## **Introduction**

The Delaware Population Consortium (DPC) is pleased to continue its program of providing 40-year population and employment projections for the State, the counties, and for selected municipalities. (The DPC was codified by the State in 2019 with its inclusion in Title 29 of the Delaware Code by SB7). These projections incorporate new information provided to or generated by DPC members and other agencies at the federal, state, and local level through 2019.

The 2020 version Delaware Population Projections Series is published in PDF format and as a series of EXCEL spreadsheets on the web site of the Delaware Population Consortium.<sup>1</sup> This site also contains supporting materials, information about the Consortium, and any special reports or studies published by the Consortium.

The 2018 projections reflect a minor decrease of a 1,000 in the state's total population over last year's projections at 2050. These data incorporate the actual births and deaths since 2010, the latest Bureau of Census estimates, and the latest migration data from the IRS. Internally, Kent County projections decreased by roughly 5,000 as of 2050, with an increase of 7,000 in Sussex County. New Castle County projections decreased by roughly 3,000 by 2050 over the 2017 projection.

In 1997, the DPC issued its first set of projections and estimates on special topics of interest to policy-makers, planners, and the general public related to the annual projections. Projections are provided for all municipalities in the state. More detailed projections are provided for Dover, Newark, and Wilmington. In addition, projections of populations residing in normally vacant seasonal units in the period June through August are offered for discussion. These projections do not include populations in hotels, motels, camp grounds, and RV sites or day trippers. These are all under study this year and will be reported when formalized.

---

## History

There were many generators of population projections prior to the founding of the Delaware Population Consortium in 1975. Every new state or local jurisdiction's capital project or proposed program seemed to generate a new set of projections. Few were comprehensive in content or geographic coverage. Most studies provided only statewide or, at best, countywide coverage. Other studies were localized to single school districts or sewer districts. These projections were often developed to deal with specific issues, and included projections of the elderly population, of school-age children, or simply the number of households.

These projections were rarely produced with standardized, accepted methodologies. There was no assurance that common and nationally recognized techniques for forecasting and projecting were used. Methodologies ranged from build-out scenarios based on existing zoning to straight-line projection of past trends. They were frequently arbitrarily adjusted for "local factors."

The resulting projections were inconsistent and conflicting. For example, there were six different governmental reports on comprehensive development planning and population change in New Castle County in the decade spanning the late 1950's and 1960's. Those studies included projections of 1980 County populations ranging from 512,900 persons to 672,000 persons versus the US Census Bureau's count of 398,115 persons living in New Castle County in 1980.

These six studies were generated by different interest groups and at different levels of government. Each used different starting and ending points. There was no system to evaluate the results over time, and no systematic approach to updating these projections. Many of these projections were issued by consultants whose involvement ended with the completion of a contract.

The Delaware Population Consortium was formed in 1975, with the goal of "providing a continuing forum for debate and discussion of matters relating to state and local population growth."<sup>2</sup> Parties interested in a common set of reliable projections were brought together under the sponsorship of the State Planning Office; they called themselves the Delaware Population Consortium (DPC). Although the State Planning Office provided sponsorship and technical support, direction was by consensus of the participants. The University of Delaware's Division of Urban Affairs prepared the initial report under contract with the State Planning Office and financed through a comprehensive planning grant from the US Department of Housing and Urban Development.

---

<sup>2</sup> *Delaware Population Growth, 1975: University of Delaware, Division of Urban Affairs*

The original core members of the DPC were from several departments of State government, the three counties, the Cities of Newark and Wilmington, WILMAPCO (the federally designated metropolitan planning organization for transportation), and the 208 Aerated Waste Treatment Management Program, with technical and methodological assistance provided by the University of Delaware. In time, the program and the DPC membership has grown to include statewide representation from private utilities, citizens' groups, non-profit organizations, community, and business interests.

The DPC effort is guided by a set of objectives. They were developed early on and have been virtually unchanged over the last 40 years. They include:

1. A ***single set of projections***, in the public domain and widely disseminated to all users of demographic data.
2. A ***long-term horizon of forty years*** starting with the most recent Decennial Census and continuing by single (for selected years) and five-year intervals.
3. A ***single methodology*** fine-tuned over time.
4. A ***regular annual release date*** during the month of October of each year, to ensure a predictable flow of information around which policy and decision-making can be built or monitored.
5. On-going ***review and update*** as required.
6. Projections for a ***consistent set of geographic areas*** including the State, each county, Wilmington, Dover and Newark.

The DPC is recognized in the Delaware Code Title 29 as of October 2019. The organization consists of the Committee-of-the-Whole, a technical or steering committee, administrative support staff, and technical support staff.

The Committee-of-the-Whole is composed of any group or persons who have an interest in demographic projections. As a result, the composition of the committee-of-the-whole is never exactly the same from year to year. The Committee-of-the-Whole usually gathers only for the annual meeting. Its role is to comment on and adopt a projection series recommended by the steering committee.

The steering committee is composed of a core committee of professional demographers, planners, analysts, economists, and other interested persons. Its role is to gather, monitor, and analyze relevant information about changes in births, deaths, migration and employment.

Volunteers are selected from the Committee-of-the-Whole to staff the project. The organization is governed by a set of by-laws<sup>3</sup>. A committee Chair, a Vice-Chair, and a Secretary are elected annually.

The steering committee includes participants from the University of Delaware's Center for Applied Demography & Survey Research, the Delaware Department of Education, the Delaware Health Statistics Center of the Delaware Department of Health and Social Services, the Delaware Office of State Planning Coordination, the Delaware State Housing Authority, and members from the county and city planning departments, WILMAPCO, The Dover/Kent MPO, and DELDOT.

The process used by DPC to produce an annual projection series is straightforward and is tied to releases of information throughout the calendar year. The previous year's projection series is evaluated against annual US Census estimates (FSCPE). The Technical Committee identifies any significant changes or newly recognized trends.

The steering committee deliberates and produces a draft report in tabular form. The draft and revisions are produced during the spring months. The draft is then distributed to the members of the Committee-of-the-Whole, based on the last annual meeting's attendance, as well as any interested party.

The product and methodology are reviewed at an annual meeting, usually held in October. At this time there is discussion of next year's product, which may include changes or refinements in the content of the projections, or how significant events might influence the base data and assumptions.

---

## Methodology

The projection process begins with the 2010 age-race-gender distribution adjusted to July 1, 2010 (obtained from the US Bureau of Census) for the jurisdiction being projected. This distribution is comprised of 102 separate age cohorts beginning with the 0 age group and ending with the 100-and-over age group. The 2010 counts are adjusted to the mid-year and 2010-2019 yearly FSCPE estimates are used to benchmark these projections. The projections also reflect the 2019 race-gender-origin distributions provided by the Census Bureau. The race component now utilizes new race categories, namely white alone non-Hispanic, black alone non-Hispanic, Hispanic, and other non-Hispanic. Appropriate survival rates, derived from Delaware mortality rates, are applied to each single-year, age-race-gender cohort. A ten-year survival rate is used to account for mortality. Each age group has its own unique survival rate. Applying the appropriate survival rate to the 0 age group, for example, yields the likely number of persons alive in 2010 who will survive to age 1 in 2011. This procedure is followed until all age groups have been survived with the exception of the birth cohort (age 0 in 2011).

The 0 age group in 2011 is formed from all of those persons expected to be born during the 2010-2011 period. This is estimated by applying an annual birth rate for females in each separate age group beginning with 10 and ending with 49. For example, if the single-year fertility rate for females age 30 is multiplied by the number of females in that age group in the base year, the result is the likely number of births for those females over the one-year projection period. This is done for all relevant age groups. These estimates are summed to produce the new birth cohort. The birth cohort is then survived to 2015. This procedure is applied for each subsequent time period from 2011 to 2050. The end result of this two-step process is a projection of population growth due solely to natural increase, which must be adjusted for net migration.

The conventional procedure to adjust the projections for net migration is to calculate a migration rate for each age-race-gender category for some past time period (such as 2005-2010), and to make assumptions about how those rates will change in the future. This procedure works well if the migration rates from the reference period accurately predict the future. If the nature of migration is changing, the result will be unsatisfactory. The rapid change in migration during the 1980s, for example, stands in stark contrast to that of the 1970s. To address that weakness, and to integrate employment projections with the population projections, another method is used to estimate migration (see *Migration* on page 7). These estimates are modified based on the FSCPE components of population change issued annually.

### ***Mortality.***

Mortality rates are based on age-by-sex-by-race/Hispanic origin, single-year survival rates calculated from data on the deaths of Delaware residents from 2008-2012 and the underlying population for each cohort in the 2008-2012 interval. Using actual deaths through 2019, survival rates are scaled proportionately so the estimated number of deaths agrees with the actual data. This scaling procedure was followed separately for the State, each of the counties, and the City of Wilmington, resulting in a slightly different set of mortality assumptions for each. Projections for the cities of Newark and Dover utilize the county-wide rates since the populations are considered too small to produce stable rates.

### ***Fertility.***

The assumptions for fertility rates were derived using births to Delaware residents from 2008-2012 and the underlying female population groups from the same period. Using these as a base, the rates were scaled proportionally to produce the estimated number of births in 2014-2019 using actual births through 2019. Following the same procedures as in mortality above, estimated births in 2016 were allowed to influence the 2019 projection. This scaling procedure was followed separately for the State, each of the counties, and the City of Wilmington, resulting in a slightly different set of fertility assumptions for each. Projections for the cities of Newark and Dover utilize the county-wide rates since the populations are too small to produce stable rates.

### ***Labor-force.***

Resident employment is calculated to balance the employment forecast with the population projections. This calculation requires a number of assumptions. The first is taken from the Bureau of Census CPS March 2018-2020, which allows computation of the probability of labor force participation for each age-sex/Hispanic origin cohort from 2020 through 2050. Applying these rates allows the derivation of a theoretical labor-force. An unemployment rate is then applied to that theoretical labor-force. That rate is the same as the one used in generating the employment forecasts. The result of this calculation is employment by place of residence. Resident jobs are derived from employment by place of residence by making adjustments for self-employment, agricultural jobs, and workers with multiple-jobs. BLS also provides labor force estimates from the Current Population Survey (CPS), Local Area Unemployment Statistics (LAUS), Current Employment Statistics (CES), and the Quarterly Census of Employment and Wages (QCEW). These are blended to update current employment and establish a starting point for forecasts.

Bureau of Labor Statistics' estimates and forecasts are used to establish an employment starting point. A single adjustment is required to generate an estimate for resident jobs from the employment forecasts. Net commuting (i.e., in-commuters less out-commuters) is used to adjust the employment forecast.

### ***Migration.***

Employment (i.e., number of jobs) is usually forecast using an economic model as opposed to a demographic model. It is assumed that there will be a sufficient number of persons to fill those jobs. If the projected population due to natural increase is too low, then net in-migration is required to fill the jobs. Alternatively, if the projected population is too high, net out-migration will occur. In either case, the migration rates from the reference year are modified proportionally to produce sufficient net migration to allow the employment forecasts and the population projection to balance. The final amount of net migration is an output of that calculation. If that estimate seems too high, adjustments must be made to the employment forecasts or to one of the other assumptions in the labor-force estimate.

### ***Adjustments.***

Projecting population is a risky business and is dependent on the quality of the assumptions. Those can change from year to year as better data becomes available. Thus, it is imperative that the projections be reviewed annually. This report is the result of the Consortium's ongoing monitoring and review process.

There are data that can be used to adjust the path of the projection without going through a major revision. First, the annual population estimates (not forecasts) provided by the Federal State Cooperative for Population Estimates (FSCPE) is useful for monitoring the total population. Second, actual birth and death statistics issued by National Center for Health Statistics (NCHS) and the Delaware Health Statistics Center are quite valuable. Third, school enrollment data, estimated migration from the Bureau of Census and the IRS, Medicare enrollment data from HCFA, and the data from the Census Bureau's Current Population Survey (CPS) and American Community Survey (ACS) can help guide structural changes in the age groups. The Census Bureau also annual provides single year estimates of the population of the state. Finally, data from the US Department of Labor tracks changes in employment growth. It is imperative that these indicators are tracked and that the projections are modified annually. These projections were carefully benchmarked to known data in 2019 (e.g. actual births, deaths, and estimated migration for 2010-2019).

### ***Seasonal populations.***

Seasonal populations are those residing in what are usually considered “vacant seasonal” units during the months of June through August. The principal assumptions are that these units will be occupied 80% of the time including all weekdays and weekends. In addition, the size of the group in residence during the period is assumed to be 3.3 persons. These factors were obtained from published studies of seasonal populations in Florida and Michigan.

To calculate the number of housing units, the number of full-time households for each time period 2015-2050 are taken from the latest DPC projections. The number of vacant units is estimated using the number of full-time households divided by the typical occupancy rate observed in the previous five-year periods. It is held constant over the entire projection period 2015-2050. The individual categories of vacancies share the total vacancies observed in 2015. Then the numbers of vacant seasonal residences calculated are expanded to population using the factors provided above. The American Community Survey provides annual estimates of vacancy status including seasonal use which are incorporated into the projections.

### ***Municipal populations.***

Two series were used provided. The first series is based on the compound annual growth rates of population using as a base the 2010 Decennial Census population for each municipality which then is applied over the period 2020-2050. A second series is based on the share of each city’s population of the respective county’s population observed 2010-2019 and then projected for the period 2020-2050. Annual population estimates for all Delaware municipalities are published annual and are used to bench mark the projections.

*Notes.*

All fertility, mortality, and migration assumptions have changed to better reflect conditions in 2019.

One other point needs clarification. In the 2010 Census, respondents were permitted to check up to six races. The projection process cannot cope with that differentiation since mortality, fertility, and migration rates would have to be calculated for very small groups. To avoid that problem, all multiple race individuals were reclassified to the Other race non-Hispanic category.

Finally, there are several categories on the summary page for the State and each county that require definition:

***Population Change*** - The net increase (decrease) in persons over the projected period;

***Births*** - The total number of births over the over the projected period;

***Deaths*** - The total number of deaths over the projected period;

***Net Migration*** - The total number of persons moving into the area less the number of persons leaving the area over the projected period;

***Household Change*** - The net increase (decrease) in households over the projected period, which is indicative of the number of housing units required;

***Jobs by Place of Work*** - The number of jobs held by civilians working in the area for the projected period excluding self-employed, private household workers, and those directly working on farms;

***Jobs by Residence*** - The number of jobs held by the employed persons for the projected period, including the jobs of persons who hold more than one job;

***Net Commuting*** - The number of persons coming into the area to work each day less the number of persons leaving the area to work each day during the projected period;
