CHAPTER 9 Concept ncept Mapping The Cell Cycle

Complete the cycle map about the cell cycle. These terms may be used more than once: cell, cytoplasm, metaphase, nuclear membrane, nucleoli, poles.

CHAPTER 9 Section 1: Cellular Growth

In your textbook, read about cell size limitations.

List two alternative futures for cells when they reach their size limitations.

1.	
2.	

In your textbook, read about the cell cycle.

Draw the cell cycle in the space below. Include the following labels: cytokinesis, G₁, G₂, interphase, mitosis, S.

3.

Match the definition in Column A with the term in Column B.

	Column A		Column B
4.	stage in which the cell divides into two daughter cells with identical nuclei	A.	S phase
5	substage of interphase immediately after a cell divides	B.	cytokinesis
5.	substage of interphase in which the cell copies its DNA	C.	G_1
0	in preparation for cell division	D.	G ₂
7.	stage in which the cell's nuclear material divides and separates	E.	interphase
8.	main stage in which the cell grows, carries out normal functions, and duplicates its DNA	F.	mitosis
9.	substage in which the cell prepares for nuclear division and a protein that makes microtubles for cell division is synthesized		

Date

Study Guide

Section 2: Mitosis and Cytokinesis

In your textbook, read about the stages of mitosis.

CHAPTER 9

For each statement below, write true or false.

1.	The nuclear membrane disintegrates during prophase.
2.	Microtubules move chromatids to the poles of the cell during anaphase.
3.	Chromosomes reach the poles of the cell during metaphase.
4.	The cell's chromatin condenses into chromosomes during prophase.
5.	The nuclear envelope re-forms during anaphase.
6.	Chromosomes attach to spindle fibers and line up along the equator of the cell during metaphase.
7.	The nucleus reappears during prophase.
8.	Centrioles migrate to the poles of the cell during telophase.
9.	Chromatids are pulled apart during anaphase.
10.	The first stage of mitosis is telophase.
11.	The chromosomes decondense or unwind during telophase.
12.	The shortest stage of mitosis is metaphase.

Label the diagram of the stages of mitosis using lines 13–16. *Use these choices:*

Label the diagrams above using lines 17–20. Use these choices:

Study Guide, Section 2: Mitosis and Cytokinesis continued

In your textbook, read about cytokinesis.

Refer to the diagrams above. Respond to each statement.

21. Discuss the role of microfilaments in cytokinesis.

22. Summarize cell division in prokaryotes.

Draw the formation of two genetically identical cells in plants in the space below. Include the following labels: cell plate, identical daughter cells, new cell wall.

23.

Name		Date	Class
	CHAPIER 9		

Section 3: Cell Cycle Regulation

In your textbook, read about the abnormal cell cycle and cancer.

Study Guide

Complete the graphic organizer about the causes and prevention of cancer. These terms may be used more than once: carcinogens, cell cycle, cells, DNA damage, genetic changes, spindle fiber failure, the Sun's ultraviolet rays, tobacco.

Complete the table by checking the correct column for each description.

Description	Apoptosis	Stem Cells
9. After a sperm fertilizes an egg, the resulting mass of cells divides until there are about 100 to 150 cells.		
10. Some cells go through a programmed death.		
11. Embryonic cells shrivel and die, resulting in the formation of fingers and toes.		
12. Unspecialized cells are either embryonic or adult.		
13. This event occurs in cells that are damaged beyond repair.
