 0 | 1 |
| Output Overcurrent | - - - - | - - - - | - | - | - | 1 |  | 0 | 0 | AND |  | 1 | 01 | 1 | 1 | 1 | 0 | 1 | 1 | 1 |  | 0 | 0 | 0 | 1 |
| Output Off Mask | 11111 | 0000 | 1 | 1 | 1 | 1 |  | 1 | 0 | AND |  | 1 | 01 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |  | 0 | 0 | 0 | 0 |
| Program State Values | - - - | - - - - | - | - |  | 1 |  | 1 | 1 | Override |  | 1 | 01 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |  | 0 | 0 | 0 | 0 |
| Fault State Values | - - - | - - - | - | - |  | 1 |  | 1 | 1 | Override | 0 | 1 | 01 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |  | 0 | 0 | 0 | 0 |
| Final Output State |  |  |  |  |  |  |  |  |  |  |  | 1 | 01 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |  | 0 | 0 | 0 | 0 |

(1) Bolded text indicates that these values have changed.

## Readback/Loopback

The Readback/loopback function is the feedback of the module's outputs via its Input Array. This 16-bit image includes both real (4) and virtual (12) outputs.

If the module's output is OFF due to overcurrent, both the Overcurrent status flag and the Readback bit will indicate the condition being 1 and 0 respectively. Conversely, should the output be ON due to any module control (eg. UDSS), this will be indicated by Readback.

## Installation and Wiring

This chapter tells you how to:

- determine the power requirements for the modules
- avoid electrostatic damage
- install the module
- wire the module's terminal block
- wire input devices

## Compliance to European <br> Union Directives

This product is approved for installation within the European Union and EEA regions. It has been designed and tested to meet the following directives.

## EMC Directive

The 1769 -HSC module is tested to meet Council Directive 89/336/EEC Electromagnetic Compatibility (EMC) and the following standards, in whole or in part, documented in a technical construction file:

- EN 50081-2

EMC - Generic Emission Standard, Part 2 - Industrial Environment

- EN 50082-2

EMC - Generic Immunity Standard, Part 2 - Industrial Environment

This product is intended for use in an industrial environment.

## Low Voltage Directive

This product is tested to meet Council Directive 73/23/EEC Low Voltage, by applying the safety requirements of EN 61131-2 Programmable Controllers, Part 2 - Equipment Requirements and Tests.

For specific information required by EN61131-2, see the appropriate sections in this publication, as well as the following Allen-Bradley publications:

- Industrial Automation, Wiring and Grounding Guidelines for Noise Immunity, publication 1770-4.1
- Automation Systems Catalog, publication B113

## Power Requirements

## General Considerations

The modules receive power through the Compact bus interface from the +5 V dc $/+24 \mathrm{~V}$ dc system power supply. The maximum current drawn by the modules is shown in the table below.

| Module Current Draw | at 5V dc | at 24V dc |
| :---: | :---: | :---: |
|  | 425 mA | 0 mA |

Compact I/O is suitable for use in an industrial environment when installed in accordance with these instructions. Specifically, this equipment is intended for use in clean, dry environments (Pollution degree $2^{(1)}$ ) and to circuits not exceeding Over Voltage Category II ${ }^{(2)}$ (IEC 60664-1). ${ }^{(3)}$
(1) Pollution Degree 2 is an environment where, normally, only non-conductive pollution occurs except that occasionally a temporary conductivity caused by condensation shall be expected.
(2) Over Voltage Category II is the load level section of the electrical distribution system. At this level transient voltages are controlled and do not exceed the impulse voltage capability of the product's insulation.
(3) Pollution Degree 2 and Over Voltage Category II are International Electrotechnical Commission (IEC) designations.

## Hazardous Location Considerations

This equipment is suitable for use in Class I, Division 2, Groups A, B, C, D or non-hazardous locations only. The following WARNING statement applies to use in hazardous locations.

EXPLOSION HAZARD

- Substitution of components may impair suitability for Class I, Division 2.
- Do not replace components or disconnect equipment unless power has been switched off or the area is known to be non-hazardous.
- Do not connect or disconnect components unless power has been switched off or the area is known to be non-hazardous.
- This product must be installed in an enclosure. All cables connected to the product must remain in the enclosure or be protected by conduit or other means.
- All wiring must comply with N.E.C. article 501-4(b).

## Prevent Electrostatic Discharge

| ATTENTIONElectrostatic discharge can damage integrated circuits <br> or semiconductors if you touch the bus connector <br> pins, terminal block, or devices on the circuit board. <br> Follow these guidelines when you handle the <br> module: <br> - Touch a grounded object to discharge static <br> potential. <br> - Wear an approved wrist-strap grounding device. <br> - Do not touch the bus connector or connector <br> pins. <br> - Do not touch circuit components inside the <br> module. <br> - If available, use a static-safe work station. <br> - When it is not in use, keep the module in its <br> static-shield box. |
| :--- |

## Remove Power

> ATTENTION $\begin{aligned} & \text { Remove power before removing or inserting this } \\ & \text { module. When you remove or insert a module with } \\ & \text { power applied, an electrical arc may occur. An } \\ & \text { electrical arc can cause personal injury or property } \\ & \text { damage by: } \\ & \text { - sending an erroneous signal to your system's } \\ & \text { field devices, causing unintended machine } \\ & \text { motion } \\ & \text { - causing an explosion in a hazardous environment } \\ & \text { Electrical arcing causes excessive wear to contacts on } \\ & \text { both the module and its mating connector and may } \\ & \text { lead to premature failure. }\end{aligned}$.

## Selecting a Location

## Reducing Noise

Most applications require installation in an industrial enclosure to reduce the effects of electrical interference. The module is highly susceptible to electrical noise. Electrical noise coupled to the inputs will reduce the performance (accuracy) of the module.

Group your modules to minimize adverse effects from radiated electrical noise and heat. Consider the following conditions when selecting a location for the module. Position the module:

- away from sources of electrical noise such as hard-contact switches, relays, and AC motor drives
- away from modules which generate significant radiated heat, such as the 1769-IA16. Refer to the module's heat dissipation specification.

In addition, route shielded, twisted-pair analog input and output wiring away from any high voltage I/O wiring.

## Protecting the Circuit Board from Contamination

The printed circuit boards of the modules must be protected from dirt, oil, moisture, and other airborne contaminants. To protect these boards, we recommend installing the system in an enclosure suitable for the environment. The interior of the enclosure should be kept clean and the enclosure door should be kept closed whenever possible.

## Power Supply Distance

You can install as many modules as your power supply can support. However, the module has a power supply distance rating of 4, which means that it may not be located more than 4 modules away from the system power supply.

The illustration below provides an example showing how power supply distance is determined.

OR

## System Assembly

The module can be attached to an adjacent controller, power supply, or I/O module. For mounting instructions, see Panel Mounting on page 3-7, or DIN Rail Mounting on page 3-9. To work with a system that is already mounted, see Replacing the Module within a System on page 3-10.

The following procedure shows you how to assemble the Compact I/O system.

1. Disconnect power.
2. Check that the bus lever of the module (A) is in the unlocked (fully right) position.
3. Use the upper and lower tongue-and-groove slots (B) to secure the modules together.
4. Move the module back along the tongue-and-groove slots until the bus connectors (C) line up with each other.
5. Use your fingers or a small screw driver to push the bus lever back slightly to clear the positioning tab (D).
6. Move the module's bus lever fully to the left (E) until it clicks. Ensure it is locked firmly in place.

When attaching I/O modules, it is very important that the bus connectors are securely locked together to ensure proper electrical connection.
7. Attach an end cap terminator (F) to the last module in the system by using the tongue-and-groove slots as before.
8. Lock the end cap bus terminator (G).

## IMPORTANT

A $1769-E C R$ or $1769-E C L$ right or left end cap must be used to terminate the end of the serial communication bus.

## Mounting

## ATTENTION

During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the module. Debris that falls into the module could cause damage at power up.

## Minimum Spacing

Maintain spacing from enclosure walls, wireways, adjacent equipment, etc. Allow 50 mm ( 2 in .) of space on all sides for adequate ventilation, as shown below:

## Panel Mounting

Mount the module to a panel using two screws per module. Use M4 or \#8 panhead screws. Mounting screws are required on every module.

## Panel Mounting Using the Dimensional Drawing

NOTE: All dimensions are in mm (inches). Hole spacing tolerance: $\pm 0.04 \mathrm{~mm}$ ( 0.016 in .).

Figure 3.1 Compact I/O with CompactLogix Controller and Power Supply

Figure 3.2 Compact I/O with MicroLogix 1500 Base Unit and Processor

## Panel Mounting Procedure Using Modules as a Template

The following procedure allows you to use the assembled modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, assemble no more than three modules.
2. Using the assembled modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the assembled modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the recommended M4 or \#8 screw.
5. Place the modules back on the panel, and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

## TIP

If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.
7. Repeat steps 1 to 6 for any remaining modules.

## DIN Rail Mounting

The module can be mounted using the following DIN rails: $35 \times 7.5 \mathrm{~mm}$ (EN $50022-35 \times 7.5$ ) or $35 \times 15 \mathrm{~mm}$ (EN 50 022-35 x 15).

Before mounting the module on a DIN rail, close the DIN rail latches. Press the DIN rail mounting area of the module against the DIN rail. The latches will momentarily open and lock into place. DIN rail mounting dimensions are shown below.

| Dimension | Height |
| :--- | :--- |
| A | $118 \mathrm{~mm}(4.65 \mathrm{in})$. |
| B | $59 \mathrm{~mm}(2.325 \mathrm{in})$. |
| C | $59 \mathrm{~mm}(2.325 \mathrm{in)}$. |

## Replacing the Module within a System

The module can be replaced while the system is mounted to a panel (or DIN rail).

1. Remove power. See important note on page 3-4.
2. Remove terminal block or disconnect input/output wiring from the module.
3. Remove the upper and lower mounting screws from the module (or open the DIN latches using a flat-blade screwdriver).
4. On the module to be replaced and the right-side adjacent module (or end cap if the module is the last module in the bank), move the bus levers to the right (unlock) to disconnect the module from the adjacent modules.
5. Gently slide the disconnected module forward.

If you feel excessive resistance, make sure that you disconnected the module from the bus and that you removed both mounting screws (or opened the DIN latches).

```
TIP
It may be necessary to rock the module slightly from front to back to remove it, or, in a panel-mounted system, to loosen the screws of adjacent modules.
```

6. Before installing the replacement module, be sure that the bus lever on the right-side adjacent module is in the unlocked (fully right) position.
7. Slide the replacement module into the open slot.
8. Connect the modules together by locking (fully left) the bus levers on the replacement module and the right-side adjacent module or end cap.
9. Replace the mounting screws (or snap the module onto the DIN rail).
10. Replace the terminal block or connect input/output wiring to the module.

## Field Wiring Connections <br> System Wiring Guidelines

Consider the following when wiring your system:
General

- Make sure the system is properly grounded.
- Input and output channels are isolated from the 1769 Compact bus. Input channels are isolated from one another; output channels are not.
- Shielded cable is required for high-speed input signals A, B, and Z. Use individually shielded, twisted-pair cable for lengths up to 300 meters ( 1000 feet).
- Group this module and other low voltage DC modules away from AC I/O or high voltage DC modules.
- Route field wiring away from any other wiring and as far as possible from sources of electrical noise, such as motors, transformers, contactors, and ac devices.
- Routing field wiring in a grounded conduit can reduce electrical noise.
- If field wiring must cross ac or power cables, ensure that they cross at right angles.

## Terminal Block

- To ensures optimum accuracy, limit overall cable impedance by keeping cable as short as possible. Locate the module as close to input devices as the application permits.
- Tighten terminal screws with care. Excessive tightening can strip a screw.

## Grounding

- This product is intended to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the module's mounting tabs or DIN rail (if used) are only required when the mounting surface is non-conductive and cannot be grounded.
- Keep shield connection to ground as short as possible.
- Ground the shield drain wire at the $1769-H S C$ input end only.
- Refer to Industrial Automation Wiring and Grounding Guidelines, Allen-Bradley publication 1770-4.1, for additional information.

## Considerations for Reducing Noise

In high noise environments, the 1769-HSC inputs may accept "false" pulses, particularly when using low frequency input signals with slowly sloping pulse edges. To minimize the effects of high frequency noise on low frequency signals, perform the following:

- Identify and remove noise sources.
- Route input cabling away from noise sources.
- Use your programming software to select low-pass filters on input signals. Filter values depend on the application and can be determined empirically.
- Use devices which output differential signals, such as differential encoders, to minimize the possibility that a noise source will cause a false input.

## Removing and Replacing the Terminal Block

When wiring the module, you do not have to remove the terminal block. If you remove the terminal block, use the write-on label located on the side of the terminal block to identify the module location and type.

To remove the terminal block, loosen the upper and lower retaining screws. The terminal block will back away from the module as you remove the screws. When replacing the terminal block, torque the retaining screws to 0.46 Nm ( $4.1 \mathrm{in}-\mathrm{lbs}$ ).

## Wiring the Finger-Safe Terminal Block

When wiring the terminal block, keep the finger-safe cover in place.

1. Loosen the terminal screws to be wired.
2. Route the wire under the terminal pressure plate. You can use the bare wire or a spade lug. The terminals accept a 6.35 mm ( 0.25 in .) spade lug.

## TIP

The terminal screws are non-captive. Therefore, it is possible to use a ring lug [maximum 1/4 inch o.d. with a 0.139 inch minimum i.d. (M3.5)] with the module.
3. Tighten the terminal screw making sure the pressure plate secures the wire. Recommended torque when tightening terminal screws is 0.68 Nm ( $6 \mathrm{in}-\mathrm{lbs}$ ).

TIP

If you need to remove the finger-safe cover, insert a screwdriver into one of the square, wiring holes and gently pry the cover off. If you wire the terminal block with the finger-safe cover removed, you will not be able to put it back on the terminal block because the wires will be in the way.

## Wire Size and Terminal Screw Torque

Each terminal accepts up to two wires with the following restrictions:

| Wire Type |  | Wire Size | Terminal Screw <br> Torque | Retaining Screw <br> Torque |
| :--- | :---: | :---: | :---: | :---: |
| Solid | $\mathrm{Cu}-90^{\circ} \mathrm{C}\left(194^{\circ} \mathrm{F}\right)$ | $\# 14$ to \#22 AWG | $0.68 \mathrm{Nm}(6 \mathrm{in}-\mathrm{lbs})$ | $0.46 \mathrm{Nm}(4.1 \mathrm{in}-\mathrm{lbs})$ |
| Stranded | $\mathrm{Cu}-90^{\circ} \mathrm{C}\left(194^{\circ} \mathrm{F}\right)$ | $\# 16$ to \#22 AWG | $0.68 \mathrm{Nm}(6 \mathrm{in}-\mathrm{lbs})$ | $0.46 \mathrm{Nm}(4.1 \mathrm{in}-\mathrm{lbs})$ |

## Wiring the Modules

ATTENTION
To prevent shock hazard, care should be taken when wiring the module to signal sources. Before wiring any module, disconnect power from the system power supply and from any other source to the module.

After the module is properly installed, follow the wiring procedure below. To ensure proper operation and high immunity to electrical noise, always use shielded wire.

To wire your module follow these steps.

1. At each end of the cable, strip some casing to expose the individual wires.
2. Trim the signal wires to $2-\mathrm{in}$. ( 5 cm ) lengths. Strip about $3 / 16 \mathrm{in}$. $(5 \mathrm{~mm})$ of insulation away to expose the end of the wire.

## ATTENTION

Be careful when stripping wires. Wire fragments that fall into a module could cause damage at power up.
3. At the $1769-$ HSC input end of the cable, twist the drain wire and foil shield together, bend them away from the cable, and apply shrink wrap. Ground the shield at this end.
4. At the other end of the cable, cut the drain wire and foil shield back to the cable and apply shrink wrap.
5. Connect the signal wires to the terminal block. Connect the other end of the cable to the input device.
6. Repeat steps 1 through 5 for each channel on the module.

## Terminal Door Label

A removable, write-on label is provided with the module. Remove the label from the door, mark the identification of each terminal with permanent ink, and slide the label back into the door. Your markings (ID tag) will be visible when the module door is closed.

## Terminal Block Wiring

The input and output terminals are illustration in the figure below. Both inputs and outputs are isolated from the 1769 Compact bus.

## Wiring Diagrams

Inputs

The module utilizes differential inputs. Therefore, two input terminals are required for each input point. For example, the A0+ and A0terminals are required for input point A 0 . Each input point is isolated from other input points, the 1769 Compact bus, and the entire output terminal group.

The inputs are compatible with standard differential line driver output devices as well as single-ended devices such as limit switches, photo-eyes, and proximity sensors. Examples of differential and single-ended circuits are shown in the following figures.

Figure 3.3 Differential Encoder Wiring

(1) Refer to your encoder manual for proper cable type. The type of cable used should be twisted pair, individually shielded cable with a maximum length of 300 m ( 1000 ft .).

Figure 3.4 Single-Ended Encoder Wiring

(1) Refer to your encoder manual for proper cable type. The type of cable used should be twisted-pair, individually shielded cable with a maximum length of $300 \mathrm{~m}(1000 \mathrm{ft}$.).
(2) External resistors are required if they are not internal to the encoder. The pull-up resistor (R) value depends on the power supply value. The table below shows the maximum resistor values for typical supply voltages. To calculate the maximum resistor value, use the following formula:
$R=\frac{(V d c-V \min )}{I \min }$
where:
$\mathrm{R}=$ maximum pull-up resistor value
$\mathrm{Vdc}=$ power supply voltage
$\mathrm{Vmin}=2.6 \mathrm{~V} \mathrm{dc}$
$\mathrm{Imin}=6.8 \mathrm{~mA}$

| Power Supply Voltage (Vdc) | Maximum Pull-up Resistor Value (R) ${ }^{(\mathbf{1})}$ |
| :--- | :--- |
| 5 V dc | $352 \Omega$ |
| 12 V dc | $1382 \Omega$ |
| 24 V dc | $3147 \Omega$ |

(1) Resistance values may change, depending upon your application.

The minimum resistor ( R ) value depends on the current sinking capability of the encoder. Refer to your encoder's documentation.

Figure 3.5 Discrete Device Wiring

(1) External resistors are required if they are not internal to the sensor. The pull-up resistor (R) value depends on the power supply value. The table below shows the maximum resistor values for typical supply voltages. To calculate the maximum resistor value, use the following formula:
$R=\frac{(V d c-V \min )}{I \min }$
where:
$R=$ maximum pull-up resistor value
$\mathrm{Vdc}=$ power supply voltage
$\mathrm{Vmin}=2.6 \mathrm{~V} \mathrm{dc}$
$1 \mathrm{~min}=6.8 \mathrm{~mA}$

| Power Supply Voltage (Vdc) | Maximum Pull-up Resistor Value (R) ${ }^{(\mathbf{1})}$ |
| :--- | :--- |
| 5 V dc | $352 \Omega$ |
| 12 V dc | $1382 \Omega$ |
| 24 V dc | $3147 \Omega$ |

(1) Resistance values may change, depending upon your application.

The minimum resistor ( R ) value depends on the current sinking capability of the sensor. Refer to your sensor's documentation.

## Outputs

The four output terminals must be powered by a user-supplied external source. User Power range is from +5 to +30 V dc. See Output Specifications on page A-2 for voltage and current levels. There is no isolation between the outputs, but the outputs are isolated from the inputs and the 1769 Compact bus.

## Electronic Protection

The electronic protection of the $1769-$ HSC has been designed to provide protection for current overload and short circuit conditions. The protection is based on a thermal cut-out principle. In the event of a short circuit or current overload condition on an output channel, that channel will turn off within milliseconds after the thermal cut-out temperature has been reached.

## Overcurrent Autoreset Operation

The module detects overcurrent situations and reports them to the backplane in the Out $n$ OverCurrent bits of the Input Array. When the overcurrent condition is detected, the outputs are turned off.

The module can latch outputs off in order to emulate the behavior of a physical fuse. Use the OvercurrentLatchOff bit to enable or disable this feature. When the OvercurrentLatchOff bit is set and an overcurrent situation occurs (even momentarily) the physical output will be latched off until the ResetBlownFuse bit is cycled from off to on (rising edge triggered). During the latched off time, the Readback. $n$ bit in the Input Array also shows that the output is off.

If the OvercurrentLatchOff bit is not set, the output will be turned off for 1 second and then be retried (if still directed to be on). Retries will repeat until the overcurrent situation is corrected.

Only the 4 physical outputs can be latched off. The virtual outputs are not affected.

IMPORTANT
During the retry period, the physical output and the Readback. $n$ bits will be on briefly (until the overcurrent causes them to shut off again). Take this into consideration and configure your system accordingly.

## TIP

Short-circuits and overload conditions should be corrected as soon as possible. Damage may occur if short-circuits or overload conditions are allowed for extended periods.

## Transistor Output Transient Pulses

The maximum duration of the transient pulse occurs when minimum load is connected to the output. However, for most applications, the energy of the transient pulse is not sufficient to energize the load.

| ATTENTION | A transient pulse occurs in transistor outputs when <br> the external DC supply voltage is applied to the <br> output common terminals (e.g. via the master control <br> relay). The sudden application of voltage creates this <br> transient pulse. This condition is inherent in <br> transistor outputs and is common to solid state <br> devices. A transient pulse can occur regardless of the <br> controller having power or not. Refer to your <br> controller's user manual to reduce inadvertent <br> operation. |
| :--- | :--- |

The graph below illustrates that the duration of the transient is proportional to the load current. Therefore, as the on-state load current increases, the transient pulse decreases. Power-up transients do not exceed the time duration shown below, for the amount of loading indicated, at $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$.

Figure 3.6 Transient Pulse Duration as a Function of Load Current

Output wiring is illustrated in the following diagram.

Figure 3.7 Output Wiring
Basic wiring ${ }^{(1)}$ of output devices ${ }^{(2)}$ to the module is shown below.

ATTENTION

- Miswiring of the module to an AC power source or applying reverse polarity will damage the module.
- Be careful when stripping wires. Wire fragments that fall into a module could cause damage at power up. Once wiring is complete, ensure the module is free of all metal fragments.

(1) Recommended Surge Suppression - The module has built-in suppression which is sufficient for most applications, however, for high-noise applications, use a 1 N 4004 diode reverse-wired across the load for transistor outputs switching 24 V dc inductive loads. For additional details, refer to Industrial Automation Wiring and Grounding Guidelines, Allen-Bradley publication 1770-4.1.
(2) Sourcing Output - Source describes the current flow between the I/O module and the field device. Sourcing output circuits supply (source) current to sinking field devices. Field devices connected to the negative side (DC Common) of the field power supply are sinking field devices. Field devices connected to the positive side ( +V ) of the field supply are sourcing field devices. Europe: DC sinking input and sourcing output module circuits are the commonly used options.

# Module Configuration, Output, and Input Data 

After installation of the 1769 -HSC module, you must configure it for operation, using the programming software compatible with the controller (for example, RSLogix 500 or RSLogix 5000).

## TIP

Normal counter configuration is done using programming software. In that case, it is not necessary to know the meaning of the bit location. However, some systems allow configuration to be changed by the control program. Refer to your controller's documentation for details.

Information on programming the module using specific controllers and software is contained in the following Appendices.

| Appendix | Controller | Software |
| :---: | :--- | :--- |
| Appendix B | CompactLogix Controller | RSLogix 5000 |
| Appendix C | MicroLogix 1500 Controller | RSLogix 500 |

## Configuring the Module

The module uses three arrays: Configuration Array, Output Array, and Input Array. You configure the module by establishing settings in the Configuration and Output Arrays. The Input Array shows the data that the module sends to the controller.

## IMPORTANT

Both the Configuration Array and Output Array settings affect the module configuration. Changing certain configuration parameters from defaults may necessitate changing other values to avoid configuration errors.

## Configuration Array

The Configuration Array, which consists of 118 words, allows you to specify how the module's counters will function. The default value is all zeros with the exception of:

- NumberofCounters (see page 4-8)
- Ctr $n$ MaxCount (see page 4-11)
- Ctr $n$ MinCount (see page 4-12)
- CtrnScalar (see page 4-14)
- Ctr $n$ CyclicUpdateTime (see page $4-14$ )

TIP

Normal counter configuration is done using programming software. In that case, it is not necessary to know the bit location. However, some systems allow configuration to be changed by the control program. Refer to your controller's documentation for details.

## IMPORTANT

When changing configuration values, verify that only valid configurations are created for the module. For example, changing NumberofCounters from its default of 1 to 0 requires that $C$ tr 1 MinCount and Ctr1MaxCount also be set to 0 , etc.

See Table 5.6 "Configuration Error Codes" on page $5-9$ if you encounter configuration errors.

Word 0 contains general configuration bits. Word 1 contains the filter settings. Words 2 through 5 refer to the physical outputs. Words 6 through 45 are counter configuration words. Words 46 through 117 are range configuration words. More detailed descriptions of the configuration words and bits follow the Configuration Array below.

## IMPORTANT

Certain values (noted below) cannot be changed while a counter(s) or range(s) is enabled. Attempting to do so will cause a configuration error and the entire Configuration Array will be rejected until the error is eliminated.

## Table 4.1 Configuration Array

| Word | Bit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Function |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## General Configuration Bits

| Configuration Array Word 0 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| General Configuration Bits | Not Used |  |  |  |  | Numberof Counters | Not Used | PFE | Not Used | Ctr <br> Reset | OCLO |  |  |  |  |  |

## OCLO - Overcurrent Latch Off (OverCurrentLatchOff)

When set, this bit causes the module to make any overcurrent activity latch the corresponding output off, simulating a physical fuse. When OCLO $=0$, it automatically resets. The rising edge of RBF resets the output.

## IMPORTANT

Do not set this bit while a counter or range is enabled (CtrOEn, $\operatorname{Ctr} 1 \mathrm{En}, \mathrm{Ctr} 2 \mathrm{En}, \mathrm{Ctr} 3 \mathrm{En}$, or RangeEn set to 1). Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Counter Reset (CtrReset)

The CtrReset bit in the Configuration Array, when set, causes the following to occur when the system transitions to Run or the Inhibit Module bit transitions to 0 :

- All counters are disabled and reset to zero.
- The Output Array is reset to default values until the ModConfig bit is set (1). The default value for the Output Array is all zeros.
- The Input Array counter Status Flags (Overflow, Underflow, RisingEdgeZ, RateValid, PresetWarning) are reset.
- The Input Array counter values (Current Count ${ }^{(1)}$, StoredCount, CurrentRate and PulseInterval) are also reset to zero.
- All counts are lost and all outputs are turned off.

IMPORTANT
For most predictable results, you may want to clear the output image of the processor BEFORE performing a counter reset (CtrReset) to the 1769-HSC module.
This is because CtrReset does not change the processor's output image. CtrReset sets the 1769-HSC module's Output Array to all zero's. If any bit is set to 1 in the processor's output image, when sent to the module, it will be seen as a state transition and be acted upon.

## PFE - Program to Fault Enable (ProgToFaultEn)

This bit indicates what should happen when the bus controller indicates a change from one condition (Program mode) to another (Fault mode). If this bit is set (1), the safe state operation of all 4 real outputs changes to that identified by the Fault State and Fault Value words. If this bit is reset (0), the module continues with the operation identified by the Program State and Program Value words.

[^5]
## Number of Counters (NumberOfCounters)

This 2-bit value indicates whether the module uses 1 counter, 2 counters, 3 counters, or 4 counters. The default value is 1 ( 2 counters).

Table 4.2 Number of Counters Determination

| Bit 01 | Bit 00 | Counters |
| :--- | :--- | :--- |
| 0 | 0 | 1 |
| 0 | 1 | 2 |
| 1 | 0 | 3 |
| 1 | 1 | 4 |

## IMPORTANT

Do not set this value while a counter or range is enabled ( Ctr 0 En , $\mathrm{Ctr} 1 \mathrm{En}, \mathrm{Ctr} 2 \mathrm{En}, \mathrm{Ctr} 3 \mathrm{En}$, or RangeEn set to 1). Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Filter Selection

| Configuration Array Word 1 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Filter Selection | Filter_Z1 | Not <br> Used | FilterB1 | Not <br> Used | FilterA1 | FilterZO | Not <br> Used | FilterB0 | Not <br> Used | FilterA0 |  |  |  |  |  |  |

This value indicates the nominal filter frequency as shown in the table below.

Table 4.3 Filter Selection Settings

|  | FilterA0 | Bit 1 - FilterA0_1 | Bit 0 - FilterA0_0 |
| :---: | :---: | :---: | :---: |
|  | FilterB0 | Bit 4 - FilterB0_1 | Bit 3 - FilterB0_0 |
|  | FilterZ0 | Bit 7 - FilterZ0_1 | Bit 6 - FilterZo_0 |
|  | FilterA1 | Bit 9 - FilterA1_1 | Bit 8 - FilterA1_0 |
|  | FilterB1 | Bit 12 - FilterB1_1 | Bit 11 - FilterB1_0 |
|  | FilterZ1 | Bit 15 - FilterZ1_1 | Bit 14 - FilterZ1_0 |
|  | None | 0 | 0 |
|  | 0.01 ms minimum pulse width | 0 | 1 |
|  | 0.5 ms minimum pulse width | 1 | 0 |
|  | 5 ms minimum pulse width | 1 | 1 |
|  |  |  |  |
| IMPORTANT | Do not set these bits while certain counters or ranges are enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings. |  |  |

# Program Mode and Program State Run 

| Configuration Array Word 2 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output Program Mode and |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Output Program State Run |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Program Mode (OutOProgramMode through Out3ProgramMode)

The program mode bits configure the output for Hold Last State (HLS) or User-Defined Safe State (UDSS) during Program State.

- 1 = Hold Last State
- $0=$ User-Defined Safe State

## IMPORTANT

Program Mode and Program State Run only apply to certain controllers. Refer to your controller's documentation for more information.

## Program State Run (OutOProgramStateRun through Out3ProgramStateRun)

Program State Run allows you to specify, on a bit basis, that the output should continue to be controlled by the module as if it were in the Run state. That is, events on the module or changes in the Output image will affect the physical outputs without regard to the Program_HLS or UDSS state indicated. When this bit is set, the corresponding Program Mode and Program Value bits are ignored.

Selecting this option will allow outputs to change state while ladder logic is not running. You must take care to assure that this does not pose a risk of injury or equipment damage when selecting this option.

The prescan initiated by some controllers could have an effect on the outputs. To overcome any changes in physical output states that may be caused by this, retentive output instructions (eg. latch, unlatch etc.) should be used when bit manipulations are done on the Output image of this module in ladder logic.
This applies to a wide range of bits when Program State Run is selected, since presetting a counter, enabling a range, changing a mask, and changing Configuration Array settings can cause ranges and outputs to change state.

## Output Program Value (OutOProgramValue through Out3ProgramValue)

| Configuration Array Word 3 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output Program Value |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

These bits are the values that will be applied to each of the real outputs when User-Defined Safe State (UDSS) is set as described above and the module is in Program state.

## Output Fault Mode and Output Fault State Run

| Configuration Array Word 4 | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output Fault Mode and Output Fault State Run | Not Used |  |  |  |  |  |  |  | $\begin{aligned} & \hline \text { Out3 } \\ & \text { FSR } \end{aligned}$ | $\begin{aligned} & \hline \text { Out2 } \\ & \text { FSR } \end{aligned}$ | $\begin{aligned} & \hline \text { Out1 } \\ & \text { FSR } \end{aligned}$ | $\begin{aligned} & \hline \text { Out0 } \\ & \text { FSR } \end{aligned}$ | $\begin{aligned} & \hline \text { Out3 } \\ & \text { FM } \end{aligned}$ | $\begin{aligned} & \hline \text { Out2 } \\ & \text { FM } \end{aligned}$ | $\begin{aligned} & \hline \text { Out1 } \\ & \text { FM } \end{aligned}$ | $\begin{aligned} & \hline \text { Out0 } \\ & \text { FM } \end{aligned}$ |

## Output Fault Mode (OutOFaultMode through Out3FaultMode)

These bits configure the output for Hold Last State or User-Defined Safe State during a Fault state.

- $1=$ Hold Last State
- 0 = User-Defined Safe State

## Output Fault State Run (OutOFaultStateRun through Out3FaultStateRun)

Similar to Program State Run, Fault State Run allows you to specify, on a bit basis, that the output should continue to be controlled by the module as if it were Run state. That is, events on the module or changes in the Output image will affect the physical outputs without regard to the Program_HLS or UDSS state indicated. When this bit is set, the corresponding Program Mode and Program Value bits are ignored.

## ATTENTION

 RSelecting this option will allow outputs to change state while ladder logic is not running. You must take care to assure that this does not pose a risk of injury or equipment damage when selecting this option.

## IMPORTANT

The prescan initiated by some controllers could have an effect on the outputs. To overcome any changes in physical output states that may be caused by this, retentive output instructions (eg. latch, unlatch etc.) should be used when bit manipulations are done on the Output image of this module in ladder logic.
This applies to a wide range of bits when Fault State Run is selected, since presetting a counter, enabling a range, changing a mask, and changing Configuration Array settings can cause ranges and outputs to change state.

## Output Fault Value (OutOFaultValue through Out3FaultValue)

| Configuration Array Word 5 |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 5 | Output Fault Value | Not Used |  |  |  |  |  |  |  |  |  |  |  | $\begin{gathered} \hline \text { Out3 } \\ \text { FV } \end{gathered}$ | $\begin{gathered} \hline \text { Out2 } \\ \text { FV } \end{gathered}$ | $\begin{gathered} \text { Out1 } \\ \text { FV } \end{gathered}$ | $\begin{gathered} \hline \text { Out0 } \\ \text { FV } \end{gathered}$ |

These bits are the values that will be applied to each of the real outputs when User-Defined Safe State is set as described above and the module is in Fault state.

## TIP

Outputs are also affected by PFT above.

## Counter Maximum Count (CtrnMaxCount)

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6 | Counter 0 Maximum Count | CtrOMaxCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 7 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 16 | Counter 1 Maximum Count | Ctr1MaxCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 17 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 26 | Counter 2 Maximum Count | Ctr2MaxCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 27 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 36 | Counter 3 Maximum Count | Ctr3MaxCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 37 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This is the maximum count value allowed for counter ( $n$ ). The count value cannot exceed this value. Allowable values are $\mathrm{Ctr} n$ MinCount + 1 through 2,147,483,647 (decimal).

The default value is $+2,147,483,647$ decimal for counters 0 and 1 . The default value is 0 for counters 2 and 3 .

IMPORTANT
Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Counter Minimum Count (CtrrMMinCount)

This is the minimum count value allowed for counter ( $n$ ). The count value cannot fall below this value. This value must be less than $\mathrm{Ctr} n$ MaxCount or a configuration error occurs. Allowable values are from -2,147,483,648 to Ctr $n$ MaxCount - 1.

The default value is $-2,147,483,648$ decimal for counters 0 and 1 . The default value is 0 for counters 2 and 3 .

## IMPORTANT

Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Counter Preset (CtrnPreset)

This value can be used to change the current count value of counter $n$ on certain gate ( $\mathrm{Z} n$ ) events and when $\mathrm{Ctr} n$ SoftPreset is used.

Ctr $n$ Preset must be greater than or equal to $\mathrm{Ctr} n$ MinCount and less than $\operatorname{Ctr} n$ MaxCount. The default value is zero.

## Counter Hysteresis (CtrnHysteresis)

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 12 | Counter 0 Hysteresis | CtrOHysteresis |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 22 | Counter 1 Hysteresis | Ctr1Hysteresis |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 32 | Counter 2 Hysteresis | Ctr2Hysteresis |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 42 | Counter 3 Hysteresis | Ctr3Hysteresis |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

The hysteresis value is the number of counts that should be disregarded in the calculation of the cyclic rate. If the count value changes by less than the hysteresis value, the rate is reported as zero, regardless of the actual rate at which the pulses are counted.

## IMPORTANT

Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

# Counter Scalar (CtrnScalar) 

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 13 | Counter 0 Scalar | CtroScalar |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 23 | Counter 1 Scalar | Ctr1Scalar |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 33 | Counter 2 Scalar | Ctr2Scalar |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 43 | Counter 3 Scalar | Ctr3Scalar |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This value is used to scale the Rate value. The Rate value is divided by the Scalar value. The default value is 1 for counters 0 and 1. The default value is 0 for counters 2 and 3 .

Ctr $n$ Scalar may be used to determine RPM. To configure the $\mathrm{Ctr}[n]$.CurrentRate value to show an RPM value, set Ctr$n$ Scalar to (counts per revolution)/60. See page 2-20 for more information.

## IMPORTANT

For any counter being used, do not set Scalar to a value less than one or a configuration error will occur.

IMPORTANT Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Cyclic Rate Update Time (CtrnCyclicRateUpdateTime)

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 14 | Counter 0 Cyclic Rate Update Time | CtrOCyclicRateUpdateTime |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 24 | Counter 1 Cyclic Rate Update Time | Ctr1CyclicRateUpdateTime |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 34 | Counter 2 Cyclic Rate Update Time | Ctr2CyclicRateUpdateTime |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 44 | Counter 3 Cyclic Rate Update Time | Ctr3CyclicRateUpdateTime |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This value is used to set the cyclic rate update time for the CurrentRate calculation. The value indicates the time in milliseconds from 1 to 32767. An invalid number causes a configuration error. The default value is 10 for counters 0 and 1 . The default value is 0 for counters 2 and 3 .

## IMPORTANT

Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

See page 2-19 for more information on cyclic rate.

## Configuration Flags

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | Counter 0 Configuration Flags | Not Used |  |  | Linear | $\begin{gathered} \hline \text { Not } \\ \text { Used } \end{gathered}$ | Storage Mode |  |  | Not Used |  |  |  |  | Operational Mode |  |  |
| 25 | Counter 1 Configuration Flags | Not Used |  |  | Linear | Not Used | Storage Mode |  |  | Not Used |  |  |  |  | Operational Mode |  |  |
| 35 | Counter 2 Configuration Flags | Not Used |  |  | Linear | Not Used |  |  |  |  |  |  |  |  |  |  |  |
| 45 | Counter 3 Configuration Flags | Not Used |  |  | Linear | Not Used |  |  |  |  |  |  |  |  |  |  |  |

## Operational Mode (CtrnConfig.OperationalMode_0 through

CtrnConfig.OperationalMode_2)
These bits apply to Counters 0 and 1 only.
This value determines how the $\mathrm{A} O$ or A 1 and $\mathrm{B} O$ or B 1 inputs are decoded when assigned to counter 0 or counter 1 . See the following table.

## Table 4.4 Operational Mode Settings

| Set bit |  |  |  | For function |
| :---: | :---: | :---: | :--- | :--- |
| CtrnConfig.OperationaIMode_2 | CtrnConfig.OperationalMode_1 | CtrnConfig.OperationalMode_0 |  |  |
| 0 | 0 | 0 | Pulse internal direction |  |
| 0 | 0 | 1 | Pulse external direction |  |
| 1 | 0 | 0 | Quadrature encoder X1 |  |
| 1 | 0 | 1 | Quadrature encoder X2 |  |
| 1 | 1 | 0 | Quadrature encoder X4 |  |
| 0 | 1 | 0 | Up/Down Pulses |  |
| 0 | 1 | 1 | reserved |  |
| 1 | 1 | 1 | reserved |  |

TIP

The Ctr1Config. OperationalMode bits are reserved if the Number of Counters equals 1. Attempting to set reserved bits will result in a configuration error.

IMPORTANT
Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Storage Mode (CtrnConfig.StorageMode_0 through CtrnConfig.StorageMode_2)

These three bits apply to Counters 0 and 1 only. They define how the module interprets the Z input, as shown below. Each bit works independently. If bit 0 and bit 2 are set simultaneously, a $Z$ event causes the Current Count Value to be stored and then preset.

## Table 4.5 Storage Mode Settings

| Set bit | For function |
| :--- | :--- |
| CtrnConfig.StorageMode_0 | Stores the Current Count Value on the rising edge of Z to Ctr[n].StoredCount in the input file. |
| CtrnConfig.StorageMode_1 | Holds the counter at its Current Count Value while Z = 1. |
| CtrnConfig.StorageMode_2 | Presets the Current Count Value on the rising edge of $Z$. |

IMPORTANT
$Z=$ internal $Z$. Internal $Z$ is the version of the $Z$ input pin as modified by the Output Array control bits Z Invert and $Z$ Inhibit.

TIP
The Ctr1Config.StorageMode bits are reserved if NumberofCounters_1 and NumberofCounters_0 are set to 00 (one counter). Attempting to set reserved bits will result in a configuration error.

## IMPORTANT

Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Linear (CtrOConfig.Linear through Ctr3Config.Linear)

This bit indicates how the counter operates upon reaching a Ctr $n$ MinCount or $\operatorname{Ctr} n$ MaxCount.

- $0=$ Ring Counter
- $1=$ Linear Counter

See page 2-14 for a description of ring and linear counter operation.

## IMPORTANT

Do not change this value while the counter is enabled. Attempting to do so will result in a BadModConfigUpdate error. See page 5-13 for a full list of prohibited settings.

## Range High Limit (RangeOTo11[n].HighLimit) and Range Low Limit (Range0To11[n].LowLimit)

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 46 and 47 | Range 0 High Limit | RangeOTo11[0]. HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 48 and 49 | Range 0 Low Limit | RangeOTo11[0].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 52 and 53 | Range 1 High Limit | RangeOTo11[1].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 54 and 55 | Range 1 Low Limit | RangeOTo11[1].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 58and 59 | Range 2 High Limit | RangeOTo11[2].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 60 and 61 | Range 2 Low Limit | RangeOTo11[2].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 64 and 65 | Range 3 High Limit | RangeOTo11[3].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 66 and 67 | Range 3 Low Limit | RangeOTo11[3].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 70 and 71 | Range 4 High Limit | RangeOTo11[4].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 72 and 73 | Range 4 Low Limit | RangeOTo11[4].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 76 and 77 | Range 5 High Limit | RangeOTo11[5]. HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 78 and 79 | Range 5 Low Limit | RangeOTo11[5].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 82 and 83 | Range 6 High Limit | RangeOTo11[6]. HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 84 and 85 | Range 6 Low Limit | RangeOTo11[6].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 88 and 89 | Range 7 High Limit | RangeOTo11[7].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 90 and 91 | Range 7 Low Limit | RangeOTo11[7].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 94 and 95 | Range 8 High Limit | RangeOTo11[8]. HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 96 and 97 | Range 8 Low Limit | RangeOTo11[8].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 100 and 101 | Range 9 High Limit | Range0To11[9].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 102 and 103 | Range 9 Low Limit | RangeOTo11[9].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 106 and 107 | Range 10 High Limit | RangeOTo11[10].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 108 and 109 | Range 10 Low Limit | RangeOTo11[10].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 112 and 113 | Range 11 High Limit | Range0To11[11].HighLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 114 and 115 | Range 11 Low Limit | Range0To11[11].LowLimit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

These values, which represent a count value or rate value, depending upon the programed Type, are used for range comparison. When the rate value is equal to Range0To11[ $n$ ]. HighLimit or Range0To11[n].LowLimit, Range $n$ changes state, becoming either active or inactive, depending upon the setting of the Range0To11[ $n$ ].Invert bit.
 Range0To11[ $n$ ]. LowLimit or a configuration error results.

Range Output Control (Range0To11[n].OutputControl)

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 50 | Range 0 Output Control | $\begin{aligned} & \text { Out } \\ & 15 \end{aligned}$ | $\begin{aligned} & \hline \text { Out } \\ & 14 \end{aligned}$ | $\begin{aligned} & \hline \text { Out } \\ & 13 \end{aligned}$ | $\begin{aligned} & \hline \text { Out } \\ & 12 \end{aligned}$ | $\begin{gathered} \hline \text { Out } \\ 11 \end{gathered}$ | $\begin{gathered} \hline \text { Out } \\ 10 \end{gathered}$ | Out 9 | Out 8 | Out 7 | Out 6 | Out 5 | Out 4 | Out 3 | Out 2 | Out 1 | Out 0 |
| 56 | Range 1 Output Control | $\begin{aligned} & \text { Out } \\ & 15 \end{aligned}$ | $\begin{aligned} & \text { Out } \\ & 14 \end{aligned}$ | $\begin{aligned} & \text { Out } \\ & 13 \end{aligned}$ | $\begin{gathered} \text { Out } \\ 12 \end{gathered}$ | $\begin{aligned} & \text { Out } \\ & 11 \end{aligned}$ | $\begin{gathered} \text { Out } \\ 10 \end{gathered}$ | Out 9 | Out 8 | Out 7 | Out 6 | Out 5 | Out 4 | Out 3 | Out 2 | Out 1 | Out 0 |

These 16 -bit words indicate which outputs should be enabled when a range is active. When range $n$ is enabled, this word is combined with the other range output masks as described in Output Off Mask (OutputOffMask.0 through OutputOffMask.15) on page 4-23 and Output On Mask (OutputOnMask. 0 through OutputOnMask.15) on page 4-22.

## Range Configuration Flags

| Configuration Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | $03 \mathrm{O2}$ | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 51 | Range 0 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used |  |  | Type | Not Used | ToThisCtr |  |
| 57 | Range 1 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used |  |  | Type | Not Used | ToThisCtr |  |
| 63 | Range 2 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used |  |  | Type | Not Used | ToThisCtr |  |

| 105 | Range 9 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used |  |  | Type | Not Used | ToThisCtr |  |
| 111 | Range 10 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used |  |  | Type | Not Used | ToThisCtr |  |
| 117 | Range 11 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used |  |  | Type | Not Used | ToThisCtr |  |

## ToThisCtr (Range0To11[n]. ToThisCounter)

This 2-bit value indicates which counter is used in the range comparison for range $n$, as shown in the table below.

Table 4.6 Range Counter Number Determination

| Bit 01 | Bit 00 | Counter |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 2 |
| 1 | 1 | 3 |

## IMPORTANT

If this value is greater than NumberOfCounters, a configuration error occurs.

## Type (RangeOTo11[n].Type)

This bit indicates which type of value to use for the range comparison in range $n$. This value and Range0To $11[n]$. ToThisCounter determine the current value that is used in range comparison as the rate or count value.

| Range0To11[n].Type | Range Type |
| :---: | :--- |
| 0 | Count Value |
| 1 | Rate Value |

## Inv (RangeOTo11[n].Invert)

This bit indicates whether the range $n$ should be active inside or outside the Range0To11[ $n$ ]. Low Limit and Range0To11[ $n$ ]. HighLimit window.

- $0=$ The range $n$ is active when the rate or count value is at or between Range0To11[ $n$ ]. Low Limit and
Range 0 To $11[n]$.HighLimit. When the range is active, the RangeActive. $n$ bit is set. When the range is active and enabled, the outputs indicated in the Range Output Control word are activated.
- $1=$ The range $n$ is active when the rate or count value is lower than or equal to Range0To11[ $n$ ].LowLimit or higher than or equal to Range0To11[ $n$ ]. HighLimit. When the range is active, the RangeActive. $n$ bit is set. When the range is active and enabled, the outputs indicated in the Range Output Control word are applied.

Ranges can be active in overflow, underflow, and rollover situations.

# Output Array 

The Output Array, which consists of 34 words, allows you to access the module's real-time output data to control the module. The default value is all zeros.

IMPORTANT
The Output Array contains dynamic configuration data. The settings in the Output Array must be compatible with the settings in the Configuration Array.
For example, do not attempt to set Counter Control Bits for a given counter in the Output Array unless NumberOfCounters in the Configuration Array indicates that the counter is declared to be used.

IMPORTANT
All Not Used bits (shaded in Table 4.7) must be set to 0 or the InvalidOutput bit in the Input Array will be set. When the InvalidOutput bit is set, the entire Output Array is rejected until an Output Array that does not have this error is sent.

Table 4.7 Output Array

| Word | Bit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Function |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |  |

Table 4.7 Output Array

Output On Mask (OutputOnMask. 0 through OutputOnMask.15)

| Output Array Word 0 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output On Mask | Out | Out | Out | Out | Out | Out | Out 9 | Out 8 | Out 7 | Out 6 | Out 5 | Out 4 | Out 3 | Out 2 | Out 1 | Out 0 |
|  | 15 | 14 | 13 | 12 | 11 | 10 |  |  |  |  |  |  |  |  |  |  |

This word allows you to turn on any output, real or virtual, when the corresponding bit is set. This mask is logically OR'ed with the range masks but logically AND'ed with the Output Off Mask Word described on page 4-23.

Using the Output On Mask, all of the module's outputs can be turned on directly by the user control program, like discrete outputs. A bit which is set in the mask turns on the corresponding real or virtual output.

See "Output Control" on page 2-23 and "Output Control Example" on page 2-30 for more information about output determination.

## TIP

The corresponding Output Off Mask bit must be set to enable this bit.

## Output Off Mask (OutputOffMask.0 through OutputOffMask.15)

| Output Array Word 1 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output Off Mask | Out | Out | Out | Out | Out | Out | Out 9 | Out 8 | Out 7 | Out 6 | Out 5 | Out 4 | Out 3 | Out 2 | Out 1 | Out 0 |
|  | 15 | 14 | 13 | 12 | 11 | 10 |  |  |  |  |  |  |  |  |  |  |

This word turns OFF any output, real or virtual, when the corresponding bit is reset. This mask has veto power over all the Range masks and the Output On Mask described above. It is logically AND'ed with the results of those masks. See "Output Control" on page 2-23 and "Output Control Example" on page 2-30 for more information about output determination.

## TIP

This mask can be overridden when a safe state is indicated.

## Range Enable (RangeEn. 0 through RangeEn.15)

| Output Array Word 2 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Range Enable | $R 15$ | $R 14$ | $R 13$ | $R 12$ | $R 11$ | $R 10$ | $R 9$ | $R 8$ | $R 7$ | $R 6$ | $R 5$ | $R 4$ | $R 3$ | $R 2$ | $R 1$ | $R 0$ |

When the bit corresponding to the range number is set, Range[ $n$ ]. OutputControl is applied whenever the range is active.

> RBF - Reset Blown Fuse (ResetBlownFuse)

| Output Array Word 4 | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reset Blown Fuse | Not Used |  |  |  |  |  |  |  | RBF | Not Used |  |  |  |  |  |  |

When the OvercurrentLatchOff bit is set and an overcurrent condition has occurred, the real output remains off until this bit is cycled from 0 to 1 (rising edge).

## Control Bits

| Output Array Words 5 to 8 | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Counter 0 Control Bits (Word 5) | Not Used |  |  |  |  |  | RPW | RREZ | Z Inh | $Z$ Inv | D Inh | D Inv | RU | RO | SP | En |
| Counter 1 Control Bits (Word 6) | Not Used |  |  |  |  |  | RPW | RREZ | Z Inh | Z Inv | D Inh | D Inv | RU | R0 | SP | En |
| Counter 2 Control Bits (Word 7) | Not Used |  |  |  |  |  | RPW | Not Used |  |  |  | D Inv | RU | R0 | SP | En |
| Counter 3 Control Bits (Word 8) | Not Used |  |  |  |  |  | RPW | Not Used |  |  |  | D Inv | RU | RO | SP | En |

The control bits for counter ( $n$ ) are described below.

The order of precedence for the Preset and Direct Write actions is:

## 1. Preset

2. Direct Write

## IMPORTANT

Setting any of the control bits under certain conditions of the NumberOfCounters value will result in the input error flag, $\operatorname{Ctr}[n]$.InvalidCounter. For more information, see IC - Invalid Counter (Ctr[1].InvalidCounter to Ctr[3].Invalid Counter) on page 4-39.

## En - Enable Counter (CtrnEn)

This bit, when set (1), enables the inputs to be counted. When reset (0), this bit inhibits any activity of the A or B inputs from affecting the count, pulse interval, and rate values.

## SP - Soft Preset (CtrnSoftPreset)

A 0 to 1 transition of this bit causes counter ( $n$ ) to be preset, changing the count to the value in $\operatorname{Ctr} n$ Preset.

## RCO - Reset Counter Overflow (CtrnResetCounterOverflow)

A 0 to 1 transition of this bit causes the corresponding $\operatorname{Ctr}[n]$ Overflow bit to be reset.

## RCU - Reset Counter Underflow (CtrnResetCounterUnderflow)

A 0 to 1 transition of this bit causes the corresponding $\mathrm{Ctr}[n]$ Underflow bit to be reset.

## D Inv - Direction Invert (CtrnDirectionInvert)

This bit, when set, inverts the direction of the counter $(n)$. If the Ctr $n$ DirectionInhibit bit is set when this bit is:

- 0 - the resulting direction is up, increasing counts
- 1 - the resulting direction is down, decreasing counts

## D Inh - Direction Inhibit (CtrnDirectionInhibit)

This bit, when set, inhibits the direction of the input signal from being used by the module.

## Z Inv - Z Invert (CtrnZlnvert)

When set, this bit inverts the Zn value. The $\mathrm{Z} n$ value is also affected by the $\mathrm{C} \operatorname{tr} n$ ZInhibit bit. If the $\mathrm{Ctr} n$ ZInhibit is set, the module uses Ctr $n$ ZInvert for all internal Z activities, preset, hold and store. Input state Zn is not affected by this bit.

Z Inh - Z Inhibit (CtrnZInhibit)

When set, this bit inhibits the Zn state from being used by the module.

RREZ - Reset Rising Edge Z (CtrnResetRisingEdgeZ)

A 0 to 1 transition causes the $\operatorname{Ctr}[n]$.RisingEdgeZ bit to be reset.
RPW - Reset Counter Preset Warning (CtrnResetCtrPresetWarning)

A 0 to 1 transition causes the $\mathrm{Ctr}[n]$ PresetWarning bit to be reset.

Range High Limit or Direct Write Value
(Range12To15[n].HiLimOrDirWr)

| Output Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 and 11 | Range 12 High Limit Direct Write Value | Range12To15[0].HiLimOrDirWr |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 16 and 17 | Range 13 High Limit Direct Write Value | Range12To15[1].HiLimOrDirWr |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 22 and 23 | Range 14 High Limit Direct Write Value | Range12To15[2].HiLimOrDirWr |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 28 and 29 | Range 15 High Limit Direct Write Value | Range12To15[3].HiLimOrDirWr |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This value may be used in one of two ways, depending on the setting of the Load Direct Write (Range12To15[n].LoadDirectWrite) bit.

When Load Direct Write $=0$
When Range12To15[ $n$ ].LoadDirectWrite $=0$, then Range12To15[ $n$ ]. HiLimOrDirWr is used in the range comparison (range represents a count value or a rate value according to the programmed range type, Range12To15[ $n$ ].Type).

When the range value is equal to Range12To15[n].HiLimOrDirWr , Range $n$ will change state. The range will become active or inactive depending on the Range12To15[ $n$ ].Invert bit.

Range Value (Current Count or Current Rate)

## TIP

Range12To15[ $n$ ]. HiLimOrDirWr must be higher than the Range12To15[ $n$ ].LowLimit or the InvalidRangeLimit $n$ error flag in the Input Array will be set.

## TIP

Range12To15[ $n$ ].HiLimOrDirWr may be higher than the maximum rate or count value. For example, when the object value is a rate,
Range12To15[n].HiLimOrDirWr may be programmed in excess of $1,000,000$ with no configuration error.

## When Load Direct Write $=1$

When Range 12 To $15[n]$.LoadDirectWrite $=1$, then Range12To15[ $n$ ].HiLimOrDirWr is used to change the $\operatorname{Ctr}[n]$.CurrentCount to Range12To15[ $n$ ].HiLimOrDirWr.

When the Range12To15[n].LoadDirectWrite bit transitions from 0 to 1 , then Range12To15[ $n$ ].HiLimOrDirWr is loaded into $\operatorname{Ctr}[n]$. CurrentCount (where $n$ is the counter indicated in Range12To15[n].ToThisCounter).

When Ctr $n$ SoftPreset and a
Range12To15[ $n]$.LoadDirectWrite to counter $n$ are indicated at the same time, only the $\operatorname{Ctr} n$ SoftPreset will occur. When more than one range indicates a Range12To15[ $n]$.LoadDirectWrite to a single counter, only the one from the lowest designated range will take effect.

## Range Low Limit (Range12To15[n].LowLimit)

|  | Output Array Words | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | $\mathbf{0 0 0} 9$

This value is used in the range comparison. It is the complement of the Range12To15[ $n$ ]. HiLimOrDirWr value in setting the compare window.

When the rate or count value is equal to Range12To15[ $n$ ]. LowLimit, the range will change state - opposite of the action at Range12To15[n].HiLimOrDirWr. The range will become active or inactive depending on the Range12To15[ $n$ ].Invert bit.

## TIP

Range12To15[ $n]$.LowLimit must be lower than the Range12To15[ $n$ ]. HiLimOrDirWr or the InvalidRangeLimit $n$ error flag in the Input Array will be set.

## TIP

Like Range12To15[ $n$ ].HiLimOrDirWr (see page 4-26) Range12To15[ $n$ ].LowLimit may extend beyond the minimum rate or count value.

## TIP

$\square$

When Range12To15[n].LoadDirectWrite is set, Range12To15[ $n$ ].LowLimit is ignored.

Range Output Control (Range12To15[n].OutputControl)

|  | Output Array Words | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 14 | Range 12 Output Control | Range12To15[0].OutputControl |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 20 | Range 13 Output Control | Range12To15[1].OutputControl |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 26 | Range 14 Output Control | Range12To15[2].OutputControl |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 32 | Range 15 Output Control | Range12To15[3].OutputControl |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This 16 -bit word indicates which outputs should be on (corresponding bit set in this word) when a range is active. When Range $n$ is enabled and active, Range12To15[ $n$ ]. OutputControl will be logically OR'ed with other Range12To15[n].OutputControl masks and the OutputOnMask. $n$ etc., as described on page 4-22.

When Range12To15[ $n$ ].LoadDirectWrite is set, Range12To15[ $n$ ].OutputControl is ignored.

Range Configuration Flags (12 through 15)

|  | Output Array Words | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 06 | 05 | 04 | $03 \mathrm{O2}$ | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 15 | Range 12 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used | LDW | Type | Not Used | ToThisCtr |  |
| 21 | Range 13 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used | LDW | Type | Not Used | ToThisCtr |  |
| 27 | Range 14 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used | LDW | Type | Not Used | ToThisCtr |  |
| 33 | Range 15 Configuration Flags | Not Used |  |  |  |  |  |  | Inv | Not Used | LDW | Type | Not Used | ToThisCtr |  |

## ToThisCtr - Range Counter Number (Range12To15[n].ToThisCounter)

This 2-bit value indicates which counter will be used in the range comparison or Range12To15[ $n$ ].LoadDirectWrite. The counter is indicated as follows:

Table 4.8 Range Counter Number Determination

| Bit 01 | Bit 00 | Counter |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 2 |
| 1 | 1 | 3 |

If Range $12 \mathrm{To} 15[n]$.ToThisCounter is set to a number larger than NumberOfCounters in the Configuration Array, then the InvalidCtrAssignToRange $n$ error bit in the Input Array will be set.

## Type - RangeType (Range12To15[n]. Type)

This bit value indicates which type of value to use for the range comparison in Range. That is, the Range12To15[ $n$ ].ToThisCounter, from above, and this Range12To15[n].Type value determine the rate or count value, the current value which is compared to, for the range comparison. The type of value is indicated as follows:

- $0=$ Count Value
- 1 = Rate Value

When Range12To15[ $n$ ].LoadDirectWrite is set Range12To15[ $n$ ].Type is ignored.

## LDW - Load Direct Write (Range12To15[n].LoadDirectWrite)

A 0 to 1 transition of this bit causes counter ( $n$ )'s current count value to change to the value of Range12To15[ $n$ ].HiLimOrDirWr.

## IMPORTANT

The write occurs according to the internal timings of the module and the system. For the most predictable results, the counter should be disabled or stopped while performing this action.

IMPORTANT If both Ctr $n$ SoftPreset and
Range12To15[ $n$ ]. HiLimOrDirWr transition to 1 during the same Output Array update, only the Ctr $n$ SoftPreset occurs.
Range12To15[ $n$ ]. HiLimOrDirWr is ignored.

Inv - Range Invert (Range12To15[n].Invert)
Indicates the active portion of Rangen. When Range12To15[n].Invert = 0 , the outputs are activated when the range value is at or between the Range12To15[ $n$ ].LowLimit and Range12To15[ $n$ ].HiLimOrDirWr. When Range $12 \mathrm{To} 15[n]$.Invert $=1$, the outputs are activated when the range is at or outside the range limits.

Object Value (Current Count or Current Rate)

## Input Array

The Input Array, which consists of 35 words, allows read-only access to the module's input data via word and bit access.The Input Array is described below. The functions are described in more detail in the sections following the table.

## IMPORTANT

During the non-run states (program and fault), the module continues to update the Input Array (continues counting, etc). Depending on the bus master, you may not see this.

## TIP

$>$ configuration settings for that counter. To receive valid status, the counter must be enabled and the module must have stored a valid configuration for that counter.

## Table 4.9 Input Array

| Word | Bit |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Function |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |  |
| 0 | Not Used |  |  |  |  |  |  |  |  |  | Z1 | B1 | A1 | Z0 | B0 | A0 | Input State |

## Input State (InputStateA0 through InputStateZ1)

| Input Array Word 0 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Input State | Not Used |  |  |  |  |  |  |  |  |  |  |  |  |  | Z 1 | B 1 |

This word indicates the state of the real (physical) inputs after filtering.

- $1=O n$
- $0=$ Off

## Readback (Readback. 0 through Readback.15)

| Input Array Word 1 | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Readback | Readback. 0 through Readback. 15 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This input word reflects counter's module-directed status of all sixteen outputs, real and virtual.

- $1=O n$
- $0=$ Off

## Status Flags

| Input Array Word 2 | $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{0 9}$ | $\mathbf{0 8}$ | $\mathbf{0 7}$ | $\mathbf{0 6}$ | $\mathbf{0 5}$ | $\mathbf{0 4}$ | $\mathbf{0 3}$ | $\mathbf{0 2}$ | $\mathbf{0 1}$ | $\mathbf{0 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Status Flags | InvalidRangeLimit12 <br> through <br> InvalidRangeLimit15 | InvalidCtrAssignToRange12 <br> through <br> InvalidCtrAssignToRange15 | Gen <br> Error | Invalid <br> Output | Mod <br> Config | Not <br> Used | Out00vercurrent <br> through <br> Out3Overcurrent |  |  |  |  |  |  |  |  |  |

## Output Overcurrent (OutOOvercurrent to Out3OverCurrent)

The output overcurrent bits are set (1) when the module is in an overcurrent condition. These bits also show whether the output is latched off, because the output(s) remain in the off state and these bits remain on until the ResetBlownFuse bit is used.

## Module Configured (ModConfig)

Word 2, bit 5 is set by the module after it has accepted all of the configuration data. When set (1), this bit confirms that the module received and accepted valid configuration data. When reset (0), this bit indicates that the module is still checking for errors or contains errors and the old configuration is still being used.

## TIP

The module takes up to 2 seconds to validate configuration data.

## Invalid Output (InvalidOutput)

- 1 = an unused bit in the Output Array is set
- $0=$ no unused bits in the Output Array are set

When this error occurs, the entire Output Array is rejected until an Output Array that does not have this error is sent.

## Error (GenError)

When this bit is set (1), it indicates one or more of the following errors for the Input Array:

- OutnOvercurrent
- InvalidRangeLimitn
- InvalidCtrAssignToRangen
- InvalidOutput
- Ctr[ $n$ ].Overflow
- $\mathrm{Ctr}[n]$.Underflow
- $\operatorname{Ctr}[n]$.InvalidDirectWrite
- $\operatorname{Ctr}[n]$.InvalidCounter
- $\operatorname{Ctr}[n]$.PresetWarning
where $n$ indicates the counter number.
To determine which error has set the GenError bit, identify which bit is set. This could be done by using a subroutine to examine these bits in the Input Array.

Invalid Counter Assigned to Range (InvalidCtrAssignToRange12 through InvalidCtrAssignToRange15)

InvalidCtrAssignToRange12 is set when the indicated range in the Output Array refers to a non-existent counter.

- It is set (1) when Range12To15[ $n$ ].ToThisCounter > NumberOfCounters.
- It is cleared (0) when Range12To15[n].ToThisCounter $\leq$ NumberOfCounters.

When this error occurs, the entire Output Array is rejected until a valid configuration is detected.

Invalid Range Limit (InvalidRangeLimit12 through InvalidRangeLimit15)
This bit is set when the range limits are invalid according to the limitations indicated in Range12To15[n].HiLimOrDirWr and Range $12 \mathrm{To} 15[n]$.LowLimit in the Output Array.

- 1 = Range limits are invalid.
- $0=$ no error

When this error occurs, the entire Output Array is rejected until a valid configuration is detected.

## Range Active (RangeActive. 0 through RangeActive.15)

This word reflects the status of all of the ranges. When a count or rate meets the criteria programmed for a given range, the range is active.

- $1=$ active
- $0=$ inactive/false

## TIP

When the range is enabled and active, the output mask for that range is applied.

## Current Count (Ctr[n].CurrentCount)

|  | nput Array Words | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | Counter 0 Current Count | Ctr[0].CurrentCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 5 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 14 | Counter 1 Current Count | Ctr[1].CurrentCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 24 | Counter 2 Current Count | $\operatorname{Ctr}$ [2].CurrentCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 25 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 30 | Counter 3 Current Count | Ctr[3].CurrentCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This is the 32 -bit count value from the counter.

## Stored Count (Ctr[n].StoredCount)

|  | Input Array Words | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6 | Counter 0 Stored Count | Ctr[0].StoredCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 7 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $\frac{16}{17}$ | Counter 1 Stored Count | Ctr[1].StoredCount |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This is the last stored 32 -bit value from counter ( $n$ ). The count value is stored depending on the $\mathrm{Ctr} n$ Config.StorageMode and $\mathrm{Z} n$ inputs.

When a storage event occurs, the $\operatorname{Ctr}[n]$.RisingEdgeZ bit is set, indicating that the value is new. If more than one $\mathrm{Z} n$ occurs before the $\mathrm{Ctr}[n]$.RisingEdgeZ bit is reset (using the Ctr $n$ ResetRisingEdgeZ bit), the $\operatorname{Ctr}[n]$.StoredCount word will contain only the last $\operatorname{Ctr}[n]$.StoredCount value. There is no indication that the data has been overwritten.

## Current Rate (Ctr[0].CurrentRate to Ctr[3].CurrentRate)

|  | nput Array Words | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8 | Counter 0 Current Rate | Ctr[0].CurrentRate |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 9 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 18 | Counter 1 Current Rate | Ctr[1].CurrentRate |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 19 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 26 | Counter 2 Current Rate | Ctr[2].CurrentRate |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 27 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 32 | Counter 3 Current Rate | Ctr[3].CurrentRate |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 33 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This 32-bit value is the current rate value, scaled by $\mathrm{Ctr} n$ Scalar, from the counter. This uses the Cyclic Rate Calculation Method (see page 2-19 for more information).

Rate-based ranges use this value for comparisons, even when the $\mathrm{Ctr}[n]$. RateValid bit is zero.

## IMPORTANT

This value is only current when the $\operatorname{Ctr}[n]$.RateValid bit is set (1).

Pulse Interval (Ctr[0].PulseInterval and Ctr[1].PulseInterval)

|  | Input Array Words | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 | Counter 0 Pulse Interval | $\mathrm{Ctr}[0]$ Pulselnterval |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 11 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 20 | Counter 1 Pulse Interval | Ctr[1].Pulselnterval |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 21 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

This is the time, in microseconds, between the last two pulses for the counter. The pulses indicated here are those transitions on which the count value can change. For example, in quadrature X1 mode, these are the successive rising edges of A only.

If more than two pulses have occurred since the value was last read, the value indicates only the time between the last two pulses that have been processed.

## Status Flags

| Input Array Words |  | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 12 | Counter 0 Status Flags | Not Used |  |  |  |  |  |  |  |  | COPW | RV | Not Used | IDW | REZ | CUdf | COvf |
| 22 | Counter 1 Status Flags | Not Used |  |  |  |  |  |  |  |  | C1PW | RV | IC | IDW | REZ | CUdf | COvf |
| 28 | Counter 2 Status Flags | Not Used |  |  |  |  |  |  |  |  | C2PW | RV | IC | IDW | Not | CUdf | COvf |
| 34 | Counter 3 Status Flags | Not Used |  |  |  |  |  |  |  |  | C3PW | RV | IC | IDW | Used | CUdf | COvf |

The status bits for the counter ( $n$ ) are described below.

## COvf - Count Overflow (Ctr[0].Overflow to Ctr[3].Overflow)

For linear counters, this bit is set when the counter is, or has been, in an overflow condition. For ring counters, this bit is set when the counter has rolled over. COvf is reset when the Ctr $n$ ResetCountOverflow bit transitions from 0 to 1.

See Counter Types on page 2-14 for more information about linear and ring counters.

## CUdf - Count Underflow (Ctr[0].Underflow to Ctr[3].Underflow)

For linear counters, this bit is set when the counter is, or has been, in an underflow condition. For ring counters, this bit is set when the counter has rolled under. CUdf is reset when the Ctr $n$ ResetCountUnderflow bit transitions from 0 to 1.

See Counter Types on page 2-14 for more information about linear and ring counters.

REZ - Rising Edge Z (Ctr[0].RisingEdgeZ to Ctr[1].RisingEdgeZ)
This bit is set (1) when $\mathrm{Z} n$, as modified by the Ctr $n$ ZInvert and Ctr $n$ ZInhibit bits, has a rising edge. It is reset (0) by a 0 to 1 transition of the $\operatorname{Ctr} n$ ResetRisingEdgeZ bit in the Output Array. $N$ is equal to 0 or 1 depending upon which input is used, Z0 or Z1.

## IDW - Invalid Direct Write (Ctr[0].InvalidDirectWrite to Ctr[3].InvalidDirectWrite)

This bit is set when the Range12To15[n].HiLimOrDirWr is invalid. (For example, if $\operatorname{Ctr} n$ MaxCount < Range12To15[ $n]$.HiLimOrDirWr or Range12To15[ $n$ ]. HiLimOrDirWr < Ctr $n$ MinCount.)

When this error occurs, the entire Output Array is rejected until a valid configuration is detected.

## IC - Invalid Counter (Ctr[1].InvalidCounter to Ctr[3].Invalid Counter)

When set (1) this bit indicates that an invalid control bit is set for the counter. Depending on the value of NumberOfCounters, the following errors will occur:

- If NumberOfCounters $<1$, then setting one of the control bits for Counter 1 will result in input error flag Ctr[1].InvalidCounter.
- If NumberOfCounters $<2$, then setting one of the control bits for Counter 2 will result in input error flag Ctr[2].InvalidCounter.
- If NumberOfCounters $<3$, then setting one of the control bits for Counter 3 will result in input error flag Ctr[3].InvalidCounter.

When this error occurs, the entire Output Array is rejected until an Output Array that does not have this error is sent.

The control bits are shown on page 4-24.

## RV - Rate Valid (Ctr[0].RateValid to Ctr[3].RateValid)

This bit is set (1) when the rate value indicated in $\operatorname{Ctr}[n]$.CurrentRate is current. When this bit is reset ( 0 ) , $\operatorname{Ctr}[n]$.CurrentRate is frozen at the last known good value.

This bit is reset when the $\operatorname{Ctr}[n]$. Overflow or $\operatorname{Ctr}[n]$. Underflow bits have been set during the last $\operatorname{Ctr} n$ CyclicRateUpdateTime period. See page 2-21 for more Rate Valid reset conditions.

## CnPW - Counter Preset Warning (Ctr[0].PresetWarning to Ctr[3].PresetWarning)

This bit is set when $\operatorname{Ctr}[n]$.CurrentCount has been forced, by the module, to the $\operatorname{Ctr} n$ Preset value. This will happen when a Configuration Array is accepted which sets:
$\mathrm{Ctr} n$ MinCount $>\operatorname{Ctr}[n]$.CurrentCount, or
Ctr $n$ MaxCount $<\operatorname{Ctr}[n]$.CurrentCount.
This bit is reset by a 0 to 1 transition of the $\mathrm{Ctr} n$ ResetCtrPresetWarning bit in the Output Array.

## TIP

You must manually reset CnPW, COvf, CUdf and REZ (but not IDW, RV or IC) to enable them to be set again.

## Diagnostics and Troubleshooting

This chapter describes troubleshooting the module. This chapter contains information on:

- safety considerations when troubleshooting
- module vs. counter operation
- the module's diagnostic features
- critical vs. non-critical errors
- error codes

## Safety Considerations

Safety considerations are an important element of proper troubleshooting procedures. Actively thinking about the safety of yourself and others, as well as the condition of your equipment, is of primary importance.

The following sections describe several safety concerns you should be aware of when troubleshooting your control system.

| ATTENTION | Never reach into a machine to actuate a switch <br> because unexpected motion can occur and cause <br> injury. |
| :--- | :--- |
| Remove all electrical power at the main power |  |
| disconnect switches before checking electrical |  |
| connections or inputs/outputs causing machine |  |
| motion. |  |

## Indicator Lights

When any LED on the module is illuminated, it indicates that power is applied to the module.

## Stand Clear of the Machine

When troubleshooting any system problem, have all personnel remain clear of the machine. The problem could be intermittent, and sudden unexpected machine motion could occur. Have someone ready to operate an emergency stop switch in case it becomes necessary to shut off power to the machine.

## Program Alteration

There are several possible causes of alteration to the user program, including extreme environmental conditions, Electromagnetic Interference (EMI), improper grounding, improper wiring connections, and unauthorized tampering. If you suspect a program has been altered, check it against a previously saved program on an EEPROM or UVPROM memory module.

## Safety Circuits

Circuits installed on the machine for safety reasons, like over-travel limit switches, stop push buttons, and interlocks, should always be hard-wired to the master control relay. These devices must be wired in series so that when any one device opens, the master control relay is de-energized, thereby removing power to the machine. Never alter these circuits to defeat their function. Serious injury or machine damage could result.

## Module Operation vs. Counter Operation

## Counter Defaults

The module performs operations at two levels:

- module level
- counter level

Module-level operations include functions such as power-up, configuration, and communication with a bus master, such as a MicroLogix 1500 controller.

Counter-level operations include counter-related functions, such as data conversion and overflow or underflow detection.

Internal diagnostics are performed at both levels of operation. When detected, module error conditions are immediately indicated by the module status LED. Both module hardware and configuration error conditions are reported to the controller. Counter overflow or underflow conditions are reported in the module's input data table. Module hardware errors are typically reported in the controller's I/O status file. Refer to your controller manual for details.

When the module powers-up, all Output Array and Configuration Array values are set to their default values (see Chapter 4 or Appendix D for default values). All Input Array values are cleared. None of the module data is retentive through a power cycle.

In effect, this means that power cycling clears the module:

- stored counts are lost
- faults and flags are cleared
- outputs are off

The bus master will attempt to write program data to the Output Array and Configuration Array.

## Module Diagnostics

## Power-up Diagnostics

At module power-up, a series of internal diagnostic tests are performed. These diagnostic tests must be successfully completed or the OK LED remains off and a module error results and is reported to the controller.

Table 5.1 Diagnostic Indicators

| LED | Color | Indicates |
| :---: | :---: | :---: |
| 0 OUT | Amber | ON/OFF logic status of output 0 |
| 1 OUT | Amber | ON/OFF logic status of output 1 |
| $20 U T$ | Amber | ON/OFF logic status of output 2 |
| 3 OUT | Amber | ON/OFF logic status of output 3 |
| FUSE | Red | Overcurrent |
| OK | Off | No power is applied. |
|  | Red (briefly) | Performing self-test. |
|  | Solid Green | OK, normal operating condition. |
|  | Flashing Green | OK, module in Program or Fault mode. |
|  | Solid Red or Amber | Hardware error. Cycle power to the module. If problem persists, replace the module. |
|  | Flashing Red | Recoverable fault. Reconfigure, reset, or perform error recovery. See section on page 5-5, Non-Critical vs. Critical Module Errors. The OK LED flashes red for all of the error codes in Table 5.6. |
| A0 | Amber | ON/OFF status of input A0 |
| A1 | Amber | ON/OFF status of input A1 |
| B0 | Amber | ON/OFF status of input BO |
| B1 | Amber | ON/OFF status of input B1 |
| Z0 | Amber | ON/OFF status of input ZO |
| 21 | Amber | ON/OFF status of input $\mathrm{Z1}$ |
| $\begin{aligned} & \text { ALL } \\ & \text { ON } \end{aligned}$ | Possible causes for all LEDs to be on: <br> - Bus Error has occurred: Controller hard fault. Cycle power. <br> - During Flash Upgrade of Controller: Normal. Do not cycle power during the Flash Upgrade. <br> - All LEDs will flash on briefly during power-up. This is normal. |  |

## Configuration Diagnostics

When a configuration is sent, the module performs a diagnostic check to see that the configuration is valid. This results in either a valid ModConfig bit or module configuration error. See Table 5.6 for configuration error codes.

## Post Configuration Diagnostics

If the ModConfig bit in the input array is set, then the module has accepted the configuration. Now, on every scan, each channel status flag in the Input Array is examined. The Output Array is checked on each scan for compatibility with the Configuration Array.

## Non-Critical vs. Critical <br> Module Errors

## Non-Critical Errors

Non-critical module errors are typically recoverable. Non-critical error conditions are indicated by the extended error code. See Table 5.6 Configuration Error Codes on page 5-9.

## TIP

The OK LED will be in a flashing red state for all of the error codes in Table 5.6.

## Critical Errors

Critical module errors are conditions that prevent normal or recoverable operation of the system. When these types of errors occur, the system typically leaves the run or program mode and enters the fault mode of operation until the error can be dealt with. Critical module errors are indicated in Table 5.5 General Common Hardware Error Codes on page 5-8.

## Module Error Definition

Module errors are expressed in two fields as four-digit Hex format with the most significant digit as "don't care" and irrelevant. The two fields are "Module Error" and "Extended Error Information". The structure of the module error data is shown below.

Table 5.2 Module Error Definition

| "Don't Care" Bits |  |  |  | Module Error |  |  |  | Extended Error Information |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1 5}$ | $\mathbf{1 4}$ | $\mathbf{1 3}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{1 0}$ | $\mathbf{9}$ | $\mathbf{8}$ | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |  |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |
| Hex Digit 4 |  |  |  | Hex Digit 3 |  |  |  | Hex Digit $\mathbf{2}$ |  |  |  | Hex Digit $\mathbf{1}$ |  |  |  |  |

## Module Error Field

The purpose of the module error field is to classify module errors into three distinct groups, as described in the table below. The type of error determines what kind of information exists in the extended error information field. These types of module errors are typically reported in the controller's I/O status file. Refer to your controller manual for details.

Table 5.3 Module Error Types

| Error Type | Module Error Field Value <br> Bits 11 through 09 <br> (Binary) | Description |
| :--- | :---: | :--- |
| No Errors | 000 | No error is present. The extended error field holds no additional information. |
| Hardware Errors | 001 | General and specific hardware error codes are specified in the extended error <br> information field. |
| Configuration <br> Errors | Module-specific error codes are indicated in the extended error field. These <br> error codes correspond to options that you can change directly. For example, the <br> input range or input filter selection. |  |

## Extended Error Information Field

Check the extended error information field when a non-zero value is present in the module error field. Depending upon the value in the module error field, the extended error information field can contain error codes that are module-specific or common to all 1769 modules.

If no errors are present in the module error field, the extended error information field will be set to zero.

## Hardware Errors

General or module-specific hardware errors are indicated by module error code 1. See Table 5.5 General Common Hardware Error Codes on page 5-8.

## Configuration Errors

If you set the fields in the configuration file to invalid or unsupported values, the module ignores the invalid configuration, generates a non-critical error, and keeps operating with the previous configuration.

Table 5.6 Configuration Error Codes on page 5-9 lists the possible module-specific configuration error codes defined for the module. Correct the error by providing proper configuration data to the module.

Table 5.4 describes configuration errors in more general terms.
Table 5.4 Error Conditions by Type of Configuration

| Programming Words | Error Conditions |
| :---: | :---: |
| General Configuration Bits, Filters and Safe State Words | - Unused or Reserved bit(s) were set. <br> - A counter or counters were running when the general configuration bits or filter and safe state words were sent. |
| Counter Configuration | - Unused or Reserved bit(s) were set. <br> - Operational Mode is invalid for the counter. (NumberOfCounters may be incorrect.) <br> - Operational Mode is invalid for the counter. (mode selection may be incorrect). <br> - The selected counter was running when the configuration was sent. <br> - CtrnMaxCount $\mathbb{S}$ trnMinCount <br> - CtrnHysteresis < 0 <br> - CtrnScalar < 1 <br> - CtrnCyclicRateUpdateTime < 1 <br> - The preset value is outside its valid range. (CtrnPreset not equal to or between CtrnMinCount or CtrnMaxCount) <br> - Counter was running when the minimum/maximum count value was changed. |
| Range Configuration | - Unused or Reserved bit(s) were set. <br> - RangeOto11[n]. HighLimit $\leq$ RangeOto11[n].LowLimit <br> - RangeOTo11[n].ToThisCounter refers to a non-declared counter (RangeOTo11[n].ToThisCounter > NumberOfCounters) |

## Error Codes

The tables in this section explain the extended error codes for general common hardware errors, configuration errors, and runtime errors.

Table 5.5 General Common Hardware Error Codes

| Error Type | Hex Equivalent ${ }^{(1)}$ | Module Error Code | Extended Error Information Code | Description | Status of the OK LED ${ }^{(2)}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Binary | Binary |  |  |
| No Error | X000 | 000 | 000000000 | OK, normal operating condition. | Solid or flashing green |
| General Common Hardware Error | X200 | 001 | 000000000 | General hardware error; no additional information | Solid red |
|  | X201 | 001 | 000000001 | Power-up reset state | Briefly red |
|  | X202 | 001 | 000000010 | Bus master incompatibility | Solid red |
|  | X203 | 001 | 000000011 | General hardware error | Solid red |
|  | X20A | 001 | 000001010 | General microprocessor error | Solid red |
|  | X20B | 001 | 000001011 | Microprocessor internal register error | Solid red |
|  | X20C | 001 | 000001100 | Microprocessor special function register error | Solid red |
|  | X20D | 001 | 000001101 | Microprocessor internal memory error | Solid red |
|  | X20E | 001 | 000001110 | Microprocessor timer error | Solid red |
|  | X20F | 001 | 000001111 | Microprocessor interrupt error | Solid red |
|  | X210 | 001 | 000010000 | Microprocessor watchdog error | Solid red |
|  | X218 | 001 | 000011000 | Firmware corrupt | Solid red |
|  | X219 | 001 | 000011001 | Firmware checksum error in non-volatile RAM | Solid red |
|  | X21A | 001 | 000011010 | Firmware checksum error in RAM | Solid red |
|  | X21E | 001 | 000011110 | External RAM test error | Solid red |
|  | X21F | 001 | 000011111 | External RAM cell test error | Solid red |
|  | X224 | 001 | 000100100 | Gate array loading failed | Solid red |
|  | X232 | 001 | 000110010 | External watchdog error | Solid red |

[^6]TIP
The OK LED will be in a flashing red state for all of the error codes in Table 5.6.

Table 5.6 Configuration Error Codes

| Hex | Module <br> Error <br> Code | Extended <br> Error <br> Information <br> Code |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Equivalent ${ }^{(1)}$ | Binary | Binary | Error | Description |
| X400 | 010 | 000000000 | General Configuration Error | no additional information |
| X401 | 010 | 000000001 | UnusedConfigBitSet | One or more of the unused module configuration bits are set. |
| X402 | 010 | 000000010 | BadModConfigUpdate | Occurs when you attempt to change a forbidden module configuration parameter while a counter or range is still enabled. See Table 5.7 on page $5-13$ for a list of the forbidden parameters. |
| X411 | 010 | 000010001 | BadCounterNum_1 | Nonzero configuration values were entered for Counter 1, when Counter 1 was not available. |
| X412 | 010 | 000010010 | BadCounterNum_2 | Nonzero configuration values were entered for Counter 2, when Counter 2 was not available. |
| X413 | 010 | 000010011 | BadCounterNum_3 | Nonzero configuration values were entered for Counter 3, when Counter 3 was not available. |
| X420 | 010 | 000100000 | BadCounterMode_0 | Operation Mode_0 is set to an invalid value. For example, value is reserved (011 or 111) or nonzero when NumberofCounters = 11 . |
| X421 | 010 | 000100001 | BadCounterMode_1 | Operation Mode_1 is set to an invalid value. For example, value is reserved (011 or 111) or nonzero when NumberofCounters = 10 or 11 . |
| X430 | 010 | 000110000 | BadMin_0 | Programmed CtroMinCount is greater than the CtroMaxCount. |
| X431 | 010 | 000110001 | BadMin_1 | Programmed Ctr1MinCount is greater than the Ctr1MinCount. |
| X432 | 010 | 000110010 | BadMin_2 | Programmed Ctr2MinCount is greater than the Ctr2MaxCount. |
| X433 | 010 | 000110011 | BadMin_3 | Programmed Ctr3MinCount is greater than the Ctr3MaxCount. |
| X440 | 010 | 001000000 | BadPreset_0 | The programmed CtroPreset is greater than the CtroMaxCount or less than the CtroMinCount. |
| X441 | 010 | 001000001 | BadPreset_1 | The programmed Ctr1Preset is greater than the Ctr1 MaxCount or less than the Ctr1MinCount. |
| X442 | 010 | 001000010 | BadPreset_2 | The programmed Ctr2Preset is greater than the Ctr2MaxCount or less than the Ctr2MinCount. |
| X443 | 010 | 001000011 | BadPreset_3 | The programmed Ctr3Preset is greater than the Ctr3MaxCount or less than the Ctr3MinCount. |

## Table 5.6 Configuration Error Codes

| Hex | Module Error Code | Extended Error Information Code |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Equivalent ${ }^{(1)}$ | Binary | Binary | Error | Description |
| X450 | 010 | 001010000 | BadHysteresis_0 | The CtrOHysteresis value is invalid, i.e. Iess than zero. |
| X451 | 010 | 001010001 | BadHysteresis_1 | The Ctr1Hysteresis value is invalid, i.e. Iess than zero. |
| X452 | 010 | 001010010 | BadHysteresis_2 | The Ctr2Hysteresis value is invalid, i.e. less than zero. |
| X453 | 010 | 001010011 | BadHysteresis_3 | The Ctr3Hysteresis value is invalid, i.e. less than zero. |
| X460 | 010 | 001100000 | BadScalar_0 | The CtrOScalar value is invalid, i.e. less than one. |
| X461 | 010 | 001100001 | BadScalar_1 | The Ctr1Scalar value is invalid, i.e. less than one when NumberofCounters $=01,10$ or 11 . |
| X462 | 010 | 001100010 | BadScalar_2 | The Ctr2Scalar value is invalid, i.e. less than one when NumberofCounters $=10$ or 11 . |
| X463 | 010 | 001100011 | BadScalar_3 | The Ctr3Scalar value is invalid, i.e. less than one when NumberofCounters = 11 . |
| X470 | 010 | 001110000 | BadScale_0 | The CtrOCyclicRateUpdateTime is invalid, i.e. less than one. |
| X471 | 010 | 001110001 | BadScale_1 | The Ctr1CyclicRateUpdateTime is invalid, i.e. less than one when NumberofCounters = 01, 10 or 11 . |
| X472 | 010 | 001110010 | BadScale_2 | The Ctr2CyclicRateUpdateTime is invalid, i.e. less than one when NumberofCounters $=10$ or 11 . |
| X473 | 010 | 001110011 | BadScale_3 | The Ctr3CyclicRateUpdateTime is invalid, i.e. less than one when NumberofCounters $=11$. |
| X480 | 010 | 010000000 | BadRangeLimit_0 | The RangeOTo11[0].LowLimit is greater than or equal to the Range0To11[0].HighLimit. |
| X481 | 010 | 010000001 | BadRangeLimit_1 | The RangeOTo11[1].LowLimit is greater than or equal to the RangeOTo11[1].HighLimit. |
| X482 | 010 | 010000010 | BadRangeLimit_2 | The RangeOTo11[2].LowLimit is greater than or equal to the Range0To11[2].HighLimit. |
| X483 | 010 | 010000011 | BadRangeLimit_3 | The RangeOTo11[3].LowLimit is greater than or equal to the Range0To11[3].HighLimit. |
| X484 | 010 | 010000100 | BadRangeLimit_4 | The RangeOTo11[4].LowLimit is greater than or equal to the RangeOTo11[4].HighLimit. |
| X485 | 010 | 010000101 | BadRangeLimit_5 | The RangeOTo11[5].LowLimit is greater than or equal to the Range0To11[5].HighLimit. |
| X486 | 010 | 010000110 | BadRangeLimit_6 | The RangeOTo11[6].LowLimit is greater than or equal to the Range0To11[6].HighLimit. |
| X487 | 010 | 010000111 | BadRangeLimit_7 | The RangeOTo11[7].LowLimit is greater than or equal to the RangeOTo11[7].HighLimit. |
| X488 | 010 | 010001000 | BadRangeLimit_8 | The RangeOTo11[8].LowLimit is greater than or equal to the RangeOTo11[8].HighLimit. |
| X489 | 010 | 010001001 | BadRangeLimit_9 | The RangeOTo11[9].LowLimit is greater than or equal to the Range0To11[9].HighLimit. |
| X48A | 010 | 010001010 | BadRangeLimit_10 | The Range0To11[10].LowLimit is greater than or equal to the RangeOTo11[10].HighLimit. |
| X48B | 010 | 010001011 | BadRangeLimit_11 | The RangeOTo11[11].LowLimit is greater than or equal to the RangeOTo11[11].HighLimit. |

## Table 5.6 Configuration Error Codes

| Hex | Module Error Code | Extended Error Information Code |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Equivalent ${ }^{(1)}$ | Binary | Binary | Error | Description |
| X490 | 010 | 010010000 | BadCtrAssignToRange_0 | This error occurs if you try to set RangeOT011[0].ToThisCounter to an invalid value (i.e. to a counter that is not available due to the number of counters selected). |
| X491 | 010 | 010010001 | BadCtrAssignToRange_1 | This error occurs if you try to set RangeOTo11[1]. ToThisCounter to an invalid value (i.e. to a counter that is not available due to the number of counters selected). |
| X492 | 010 | 010010010 | BadCtrAssignToRange_2 | This error occurs if you try to set RangeOTo11[2]. ToThisCounter to an invalid value (i.e. to a counter that is not available due to the number of counters selected). |
| X493 | 010 | 010010011 | BadCtrAssignToRange_3 | This error occurs if you try to set RangeOTo11[3].ToThisCounter to an invalid value (i.e. to a counter that is not available due to the number of counters selected). |

(1) X represents the "Don't Care" digit.

The BadModConfigUpdate error conditions are shown in the following table. They occur when you attempt to change a forbidden module configuration parameter while a counter or range is still enabled. To recover from this situation:

- correct the configuration problem
- reconfigure the module ${ }^{(1)}$

Table 5.7 "BadModConfigUpdate" Error Prohibited Configuration Settings - Do not set while counter or range is enabled.

| Configuration Parameter | Array Position |  | Prohibited from changing when indicated (¢) bits are set: |  |  |  |  |

## Contacting Rockwell Automation

If you need to contact Rockwell Automation for assistance, please have the following information available when you call:

- a clear statement of the problem, including a description of what the system is actually doing. Note the LED state; also note input and output image words for the module.
- a list of remedies you have already tried
- processor type and firmware number (See the label on the processor.)
- hardware types in the system, including all I/O modules
- fault code if the processor is faulted

Then contact your local Allen-Bradley distributor or Rockwell Automation Technical Support.

Technical Support contact information:

- phone - 440-646-5800
- internet - http://support.rockwellautomation.com

## Specifications

## General Specifications

| Specification | Value |
| :---: | :---: |
| Dimensions | 118 mm (height) $\times 87 \mathrm{~mm}$ (depth) $\times 35 \mathrm{~mm}$ (width), height including mounting tabs is 138 mm 4.65 in. (height) $\times 3.43$ in (depth) $\times 1.38$ in (width), height including mounting tabs is 5.43 in. |
| Approximate Shipping Weight (with carton) | $309 \mathrm{~g}(0.681 \mathrm{lbs}$. |
| Bus Current Draw (max.) | 425 mA at 5 V dc 0 mA at 24 V dc |
| Heat Dissipation | 6.21 Total Watts (The Watts per point, plus the minimum Watts, with all points energized.) |
| Storage Temperature | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}\left(-40^{\circ} \mathrm{F}\right.$ to $\left.+185^{\circ} \mathrm{F}\right)$ |
| Operating Temperature | $0^{\circ} \mathrm{C}$ to $+60^{\circ} \mathrm{C}$ ( $32^{\circ} \mathrm{F}$ to $+140^{\circ} \mathrm{F}$ ) |
| Operating Humidity | $5 \%$ to 95\% non-condensing |
| Operating Altitude | 2000 meters (6561 feet) |
| Vibration | Operating: 10 to $500 \mathrm{~Hz}, 5 \mathrm{G}, 0.030$ in. peak-to-peak Relay Operation: $\mathrm{ZG}^{(1)}$ |
| Shock | Operating: $30 \mathrm{G}, 11 \mathrm{~ms}$ panel mounted ( $20 \mathrm{G}, 11 \mathrm{~ms}$ DIN rail mounted) Non-Operating: 40G panel mounted (30G DIN rail mounted) |
| System Power Supply Distance Rating | 4 (The module may not be more than 4 modules away from a system power supply.) |
| Recommended Cable | individually shielded, twisted-pair cable (or the type recommended by the encoder or sensor manufacturer) |
| Agency Certification | - C-UL certified (under CSA C22.2 No. 142) <br> - UL 508 listed <br> - CE compliant for all applicable directives |
| Hazardous Environment Class | Class I, Division 2, Hazardous Location, Groups A, B, C, D (UL 1604, C-UL under CSA C22.2 No. 213) |
| Radiated and Conducted Emissions | EN50081-2 Class A |
| Vendor I.D. Code | 1 |
| Product Type Code | 109 |
| Product Code | 19 |
| Electrical/EMC: | The module has passed testing at the following levels: |
| ESD Immunity (IEC61000-4-2) | - 4 kV contact, 8 kV air, 4 kV indirect |
| Radiated Immunity (IEC61000-4-3) | - $10 \mathrm{~V} / \mathrm{m}, 80$ to $1000 \mathrm{MHz}, 80 \%$ amplitude modulation, +900 MHz keyed carrier |
| Fast Transient Burst (IEC61000-4-4) | - $2 \mathrm{kV}, 5 \mathrm{kHz}$ |
| Surge Immunity (IEC61000-4-5) | - 1 kV galvanic gun |
| Conducted Immunity (IEC61000-4-6) | - 10V, 0.15 to 80MHz ${ }^{(2)}$ |
| (1) This rating applies for your system if a relay module such as the $1769-0 W 8$ is used. If no relays are used, use the "Operating" vibration specification. |  |

## Input Specifications

| Specification | Value |
| :--- | :--- |
| Input Voltage Range | $-30 \mathrm{to} 30 \mathrm{~V} \mathrm{dc}{ }^{(1)}$ |
| On-State Voltage (max.) | $30 \mathrm{~V} \mathrm{dc}{ }^{(1)}$ |
| On-State Voltage (min.) | 2.6 V dc |
| On-State Current (min.) | 6.8 mA |
| Off-State Voltage (max.) | 1.0 V dc |
| Off-State Current (max.) | 1.5 mA |
| Off-State Leakage Current (max.) | 1.5 mA |
| Input Current (max.) | 15 mA |
| Input Current (min.) | 6.8 mA |
| Input Impedance (nominal) | $1950 \Omega$ |
| Pulse Width (min.) | 250 nsec |
| Phase Separation (min.) | 131 nsec |
| Input Frequency (max.) | 1 MHz |
| Isolation (Inputs to the Bus and | Verified by one of the following dielectric tests: <br> Input to Input) <br> $\bullet$ |

(1) See Maximum Input Voltage - 24 V dc Operation temperature derating on page A-4.

## Output Specifications

| Specification | Value |
| :--- | :--- |
| Output Voltage Range | 5 to 30 V dc |
| (1) |  |

(1) See Maximum Output Voltage - 24V dc Operation temperature derating on page A-4.
(2) See Maximum Output Current per Point - 5 V dc Operation temperature derating on page $\mathrm{A}-5$ and Maximum Output Current per Point - 24V dc Operation temperature derating on page A-6.
(3) See Maximum Output Current per Module - 5 V dc Operation temperature derating on page A-5 and Maximum Output Current per Module - 24 V dc Operation temperature derating on page A-6.
(4) Maximum turn-on time applies to output voltage range of 5 to 7 V dc . For output voltages greater than 7 V dc , the maximum turn-on time is $200 \mu \mathrm{~s}$.

## Throughput and Timing

| Operation | Description | Timing |
| :--- | :--- | :---: |
| Input File Update Time | The delay between the time the module receives a pulse and when the <br> Compact bus count value is updated. | 1 ms (maximum) |
| Output Turn-on Time | The time it takes for the real output to reach 90\% output voltage after <br> commanded by the module, not including processor scan time. | $400 \mu \mathrm{~s}$ (maximum) |
| Output Turn-off Time | The time it takes for the real output to reach 10\% output voltage after <br> commanded by the module, not including the processor scan time. | $200 \mu \mathrm{~s}$ (maximum) |
| Rate Accuracy | The accuracy of the reported rate as compared to actual input rate in the <br> equation: reported rate/actual input rate. | Depends on frequency. <br> See graph below. |

## Rate Accuracy

The following graph shows rate error at various frequencies. Pointing out a few trends may assist you in reading the graph:

- Of the lines that rise at low frequencies, the leftmost is a 10 second update time $(\operatorname{Ctr} n$ CyclicRateUpdateTime $=10000)$.
- The rightmost of these lines is a 1 ms update time $(C \operatorname{tr} n$ CyclicRateUpdateTime $=1)$.
- The line that rises at high frequencies illustrates $\operatorname{Ctr}[n]$.PulseInterval.

Figure A. 1 Rate Errors Comparison

## Temperature Derating

## Maximum Input Voltage - 24V dc Operation

Voltage Derating Based on Temperature

| Temperature | Derated Voltage ${ }^{(\mathbf{1})}$ |
| :--- | :--- |
| $0^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}\left(-32^{\circ} \mathrm{F}\right.$ to $\left.104^{\circ} \mathrm{F}\right)$ | 30 V dc |
| $55^{\circ} \mathrm{C}\left(131^{\circ} \mathrm{F}\right)$ | 26.4 V dc |
| $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$ | 5 V dc |

(1) Input voltage derating between $55^{\circ} \mathrm{C}$ and $60^{\circ} \mathrm{C}$ is achieved by using a dropping resistor. For 24 V dc input voltage, use a $2.4 \mathrm{k} \Omega 1 / 2 \mathrm{Watt}$ resistor.
For input voltages greater than 24 V dc, use a $1 / 2$ Watt resistor with value: $125 \mathrm{x}\left(\mathrm{V}_{\text {in }}-5 \mathrm{~V}\right)$

## Maximum Output Voltage - 24V dc Operation

Voltage Derating Based on Temperature

| Temperature | Derated Voltage |
| :--- | :--- |
| $0^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}\left(-32^{\circ} \mathrm{F}\right.$ to $\left.104^{\circ} \mathrm{F}\right)$ | 30 V dc |
| $55^{\circ} \mathrm{C}$ to $60^{\circ} \mathrm{C}\left(131^{\circ} \mathrm{F}\right.$ to $\left.140^{\circ} \mathrm{F}\right)$ | 26.4 V dc |

## Maximum Output Current per Point - 5V dc Operation

Current Derating Based on Temperature

| Temperature | Derated Current |
| :--- | :--- |
| $0^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}\left(-32^{\circ} \mathrm{F}\right.$ to $\left.104^{\circ} \mathrm{F}\right)$ | 1 A |
| $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$ | 0.5 A |

## Maximum Output Current per Module - 5V dc Operation

Current Derating Based on Temperature

| Temperature | Derated Current |
| :--- | :--- |
| $0^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}\left(-32^{\circ} \mathrm{F}\right.$ to $\left.104^{\circ} \mathrm{F}\right)$ | 4 A |
| $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$ | 2.0 A |

## Maximum Output Current per Point - 24V dc Operation

Current Derating Based on Temperature

| Temperature | Derated Current |
| :--- | :--- |
| $0^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}\left(-32^{\circ} \mathrm{F}\right.$ to $\left.104^{\circ} \mathrm{F}\right)$ | 1 A |
| $55^{\circ} \mathrm{C}\left(131^{\circ} \mathrm{F}\right)$ | 0.5 A |
| $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$ | 0.25 A |

## Maximum Output Current per Module - 24V dc Operation

Current Derating Based on Temperature

| Temperature | Derated Current |
| :--- | :--- |
| $0^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}\left(-32^{\circ} \mathrm{F}\right.$ to $\left.104^{\circ} \mathrm{F}\right)$ | 4 A |
| $55^{\circ} \mathrm{C}\left(131^{\circ} \mathrm{F}\right)$ | 2 A |
| $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$ | 1 A |

## Dimensions

NOTE: All dimensions are in mm (inches). Hole spacing tolerance: $\pm 0.04 \mathrm{~mm}$ ( 0.016 in.).

# 1769-HSC Module with CompactLogix Controllers and an Allen-Bradley 845F Encoder 

## System Diagram

845F Encoder Wiring to the 1769-HSC

Table B. 1 Encoder Wiring

| 845F Encoder Wire | Color | 1769-HSC Terminal |
| :--- | :--- | :--- |
| Blue/Black Wire Pair | Blue | A0 + |
|  | Black | A0- |
| White/Black Wire Pair | White | B0 + |
|  | Black | B0- |
| Green/Black Wire Pair | Green | Z0+ |
|  | Black | ZO- |
|  | Red | +24 V dc Power Supply |
|  | Black | 24 V dc Common |

## Purpose

Scope

Adding a 1769-HSC High Speed Counter Module into a CompactLogix System

The purpose of this application example is to demonstrate how to wire an Allen-Bradley 845F optical incremental encoder to a $1769-\mathrm{HSC}$ module and ultimately monitor the Current Count value in the CompactLogix controller. We will also control 2 onboard outputs with 2 Ranges.

This example will cover the following steps:

1. Add the 1769 -HSC High Speed Counter module into a CompactLogix system using the Generic profile in RSLogix 5000 programming software.
2. Configure the $1769-$ HSC by entering configuration information into Configuration and Output tags created in RSLogix 5000 for the $1769-H S C$ module.
3. Monitor the Current Count value from the $1769-H S C$ module in the Input Tag created for the module.
4. Verify that module outputs 0 and 1 turn on when the Current Counts value is in the specified Ranges.

This example uses a 1769-L20 CompactLogix controller. The 1769-L30 controller will operate the same with respect to the $1769-H S C$ module.

1. Start the RSLogix 5000 programming software by double clicking its icon on your desktop. The following screen appears:

2. Click the "New" icon or the File pull-down menu and select New. In the box that appears, choose the correct controller type (1769-L20 CompactLogix 5320 controller for this example) and give your project a name. Then click OK and the following screen will appear:

3. The area on the left of this screen is called the Controller Organizer. To add I/O modules to your CompactLogix Project, right-click on the last parameter listed in the Controller Organizer, called "[0] CompactBus Local" and choose "New Module". The following screen will appear:

4. This screen displays all 1769 I/O modules that have a Thin Profile. Any module listed by its catalog number has such a profile. To add these modules to your CompactLogix system, click on the module, then click OK. The screen that appears allows you to name the module. All other parameters should be left at their defaults.
5. Click "Finish" and your module will be displayed below the " $[0]$ CompactBus Local" in slot 1 . The next I/O module you configure, by default, will be placed in slot 2 and so on. Configure the remaining I/O modules that are listed by name in the same manner.
6. The $1769-H S C$ module does not yet have a Thin Profile. This means that until this module appears in the I/O list by name, the "Generic 1769 Module" profile will be used to add the 1769-HSC module to your CompactLogix system. To add it to your system, click on the "Generic 1769 Module", then click OK and the following screen appears:

7. Fill in this Generic profile screen as follows:

| Name | Give your HSC module a name |
| :--- | :--- |
| Comm Format: | Data-INT |
| Input: | Assembly Instance $=101$, size $=35$ |
| Output: | Assembly Instance $=100$, size $=34$ |
| Configuration: | Assembly Instance $=102$, size $=118$ |
| Slot: | For this example, the HSC module is in slot 4 |

8. When you have entered the data into your Generic profile screen, click Finish. Your module will be added to your CompactLogix system and it will be displayed under the [0] CompactBus Local in the Controller Organizer.

# Configuring Your 1769-HSC Module 

When the $1769-$ HSC module is added to the CompactLogix project, Input, Output and Configuration tags are automatically created in the Controller Tags area.

1. Double click on Controller Tags. The following screen appears:

This screen displays all the tags created for all the I/O modules added to the system. Discrete I/O modules are not configurable at this time, but all other types of I/O modules must be configured. In this example, the $1769-$ IF 4 and the 1769 -HSC must be configured. Refer to your Compact I/O Analog Modules User Manual, publication 1769-UM002A-EN-P, for information on configuring the 1769 -IF 4 module.

The tags for $\mathrm{I} / \mathrm{O}$ modules are displayed in the following format, where $s$ is the slot number of the module:

| Tag | Description |
| :--- | :--- |
| Local:s:I | Input Image |
| Local:s:0 | Output Image |
| Local:s:C | Configuration Data |

Each of these tags has a plus sign to its left. Click on the plus sign to the left of any tag to open it. For the 1769 -HSC in slot 4 ,
click on the plus sign to the left of Local:4:C. A Reserved tag along with a Data tag are displayed. We need only be concerned with the Data tag. This is where we enter our configuration parameters for the $1769-\mathrm{HSC}$ module.
2. Expand Local:4:C.Data by clicking its plus sign. A configuration tag with a length of 198 words is displayed, but only the first 118 words are needed to configure the 1769 -HSC module. This 118 word configuration file is shown in Table 4.3. Word 0 in Table 4.3 corresponds to Local:4:C.Data[0], Word 1 corresponds to Local:4:C.Data[1] and so on.

It is best to configure the module in your offline project, then download the project to your CompactLogix controller. This is due to the fact that configuration files are downloaded to the I/O modules only at download, when an inhibited module is uninhibited and at power up. For this example, we will configure the module to operate in the following way:

| Configuration Parameter | Value |  |
| :---: | :---: | :---: |
| Number of Counters | 1 |  |
| Maximum Count Value | 1,200,000 |  |
| Minimum Count Value | 0 |  |
| Scalar | 1 |  |
| Update Time Value | 1 |  |
| Operational Mode | Quadrature encoder X 4 |  |
| Ring Counter Two Ranges | Range0 | Maximum Value: 600,000 |
|  |  | Minimum Value: 500,000 |
|  |  | Control Output 0 with this range |
|  |  | Range Type: Count Value |
|  |  | ToThisCounter: 0 |
|  | Range1 | Maximum Value: 1,200,000 |
|  |  | Minimum Value: 1,000,000 |
|  |  | Control Output 1 with this range |
|  |  | Range Type: Count Value |
|  |  | ToThisCounter: 0 |

Translate the configuration parameters above into the $1769-\mathrm{HSC}$ Configuration file, per Chapter 4 as follows:

| Configuration Tag | Hex Value | Description |
| :--- | :--- | :--- |
| Local:4:C.Data[0] | $16 \# 0000$ | Number of Counters =1 |
| Local:4:C.Data[1] | $16 \# 0000$ | No filters used in this example |
| Local:4:C.Data[2] | $16 \# 0000$ | PSO and PSR not used |
| Local:4:C.Data[3] | $16 \# 0000$ | PV0 not used |
| Local:4:C.Data[4] | $16 \# 0000$ | FSO and FSR not used |
| Local:4:C.Data[5] | $16 \# 0000$ | FVO not used |
| Local:4:C.Data[6] | $16 \# 4 F 80$ | Low word for CtroMaxCount |
| Local:4:C.Data[7] | $16 \# 0012$ | High word for CtrOMaxCount |
| Local:4:C.Data[8] | $16 \# 0000$ | Low word for CtroMinCount |
| Local:4:C.Data[9] | $16 \# 0000$ | High word for CtroMinCount |
| Local:4:C.Data[10] | $16 \# 0000$ | Low word for CtrOPreset |
| Local:4:C.Data[11] | $16 \# 0000$ | High word for CtrOPreset |
| Local:4:C.Data[12] | $16 \# 0000$ | Hysteresis not used |
| Local:4:C.Data[13] | $16 \# 0001$ | Not used, must set to 1 |
| Local:4:C.Data[14] | $16 \# 0001$ | Not used, valid range:1-32767 |
| Local:4:C.Data[15] | $16 \# 0006$ | Operational Mode: Ouadrature Encoder X4 |

Local:4:C.Data[16] through Local:4:C.Data[45] are for configuring counters 1 through 3. Since we are only using counter 0 in this example, these words should not be modified.

| Local:4:C.Data[46] | 16\#27C0 | Low word for RangeOHighLimit |
| :--- | :--- | :--- |
| Local:4:C.Data[47] | 16\#0009 | High word for RangeOHighLimit |
| Local:4:C.Data[48] | 16\#A120 | Low word for RangeOLowLimit |
| Local:4:C.Data[49] | $16 \# 0007$ | High word for RangeOLowLimit |
| Local:4:C.Data[50] | $16 \# 0001$ | Enable Output 0 for Range0 |
| Local:4:C.Data[51] | 16\#0000 | For Counter0, Counter Value |
| Local:4:C.Data[52] | 16\#4F80 | Low word for Range1HighLimit |
| Local:4:C.Data[53] | 16\#0012 | High word for Range1HighLimit |
| Local:4:C.Data[54] | 16\#4240 | Low word for Range1LowLimit |
| Local:4:C.Data[55] | 16\#000F | High word for Range1LowLimit |
| Local:4:C.Data[56] | 16\#0002 | Enable Output 1 for Range1 |
| Local:4:C.Data[57] | 16\#0000 | For Counter0, Counter Value |

Local:4:C.Data[58] through Local:4:C.Data[117] are for configuring ranges 2 through 11. Since we are only using ranges 0 and 1 in this example, these words should not be modified.

To enter double integer (DINT) values into 2 integer words, create a single DINT in your Controller Tags area and call it "Buffer" or something similar.
Enter any DINT value into this tag in the decimal radix, then change the radix to Hex. The DINT value will be displayed in two 4-digit hex values. The 4-digit hex value on the left is the high word and the one on the right is the low word.

Enter these values into the Configuration file or Output file where appropriate, in the hex radix. For example, the Ctr0MaxCount value is a DINT, represented in the Configuration tag for the $1769-H S C$ as 2 integer words, Local:4:C.Data[6] and Local:4:C.Data[7]. The value we want to enter here is $1,200,000$.

Enter this value into our DINT "Buffer" in decimal, then change to the hex radix. The result is $16 \# 0012 \_4 f 80$. The low word is $4 f 80$ hex and must be entered into tag Local:4:C.Data[6]. The high word is 0012 hex and must be entered into tag Local:4:C.Data[7]. Be sure to be in the hex radix before entering the hex values into these words.
3. To fully configure the 1769 -HSC module, we must now modify parameters in the Output tag as well. Click the plus sign to the left of Local:4:O, then click the plus sign to the left of Local:4:O.Data. 34 words of output image appear. Addresses for these 34 words are:

Local:4:0.Data[0] through Local:4:O.Data[33].

For this example, only the first 6 words are modified. Words Local:4:O.Data[6] through Local:4:O.Data[33] are for Counters 1 to 3 and Ranges 12 to 15 , which we are not using in this example.

The 6 Output words are as follows:

| Output Tag | Hex Value | Description |
| :--- | :--- | :--- |
| Local:4:O.Data[0] | $16 \# 0000$ |  |
| Local:4:O.Data[1] | $16 \# 0003$ | Enables Outputs 0 and 1 to be controlled <br> by Ranges 0 and 1. |
| Local:4:0.Data[2] | $16 \# 0003$ | Enable Ranges 0 and 1 |
| Local:4:0.Data[3] | $16 \# 0000$ | Not using Interrupts |
| Local:4:0.Data[4] | $16 \# 0000$ | Not using Interrupts |
| Local:4:0.Data[5] | $16 \# 0001$ | Enable Counter 0 |

Local:4:0.Data[6] through Local:4:0.Data[33] are not used by this example and should not be modified

## Monitoring the Current Count Value and Verifying Output Operation

The Current Count value for Counter0 is represented in the Input tag for the module with 2 integer words. Since this value is a DINT value, we must copy the two integer words to a DINT tag to properly view the Current Count of Counter0.

1. In the Controller tags screen, enter the edit mode and create a tag called "Ctr0CurrentCount". Be sure this tag is a DINT. Then enter the following ladder rung:

2. Notice that the Source of the COP instruction is the first of the two integer tags that represent the Current Count for Counter0. The destination of the COP instruction is the DINT you just created. The length of a COP instruction is always determined by the Destination tag, in this case a single DINT. If this were reversed and the Source of the COP were the DINT and the Destination was the address of the first of two integers, then the length would be 2 .
3. Save the program and download it to your controller. Place the controller into the RUN mode and spin the shaft on your 845F encoder. Tag "Ctr0CurrentCount" will display the current count data for Counter0 of the $1769-H S C$. This count, for this example is the number of pulses received from the encoder times 4 (we chose the operating mode to be "Quadrature Encoder X4").
4. Continue to spin the encoder shaft until the current count value is within the limits set for Range $0(500,000$ to 600,000 ). Output0 should turn on only when the current count value is equal to or within the Range 0 limits. Output1 should turn on only when the Current Counts value is equal to or within the Range 1 limits ( $1,000,000$ to $1,200,000$ ). These two outputs will be off for all other values of the Current Count for Counter0.

# 1769-HSC Module with MicroLogix 1500 Controllers and an Allen-Bradley 845F Encoder 

## System Diagram

845F Encoder Wiring to the 1769-HSC

Table C. 1 Encoder Wiring

| 845F Encoder Wire | Color | 1769-HSC Terminal |
| :--- | :--- | :--- |
| Blue/Black Wire Pair | Blue | A0 + |
|  | Black | A0- |
| White/Black Wire Pair | White | B0 + |
|  | Black | B0- |
| Green/Black Wire Pair | Green | Z0 + |
|  | Black | ZO- |
|  | Red | +24 V dc Power Supply |
|  | Black | 24 V dc Common |

## Purpose

Scope

The purpose of this application example is to demonstrate how to wire an Allen-Bradley 845F optical incremental encoder to a $1769-H S C$ module and ultimately monitor the Current Count value in the MicroLogix 1500 controller. We will also control 2 onboard outputs with 2 Ranges.

This example will cover the following steps:

1. Add the 1769 -HSC High Speed Counter module into a MicroLogix 1500 system using the RSLogix 500 programming software.
2. Configure the $1769-$ HSC by entering configuration information into I/O Configuration created in RSLogix 500 for the 1769-HSC module.
3. Monitor the Current Count value from the $1769-H S C$ module
4. Verify that module outputs 0 and 1 turn on when the Current Count value is within the specified Ranges.

This example uses a MicroLogix 1500 controller.

1. Start the RSLogix 500 programming software by double clicking its icon on your desktop or from the
Start>Programs>Rockwell Software $>$ RSLogix 500
English>RSLogix $\mathbf{5 0 0}$ English. The following screen appears:

2. Click the "New" icon or the File pull down menu and select New. The following screen appears:

3. Choose the correct controller type (Bul. 1764 MicroLogix 1500 LRP series C controller for this example) and give your processor a name. Then click OK and the following screen appears:

4. The area on the left of this screen is called the Project Menu. To add I/O modules to your MicroLogix 1500 Project, left click on the I/O Configuration parameter listed in the Project Menu. The following screen appears:

5. This screen displays all 1769 I/O modules supported by the MicroLogix 1500. To add the 1769 -HSC module to your MicroLogix 1500 system, double left click on the module or click, hold and drag the module to its desired slot. In this case we will use slot 1 .

Configuring Your 1769-HSC Module

Configuration of the module is done in your offline project, and then downloaded to the MicroLogix 1500 controller. This is due to the fact that configuration files are downloaded to the I/O modules only at download.

1. Click the Adv Config button to open the 1746 -HSC-module configuration file.
2. Then select the Counter Tab to display the counter configuration screen with all its default values.

3. For this example, configure the module to operate in the following way:

| Number of Counters : | 1 (default $=2$ ) |
| :--- | :--- |
| Maximum Count Value: | $1,200,000$ (default $=2147483647$ ) |
| Minimum Count Value: | 0 (default $=-2147483648$ ) |
| Preset: | 1 (default $=0$ ) |
| Update Time Value: | 1 (default $=10)$ |
| Operational Mode: | (Quadrature) Encoder X 4 |
|  | (default $=$ Pulse Internal Dir) |
| Count Behavior |  |
| On Configuration: | Retained (default $=$ Retained) |
| Hysteresis: | 0 (default $=0)$ |
| RPM Scale Factor | 1 (default $=0$ ) |
| Number Of Counters | 1 (default $=2)$ |
| Storage modes | All Unchecked (default $=$ all unchecked) |
| Acc behavior on |  |
| Over/Under flow | Ring Counter (default $=$ Ring counter) |
| A, B, Z Filters | None (default $=$ none) |

4. Select the Range Tab to display the counter range configuration screen with all its default values. This configuration will use two of the 12 ranges available for the ring counter.

5. Configure the module to operate with the following values:

| Range \#0: |  |
| :--- | :--- |
| Counter used: | Counter \#0 |
| Range Type: | Count Value |
| High limit | 600,000 |
| Low limit | 500,000 |
| Range Active | Within the limits |
| Output Mask | 0001 |
|  |  |
| Range \#1: | Counter \#0 |
| Counter used: | Count Value |
| Range Type: | $1,200,000$ |
| High limit | $1,000,000$ |
| Low limit | Within the limits |
| Range Active | 0002 |
| Output Mask |  |

6. In order to fully configure the $1769-H S C$ module, we must now modify parameters in the Output Data file as well. Click on the Output Data file on the left side under the Data files. 34 words of output image will appear. Addresses for these 34 words are Output word [0] through Output word [33].
7. For this example, only the first 6 words are modified. Output Word [6] through Output Word [33] are for Counters 1-3 and Ranges 12-15, which we are not using in this example.

The 6 Output words are as follows:

| Output Data File | Decimal Value | Description |
| :--- | :--- | :--- |
| Output Word [0] | 0 | Not used |
| Output Word [1] | 3 | Enables Outputs 0 and 1 to be <br> controlled by Ranges 0 and 1. |
| Output Word [2] | 3 | Enable Ranges 0 and 1 |
| Output Word [3] | 0 | Not using Interrupts |
| Output Word [4] | 0 | Not using Interrupts |
| Output Word [5] | 1 | Enable Counter 0 |

Output Word [6] through Output Word [33] are not used by this example and should not be modified.

Monitoring the Current Count and Verifying Output Operation

No program logic is needed for this example. Save the program and download it to your controller. Place the controller into the RUN mode and spin the shaft on your 845 F encoder. Input words 4 and 5 "Current Count" will display the current count data for Counter \#0 of the $1769-\mathrm{HSC}$. This count, for this example, is the number of pulses received from the encoder times 4 (we chose the operating mode to be "Quadrature Encoder X4").

Continue to spin the encoder shaft until the current count value is within the limits set for Range0 $(500,000$ to 600,000$)$. Output 0 should turn on only when the current count value is equal to or within the Range0 limits. Output1 should turn on only when the Current Count value is equal to or within the Range1 limits ( $1,000,000$ to $1,200,000$ ). These two outputs will be off for all other values of the Current Count for Counter 0 .

You could also use a CPW instruction to monitor 32-bit values via ladder logic.

## Programming Quick Reference

This appendix contains at-a-glance listings of the:

- Configuration Array
- Output Array
- Input Array

These sheets are also available electronically. They can be downloaded from www.theautomationbookstore.com.

Search for Item Number 1769-QR002A-EN-E. You can print out the PDF file for your reference.

The default value for the Configuration Array is all zeros except where noted.

[^0]:    Allen-Bradley, Compact, MicroLogix, CompactLogix, RSLogix and RSNetworx are trademarks of Rockwell Automation. Belden is a trademark of Belden, Inc.

[^1]:    (1) Low-pass filters block frequencies above the threshold frequency.

[^2]:    (1) If zero is outside the MinCount and MaxCount limits set in the Configuration Array, then the Preset value is loaded into CurrentCount instead of zero. This also causes the PresetWarning bit to be set, which, in turn, sets the GenError bit.

[^3]:    (1) For Range Type, $0=$ count range and $1=$ rate range.
    (2) Bits 0 through 3 are real outputs. Bits 4 through 15 are virtual outputs.

[^4]:    (1) The module continues to update the Input Array and count inputs in all modes. The operation of the outputs will vary according to mode and configuration and the capabilities of the controller or bus master.

[^5]:    (1) If zero is outside the MinCount and MaxCount limits set in the Configuration Array, then the Preset value is loaded into CurrentCount instead of zero. This also causes the PresetWarning bit to be set, which, in turn, sets the GenError bit.

[^6]:    (1) X represents the "Don't Care" digit.
    (2) See Table 5.1 on page 5-4 for recommendation based on LED operation.
