

Controllable reduced pressure zone backflow preventer, BA type

574 - 575 - 570 series

01022/20 EN

replaces 01022/15 GB

Function

The backflow preventer is a hydraulic protection device designed to prevent polluted water from flowing back into the mains system. This type of backflow may occur when the pressure in the distribution system changes and causes a reversal of the flow. The backflow preventer is installed between the main water system and the internal user circuit in domestic water distribution systems and creates a separation zone that prevents the water in the two circuits from coming into contact.

Product range

- 574 Series Controllable reduced pressure zone backflow preventer, BA type. Threaded version _____ DN sizes 15 (1/2"), DN 20 (3/4"), DN 25 (1"), DN 32 (1 1/4"), DN 40 (1 1/2"), DN 50 (2")
- 575 Series Controllable reduced pressure zone backflow preventer, BA type. Flanged version _____ DN sizes 50-DN 100
- 570 series Pre-assembled group with BA type backflow preventer, shut-off valves, strainer. Threaded version _____ DN sizes 15 (1/2"), DN 20 (3/4"), DN 25 (1"), DN 32 (1 1/4"), DN 40 (1 1/2"), DN 50 (2")
- 570 series Pre-assembled group with BA type backflow preventer, shut-off valves, strainer. Flanged version _____ DN sizes 50-DN 100

Backflow

Potable water from the mains system may suffer from hazardous pollution caused mainly by contaminated fluids from plumbing systems flowing back directly into the mains supply.

This phenomenon, termed "back flow", occurs when:

a) the pressure in the main water system is less than that in the downstream circuit (back siphoning). This situation may occur when a pipe is broken in the mains system or when consumer demand on the mains supply is very heavy.

b) the pressure in the downstream circuit rises (counter pressure) due, for example, to water being pumped from a well.

Risk assessment

Given the potential dangers of the phenomenon and the requirements of current legislation, a risk assessment of backflow pollution must be carried out on the basis of the type of system and the characteristics of the fluid that flows inside it. A suitable backflow prevention device must be selected on the basis of the assessment performed by the system designer and the mains supplier. The device must be located along the internal distribution system at the points at risk of backflow which would be hazardous to human health.

The protection can be provided by inserting a backflow preventer at critical points in the circuit at the inlet from the main supply or in the internal distribution system. This will prevent the backflow of polluted water in all systems for which direct connection to the mains or an internal supply is considered hazardous.

Installation in a building with multiple users

Installation in a fire fighting system

**Use of BA type backflow preventers
- reference to European standard
EN 1717 and EN 12729**

Proper use of the BA type backflow preventer is regulated by the European standards governing prevention of pollution caused by backflow.

The reference standard is *EN 1717: 2000 "Protection against pollution of potable water in hydraulic installations and general requirements of devices to prevent pollution by backflow"*.

In this standard, the water in the systems is classified according to the level of risk it represents for human health.

Category 1:

Water to be used for human consumption coming directly from a potable water distribution system.

Category 2:

Fluid presenting no human health hazard, as per 1, the quality of which can have undergone a change in taste, odour, colour or temperature.

Category 3:

Fluid representing some human health hazard due to the presence of one or more harmful substances.

Category 4:

Fluid presenting a human health hazard due to the presence of one or more "toxic" or "very toxic" substances or one or more radioactive, mutagenic or carcinogenic substances.

Category 5:

Fluid presenting a human health hazard due to the presence of microbiological or viral elements.

According to this classification, suitable backflow prevention devices must be fitted in water distribution plant systems.

BA type backflow preventers are used to protect against risk of contamination by water in categories up to 4.

For category 5 water, use a hydraulic separation tank.

The table opposite, titled "Protection matrix", associates the various types of system with the corresponding categories of fluid, and has been drawn up based on the indications provided in the European standard.

European standard EN 12729 - "*Devices to prevent pollution by backflow of potable water*". *Controllable backflow preventer with reduced pressure zone. Family B - Type A*" defines the functional, dimensional and mechanical features required by BA type controllable reduced pressure zone backflow preventers.

Operating principle

The controllable reduced pressure zone backflow preventer is composed of: a body with an inspection cover, an upstream check valve (1), a downstream check valve (2), a discharge device (3).

The two check valves mark off three different zones, each of which at a different pressure: an upstream or inlet zone (A); an intermediate zone, also known as the reduced pressure zone (B); a downstream or outlet zone (C). Each of these is equipped with a test port connection for pressure measurement. A discharge device (3) is located in the lower part of the intermediate zone.

The obturator of the discharge device is connected via the valve stem (4) to the diaphragm (5).

This mobile unit is pushed upwards by the counter-spring (6). The diaphragm (5) marks the limit of the operation chamber (D), which is connected to the upstream zone by the channel (7).

Correct flow conditions

Under normal flow conditions, both check valves are open, while the pressure in the intermediate chamber (B) is always lower than the inlet pressure by at least 140 mbar due to the pressure drop caused by the check valve (1).

In the operation chamber (D), however, the pressure is the same as in the inlet zone.

In this situation, the mobile unit consisting of the diaphragm (5), the valve stem (4) and the valve obturator (3) is pushed down by the thrust created by the difference in pressure acting on the diaphragm which is greater than that of the spring (6) acting in the opposite direction. The drain valve is therefore held in the closed position.

No flow conditions

The check valves (1) and (2) are now closed.

Since the pressure in the upstream zone, and therefore also in the operation chamber (D), is still at least 140 mbar higher than the pressure in the intermediate chamber (B), the drain valve remains closed.

Upstream pressure loss

Both check valves close as the pressure upstream drops. The drain valve (3) opens at the moment in which the difference in pressure Δp , existing between the upstream and intermediate zones, decreases to reach a value just over 140 mbar.

Under these conditions the action exerted by the pressure difference Δp on the diaphragm (5) becomes weaker than that exerted by the counter-spring (6) and the drain valve (3) opens as a result. Discharge then occurs until the body of the backflow preventer is empty.

When the situation returns to normal (pressure upstream greater than pressure downstream), the drain valve closes and the backflow preventer is again ready to operate.

Downstream counter pressure

If the pressure in the downstream zone increases until it is greater than the upstream pressure, the check valve (2) closes and therefore prevents water already delivered to the user from returning back into the mains system.

If the seal of the check valve (2) is slightly defective or in general terms there is any other type of fault in the backflow preventer, the device always interrupts (disconnects) the connection between the mains system and the user system.

The backflow preventer has been designed with all construction details required for a properly functioning positive action device; the best possible safety conditions are therefore ensured under all conditions.

Construction details

Discharge tundish

In compliance with standard EN 1717, backflow from the connection pipe must be prevented during water discharge from the backflow preventer, and discharge must occur without any water spraying outside. Consequently the tundish connected to the drain pipe must be of an appropriate size with special slits to create the necessary air gap and it must be equipped with a suitable flow conveyor.

Corrosion-proof materials

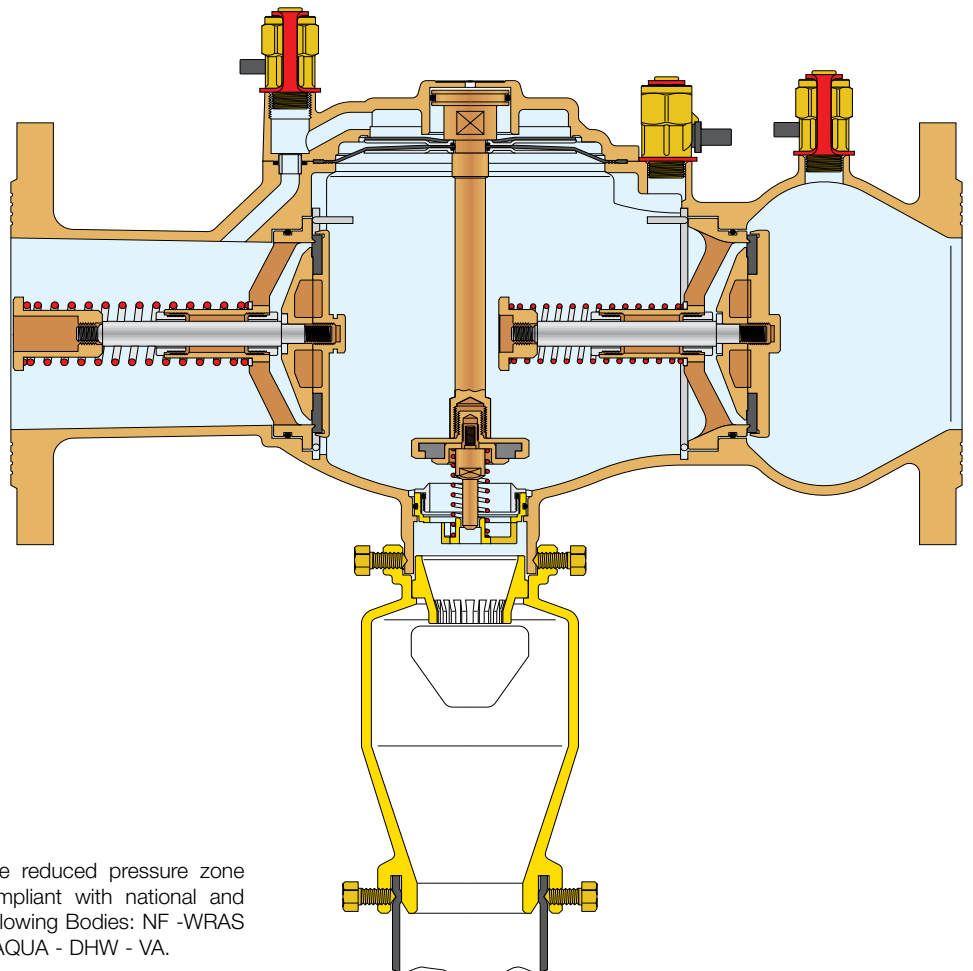

The materials used to manufacture the backflow preventers must be insensitive to corrosion caused by contact with potable water. They are therefore constructed using a dezincification resistant alloy **CR**, bronze and stainless steel to ensure high performance over time.

Elastomers complying with food regulations

The elastomers used for the hydraulic seals have been approved by the Certifying Bodies in accordance with the most recent provisions regarding compatibility for use with potable water.

Easy maintenance

The backflow preventer is a device that must undergo periodic checking of its operating status during its normal working life. When needed any disassembly and maintenance work is easier to perform thanks to the use of components easy to verify and replace without having to disassemble the valve body from the pipe.

Certification

574 and 575 series BA type controllable reduced pressure zone backflow preventers are certified as compliant with national and European product specifications by the following Bodies: NF -WRAS - KIWA - DVGW - SVGW - SITAC - BELGAQUA - DHW - VA.

Hydraulic characteristics

570 series

	Kv (m³/h)									
	1/2"	3/4"	1"	1 1/4"	1 1/2"	2"	DN 50	DN 65	DN 80	DN 100
Strainer	4.5	8	11	16	22	25	104	180	258	365
Shut-off valves	7	11	20	35	49	80	300	610	950	1,700

Installation

Backflow preventers must be installed by qualified personnel in accordance with current regulations. The backflow preventer must be installed downstream from a shut-off valve and from an inspectable strainer with drain; another shut-off valve must be fitted downstream from it. The unit must be installed in an accessible position, appropriately sized to avoid possible immersion due to accidental flooding (see diagram). The device must be installed horizontally. The discharge tundish must comply with standard EN 1717 and be connected to the sewage piping. Before installing the backflow preventer and strainer, flush the pipe with a high flow rate. For the protection of the main water system the backflow preventer must be installed after the water meter, whereas in order to protect the domestic use outlets of the internal network it should be installed at the limit of the areas where there may be contamination, for example: central heating, watering gardens, etc.

Inspection and maintenance

The backflow preventer unit is a health and safety device and therefore requires periodical inspection.

The first indication of poor operation, generally caused by foreign matter (sand or other debris) that is blocking the upstream check valve in an opened position, is revealed with a permanent leak from the drain. This leak is merely an early warning and definitely does not put the safety of the check valve at risk, but it requires removing and cleaning the unit and the strainer upstream. A quick method of inspection (taking less than 15 minutes) is described in the following table.

N.B. In the event of leakage from the drain, it is advisable to open one or more taps for a few minutes to create a strong circulation flow; this is often sufficient to expel any foreign matter and bring everything back to normal.

Test kit (code 575000)

The regular (annual) test kit for the backflow preventers includes:

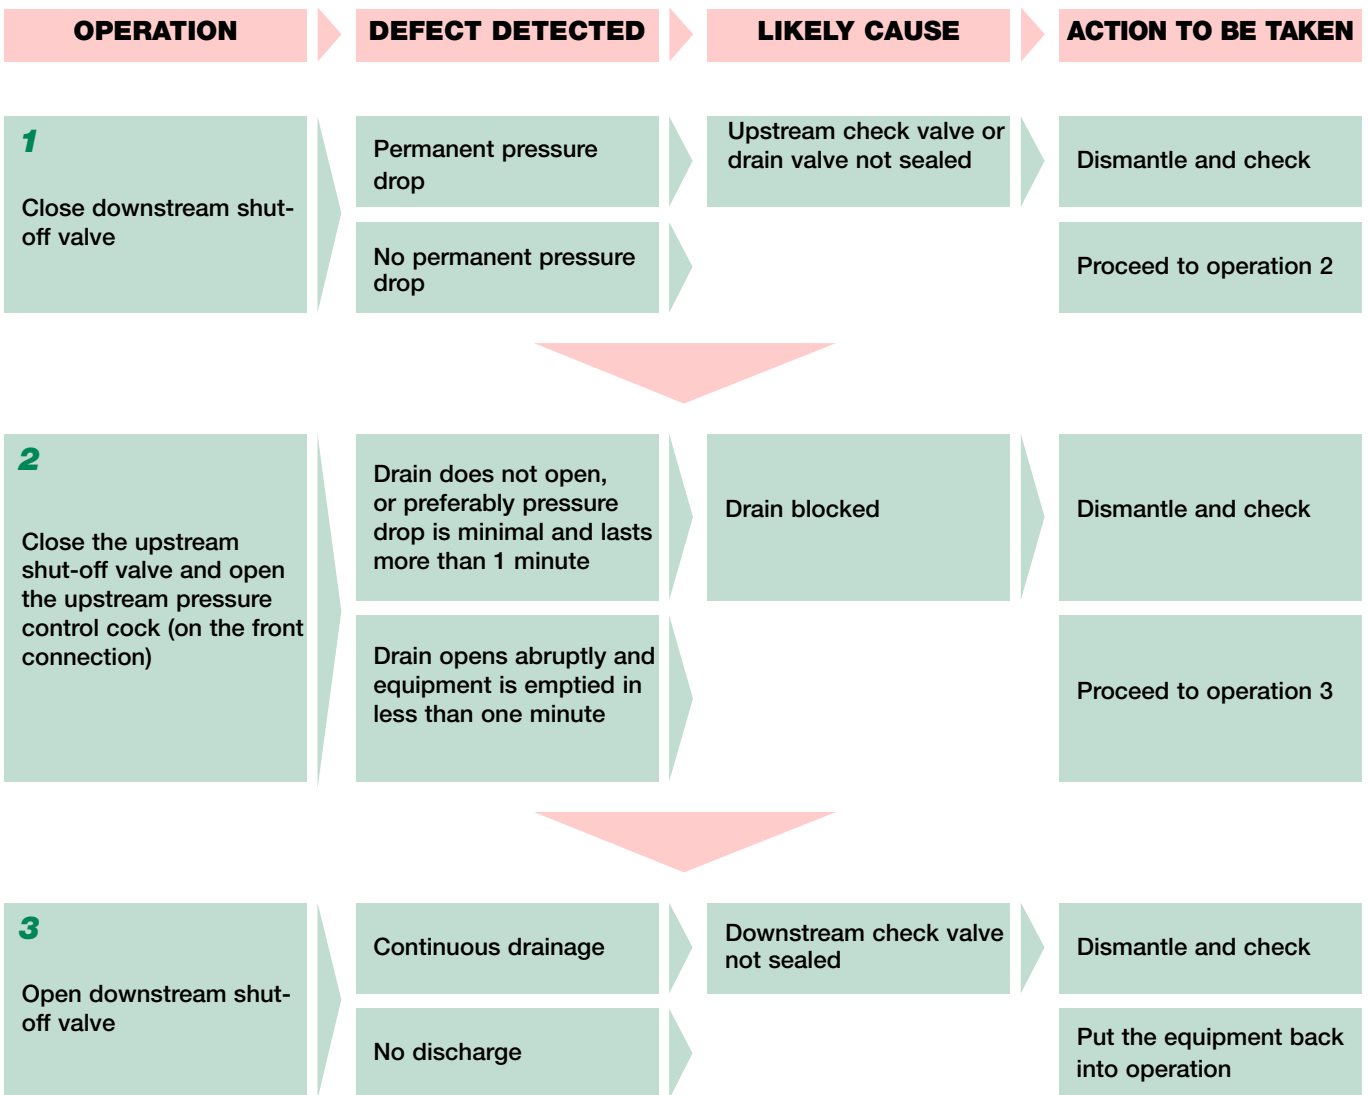

- Upstream pressure gauge
- Downstream pressure gauge
- Differential pressure gauge

The kit includes all the necessary hoses and connections, as well as the various accessories required for equipment disassembly.

This equipment is supplied in the specific tool kit case.

QUICK CHECKING METHOD

Check that the system is under pressure before each operation and watch the drain valve located on the lower part of the device (use a mirror if necessary).

N.B. : In normal operation the appliance must not present any permanent pressure drop. Otherwise dismantle and verify.

SPECIFICATION SUMMARY

Code 574004

Controllable reduced pressure zone backflow preventer. BA Type. Certified to EN standard 12729. DN size 15. Threaded 1/2" M connections (ISO 228-1) with union. Body, cover and relief seat in dezincification resistant alloy. Check valves in PSU-POM. Stainless steel springs. NBR seals. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar. Acoustic group I.

Code 574040/574050

Controllable reduced pressure zone backflow preventer. BA Type. DN size 15 (and DN 20). Threaded connections 1/2" (and 3/4") M (EN 10226-1) with union. Body, cover and relief seat in dezincification resistant alloy. Check valve stems and springs in stainless steel. NBR seals. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Positive action safety device compliant with standard EN 12729. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar. Acoustic group I.

Code 574006

Controllable reduced pressure zone backflow preventer. BA Type. DN size 25. Threaded 1" M connections (EN 10226-1) with union. Body, cover and relief seat in dezincification resistant alloy. Check valve stems and springs in stainless steel. NBR seals. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Positive action safety device compliant with standard EN 12729. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar. Acoustic group I.

Code 574600/574700

Controllable reduced pressure zone backflow preventer. BA Type. DN size 25 (and DN 32). Threaded 1" (and 1 1/4") M connections (EN 10226-1) with union. Dezincification resistant alloy body and cover. Check valve stems, relief seat and springs in stainless steel. NBR seals. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Positive action safety device compliant with standard EN 12729. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar. Acoustic group I.

Code 574800/574900

Controllable reduced pressure zone backflow preventer. BA Type. DN size 40 (and DN 50). Threaded 1 1/2" (and 2") M connections (EN 10226-1) with union. Brass body and cover. Check valve stems, relief seat and springs in stainless steel. NBR seals. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Positive action safety device compliant with standard EN 12729. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar.

575 series

Controllable reduced pressure zone backflow preventer. BA Type. Flanged connections DN 50 (DN 50 - DN 100), PN 16 can be coupled with counterflanges EN 1092-1. Brass body and cover. Check valve stems, relief seat and springs in stainless steel. NBR seals. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Positive action safety device compliant with standard EN 12729. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar.

570 series

Pre-assembled group with backflow preventer. Threaded 1/2" (from 1/2" to 2") F connections. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Consisting of:

- Controllable reduced pressure zone backflow preventer. BA Type. M threaded connections with union. Dezincification resistant alloy body. Check valve stems, relief seat and springs in stainless steel. Relief seat in dezincification resistant alloy for sizes 1/2", 3/4" and 1" (code 574006). NBR seals. Positive action safety device compliant with standard EN 12729. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar. Acoustic group I (1"-1 1/4").
- Y-strainer. Bronze body. Stainless steel mesh. Seal in Saital K. Mesh size 0,8 mm.
- Upstream and downstream ball shut-off valves. Brass body.

570 series

Pre-assembled group with backflow preventer. Flanged connections DN 50 (from DN 50 to DN 100) PN 16 can be coupled with counterflanges EN 1092-1. Maximum working temperature 65 °C. Maximum working pressure 10 bar. Consisting of:

- Controllable reduced pressure zone backflow preventer. BA Type. Certified to EN standard 12729. Brass body and cover. Check valve stems, relief seat and springs in stainless steel. NBR seals. Positive action safety device compliant with standard EN 12729. Complete with upstream, intermediate and downstream pressure test ports and discharge tundish with pipe fixing collar.
- Y-strainer. Epoxy resin coated cast iron body. Stainless steel mesh, mesh size 0,7 mm (DN 50 and DN 65), 0,9 mm (DN 80 and DN 100). Complete with drain cock, connection 1/2" F.
- Upstream and downstream shut-off valves. Epoxy resin coated cast iron body. NBR control stem seals.

5750 series

Regular (annual) test kit for backflow preventers including:

Upstream pressure gauge 0-10 bar; Downstream pressure gauge 0-10 bar; Differential pressure gauge 0-1000 mbar; Pipes and connections for pressure test ports; Carry case.
