

## DESCRIBING AND COMPARING DATA DISTRIBUTIONS TEACHER VERSION

## Subject Level:

High School Math
Grade Level:
9

Approx. Time Required:
50 minutes

## Learning Objectives:

- Students will be able to compare and contrast data distributions in terms of shape, center, and spread.
- Students will be able to describe key features of a histogram or box plot.

## Activity Description

Students will use data on the organization, spending, and populations of governments at different levels (city or town, county, and state) to compare and contrast the distributions of these variables in graphs, analyzing the shape, center, and spread of each.

## Suggested Grade Level:

 9
## Approximate Time Required:

50 minutes

## Learning Objectives:

- Students will be able to compare and contrast data distributions in terms of shape, center, and spread.
- Students will be able to describe key features of a histogram or box plot.

## Topics:

- Box plots
- Histograms

Skills Taught:

- Comparing and contrasting the shapes of data distributions

## Materials Required

- The student version of this activity, 11 pages
- Calculators
- Graph paper

A graphing calculator or other graphing technology and a teacher computer with a projector are optional.

## Activity Items

The following items are part of this activity. The items, their data sources, and any relevant instructions for viewing the source data online appear at the end of this teacher version.

- Item 1: Population, Land Area, and Other Data for the 50 U.S. States and District of Columbia
- Item 2: Income, Employment, and Other Demographic Data for the 50 U.S. States and District of Columbia

For more information to help you introduce your students to the U.S. Census Bureau, read
"Census Bureau 101 for Students." This information sheet can be printed and passed out to your students as well.

## Standards Addressed

See charts below. For more information, read "Overview of Education Standards and Guidelines Addressed in Statistics in Schools Activities."

## Common Core State Standards for Mathematics

| Standard | Domain | Cluster |
| :---: | :---: | :---: |
| CCSS.MATH.CONTENT.HSS-ID.A. 2 <br> Use statistics appropriate to the shape of the data distribution to compare center (median, mean) and spread (interquartile range, standard deviation) of two or more different data sets. | ID - Interpreting Categorical \& Quantitative Data | Summarize, represent, and interpret data on a single count or measurement variable. |
| CCSS.MATH.CONTENT.HSS-ID.A. 3 <br> Interpret differences in shape, center, and spread in the context of the data sets, accounting for possible effects of extreme data points (outliers). | ID - Interpreting Categorical \& Quantitative Data | Summarize, represent, and interpret data on a single count or measurement variable. |

Common Core State Standards for Mathematical Practice

## Standard

CCSS.MATH.PRACTICE.MP2. Reason abstractly and quantitatively.
Students will describe and compare distributions in terms of shape, center, and spread.
CCSS.MATH.PRACTICE.MP6. Attend to precision.
Students will communicate precisely when comparing and contrasting distributions with statistical analysis.

National Council of Teachers of Mathematics' Principles and Standards for School Mathematics

| Content Standard | Students should be able to: | Expectation for Grade Band |
| :--- | :--- | :--- |
| Data Analysis and <br> Probability | Formulate questions that can be <br> addressed with data and collect, <br> organize, and display relevant data <br> to answer them. | Understand histograms, parallel box plots, <br> and scatterplots and use them to display data. |
| Data Analysis and <br> Probability | Select and use appropriate <br> statistical methods to analyze data. | For univariate measurement data, be able to <br> display the distribution, describe its shape, <br> and select and calculate summary statistics. |

Guidelines for Assessment and Instruction in Statistics Education

| GAISE | Level A | Level B | Level C |
| :--- | :---: | :---: | :---: |
| Formulate Questions | $\times$ |  |  |
| Collect Data | $\times$ |  |  |
| Analyze Data | $\times$ |  |  |
| Interpret Results | $\times$ |  |  |

## Bloom's Taxonomy

Students will analyze histograms and box plots to describe and compare data distributions, deciding the appropriate summary statistics to report and investigating their own questions.

## Teacher Notes

## Before the Activity

Students must understand the following key terms:

- Frequency - the number of times a value occurs in a data set
- Interquartile range (IQR) - a measure of variability in a set of numerical data to indicate the difference between the first and third quartiles of the data set
- Mean - a measure of center in a set of numerical data, computed by adding the values in a list and then dividing by the number of values in the list
- Median - a measure of center in a set of numerical data, identified as the value appearing at the center of a sorted version of the list (or the mean of the two central values if the list contains an even number of values)
- First quartile $\left(\mathrm{Q}_{1}\right)$ - also known as lower quartile, the value that divides an ordered data set into the smallest 25 percent of the data and the largest 75 percent
- Third quartile $\left(\mathrm{Q}_{3}\right)$ - also known as upper quartile, the value that divides an ordered data set into the smallest 75 percent of the data and the largest 25 percent
- Box plot - a method of visually displaying a data set using the median, quartiles, and extremes of the data set
- Standard deviation - a measure of spread for a set of numerical data, calculated by taking the square root of the variance, that increases in value as the data in the set become more spread out
- Shape - the general form of a data distribution (e.g., bell-shaped, bimodal, irregular, uniform)

Students should have the following skills:

- Ability to calculate the mean, the median, the IQR, and the standard deviation
- Ability to construct a histogram
- Ability to describe the shape of a data distribution

Teachers should divide students into groups of two to four and ask them to examine Items 1 and $\mathbf{2}$. Teachers should have each group share what they know or think about the data to make predictions about trends, prompting them with questions like: Do all states operate in a similar way? Are the school district structures similar? Do you think residents in these states have similar lifestyles?

Teachers could review with students the Census Bureau one-pager mentioned earlier and describe the various data the Census Bureau collects, explaining that this activity involves analysis of some of these data.

## During the Activity

Teachers should remind students that when they describe the distribution of numerical data, they should always consider shape, center, and spread.

Teachers should have groups share their responses to questions 1 and 2 with the class, recording students' observations and questions on the board or chart paper, or typing and projecting them on a screen. Students may return to this list to choose their topic for question 10.

Before question 6, teachers could ask students to guess how histograms showing the number of counties in the four regions of the United States designated by the Census Bureau (Midwest, Northeast, South, and West) might compare with one another.

Teachers should decide whether students will use graph paper or graphing technology to create their histograms for question 10.

## After the Activity

Teachers could facilitate a discussion of the data chosen for question 10, asking students to share what they found interesting or surprising with their groups and then with the class.

As a review, teachers could have students summarize ways to describe a data distribution by its shape, center, and spread and ways to compare two or more distributions by examining their key features.

## Extension Idea

Teachers could have students create histograms or box plots according to Census Bureau region for the variable they select in question 10. Students could compare and contrast these regional distributions, noting anything interesting or surprising.

## Student Activity

Click here to download a printable version for students.

## Activity Items

The following items are part of this activity and appear at the end of this student version.

- Item 1: Population, Land Area, and Other Data for the 50 U.S. States and the District of Columbia
- Item 2: Income, Employment, and Other Demographic Data for the 50 U.S. States and the District of Columbia

## Student Learning Objectives

- I will be able to compare and contrast data distributions in terms of shape, center, and spread.
- I will be able to describe key features of a histogram or box plot.

Government entities in the United States exist in many forms and sizes. From the smallest town council to the U.S. Congress, these entities pass laws, oversee infrastructure, and provide for public education, among other things. In this activity, you will analyze state and county data and compare distributions by examining their shape, center, and spread.

1. Look at Item 1: Population, Land Area, and Other Data for the 50 U.S. States and the District of Columbia and Item 2: Income, Employment, and Other Demographic Data for the 50 U.S. States and the District of Columbia.
a. What is one thing about the data that catches your attention?

Student responses will vary but could include:

- Texas has the most counties of any state.
- A typical state has between $\mathbf{4 0}$ and $\mathbf{1 0 0}$ counties.
- Many states have fewer than 20 counties.
- A large percentage of people in the District of Columbia and Massachusetts have bachelor's degrees or higher.
b. What is one question you have about the data that you can investigate?

Student responses will vary but could include:

- Does the number of counties have anything to do with the area of a state?
- Does the number of counties have anything to do with the population of a state?
- Does the number of counties have anything to do with the state's region in the country?

2. Share your responses to question 1 with your group. Are they similar or different? How so?

Student answers will vary.
3. Recall that a data distribution's shape can be described as symmetric, skewed left, skewed right, uniform, or bimodal. Looking at the histogram below that shows the distribution of the number of counties in each state and the District of Columbia, how would you describe its shape?

Number of Counties in Each U.S. State and the District of Columbia

## Skewed right

4. Does the mean or the median better represent the center of this type of data distribution? Why?

The median, because this measure is more appropriate for data distributions that are skewed or have an outlier. For a data distribution is skewed or has an outlier, the mean can sometimes be too high or too low to represent the center because it accounts for extreme data points.
5. The range of this distribution's data set is 253 , the standard deviation is 46.8 , and the interquartile range (IQR) is 65 . Which value best represents the spread for this type of data distribution, and why?

The IQR, because it shows the length of the interval containing the middle half of the data, it relates to the median value we identified as the center, and it is not as affected as the other measures by the outlier in this data set.
6. The U.S. Census Bureau partitions the United States into four regions: Midwest, Northeast, South, and West. The histograms below show the number of counties in each state and the District of Columbia for each region. How do the distributions compare in terms of shape?

Number of Counties in Each U.S. State and the District of Columbia by Census Bureau Region

The distribution for the Midwest is skewed left, while those for the other regions are skewed right. The South appears to have an outlier state with between 240 and $\mathbf{2 6 0}$ counties.
7. Use the appropriate summary statistics from the table below to describe the distribution for each region in terms of its shape, center, and spread.

Summary Statistics for Each Census Bureau Region: Number of Counties in Each U.S. State and the District of Columbia

|  | Mean | Median | Standard <br> Deviation | IQR | Range |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Midwest | 87.9 | 90 | 17.5 | 23.0 | 62 |
| Northeast | 24.7 | 14 | 23.4 | 32.5 | 62 |
| South | 83.7 | 75 | 60.8 | 59.5 | 253 |
| West | 34.5 | 33 | 17.7 | 30.0 | 59 |

- Midwest: The distribution is skewed left slightly. The median is 90, and the IQR is 23 .
- Northeast: The distribution is skewed right. The median is 14 , and the IQR is 32.5.
- South: The distribution is skewed right but might be approximately symmetric with the outlier. The median is 75, and the IQR is 59.5.
- West: The distribution is skewed right slightly and approximately symmetric. The mean is 34.5, and the standard deviation is 17.7.

8. In what ways are these distributions similar, and in what ways are they different?

Student answers will vary but could include:

- The ranges for the Midwest, Northeast, and West distributions are similar, but their medians are very different: 90, 14, and 33 , respectively.
- In general, the number of counties in states in the Midwest is higher than in the Northeast or the West.
- The mean and median numbers of counties per state in the Midwest are higher than in the South, while the South has much greater measures of spread than does the Midwest.

9. The following box plots, constructed from the summary statistics mentioned earlier, can give you a different view of the same data.

Number of Counties in Each U.S. State and the District of Columbia by Census Bureau Region

a. What kind of information is easier to see in the box plots than in the histograms?

The box plots give a clearer picture of skewness and symmetry, and they also allow readers to estimate the values in the five-number summary for each region.
b. What kind of information is easier to see in the histograms than in the box plots?

The histograms show any gaps in the data set, such as in the one for the South. They can also show frequencies for specific intervals.
c. How does examining the box plots change your responses to question 8 ?

Student answers will vary but could include:

- The ranges for the Northeast and the West are about the same; but the distribution for the Northeast is clearly skewed right, while the one for the West is approximately symmetric.
- The distributions for the Midwest and the West are approximately symmetric, but the distribution for the Midwest is clustered more closely near the median because it has a smaller IQR than does the West.
- The data set for the South probably has an outlier at its maximum, because the distance from the third quartile to the maximum is large compared with the IQR.
d. If the only graphs you saw of the data were box plots, how would that influence your interpretations?

Looking only at the box plots would let you see symmetry and skewness but not any gaps in the data.
10. Select your own data set from Item 1 or Item 2 by choosing one variable to investigate.

Student answers below will vary depending on the data chosen but should be thorough and should display a depth of understanding.
a. Create a histogram of the data.
b. Calculate the summary statistics and record them in the table below.

| Variable | Mean | Median | Standard <br> Deviation | IQR | Range |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |
|  |  |  |  |  |  |

c. Describe the distribution in terms of shape, center, and spread.
d. Compare and contrast the distribution of your variable with the distribution of the number of counties by state and the District of Columbia.

## Item 1: Population, Land Area, and Other Data for the 50 U.S. States and the District of Columbia

| State | Number of Counties | County <br> Subdivisions | Population | Land Area in Square Miles | Population Density per Square Mile | Number of Unified School Districts | Region |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Alabama | 67 | 390 | 4,779,736 | 50,645.33 | 94.4 | 134 | South |
| Alaska | 29 | 37 | 710,231 | 570,640.95 | 1.2 | 53 | West |
| Arizona | 15 | 80 | 6,392,017 | 113,594.08 | 56.3 | 99 | West |
| Arkansas | 75 | 1,271 | 2,915,918 | 52,035.48 | 56.0 | 251 | South |

## Item 2: Income, Employment, and Other Demographic Data for the 50 U.S. States and the District of Columbia (Continued)

Some of the data in the table use 5-year estimates. The values are based on sample data that are pooled and weighted to an average of 5 years of estimates and may exhibit differences from the official estimates of the population produced by the Population Estimates Program (PEP). For more information about PEP, go to www.census.gov/programs-surveys/popest.html.
