The Problem with The Simplest Drawing

 Applied Geometrics Inc. Copyright

The ASME Y14.5 Interpretation

 Applied Geometrics Inc. Copyright

Mil-Std. 8 1949
Established Rule #1

- Unless otherwise specified, the limits of size of an individual feature of size control the form of the feature as well as the size.

 Applied Geometrics Inc. Copyright

What can be controlled?

- Size
- Form
- Orientation
- Location

Applied Geometrics Inc. Copyright

Size Controls

- Features of size are usually controlled with nominal dimensions and size tolerances – plus or minus tolerancing.
- It is also possible, and even desirable in some instances, to control size using basic dimensions (for “nominal” size) and defining a profile tolerance zone for the tolerancing.

Applied Geometrics Inc. Copyright

Form Controls

- Flatness ----- ▭
- Straightness ----- —
- Cylindricity ----- 
- Circularity ----- ○

Form controls define the tolerances for the shape of features.

Applied Geometrics Inc. Copyright

Orientation Controls

- Perpendicularity ----- ⊥
- Angularity ----- ∠
- Parallelism ----- //

Orientation controls define the tolerances for the shape of features relative to datums.

Applied Geometrics Inc. Copyright

Orientation Controls

All orientation controls are essentially the same.
Perpendicularity is angularity at 90°
Parallelism is angularity at 0°

Note that each of these things COULD be controlled using Profile (but don't if you don't need to do so).

Applied Geometrics Inc. Copyright

Location Controls

- Position ----- ⊕
- Concentricity ----- ⊙
- Symmetry ----- ≡

Location controls are relational controls.

Applied Geometrics Inc. Copyright

Location Controls

Concentricity and Symmetry are often misunderstood by people from Design to Manufacturing to Inspection. Take special care to understand these controls so that you actually measure the data set that the print requires.

The ASME Y14.5 standard states that these controls should be avoided and Position or Runout used instead.

Applied Geometrics Inc. Copyright

Combination Controls

- Total Runout ----- ↗
- Circular Runout ----- ↗
- Profile of a surface ----- ⤴
- Profile of a line ----- ⤴

Profile can be used as a combination control or just a form control.

Basic Dimension

➤ A numerical value used to describe the theoretically exact size, profile, orientation or location of a feature or datum target. Basic Dimensions establish the perfect orientation and location (and sometimes the size of) tolerance zones within which variations are allowed.

➤ Basic dimensions perfectly **orient** and **locate** (and occasionally size) tolerance zones.

Three BASIC Dimension Methods

BASIC dimensions shown boxed

Applied Geometrics Inc. Copyright

Three BASIC Dimension Methods

NOTE: UNTOLERANCED DIMENSIONS ARE BASIC

*When this method is used, a plus/minus general tolerance is not allowed.

Reading a Feature Control Frame

1. What is the size of the tolerance zone?
2. What is the shape of the tolerance zone?
3. What is the orientation of the tolerance zone?
4. What is the location of the tolerance zone?
5. What entity must lie within the tolerance zone?

This is our method for “reading” the information that was “written” by the designer. Consider it a checklist to help you understand what you are to measure as an inspector.

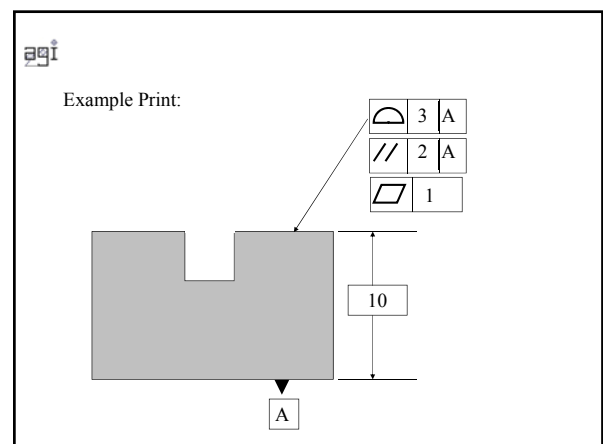

Applied Geometrics Inc. Copyright

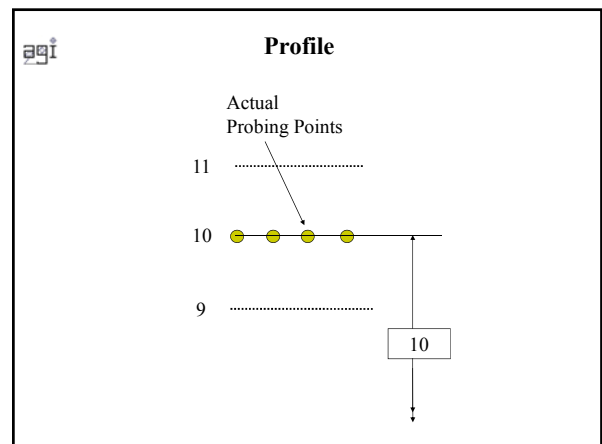

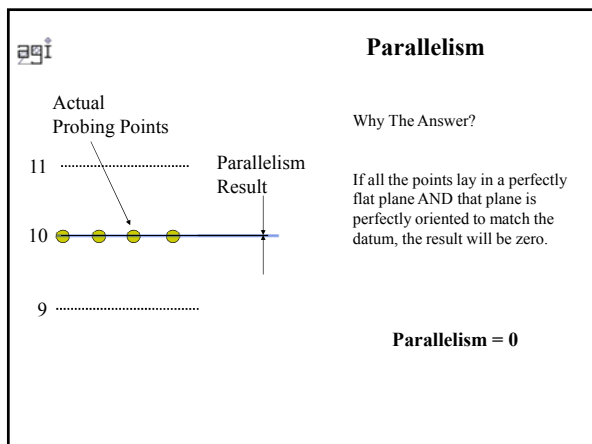

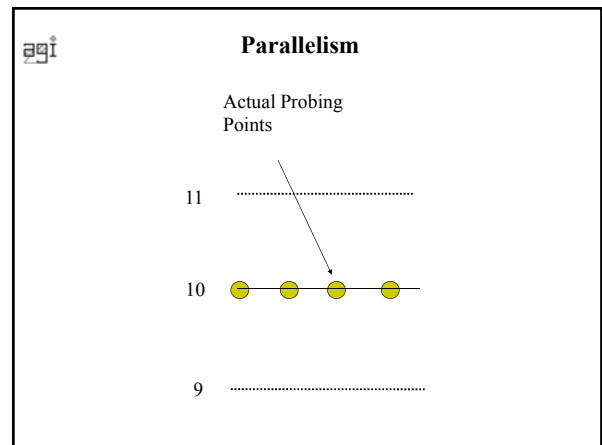

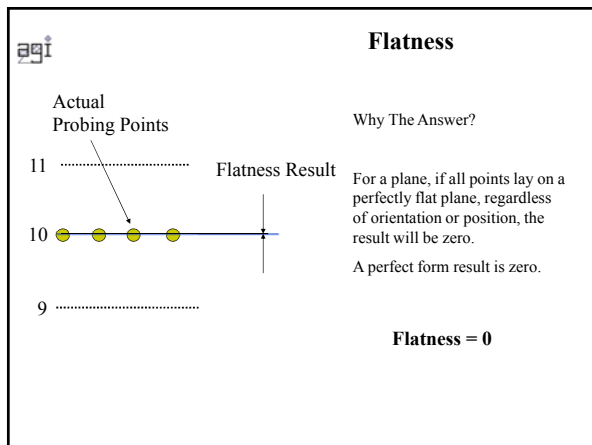

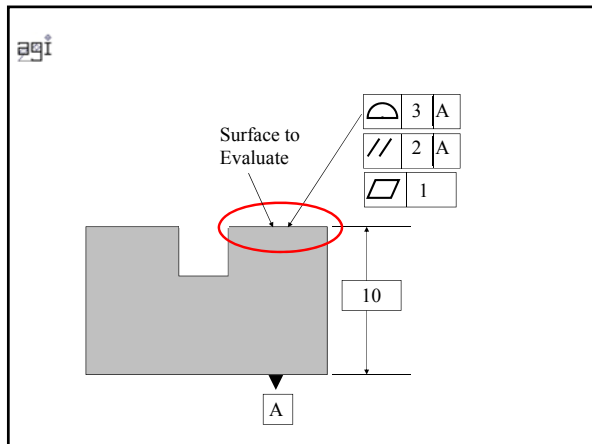

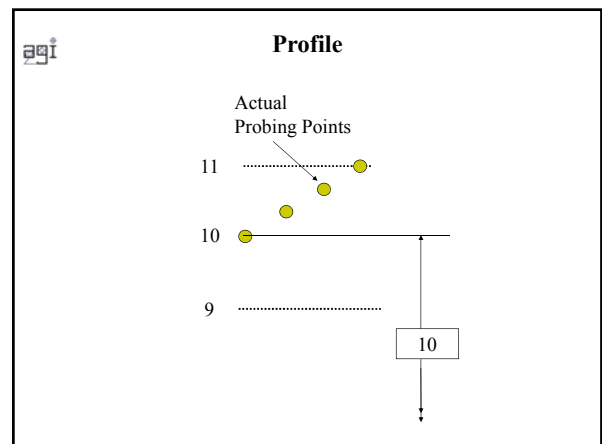

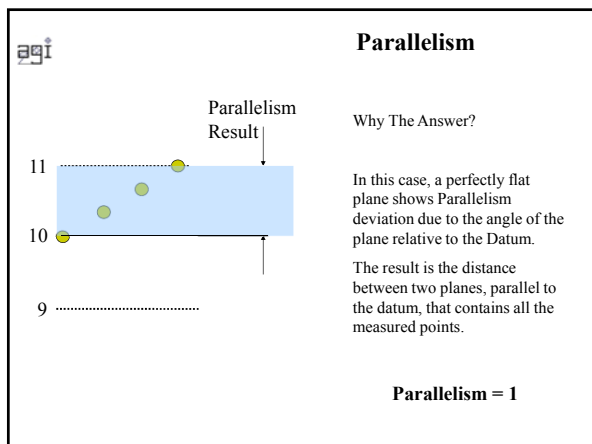

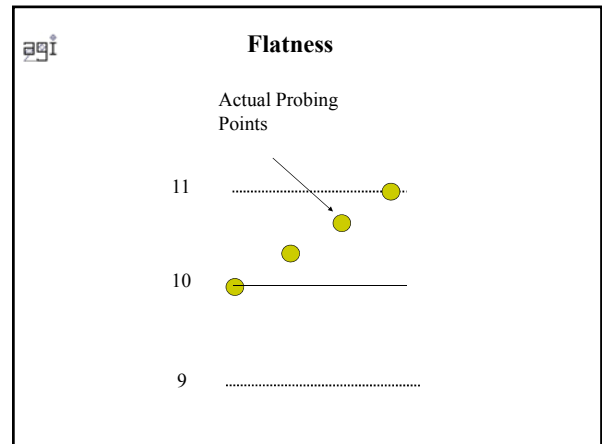

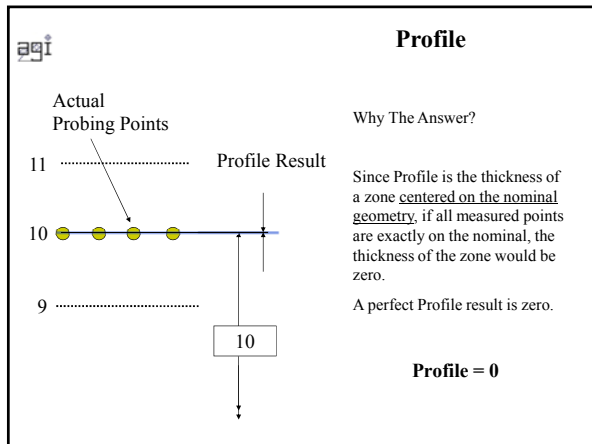

What must lie within?

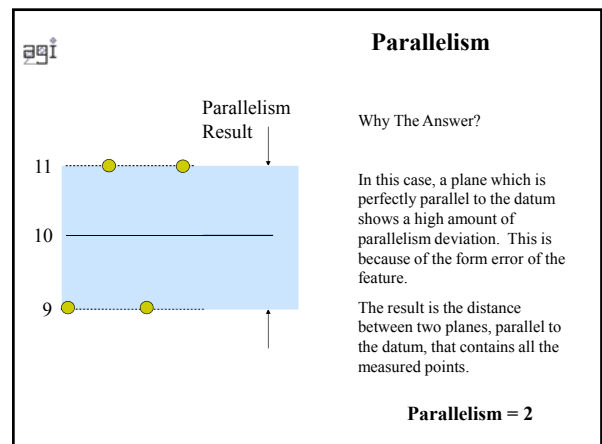

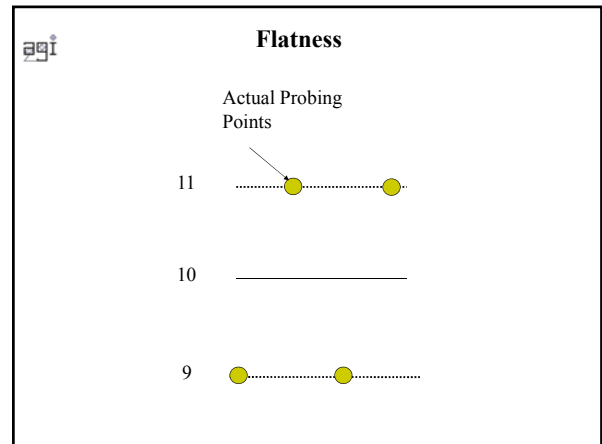

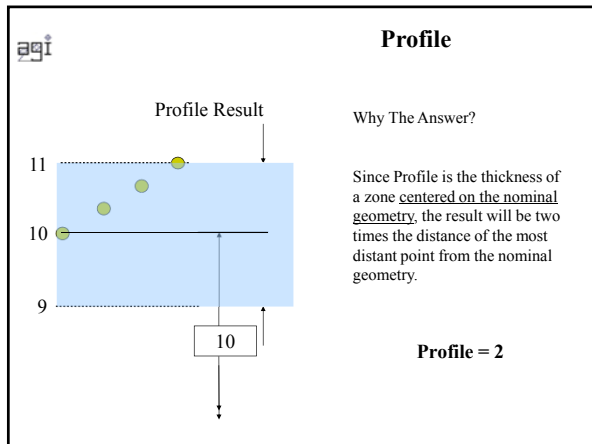

- The key concept to understand with any one of the GD&T symbols is that the definition of each symbol answers the question, “What entity must lie within the tolerance zone?”
 - What is the significance of the answer to this question; to the inspector – EVERYTHING!
 - The ability to successfully answer that question means that you, as the inspector, understand the data set you are seeking – i.e. what you need to measure
 - The answer will always be one of the following: a point; a collection of points (e.g. a surface or a derived median line or derived median plane); an axis; or a plane.

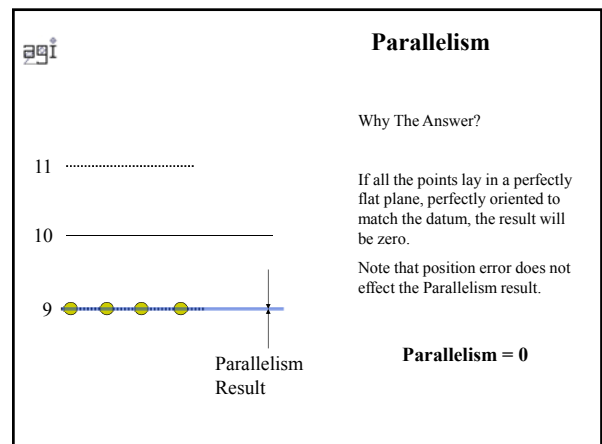

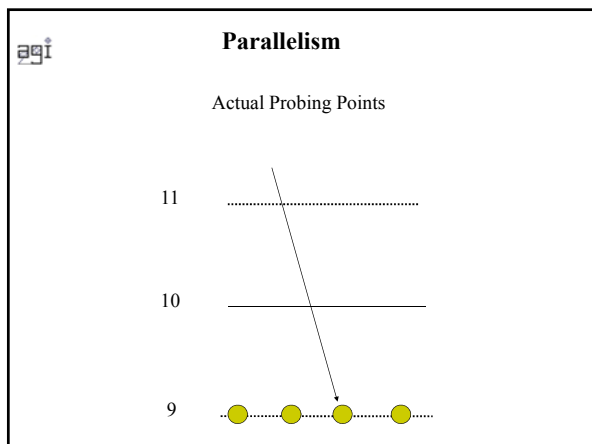

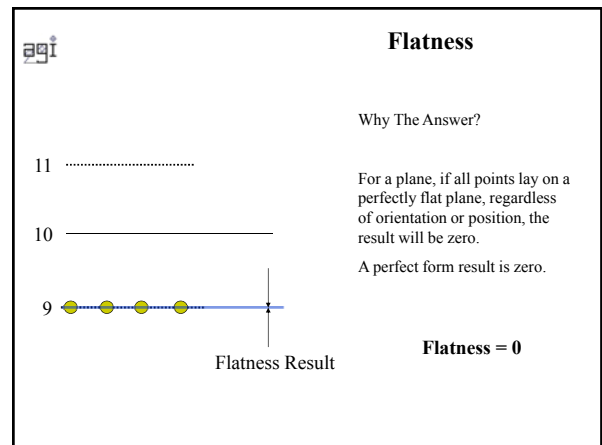

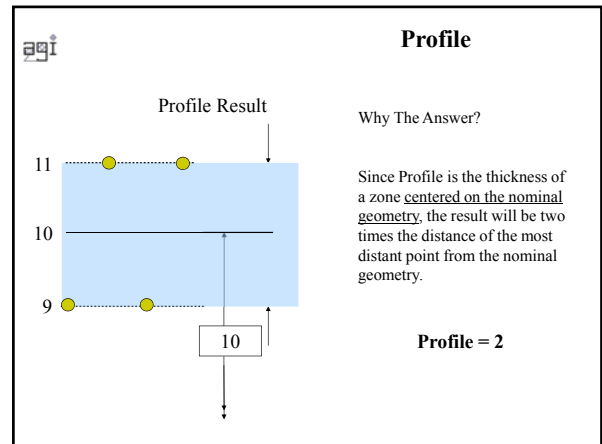

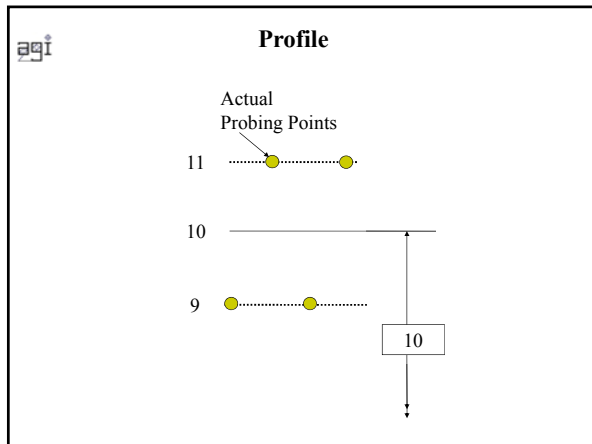

Applied Geometrics Inc. Copyright

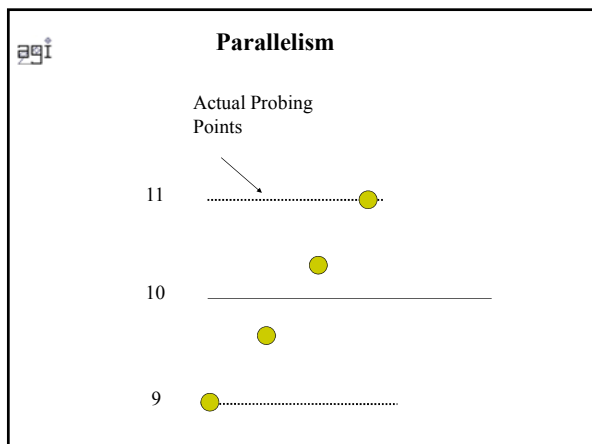

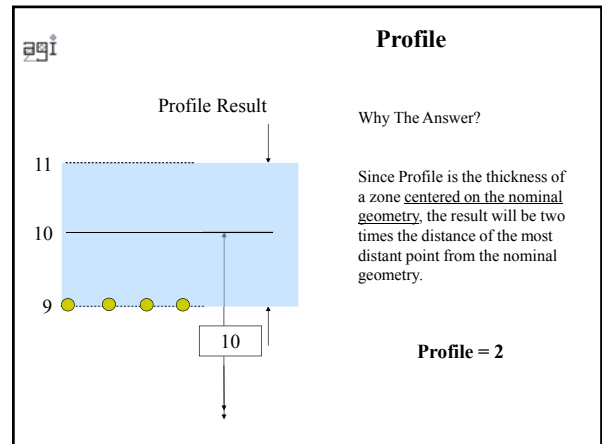

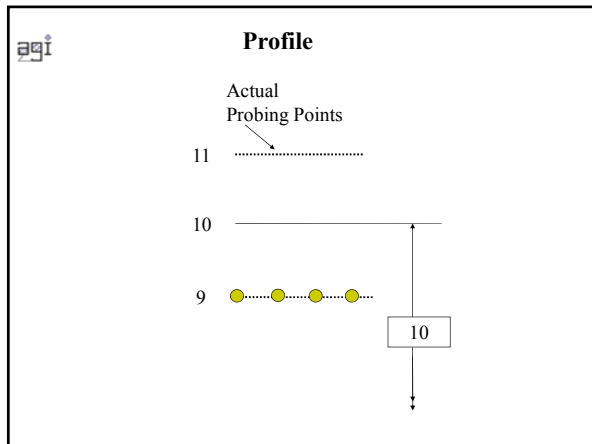

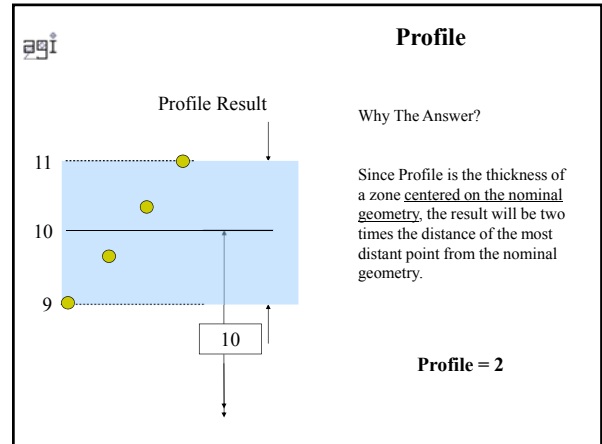

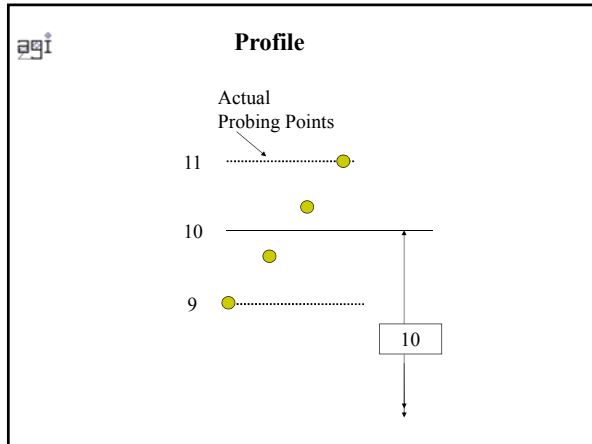

Profile:

- **Definition:** Profile tolerancing is a method used to specify a uniform amount of variation of a surface or line elements of a surface.
- **Tolerance Zone:** Profile tolerance specifies a tolerance zone confined by two equidistant profiles within which the entire surface must lie.

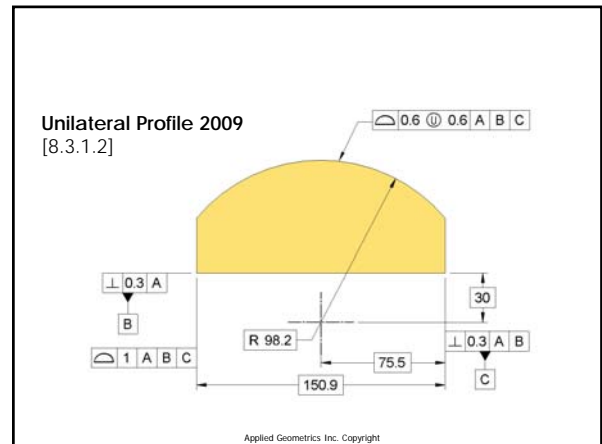

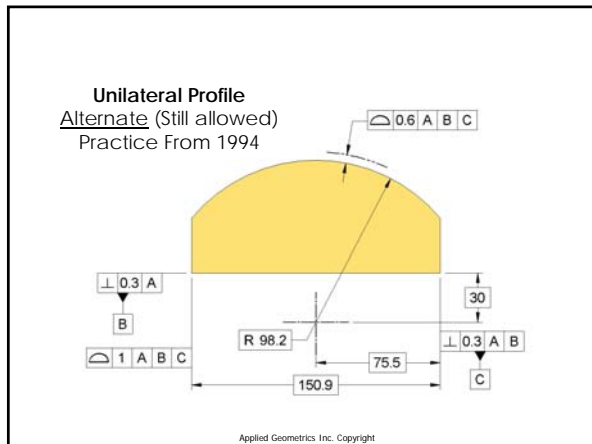

Applied Geometrics Inc. Copyright

Unequally & Unilateral Disposed Tolerance Zones

- For an unequally disposed profile tolerance zone a basic dimension is added to illustrate the tolerance zone distribution.
- For a unilateral disposed profile tolerance zone a single phantom curve is shown either inside or outside of the material.

Applied Geometrics Inc. Copyright

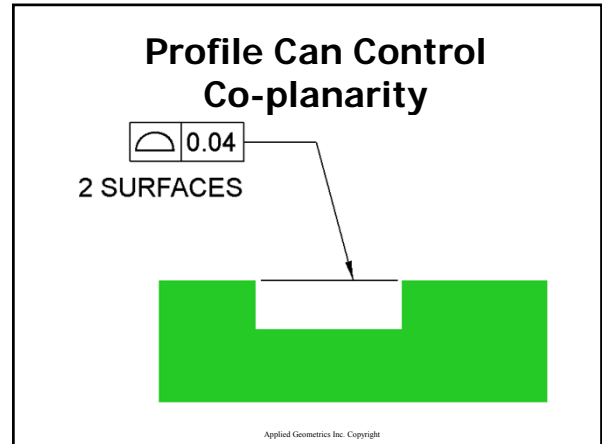

Profile Between Two Points

➤ A Symbol (# ↔ #) is used to indicate a tolerance applies to a limited segment of a surface between designated extremes.

- ### Technical Terminology – ASME
- Datum
 - Datum Feature
 - Theoretical Datum Feature Simulator
 - Formerly “True Geometric Counterpart”
 - Physical Datum Feature Simulator
 - Simulated Datum
- Applied Geometrics Inc. Copyright

- ### ■ Technical Terminology – ASME
- Datum - Theoretical, Perfect
 - Datum Feature - Real, Imperfect
 - Theoretical Datum Feature Simulator
 - Physical Datum Feature Simulator - Real
 - Best approximation of the TDFS
 - Simulated Datum - Real (Derived from real)
 - Best approximation of the Datum
- Applied Geometrics Inc. Copyright

- ### Datum – ASME
- A theoretically exact point, axis, plane or combination thereof derived from the theoretical datum feature simulator and the specified datum feature.
 - A datum is the origin from which the location or geometric characteristics of features of a part are established.
- Applied Geometrics Inc. Copyright

Datum Theory vs. Reality

Theoretical Datum Feature Simulators A|B|C

(Datums in This Example)

Formally "True Geometric Counterpart" in 1994

Physical Datum Feature Simulators A|B|C

Simulated Datum Planes

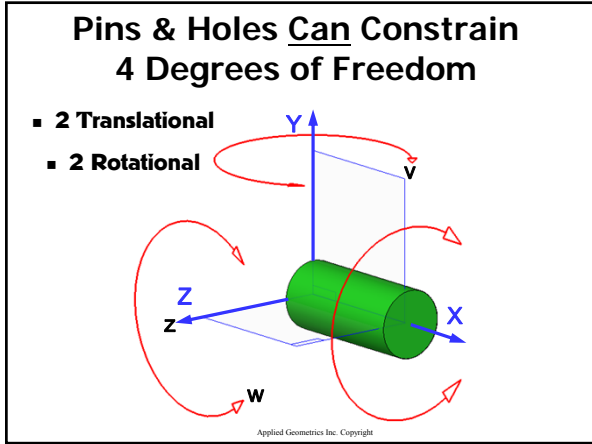

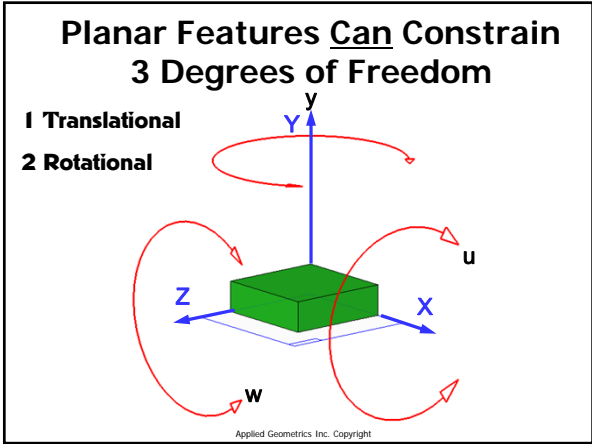

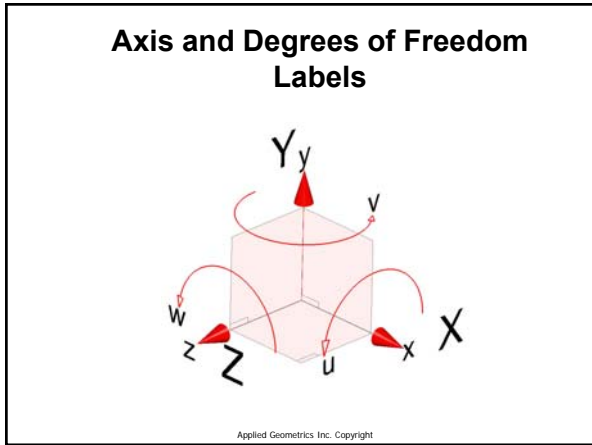

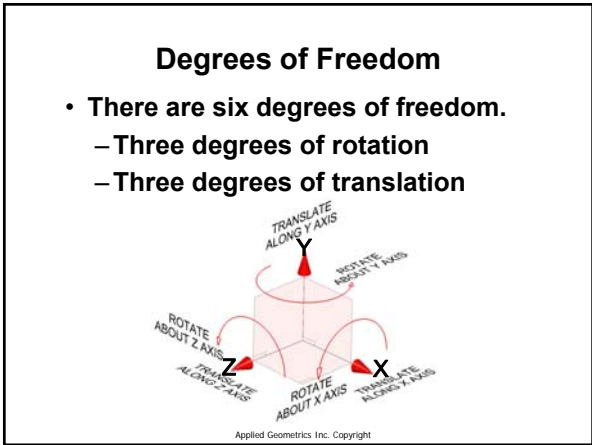

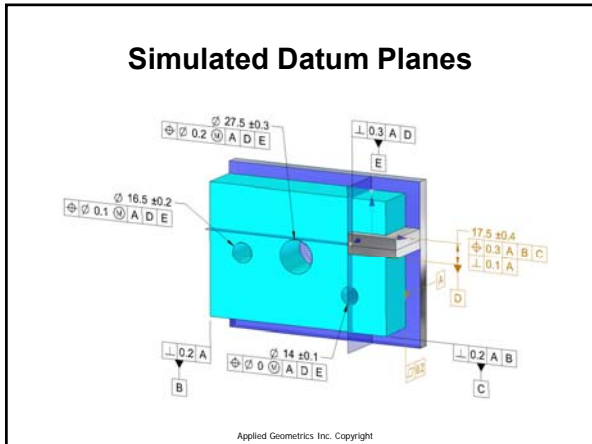

Theoretical Datum Feature Simulators A|D|E

Theoretical Datum Planes A|D|E

In Reality, Can/May/Must

- Physically Establishing a Datum Reference Frame
 - If a Datum Feature **CAN** Stop a Particular D.O.F.,
 - AND** that Datum Feature **MAY** Stop that D.O.F.,
 - Then that Datum Feature **MUST** Completely Stop that D.O.F.
 - (Unless Otherwise Specified – e.g. MMB)

Applied Geometrics Inc. Copyright

Maximum Material Condition

- Condition of a part feature wherein it contains the **maximum amount of material**.
- Symbol: \textcircled{M}
- Abbreviation: MMC
 - (MMB in the DRF)

Applied Geometrics Inc. Copyright

More vs. Mobility

MORE Positional Tolerance for **EACH CONSIDERED FEATURE** Based on the Actual Mating Size

MOBILITY for the Pattern of all Considered Features **AS A GROUP** Based on the Datum Feature's Actual Mating Size

Applied Geometrics Inc. Copyright

Considered Feature Bonus Tolerance Gives "MORE TOLERANCE" to Each Individual Considered Feature

Applied Geometrics Inc. Copyright

Considered Feature Bonus Tolerance Gives "MORE TOLERANCE" to Each Individual Considered Feature

Both Features MMC
AMS = $\phi 11.7$
Nominal Position

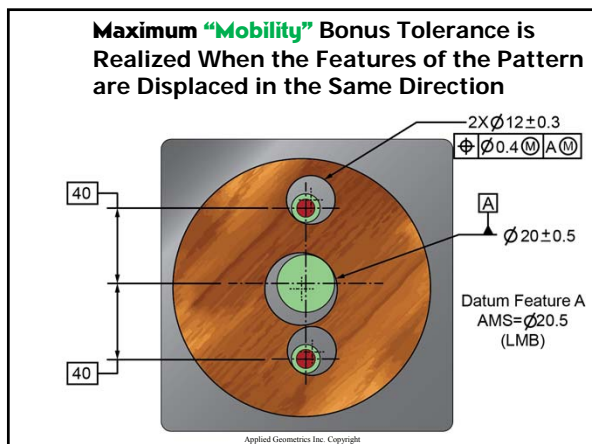

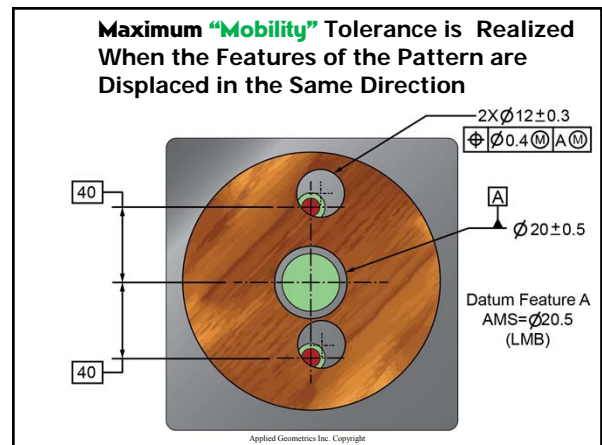

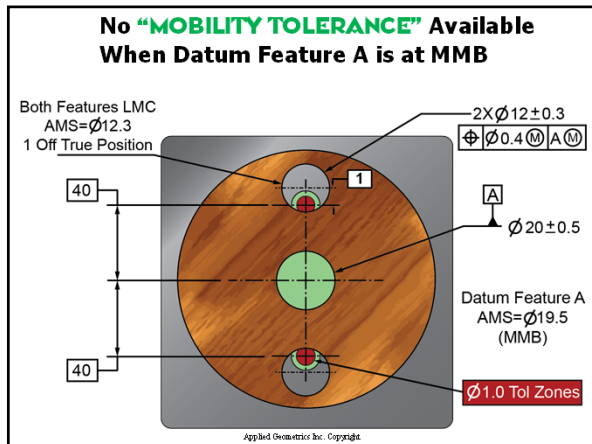

Applied Geometrics Inc. Copyright

Considered Feature Bonus Tolerance Gives "MORE TOLERANCE" to Each Individual Considered Feature

Both Features LMC
AMS = $\phi 12.3$
Worst Case Position

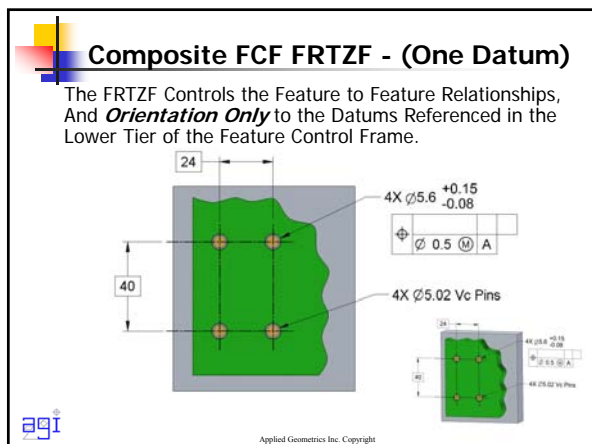

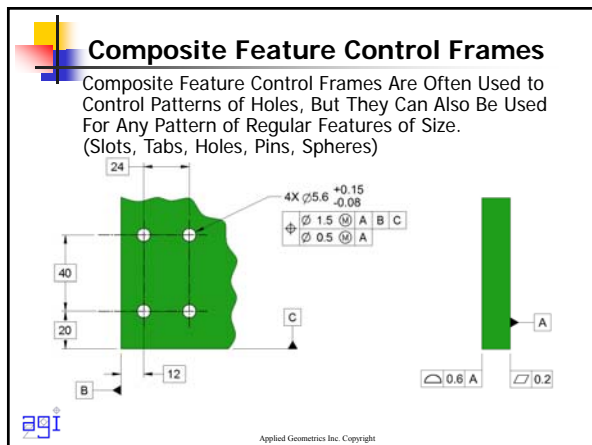

Applied Geometrics Inc. Copyright

- Characteristics of "Maximum Material Modifiers"**
- Allows **BONUS TOLERANCE**
 - Maximum allowable tolerances promotes **LOWEST MANUFACTURING COSTS!**
 - Allows **FUNCTIONAL GAUGING**
 - Allows **DATUM FEATURE SHIFT OR MOBILITY**
 - Common Usage: **100% INTERCHANGEABILITY**
 - Parts Assembled with Clearance Fits**
 - Must apply to a Regular or Irregular **FEATURE OF SIZE**
 - MMB may be applied to a Surface Feature in certain scenarios.
- Applied Geometrics Inc. Copyright

Composite FCF PLTZF

The PLTZF Controls the **Location of the Pattern** to the Datums Referenced in the Upper Tier of the Feature Control Frame.

Applied Geometrics Inc. Copyright

Composite FRTZF - (Two Datums)

The FRTZF Controls the Feature to Feature Relationships, And **Orientation Only** to the Datums Referenced in the Lower Tier of the Feature Control Frame.

Applied Geometrics Inc. Copyright

Multiple Single Segment FCF

Applied Geometrics Inc. Copyright

Multiple Single Segment FCF – PLTZF

The Top Tier Controls the **Location of the Pattern** to the Datums Referenced in the Upper Entry of the Feature Control Frame.

Applied Geometrics Inc. Copyright

Multiple Single Segment FCF – FRTZF

The Lower Tier Controls the Feature to Feature Relationships, And **Orientation & Location** to the Datums Referenced in the Lower Entry of the Feature Control Frame.
