## ABSTRACT

This bulletin contains information, culled from the March 1985 Current Population Survey (CPS) and the Survey of Income and Program Participation (SIPP), on the employment problems faced by American workers in 1984 and the impact of these problems on the economic status of their families and households. The following employment problems are covered: (1) unemployment; (2) involuntary part-time employment; and (3) low earnings among year-round full-time vorkers. Among the findings were the following: (I) over 21.5 million persons experienced some unemployment during 1984; (2) slightly more than 14.4 million persons had to work part-time for at least part of the year either because their hours were reduced or because no full-time work was available to them; (3) about 4.5 million workers with year-round full-time work had total earnings below the minimum-wage equivalent of $\$ 6,700$; (4) 33.7 million persons experienced one or more of the above three employment problems, with 6.8 million having encountered two or more; (5) the total number of persons with employment problems in 1984 was 2.1 million less than the number in 1983; and (6) 25.8 million persons experienced employment problems in an average 4-month span over the first half of 1984. Trends in employment problems since 1984 are identified. Statistics for persons with these problems are linked with data on family and household income. Data are presented on 25 tables. Appendices provide supplementary data, explanatory notes, and comparisons of SIPP and CPS data. (BJV)

September 1986
Bulletin 2270

## Preface

This bulletin contains information on the employment problems faced by American workers in 1984 and the impact of these problems on the economic status of their families and households. The bullesin is based largely on data from the March 1985 Current Por slation Survey (CPS) which relate to the year 1984. Three employment problems are covered: Unemployment; involuntary part-time employment; and low earnings among year-round full-time workers. Statistics for persons with these problems are linked with data on family and household income. The poverty status is then determined using the Federal Government's official poverty lines. In addition, the analysis is extended to cover trends since 1979 and multiple employment problems of workers during 1984. In the final section, additional data on income and participation in government
assistance programs are used to supplement the analysis of employment problems. These data are from the Survey of Income and Program Participation (SIPP) conducted by the Bureau of the Census.
This bulletin was prepared in the Office of Employment and Unemployınent Statistics, Division of Data Development and Users' Services under the direction of Paul O. Flaim, Chief. Staff members contributing to its preparation were Bernard R. Altschuler, Gloria Peterson Green, Francis W. Horvath, Bruce W. Klein, Robert J. McIntire, and Jeannette S. Montgomery. Joya V. Ashe, Mildred W. Behlin, Lois D. Gatling, and John E. Howe processed the text.
Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

# Linking Employment Probiems to Economic Status 

## Introduction

In 1984, as the economy continued its recovery from the recession years of 1981-82, the total number of persons experiencing some unemployment fell substantially from the level in 1983, dropping by 2.2 million. The number of peisons who were involuntarily limited to part-time work for at least part of the year also dropped, by 440,000 . By contrast, the number of workers whose reported earnings from year-round full-time work were below the minimum wage equivalent was about unchanged from the level in 1983.
These aggregates relate to individual workers and do not directly address the effect that specific employment problems have on the economic well-being of their families. In order to determine how unemployment and other employment problems affect the economic status of a worker's family, several additional factors need to be considered: The earnings lost by the worker in question, the presence of other earners in the family, the level of their earnings, and the availability of other sources of income.

Over the past two or three decades, the rapid increase in labor force participation of women has made dualearner families the rule rather than the exception. In such families, the economic setbacks which may be encountered by one member are often cushioned by the earnings of other members. Income transfer programs also shield family income from the full consequences of unemployment and other labor market problems.
There are, however, still many families with only one earner, and in these the effect of any employment problems has a more direct bearing on family income. While the proportion of married-couple families with two earners or more has increased rapidly, there also has been a large increase in the proportion of families maintained by single women, and when employment problems strike these households the economic consequences can be serious. For example, nearly 3 out of 4 black women who maintained families alone and were unemployed for any length of time during 1984 had family income below the poverty level.
Of the 124.1 million persons who were in the labor force at sometime during 1984 (they worked or looked for work), about 21.5 milion were unemployed for at least a week during the year. About 14.4 million, though preferring to work full time, had to work part time at
least part of the year; and 4.5 million, though working full time year round, reported annual earnings below the minimum wage equivalent of $\$ 6,700$ (the amount which would have been earned by someone working 2,000 hours- 50 weeks at 40 hours per week-at the Federal minimum wage of $\$ 3.35$ an hour). Because many persons experienced a combination of these three problems over the course of the year (for example, both some unemployment and involuntary part-time employment), the total affected- 33.7 million-was significantly less than would have been obtained through the simple aggregation of the persons in each of the three categories.
Oì course, the application of different criteria in identifying persons with employment problems and, among these, those who are in poverty, would substantially alter the numbers. For example, if, instead of including all persons with 1 week or more of unemployment or involuntary part-time work, the count was limited to only those whose employment problems lasted a minimum of 5 weeks, the unduplicated count for 1984 would be reduced from 33.7 million to 26.8 million.
Although the data lend themselves to the construction of alternative estimates of the number of persons affected by the three employment problems and of those falling into povert ${ }^{\prime}$, they are presented in this bulletin in accordance with the more conventional concepts and definitions used in previous reports of this nature. The concepts and definitions, methods of presentation, and sources of the data used in this bulletin are described below:

Unemployment. Persons with unemployment are those reported as having looked for work while not employed, or as having been on layoff for at least 1 week during the year. The actual time unemployed may vary from a single week to a fuli year.

Involuntary part-time employment. The persons affected are those who wanted to work full time but who, because of economic conditions, had to work less than 35 hours a week at some time during the year. This may have occurred eitheı 亡ecause of reductions in hours due to slack work or material shortages, or because a parttime job was all that could be found.

Low annual earnings among full-year workers. Low annual earnings from a full year of work are those falling beiow $\$ 6,700$, corresponding to 50 weeks of 40 hours of work at the minimum wage, which was $\$ 3.35$ in 1984. Full-year workers are those who usually work 35 hours or more per week and who were employed for 50 weeks or more during the year.

Income and poverty. Income leveis and poverty status are determined on the basis of total money income, before personal income taxes and payroll deductions, as reported in the March Current Population Survey. The value of noncash income such as food stamps, subsidized housing, and certain fringe benefits is not taken into account in computing total family income. Unlike the minimum wage figure, the poverty lines are adjusted each year to reflect the changes in the Consumer Price Index. Poverty lines are defined for families of various sizes as well as for individuals living alone or with unrelated individuals. For a family of four, the poverty line was $\$ 10,609$ in 1984; for a single individual under 65 , it was $\$ 5,400$. In this bulletin, the term "family" includes households consisting of individuals living alone or with unrelated persons, so that individual employment problems can be related to poverty. ${ }^{1}$

Source of data. This report is the sixth in an annual series focusing on these problems. ${ }^{2}$ It is based primarily on data obtained from the March 1985 supplement to the Current Population Survey (CPS). However, for the first time in the series, some data from the Survey of Income and Program Participation (SIPP), conducted by the Bureau of the Census, are also used, beginning on page 5 .
The March supplement to the CPS provides data on the work experience of the entire population of working age ( 16 years and over) over the course of the previous calendar year-number of weeks worked, weeks spent looking for work, and so forth. Data are also gathered on the annual earnings of workers and on the total income of their families. ${ }^{3}$
The SIPP is a panel survey in which the respondents are interviewed every 4 months over a $21 / 2$-year period. The

[^1]survey's focus is on income and participation in government assistance programs, but information is also obtained on employment status and other characteristics.
The SIPP data are relatively new and subject both to sampling errors and possible bias, the nature and dimensions of which are yet unknown. Although use of these data was recommended by the National Commission on Employment and Unemployment Statistics, this initial analysis should be treated as exploratory.

While the labor force activity concepts used in the sipp are similar to those used in the CPS, the resulting estimates vary significantly in terms of the numbers of persons with employment problems. These differences are due to the widely dissimilar reference periods used in the two surveys and to differences in survey procedures and methodology. Comparisons of SIPP and CPS data and some of the reasons for divergences between them are discussed in appendix $C$.

## Summary of Findings

The recent data on employment problems and their effect on the economic status of families may be summarized as follows:

1. Over 21.5 million persons experienced some unemployment during 1984. The vast majority of these persons worked for some part of the year. Nevertheless, 22 percent lived in families :vith incomes below the poverty level.
2. Slightly more than 14.4 million persons had to work part time for at least a part of the year either because their hours were reduced or because no full-time work was available to them. About 18 percent were members of families living in poverty.
3. About 4.5 million workers with year-round fulltime work had total earnings in 1984 below the minimum-wage equivalent of $\$ 6,700$. Many of these workers were either self-employed or held jobs exempt from coverage under the minimum wage law. Close to one-third of the 4.5 million lived in families with incomes below the poverty line.
4. A total of 33.7 million persons experienced one or more of the three above-mentioned employment problems, with 6.8 million having encountered two or more-most frequently unemployment and involuntary part-time work-and, on rare occasions, all three. ${ }^{4}$ Of

[^2]the 33.7 million, 7.1 million were members of families whose total income for 1984 fell below the federally designated poverty thresholds.
5. In 1983, the total number of persons with employment problems had been 15.8 million, 3.2 million below the level for 1982. The decline continued in 1984, with the total falling another 2.1 million. Persons with either unemployment or involuntary part-time work in 1984 were less likely to live in poverty than similarly situated persons in 1983. However, the poverty incidence rose slightly among persons who were low earners.
6. According to the survey of Income and Program Participation, a total of 25.8 million persons experienced employment problems in an average 4 -month span over the first half of 1984. Over 40 percent of these persons received cash and in-kin.d government benefits. The most often cited forms of payments were food stamps and unemployment compensation.

## Data from the Current Population Survey

Employment problems and family income in 1984 Unemployment and poverty. The 21.5 million persons 16 years and older who were unemployed at some time during 1984 (on the basis of data from the March 1985 CPS) represented 17.4 percent of all individuals with some labo: force activity over the course of the year (124.1 million). This 17.4 percent, referred to as "the incidence of unemployment" during the year, should not be confused with the annual averge unemployment rate; in fact, the annual incidence was more than double the annual average unemployment rate of 7.5 percent. This large difference reflects the high turnover among persons experiencing unemployment. Since the persons making up the universe of the unemployed are continually changing, their courit over an entire year is always much larger than for any month or the annual average of the monthly levels.
The majority of persons with some unemployment in 1984 were in the labor force for the entire year. The incidence of unemployment among full-year labor force participants was 17 percent for men and 13 percent for women. Students and other work force entrants and reentrants, who are in the labor force only part of the year, had a much higher incidence of unemployment. About one-fourth of the persons under age 25 , many of whom were entering or reentering th labor force, encountered some unemployment during 1984 (table 1). Persons 25 to 54, who make up the majority of the labor force, had an unemployment incidence of 16 percent, while older workers, 55 and over, who often retire rather than continue to seek employment, had by far the lowest incidence of untmployment-below 10 percent.
Almost 1 out of 3 persons with some unemployment during the year was classified-within a family contextas "other" members. They were generally the young sons
and daughters in married-couple families or families maintained alone (no spouse present) by women or men (table 2). These young people had the highest incidence of unemployment. For women and men who maintained their own families, the likelihood of encountering some unemployment was also relatively high-about 20 percent. At about 13 percent, husbands and wives experienced the lowest incidence of unemployment of any family classification.
Of the persons unemployed at some time in 1984, about one-fourth or 5.3 million were unemployed for a total of less than 5 weeks during the year. The impact of unemployment on these workers was probably not very severe, particularly if there were other earners in their families. Only 15 percent of persons with short spells of unemployment lived in families with incomes below the poverty level (table B-1).
Just under one-half of all workers with unemployment in 1984 were members of families in which annual income exceeded $\$ 20,000$ (table B-1). At the same time, 22 percent lived in families with incomes below the poverty level (table 3). Of course, the longer the duration of unemployment, the greater the reduction in income and the probability of falling into poverty. For example, among those unemployed for more than half 'he year, over one-third reported family income below the poverty line.
Often when a family member encounters unemployment, other family members continue or begin working to sustain the flow of family income. For example, in 1984, the median income in married-couple families was about $\$ 20,300$ when the husband encountered some unemployment; it was $\$ 24,800$ when the wife had some unemployment; and it was $\$ 36,100$ when some "other" family member had a period of joblessness (table 4). Families with the advantage of multiple workers typically had a relatively low incidence of poverty. This is partly because the parents in a family containing a son or daughter of working age tend to be somewhat older and well established in their jobs and careers. In contrast, women maintaining their own families are less likely to have other working family members, and their unemployment is often accompanied by income below the poverty line. Thus the median income for fumilies maintained by women who were unemployed during 1984 was about 60 percent lower than that for the families of women who had no unemployment during the year.
Although unemployment may not, by itself, result in a family's income falling below the poverty level, it may still cause a considerable reduction in the standard of living. As indicated in table 4, the median famil'y income of persons with some unemployment in 1984 was nearly 40 percent lower than it was for those without any unemployment. Of course, the 40 -percert gap cannot be
attributed entirely to unemployment. It also reflects the fact that persons who expenience unemployment tend to be in lower paying jobs and that this may also be true for other workers in their families.

The disparity in family income between those with and without unemployment was particularly large for blacks: Median family income of blacks with unemployment was 47 percent lower than for those with no unemployment. For whites and Hispanics with unemployment, median family income was about 38 percent lower than for those with no unemployment.

Involuntary part-time employment and poverty. Some 43.9 million persons worked part time for at least 1 week during 1984. While this total was slightly higher than the figure for 1983 , the number of persons working part time involuntarily fell from 14.9 to 14.4 million over the year. Over three-fifths of those who worked part time involuntarily cited slack work or material shortages as the reason for their short hours; the rest reported that they could not find full-time work (table 5).
Among men, almost 70 percent of those with some involuntary part-time work during 1984 had been on short schedule, because of slack work or material shortages. By comparison, women with involuntary part-time work were more equally divided between those whose hours had been cut back at least temporarily and those who had worked part time after being unable to find full-time work. A substantially larger proportion of men than women reporting part-time work attributed it to economic factors beyond their control.
Just under one-ha'f of all blacks and Hisyanics who worked part time in 1984 did so involuntarily, compared with about one-third of white workers. Again, in each group, a larger proportion of men than women had been constrained to work part time against their preferences.

If husbands worked part time, about one-half of them did so involuntarily, as did about one-half of men and women who maintained their own families. On the other hand, only about one-fourth of the wives who worked part time in 1984 had done so involuntarily (table 6).

The duration of involuntary part-time work during 1984 was much shorter for those who ..ported "slack work" than for persons citing that they could not find a full-time job. Only 26 peicent of those working part time because of reduced workweeks did so for 15 weeks or more, compared with 56 percent of those who reported they could only find part-time work (table 7).

The poverty rate among persons with some involuntary part-time work in 1984 was 18 percent, compared with 9 percent for those working part time by choice (table 8). A mong the persons with involuntary part-time work, those who could not find a full-time job had
about double the incidence of poverty than thoie affected by slack work ( 25 percent and 13 percent, respectively).
About 1 in 3 blacks and 1 in 4 Hispanics who worked part time involuntariiy in 1984 lived in a poor family, in contrast to about 1 in 7 for whites. The incidence of poverty was over 60 percent for black women who maintained families alone and had some involuntary part-time work.

Low earnings and poverty. Of all full-ycar full-time workers, 4.5 million, or 6 percent, reported earnings of less than $\$ 6,700$ in 1984.
Although the majority of these low earners wers, wage and salary workers, a substantial number were selliemployed in family-operated enterprises such as farms or small businesses. Many of these workers, therefore, were exempt from the minimum wage provisions of the Fair Labor Standards Act. Also, since full-year status is defined as employment of 50 weeks or more, and fulitime status is based on "usual hours" of work, earnings of some persons could fall below $\$ 6,700$ merely because of "unusual" weeks of part-time hours or a week or two of unemployment. In fact, 675,000 persons classificd as low earners with year-round work did report some brief spells of unemployment or part-time work during the year.

Of the 4.5 million low earners, almost 9 in 10 ( 3.9 million) were white, divided almost equally between men and women (table 9). There were 450,000 bla.cks and 348,000 Hispanics with reported earnings of less than $\$ 6,700$, despite year-round full-time work. Absut 6 to 7 percent of bntin white and black year-round fulltime workers were low earners. For Kispanics, the proportion of year-round full-time workers with less than minimum wage earnings was 8 percent.

Low earnings from a full year's work were most often reported for teenagers and workers 65 years and over (table 10). About one-third of men and womer, 16 to 19 years old and about one-fifth of men and womsen 65 and over with year-round full-time work were reported as earning less than $\$ 6,700$ in 1984. Overall, the incidence of low earnings among full-year workers was much higher for women than for men, 8 percen. compared to 5 percent. The highest incidence was among Hispanic women (11.2 percent), and the lowest yras among white men ( 5.3 percent).
Table 11 shows the incidence of 1, w earninge among year-round full-time workers by marital and family status. Young persons, generally slassified as "others" in a family context, had a high incidence of low earnings, about 9 to 16 percent, repending on the type of family in which they lived. Only 4 percent of husbands fell in the low-earnings category, while 9 percent of wives fell below the minimum.

Nearly 1 in 3 of the 4.5 million workers with low earnings from year-round full-time work lived in families with total income below their specific poverty line (table 12). As in pasi years, the puverty incidence assosiated with low earnings was higher than that associated with either unemployment or involuntary part-time work.

## Trends since 1979

Unemployment. Of the three labor market problems, unemployment, which is very cylically sensitive, has been most volatile since 1979, the year marking the introduction of this report. The total number of persons with some unemployment climbed to 26.5 million in !982, before falling in both 1983 and 1984, reaching a level of 21.5 million. This drop occurred among men and women, blacks and whites, and Hispanics, and, as seen in table 14, was spread across all types of fomilies.

Involuntary part-time employment. The number of workers with some involuntary part-time employment dropped by 440,000 in 1984, down to 14.4 million. The decline in this number, which had exceeded 16 million in 1982, reflected the continuing economic recovery and was w: 'espread across most of the various labor force groups (table 15).

Low earnings. In 1984, the number of year-round tu!!time workers with earnings below $\$ 6,700$ was about unchanged from the level in 1983 (table 16). However, it is important to note that the standard used to classify low earners, namely, the Federal minimum wage, has remained at the same level since 1981. ${ }^{5}$ In the meantime, the poverty threshhold has been gradually increased. This explains in part the steady increase in the proportion of low earners whose total family income for the year falls below the poverty line. This proportion increased from 22.4 percent in 1979 to 31.2 percent in 1984.

The poverty rate for black year-round full-time workers with low earnings rose by 4.5 percentage points to 37.2 percent in 1984. In contrast, the incidence of poverty among whites and Hispanics was little changed between 1983 and 1984.

## Multiple employment problems

When the number of persons experiencing either unemployment, involuntary part-time employment, or low earnings in 1984 is added up, the total comes to more than 40.6 million persons. However, this figure overestimates the total number of separate individuals

[^3]having employment problems over the year, because many persons encountered more than one of these labor market difficulties in the same year. About 6.8 million individuals experienced a combination of these problems; thus, the unduplicated count of persons with one or more of these difficulties was about 33.7 million in 1984. This figure was about 2.1 million lower than the comparable total for 1983.
Of the 6.8 million persons with more than one employment problem in 1984, the most common com. bination of difficulties was unemployment and involuntary part-time work. More than 6 million persons experienced these difficulties, and close to one-fourth of such persons were in families below the poverty level. It should be emphasized that among the 33.7 million persons with employment problems as defined here, many had only short spells of 1 or 2 weeks of unemployment or involuntary part-time work. Not surprisingly, the total number of persons with these problems decreases when more restrictive definitions are used. If only those with a minimum of 5 weeks of unemployment or involuntary part-time work are counted, the total would be lowered to 26.8 million for 1984 (table 18). If the definition is restricued to 15 weeks or more, the number is reduced by almost another 8.5 million, as shown in table 19. At the same time, the application of these more restrictive definitions affects the incidence of poverty by only a small amount. For example, for those with labor market problems for 5 weeks or more, the incidence of poverty was 23.1 percent, versus 21.0 percent for those having employment problems of 1 week or more.

## Data from the Survey of income and Program Participation

## Source of data

The Survey of Income and Program Participation (SIPP), a relatively new longitudinal survey conducted by the Bureau of the Census, provides additional insights into the economic situation of persons with employment problems, as it yields very detailed data on income and on participation in government assistance programs. ${ }^{6}$ Particularly useful is the emphasis placed in SIPP on the collection of data ori both cash and in-kind government benefits and assistance payments, which many of the persons with employment problems may receive. Also, SIPP's 4-month reference period is a useful intermediate interval between the fo:us of the monthly CPS and the annual March supplement to the CPS.

[^4]The SIPP data in this bulletin are from the third wave of the 1984 SIPP panel. ${ }^{7}$ In this wave, households were interviewed about their labor force situation and incone received during overlapping 4 -month periods between January and July 1984. The specific interview periods for the four rotation groups that made up the sample were January through April, February through May, March through June, and April through July. The data presented are the averages for the sum of the four rotation groups, and are thus fairly representative $\mathbf{c}$ ! the situation in the first half of 1984.

Given the relatively new and complex nature of the SIPP data, the analysis presented in this repert should be viewed as reploratory. Future SIPP data $\therefore$ es will allow the examination of more than 4 months of data for each of the rotatior groups, since the househoids in the sample are interviewed at 4 -month intervals for $21 / 2$ years. The linkage of the 4 -month files will provide the poaential for tracking those who receive assis'o.e.e payments and for assessing the relationship tetween changes in employment status and qualifyi: s !or assistance.

## Employment problems during January-July 1984

On the basis of SIPP data, 15.6 million persons experienced periods of unemployment lasting 1 week or more during an average 4 -month period between January and July 1984, In addition, 6.5 million persons spent a week or more working part time involuntarily, and 5.6 million persons reported working full tine at an average below the Federal minimum. Altogether, there were 25.8 million persons who experienced one of these problems or a combintion of them for the 4 -month periods. An additional 2.2 million reported some periods of inactivity which they attributed to discouragement over job prospects. These estimates are compared to the CPS estimates ${ }^{\circ} \mathrm{n}$ appendix C .

Cumulative duration of unemployment and involuntary part-time work. The severity of employment problems depends largely on how long they persist, or how frequently they occur, pa-ticularly whel they involve unemployment and involuntary part-time work. While many of these problems may have begun or ended outside the 4 -month period studied, the cumulative duration within the 4 -month period was $!0$ weeks both for unemployment and involuntary part-time work. The distribution by cumblative duration tows that among those who had some unemployment, 29 percent had 4 weeks or less, while among those who worked part time involuntarily, 28 percent did so for 4 weeks or less. In many cases, such stirt spells oi unemployment and

[^5]- cycle of four interviews ugitudinal sample which is
periods of involuntary part-tume work would not cause much of an impact on tamily income. On the other hand, about 35 percent of those reporting some unemployment and 42 percent of thuse with some involuntary part-time work reported that their condition lasted the entire 4 -month period covered in the stpr interview (table 20).

Family r lationship, employment problems, and discuaragement. Of all the persons with employment problems, as indicated by the SIPP data, husbands in married-couple families acccunted for 22 percent and wives for a slightly smaller proportion (19.5 percent) Women who maintainea their own families (no spouse present) accourted for another 8 percent. Together, these three groups accounted for about one-half of all persons with employment problems (table 21). The remainder consisted almost entirely of young men and women (classified as "other" family members) and persons living outside the family nucleus. These latter groups had the highest incidence of employment problems. For example, almost half ( 47 percent) of the "other" members in families maintained by women reported so.ne employment problems, as did one-third of those in married-couple families (table 21).
Among the persons whio had a period of inac-tivity-that is a period in which they neither worked nor looked for work-and who attributed such inactivity to discouragement over job prospects, a large proportion ( 22 percent') were wives. Another relatively large proportion ( 26 percent) were family members other than either the husband or wife. Husbands, who are not likely to leave the labor force regardless of the conditions of the iob market, accounted for only 8 perceat of the persons reporting periods of inactivity associated with discouragement table 22).

Effects of employment problems by family size. The income, consumption, and othici requirements of a family are related to its size. Because large families have greater needs, employment problems may cause them greater difficulty. For these reasons,.employment problems are examined in terms of family size. Almost one-third (32 percent) of persons with labor force activity in families having six members or more experienced employment problems during the 4 -month periods studied. On the other hand, about 20 to 23 percent of persons who lived in families having two to five members experienced employment problems. Among the latter families, the prevalence of employmert problems bore little relation to family size (table 21).

Receipt of cash and in-kind benefits by persons with employment problems. Gevernment benefits lessen the burden ceused by loss of earnings. Of the 25.8 million
persons with employment problems, 10.9 million ( 42 percent) reported receiving some type of cash or in-kind benefits, and very often both types (table 23). Understandably, the most commonly reported type of cash benefits for these persons was unemployment compensation. Food stamps-a major assistance pro-gram-were the second most commonly reported inkind aid. A significant proportion of those with employment problems lived in households where children received free or reduced-price school lunches.
Persons with employment problems accounted for about one-fifth of all the recipients of government benefits. But among the participants in some specific programs, the proportion with such problems was much higher-one-third ( 36 percent) among the recipients of Aid to Families with Dependent Children (AFDC) and nearly one-half ( 44 percent) among the recipients of general assistance (State welfare for the needy not covered under other programs). Among the recipients
of food stamps, one-third reported employment problems, as did one-fifth of those receiving a housing subsidy.

The highest average monthly cash benefits (\$386) for persons with employment problems came from Social Security. The lowest average amount (\$207) came from general assistance. The average monthly amount for State unemployment compensation recipients (\$376) wa, higl relative to the income from other programs (table 24).

Alth Jugh one-third of the persons with labor force activity in families of six members or more had employment problems, only 16 percent of these persons received government benefits (table 25). Among the persons with employment problems who lived in families with two to five members, the proportion receiving government benefits varied from 12 to 21 percent; the smaller the family the larger the proportion receiving benefits.

[^7]${ }^{2}$ Data not shown where base is less than 75,000 .
the 33.7 million, 7.1 million were meinbers of families whose total income for 1984 fell below the federally designated poverty thresholds.
5. In 1983, the total number of persons with employment problems had been 15.8 million, 3.2 million below the level for 1982. The decline continued in 1984, with the total falling another 2.1 million. Persons with either unemployment or involuntary part-time work in 1984 were less likely to live in poverty than similarly situated persons in 1983. However, the poverty incidence rose slightly among persons who were low earners.
6. According to the survey of Income and Program Participation, a total of 25.8 million persons experienced employment $:$ :oblems in an average 4 -month span over the first half of 1984. Over 40 percent of these persons received cash and in-kind government benefits. The most often cited forms of payments were food stamps and unemployment compensation.

## Eata from the Current Population Survey

Employment problems and family income in 1984 Unemployment and poverty. The 21.5 million persons 16 years and older who were unemployed at some time during 1984 (on the basis of data from the March 1985 CPS) represented 17.4 percent of all individuals with some labor force activity over the course of the year (124.1 millic.ı. This 17.4 percent, referred to as "the incidence of unemployment" during the year, should not be confused with the annual averge unemployment rate; in fact, the annual incidence was more than double the annual average unemployment rate of 7.5 percent. This large difference reflects the high turnover among persons experiencing unemplcyment. Since the persons making up the universe of the unemployed are continually changing, their count over an entire year is always much larger than for any month or the annual average of the monthly levels.

The majority of persons with some unemployment in 1984 were in the labor force for the entire year. The incidence of unemployment among full-year labor farce participants was 17 percent for men and 13 percent for women. Students and other work force entrants and reentrants, who are in the labor force only part of the year, had a much higher incidence of unemployment. About one-fourth of the persons under age 25 , many of whom were entering or reentering the labor force, encountered some unemployment during 1984 (table 1). Persons 25 to 54, who make up the majority of the labor force, had an unemployment incidence of 16 percent, while older workers, 55 and over, who often retire rather than continue to seek employment, had by far the lowest incidence of unemployment-below 10 percent.

Almost 1 out of 3 persons with some unemployment during the year was classified-within a family contextas "other" members. They were generally the young sons
and daughters in married-couple families or families maintained alone (no spouse present) by women or men (table 2). These young people had the highest incidence of unemployment. For women and men who maintained their own families, the likelihood of encountering some unemployment was also relatively high-about 20 percent. At about 13 percent, husbands and wives experienced the lowest incidence of unemployment of any family classification.

Of the persons unemployed at some time in 1984, about one-fourth or 5.3 million were unemployed for a total of less than 5 weeks during the year. The impact of unemployment on these workers was probably not very severe, particularly if there were other earners in their families. Only 15 percent of persons with short spells of unemployment lived in families with incomes below the poverty level (table B-1).

Just under one-half of all workers with unemployment in 1984 were members of families in which annual income exceeded $\$ 20,000$ (table B-1). At the same time, 22 percent lived in families with incomes below the poverty level (table 3). Of course, the longer the duration of unemployment, the greater the reduction in income and the probability of falling into poverty. For example, among those unemployed for more than half the year, over one-third reported family income below the poverty line.

Often when a family member encounters unemployment, other family members continue or begin working to sustain the flow of family income. For example, in 1984, the median income in married-couple families was about $\$ 20,300$ when the husband encountered some unemployment; it was $\$ 24,800$ when the wife had some unemployment; and it was $\$ 36,100$ when some "other" family member had a period of joblessness (table 4). Families with the advantage of multiple workers typically had a relatively low incidence of poverty. This is partly because the parents in a family containing a son or daughter of working age tend to be somewhat older and well established in their jobs and careers. In contrast, women maintaining their own families are less likely to have other working family members, and their unemployment is often accompanied by income below the poverty line. Thus the median income for families maintained by women who were unemployed during 1984 was about 60 percent lower than that for the families of women who had no unemployment during the year.

Although unemployment may not, by itself, result in a family's income falling below the poverty level, it may still cause a considerable reduction in the standard of living. As indicated in table 4, the median family income of persons with some unemployment in 1984 was nearly 40 Nercent lower than it was for those without any unemployment. Of course, the 40 -percent gap cannot be
attributed entirely to unemployment. It also reflects the fact that persons who experience unemployment tend to be in lower paying jobs and that this may also be true for other workers in their families.

The disparity in family income between those with and without unemployment was particularly large for blacks: Median family income of blacks with unemployment was 47 percent lower than for those with no unemployment. For whites and Hispanics with unemployment, median family income was about 38 percent lower than for those with no unemployment.

Involuntary part-time employment and poverty. Some 43.9 million persons worked part time for at least 1 week during 1984. While this total was slightly higher than the figure for 1983, the number of persons working part time involuntarily fell from 14.9 to 14.4 million over the year. Over three-fifths of those who worked part time involuntarily cited slack work or material shortages as the reason for their short hours; the rest reported that they could not find full-time work (table 5).
Among men, almost 70 percent of those with some involuntary part-time work during 1984 had been on short scheduies because of slack work or material shortages. By comparison, womer. with involuntany part-time work were more equally divided between those whose hours had been cut back at least temporarily and those who had worked part time after being unable to find full-time work. A substantially larger proportion of men than women reporting part-time work attributed it to economic factors beyond their control.
Just under one-half of all blacks and Hispanics who worked part time in 1984 did so involuntarily, compared with about one-third of white workers. Again, in each group, a larger proportion of men than women had been constrained to work part time against their preferences.
If husbands worked part time, about one-half of them did so involuntarily, as did about one-half of men and women who maintained their own families. On the other hand, only about one-fourth of the wives who worked part time in 1984 had done so involuntarily (table 6).
The duration of involuntary part-time work during 1984 was much shorter for those who reported "slack work" than for persons citing that they $\mathrm{c} . . \mathrm{d}$ not find a frll-time job. Only 26 percent of those working part time because of reduced workweeks did so for 15 weeks or more, compared with 56 percent of those who reported they could only find part-time work (table 7).
The poverty rate among persons with some involuntary part-time work in 1984 was 18 percent, compared with 9 percent for those working part time by choice (table 8). Among the persons with involuntary part-time work, those who could not find a full-time job had
about double the incidence of poverty than those affected by slack work ( 25 percent and 13 percent, respectively).

About 1 in 3 blacks and 1 in 4 Hispanics who worked part time involuntarily in 1984 lived in a peor family, in contrast to about 1 in 7 for whites. The incidence of poverty was over 60 percent for black women who maintained families alone and had some involuntary part-time work.

Low earnings and poverty. Of all full-year full-time workers, 4.5 million, or 6 percent, reported earnings of less than $\$ 6,700$ in 1984.

Although the majority of these low earners were wage and salary workers, a substantial number were selfemployed in family-operated enterprises such as farms or small businesses. Many of these workers, therefore, were exempt from the minimum wage provisions of the Fair Labor Standards Act. Also, since full-year status is defined as employment of 50 weeks or more, and fulltime status is based on "usual hours" of work, earnings of some persons could fall below $\$ 6,700$ merely because of "unusual" weeks of part-time hours or a week or two of unemployment. In fact, 675,000 persons classified as low earners with year-round work did report some brief spells of unemployment or part-time work during the year.

Of the 4.5 million low earners, almost 9 in $10(3.9$ million) were white, divided almost equally between inen and women (table 9). There were 450,000 blacks and 348,000 Hispanics with reported earnings of less than $\$ 6,700$, despite year-round full-time work. About 6 to 7 percent of both white and black year-round fulltime workers were low earners. For Hispanics, the proportion of year-round full-time workers with less than minimum wage earnings was 8 percent.
Low earnings from a full year's work were most often reported for teenagers and workers 65 years and over (table 10). About one-third of men and women 16 to 19 years old and about one-fifth of men and women 65 and over with year-round full-time work were reported as earning less than $\$ 6,700$ in 1984. Overall, the incidence of low earnings among full-year workers was much higher for women than for men, 8 percent compared to 5 percent. The highest incidence was among Hispanic women (11.2 percent), and the lowest was among white men ( 5.3 percent).
Table 11 shows the incidence of low earnings among year-round full-time workers by marital and family status. Young persons, generally classified as "others" in a family context, had a high incidence of low earnings, about 9 to 16 percent, depending on the type of family in which they lived. Only 4 percent of husbands fell in the low-earnings category, while 9 percent of wives fell below the minimum.

Nearly 1 in 3 of the 4.5 million workers with low earnings from year-round full-time work lived in families with total income below their specific poverty line (table 12). As in past years, the poverty incidence associated with low earnings was higher than that associated with either unemployment or involuntary part-time work.

## Trends since 1979

Unemployment. Of the three labor market problems, unemployment, which is very cylically sensitive, has been most volatile since 1979, the year marking the introduction of this report. The total number of persons with some unemployment climbed to 26.5 million in 1982, before falling in both 1983 and 1984, reaching a level of 21.5 million. This drop occurred among men and women, blacks and whites, and Hispanics, and, as seen in table 14, was spread across all types of families.

Involuntary part-time employment. The number of workers with some involuntary part-time employment dropped by 440,000 in 1984 , down to 14.4 million. The decline in this number, which had exceeded 16 million in 1982, reflected the continuing economic recovery and was widespread across most of the various labor force groups (table 15).

Low earnings. In 1984, the number of year-round fulltime workers with earnings below $\$ 6,700$ was about unchanged from the level in 1983 (table 16). However, it is important to note that the standard used to classify low earners, namely, the Feder:l minimum wage, has remained at the same level since $1981 .{ }^{5}$ In the meantime, the poverty threshhold has been gradually increased. This explains in part the steady increase in the proportion of low earners whose total family income for the year falls below the poverty line. This proportion increased from 22.4 percent in 1979 to 31.2 percent in 1984.

The noverty rate for black year-round full-time workers with low earnings rose by 4.5 percentage points to 37.2 percent in 1984. In contrast, the incidence of poverty among whites and Hispanics was little changed between 1983 and 1984.

## Multiple employment problems

When the number of persons experiencing either unemployment, involuntary part-time employment, or lo'v earnings in 1984 is added up, the total cortes to more than 40.6 million persons. However, this figure overestimates the total number of separate individuals

[^8]having employment problems over the year, because many persons encountered more than one of these labor market difficulties in the same year. About 6.8 million individuals experienced a combination of these problems; thus, the unduplicated count of persons with one or more of these difficulties was about 33.7 million in 1984. This figure was about 2.1 million lower than the comparable total for 1983.

Of the 6.8 million persons with more than one employment problem in 1984, the most common combination of difficulties was unemployment and involuntary part-time work. More than 6 million persons experienced these difficulties, and close to one-fourth of such persons were in families below the poverty level. It should be emphasized that among the 33.7 million persons with employment problems as defined here, many had only short spells of 1 or 2 weeks of unemployment or involuntary part-time work. Not surprisingly, the total number of persons with these problems decreases when more restrictive definitions are used. If only those with a minimum of 5 weeks of unemployment or involuntary part-time work are counted, the total would be lowered to 26.8 million for 1984 (table 18). If the definition is restricted to 15 weeks or more, the number is reduced by almost another 8.5 million, as shown in table 19. At the same time, the application of these more restrictive definitions affects the incidence of poverty by only a small amount. For example, for those with labor market problems for 5 weeks or more, the incidence of poverty was 23.1 percent, versus 21.0 percent for those having employment problems of 1 week or more.

## Data from the Survey of income and Program Participation

## Source of data

The Survey of Income and Program Participation (SIPP), a relatively new longitudinal survey conducted by the Bureau of the Census, provides additional insights into the economic situation of persons with employment problems, as it yields very detailed data on income and on participation in government assistance programs. ${ }^{6}$ Particularly useful is the emphasis placed in SIPP on the collection of data on both cash and in-kind government benefits and assistance payments, which many of the persons with employment problems may receive. Also, SIPP's 4-month reference period is a useful intermediate interval between the focus of the monthly CPS and the annual March supplement to the CPS.

[^9]The SIPP data in this bulletin are from the third wave of the 1984 SIPP panel. ${ }^{7}$ In this wave, households were interviewed about their labor force situation and income received during overlapping 4 -month periods between January and July 1984. The specific interview periods for the four rotation groups that made up the sample were January through April, February through May, March through June, and April through July. The data presented are the averages for the sum of the four rotation groups, and are thus fairly representative of the situation in the first half of 1984.
Given the relatively new and complex nature of the SIPP data, the analysis presented in this report should be viewed as exploratory. Future SIPP data files will allow the examination of more than 4 months of data for each of the rotation groups, since the households in the sample are interviewed at 4 -month intervals for $21 / 2$ years. The linkage of the 4 -month files will provide the potential for tracking those who receive assistance payments and for assessing the relationship between changes in employment status and qualifying for assistance.

## Employment problems during January.July 1984

On the basis of SIPP data, 15.6 million persons experienced periods of unemployment lasting 1 week or more during an average 4 -month period between January and July 1984. In addition, 6.5 million persons spent a week or more working part time involuntarily, and 5.6 million persuns reported working full time at an average below the Federal minimum. Altogether, there were 25.8 million persons who experienced one of these problems or a combintion of them for the 4-month periods. An additional 2.2 million reported some periods of inactivity which they attributed to discouragement over job prospects. These estimates are compared to the CPS estimates in appendix C .

Cumulative duration of unemployment and involuntary part-time work. The severity of employment problems depends largely on how long they persist, or how frequently they occur, particularly when they involve unemployment and involuntary part-time work. While many of these problems may have begun or ended outside the 4 -month period studied, the cumulative duration within the 4 -month period was 10 weeks both for unemployment and involuntary part-time work. The distribution by cumulative duration shows that among those who had some unemployment, 29 percent had 4 weeks or less, while among those who worked part time involuntarily, 28 percent did so for 4 weeks or less. In many cases, such short spells of unemployment and

[^10]periods of involuntary part-time work would not cause much of an impact on family income. On the other hand, about 35 percent of those reporting some unemployment and 42 percent of those with some involuntary part-time work reported that their condition lasted the entire 4 -month period covered in the SIPP interview (table 20).

Family relationship, employment problems, and discouragement. Of all the persons with employment problems, as indicated by the sIPP data, husbands in married-couple families accounted for 22 percent and wives for a slightly smaller proportion ( 19.5 percent). Women who maintained their own families (no spouse present) accounted for another 8 percent. Together, these three groups accounted for about one-half of all persons with employment problems (table 21). The remainder consisted almost entirely of young men and women (classified as "other" family members) and persons living outside the family nucleus. These latter groups had the highest incidence of employment problems. For example, almost half ( 47 percent) of the "other" members in families maintained by women reported some employment problems, as did one-third of those in married-couple families (table 21).
Among the persons who had a period of inac-tivity-that is a period in which they neither worked nor looked for work-and who attributed such inactivity to discouragement over job prospects, a large proportion ( 22 percent) were wives. Another relatively large proportion ( 26 percent) were family members other than either the husband or wife. Husbands, who are not likely to leave the labor force regardless of the conditions of the job market, accounted for only 8 percent of the persons reporting periods of inactivity associated with discouragement (table 22).

Effects of employment problems by family size. The income, consumption, and other requirements of a family are related to its size. Because large families have greater needs, employment problems may cause them greater difficulty. For these reasons, employment problems are examined in terms of family size. Almost one-third (32 percent) of persons with labor force activity in families having six members or more experienced employment problems during the 4 -month periods studied. On the other hand, about 20 to 23 percent of persons who lived in families having two to five members experienced employment problems. Among the latter families, the prevalence of employment problems bore little relation to family size (table 21).

Receipt of cash and in-kind benefits by persons with employment problems. Government benefits lessen the burden caused by loss of earnings. Of the 25.8 million
persons with employment problems, 10.9 million ( 42 percent) reported receiving some type of cash or in-kind benefits, and very often both types (table 23). Understandabiy, th: most commonly reported type of cash benefits for these persons was unemployment compensation. Food stamps-a major assistance pro-gram-were the second most commonly reported inkind aid. A significant proportion of those with employment problems lived in households where children received free or reduced-price school lunches.

Persons with employment problems accounted for about one-fifth of all the recipients of government benefits. But among the participants in some specific programs, the proportion with such problems was much higher-one-third ( 36 percent) among the recipients of Aid to Families with Dependent Children (AFDC) and nearly one-half (44 percent) among the recipients of general assistance (State welfare for the needy not covered under other programs). Among the recipients
of food stamps, one-third reported employment problems, as did one-fifth of those receiving a housing subsidy.

The highest average monthly cash beiefits (\$386) for persons with employment problems came from Social Security. The lowest average amount (\$207) came from general assistance. The average monthly amount for State unemployment compensation recipients (\$376) was high relative to the income from other programs (table 24).

Although one-third of the persons with labor force activity in families of six members or more had employment problems, only 16 percent of these persons received government benefits (table 25). Among the persons with employment problems who lived in families with two to five members, the proportion receiving government benefits varied from 12 to 21 percent; the smaller the family the larger the proportion receiving benefits.

reference penods betwoen January and July 1984. The four periods are January through Apnl. February through May, March through June. and April through July.

# Appendix A. Explanatory Notes 

## Current Population Survey (CPS)

(Tables $1-19$ and B-1-B-3)
The source, coverage, concepts and definitions, and limitations of the data presented in this bulletin are described below,

## Source of data

The primary data source is the supplement to the March 1985 CPS. The data refer to calendar year 1984.

## Population coverage

Each month, trained interviewers collect information from a sample which, in 1985, totaled about 59,500 households in 729 areas in 1,973 counties and independent cities in each of the 50 States and the District of Columbia. Estimates are for persons 16 years of age and over in the civilian noninstitutional ?opulation during the calendar week ending March 23, 1985. The civilian nonistitutional population excludes all members of the Armed Forces and inmates of institutions such as homes for the aged and correctional institutions.
No information was obtained on persons who might have been in the civilian labor force during 1984 but were not in the civilian noninstitutional population as of the March date. Similarly, data on persons who died in 1984 or in 1985 before the survey date are not reflected. Persons who reached age 16 during January, February, or March 1985, however, are included.

## Concepts and definitions

Work experience. Persons with work experience are those who worked as civiiians at any time during the year at full- or part-time jobs. Respondents are asked how many hours they usually worked per week during the year. They are clessified as having worked at fulltime jobs if they worked 35 nours or more per week in a majority of the weeks employed during the year; respondents are classified as having worked at part-time jobs if they worked 1 to 34 hours per week in a majority of the weeks employed during the year.

Income. Data on income are limited to money income received before personal income taxes and payroll deductions. Money income is the sum of the amounts received from earnings (hourly wages, salaries, or profits or losses of self-employed operations); Social Security or Railroad Retirement benefits; public
assistance or welfare payments; Supplemental Security Income; dividends, interest, and rental incone or losses; unemployment, veterans', and workers' compensation; government and private employee pensions; alimony, child support, or regular contributions from persons not living in the houschold; and other periodic income. In the March 1985 CPS, income did not reflect nonmoney transfers, such as food stamps; subsidized housing; goods produced on a farm or in a home; and employerfinanced fringe benefits like retirement, educational expenses, stock options, or health and life insurance. For more information on the income concept, see Money Income of Households, Families, and Persons in the United States: 1984, CL eent Population Reports, Series P-60, No. 151 (Bureau $\frac{1}{}$ the Census, April 1986).

Poverty (low income) classification. Poverty statistics presented in this bulletin are based on definitions developed by the Social Security Administration in 1964 and revised by Federal interagency committees in 1969 and 1980. These definitions are based on the Department of Agriculture's Economy Food Plan and reflect the different consumption requirements of families based on their size and number of children under 18 years old. Unrelated individuals and two-person families are further differentiated by age.

The latest modifications, implemented in the March 1982 CPS, were: (1) Elimination of separate thresholds (poverty levels) for farm families, (2) averaging of thresholds for female householders and "all other" families, and (3) development of a poverty threshold for families with nine members or more.

In 1984, the average poverty threshold for a family of four was $\$ 10,609$; for a family of nine persons or more, the threshhold was $\$ 21,247$; and for an unrelated individual age 65 and over, $\$ 4, \mathbf{9 7 9}$. The poverty threshholds are updated each year to reflect changes in the Consumer Price Index for All Urban Consumers (CPI-L). For more information, see Money Income and Poverty Status of Families and Persons in the United States: 1984 (Advance Data from the March 1985 Current Population Survey), Current Population Reports, Series P-60, No. 149 (Bureau of the Census, August 1985.)

Civilian labor force. The civilian labor force comprises all civilians 16 years and older classified as employed or unemployed sometime during the year.

Employed. Employed persons are all those who in 1984 worked as civilians for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Year-round, full-tune work. Year-round, full-time work is employment c .50 to 52 weeks during the year, usually at a full-time job.

Unemployed. Unemployed persons are those who were looking for work while not employed ur were on layoff for at least 1 week during the year. The number of weeks unemployed is the total number of weeks accumulated during the entire year.

Involuntary part-time employment. Persons who worked less than 35 hours for at least 1 week during the year because of a) siack work or material shortages, or b) they could not find part-time work.

Median. The median is the value which divides a distribution into two equal parts, one part having vaiues above the medinn and the other having values below the median. Median earnings in this bulletin are based on distributions which include zero values. The median is estimated by linear interpolation within the distribution. The precision of the estimates depends on the size of the interval which contains the median.

Earnings. Earnings are all money income from hourly wages, salaries, and profits or losses from selfemployment.

Age. The age classification is based upon a person's age as of the last birthday.

Family. A family is a group of two persons or more residing together who are related by birth, marriage, or adoption. All such persons are considered as members of one family even though they may include a "subfamily," that is, a married couple or a parent-child group sharing the living quarters of the married couple or person maintaining the household.

Family or household income. In this bulletin, this term refers to family income for persons in families and per. sonal income for unrelated individuals.

## Rellability of the estimates

Estimating procedure. The estimating procedure used in this survey inflates weighted sample results to independent es-imates of the civilian noninstitutional prnי.la. tion by age, sex, and race. These independent est ... s were based on statistics from the 1980 Census of

Population and other data on births, deaths, immigraton, emigration, and size of the Armed Forces.

Since the CPS estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: Sarnpling and nonsampling. The standard errors provided in this bulletin primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling er:ors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on stuall differences between estimates.

Sampling variability. The standard errors that may be obtained using this appendix are primarily measures of sampling variability; that is, of the variation that occurred by chance because a sample rather than the entire population was surs eyed. The sample estimate and its estimated standard error enable one to construct confidence intervals-ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its estimated standard error were calculated from each sam: le, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard crror above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.
The average estimate derived from all possible samples may not be contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the averag' estimate derived from all possible sampies is included in the confidence interval.

Standard ${ }^{\text {rrors }}$ for data based on the cPS. Because of the large number of estimates that are produced from the CPS, it is not feasible to give a standard error for each of the estimates. Instead, generalized standard error tables and adjustment fators for different types of

## Appendix C. Some Comparisons of SIPP and CPS Data

As indicated in appe: dix A, the labor force activity concepts used in the SIPP are similar to those used in the CPS. The resulting estimates, however, vary significantly due to the widely dissimilar reference periods and to differences in survey procedures and collection methods. ${ }^{1}$ While the estimates from the two surveys cannot be reconciled, it is useful to compare these estimates, where possible, in order to gain additional insight into the number of persons experiencing employment problems. Table C-1 below compares data from the SIPP with monthly and annual data from the CFS. A discussion of some differences and the reasons for them follows.

Table C.1. Comparison of selectod data from the SIPP with monthly ard annual data from the CPS, 1984

| Data source | Persons with- |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Unemploy ment | Invoiuntary part-ume work | Low earnings | Discouragement |
| Monthly CPS | 8.885 | 5,839 | (1) | 1,338 |
| 4-month SIPP data | 15,615 | 6.472 | 5,549 | 2,160 |
| plement to the CPS | 21.535 | 14,429 | 4.492 | (1) |

Unemployment. As measured in the CPS, average monthly unemployment in the period January through July 1984 was 8.9 million. This compares with a SIPP 4 month average estimate of 15.6 million persons and with a CPS "work experience" total of 21.5 million persons for the entire calendar year of 1984, as measured in the annual March supplemert.

Because of tht !onger reference period, more people who were jobseeking or on layoff are reflected in the SIPP than in the monthly estimates fromi the CPS.In the CPS, persons re classified into three separate but distinct categories-the employed, the unemployed, and not in the labor force. The SIPP concept, however, permits multiple labor force statuses, and persons are counted in each status over the course of the 4 month reference period. In this

[^27]regard, the SIPP is similar to the March CPS supplement which obtains information on the work experience of the population during the previous calendar year.

## Involuntary part-time work. During the January through

 July 1984 period, the average monthly count of persons on part-time schedules who wanted full-time jobs was 5.8 million in the CPS. During the 4 -month SIPP reference periods, an average of 6.5 inillion persons spent some weeks working part time involuntarily, while for all of 1984, the CPS March supplement recorded 14.4 million such persons. The reasons for the pattern are the same as those for unemployment, as cited above.Low earners. The SIPP indicates more low eareers-persons working full time with earnings below the minimum wage equivalent over a 4 -month period-than the CPS reported for the whole year ( 5.5 million vs. 4.5 million). The higher SIPP estimate may reflect, in part. the fact that persons can experience t-mporary fluctuations in their earnings which may bring them below the minimumwage equivalent for parts of the year, as measured by SIPP, although they might exceed such a standard for the entire year as measured by the annual CPS. Also, there is some evidence that wage and salary earnings as reported in the SIPP are lower than in the cPS.

Discouragement. In the SIPP, an average of 2.2 million persons reported 1 week or more ố inactivity due to discouragement over job prospects. In contrast, the average monthly number of discouraged workers as measured in the CPS was 1.3 million. Here, the difference may reflect primarily the longer SIPP reference period, althouigh definitions used in the two surveys may also play a role. As noted earlie:, the CPS data indicate how many persons, on average, were 'discouraged' at any one point in time, while the SIPP data are a cumulative count of all persons with discouragement over a 4 -month period.

FOR THE MOST PART, SIPP estimates for the 4-month reference periods compare reasonably well with both monthly and annual CPS data. The directions and general magnitude of the differences that can be seen in table C-1 are consistent with what can be expected based on the varying lengths of the reference periods and the inherent character of the types of experiences being measured.

For unemployment, involuntary part-time work, and discouragement the longer the reference period, the greater the probability that more people will have experienced these statuses. Estimates of low earners, however, need not be higher when the reference period is a year than when it is a part of a year. A person who experiences low earnings during part of a year has a chance
to realize higher ea:nings during the rest of the year and not be a low earner for the whole yea. On the other hani, a person with a period of unemployment during part of the year will be classified as havin een unemployed at some time during that year regardless of the labor force status during the balance of that year.

## BLS projections of employment

Revised projections of employment, output, and demand for 1995 by industry and occupation are presented in this collection of four articles from the Monthly Labor Review. Additonal data and a detailed methodology also are provided.

Subjects include:

- The labor force-expected changes in size and composition.
- Gross ṇational product-alternative trends and major assumptions.
- Distribution of demand-changing patterns in the major sectors of consumption, business investriont, government expenditures, and foreign trade.
- Industry output and employment.
- Changing occupational employment requirements.

[^0]:    ***********************************************************************

    * Reproductions supplied by EDRS are the best that can be made from the original document.

[^1]:    ${ }^{1}$ Although recognizing the limitations of the Federal Government measure of poverty, BLS chose it because of its convenience. For information on this measure of poverty, see Money Income and Poverty Status of Families and Persons in the United States: 1984 (Advance Data From the March 1985 Current Population Survey) Current Population Reports, Series P-60, No. 149 (Bureau of the Census, August 1985).
    ${ }^{2}$ Data for 1983 were published in BLS Bulletin 2222 of the same title (1985). That report contains a complete listing of all previous BLS bulletins on the subject.
    'More detailed information on earnings, part-time work, and unemployment is presented in the Current Population Reports, Series P-60, of the Bureau of the Census. In addition, work experience data have been reported by BLS in Special Labor Force Reperts. Over 50 extensive tables are compiled each year, most of which are unpublished but available by request.

[^2]:    ${ }^{4}$ It may not seem possible that a person could encounter three employment problems during the same year-that is, be unemployed for a period, work part time for economic reasons for another period, and also fall in the category of year-round full-time workers with low carnings. Yet it is possible. Year-round employment is defined as 50 weeks or more of employment in a given year, a definition which allows for 1 or 2 weeks of unemployment. Yearround full-ime employment is defined as 50 weeks or more of cmployment whech is usually full time, but which may include some weeks of part-time work, as well as a very bief period of anemployment. Depending on the type of job, this pattern of employment could also conceivably produce less than the $\$ 6,700$ minimumwage equivalent in terms of annual carnings, leaving the worker in question with all three employment problems.

[^3]:    ${ }^{5}$ The low-earnings line was sel at $\$ 5,800$ in 1979 ( 2,000 hours $x$ \$2.94), \$6,200 in $1980(2,000$ hours $x$ \$3.10), and $\$ 6,700$ in 1981.84 ( 2,000 hours $x \$ 3.35$ ). These hourly wage rates represent the Federal minimum wage rat: in these years.

[^4]:    ${ }^{4}$ For more information, see D. Nelson, D. B. McMillen, and D. Kasprzyk, "An Overview of the Survey of Income and Program Participation, Update 1," SIPP Working Paper Series No. 8401 (Bureau of the Census, 1985).
