Treatment Calculations

Shirley Ann Pinegar-Johnston MS RT(R)(T)CMD

Overview

- Math Concepts
 - Definitions
- Basic MU Calculations

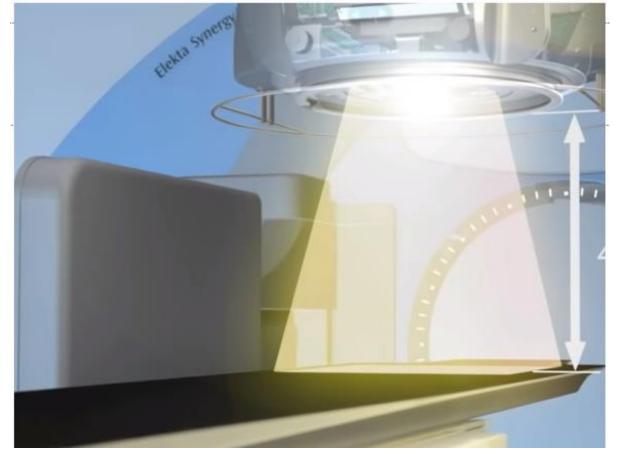

What are we calculating?

Divergence Formula – calculates the SIZE of the radiation field

Inverse Square Formula – helps us calculate the INTENSITY of a radiation beam

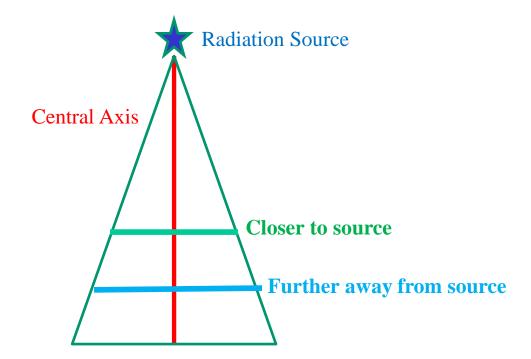

Increasing Distance from Source

- Increase Field Size --- Direct Proportion
- Decrease Intensity --- Indirect Proportion

Divergence

• X-rays travel in Straight but divergent lines

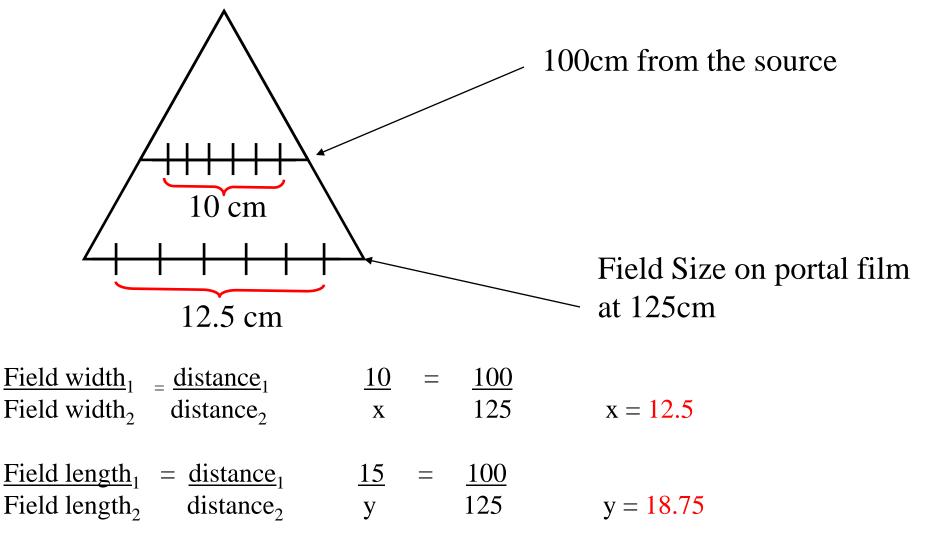

Divergence Formula (Direct Proportion)

 $\frac{\text{Field width}_1}{\text{Field width}_2} = \frac{\text{distance}_1}{\text{distance}_2}$

 $\frac{\text{Field length}_1}{\text{Field length}_2} = \frac{\text{distance}_1}{\text{distance}_2}$

Divergence

If the field size is 10x15 at 100cm, what is it on a port film at 125cm?

Setup for Entire Femur

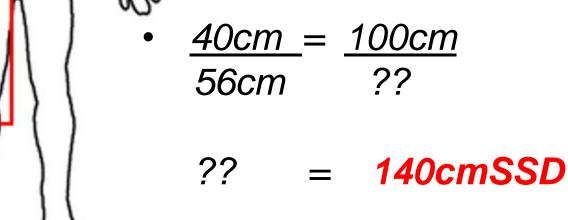

Largest field length at 100cm is 40cm

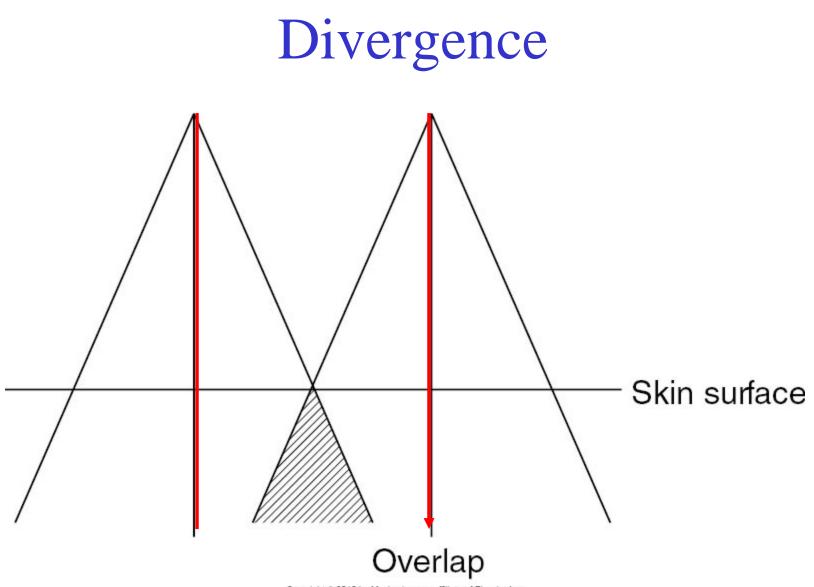

- Need 56cm length
- What would be the SSD required?

Setup for Entire Femur

- Need 56cm length
- What would be the SSD required?

Gap Problem $Gap = (\underline{field \ size_1} \times \underline{depth}) + (\underline{field \ size_2} \times \underline{depth})$ $2 \qquad SSD \qquad 2 \qquad SSD$

What is the gap needed between two adjacent fields to a depth of 6cm. The field lengths of the fields are 8cm and 20cm, respectively at 100cm SSD?

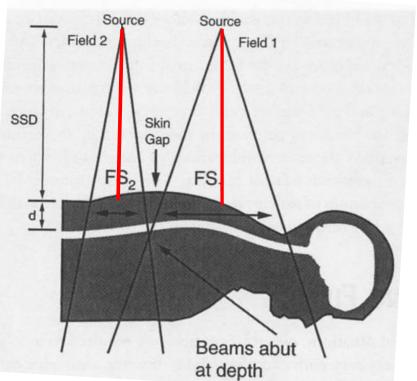

$$Gap = (\underbrace{8}_{2} x \underbrace{6}_{100}) + (\underbrace{20}_{2} x \underbrace{6}_{100})$$

$$(4 x .06) + (10 x .06)$$

$$.24 + .6$$

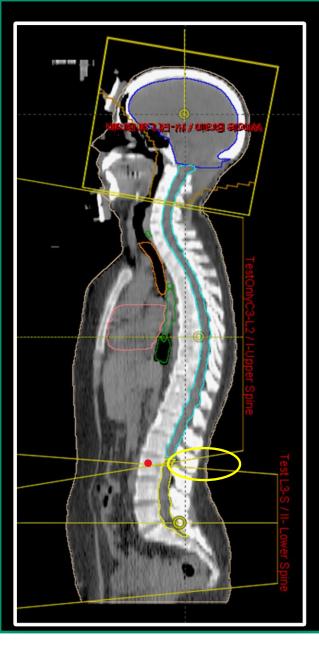

$$Gap = .84cm$$

Feathering

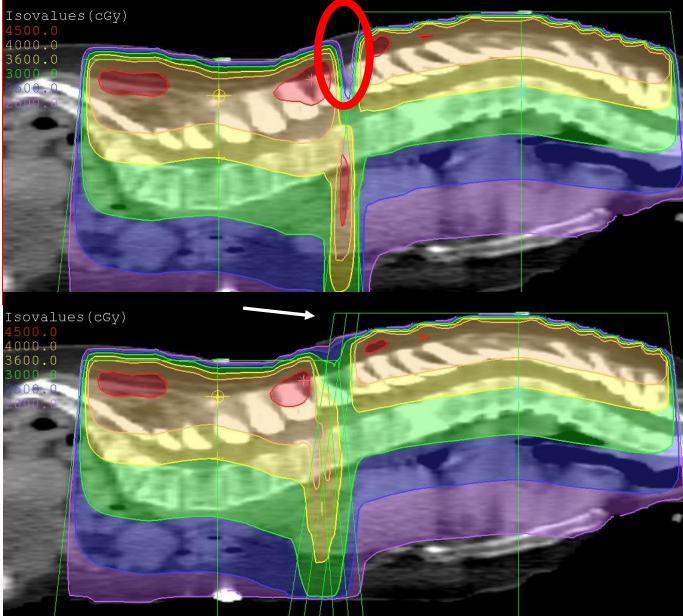

Initial Plan

Used w permission TJU Graduate MD Student

2nd Plan - Feathered 1cm inferiorly 3rd Plan- Feathered additional 1 cm inferiorly

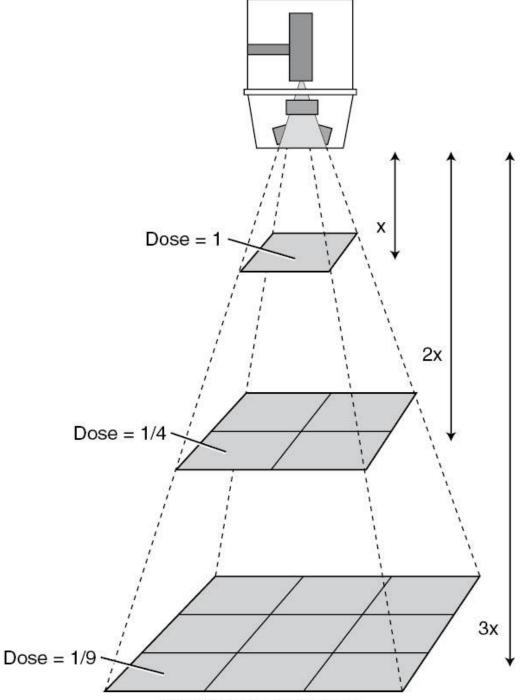

Feathering - CSI

Inverse Square Law

states that the intensity is inversely proportional to the <u>square</u> of the distance from the source

Copyright © 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

Inverse Square Formula

$$Intensity_1 = (Distance_2)^2$$

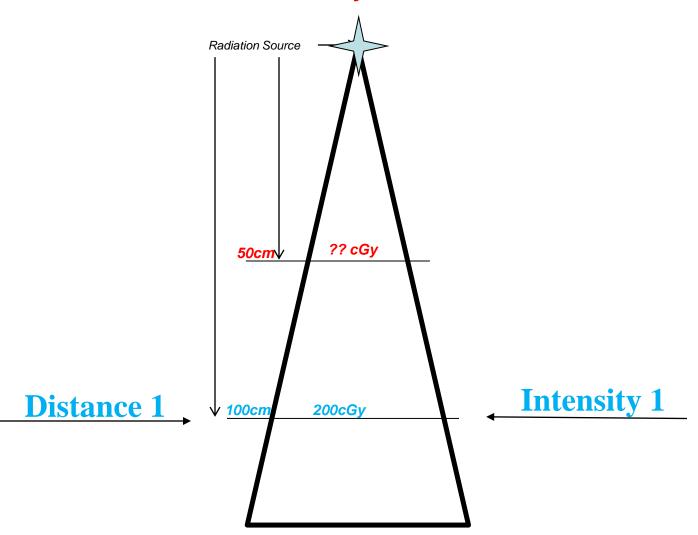

Intensity_2 (Distance_1)^2

OR

(Distance where Intensity is KNOWN)² ^x Intensity (Distance where Intensity is UNKNOWN)²

If the Intensity at 100cm is 200cGy, what is the Intensity at 50cm?

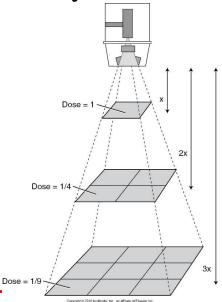

Inverse Square Problem

• If the Intensity at 100cm is 200cGy, what is the Intensity at 50cm?

 $\frac{\text{Intensity}_{1}}{\text{Intensity}_{2}} = \frac{(\text{Distance}_{2})^{2}}{(\text{Distance}_{1})^{2}}$

 $\frac{200cGy}{x} = \frac{(50)^2}{(100)^2} = \text{Intensity at } 50cm = 800cGy}$

(Distance where Intensity is KNOWN)² ^x Intensity (Distance where Intensity is UNKNOWN)²

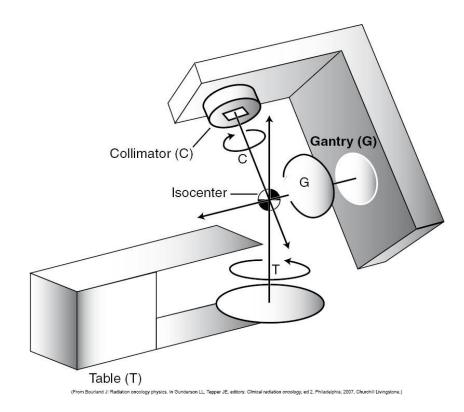

$$\frac{(100)^2}{(50)^2} \quad X \quad 200cGy = Intensity at 50cm = 800cGy$$

Definitions Basic Concepts Equivalent Square

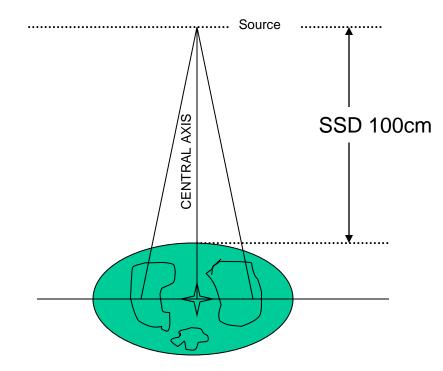

Isocenter

Point around which a gantry rotates Intersection of the collimator axis and the axis of rotation Point within the patient or on the patient's skin

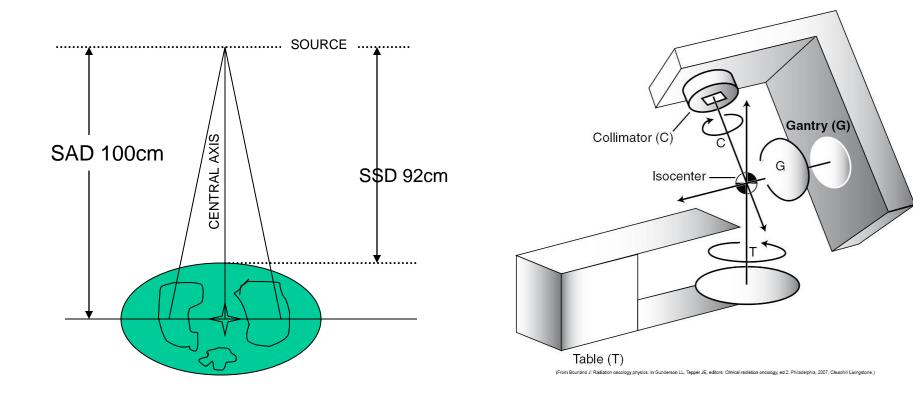

SSD

SSD – SOURCE TO SKIN DISTANCE Field size is defined at SKIN surface

SAD

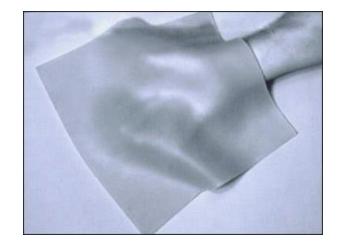

SAD – SOURCE TO AXIS DISTANCE SSD + depth = SAD Field size is defined at Isocenter 92 + depth = 100

Bolus

- Tissue Equivalent Material
- Same density
- Same Z
- Examples:

Water, rice, wax, brass mesh, superflab, superstuff

https://www.google.com/search?q=brass+mesh+bolus+radiation+therapy&rlz=1C1CHradiation+therapy&rld=1C1CHradiation+therapy&rld=1C

http://www.google.com/search?p?aarshmol.erginer.http://www.lisqny

Can Swing Over Short

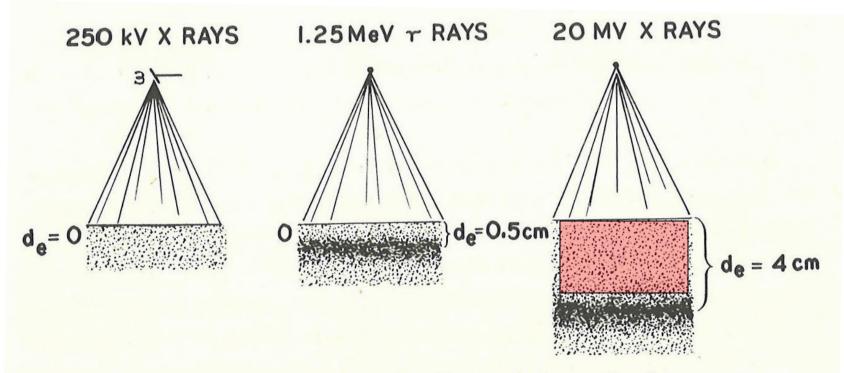

- Grenz Ray \leq 10-15 KvP HVL in mm AL
- Contact Therapy 40-50 KvP HVL mm AL
- Superficial 50-150 KvP HVL in mm AL
- Orthovoltage 1921 150-500 KvP HVL in mm Cu

uses Thoreaus filter – Tin, Copper, Aluminum from tube to patient

- Supervoltage 500-1000 KVP
- Megavoltage 1961 \geq 1000 KvP HVL in mm Pb

D/Max – depth of maximum ionization

de ls Equilibrium Depth or Buildup Region

FIGURE 9.03. Simplified diagram showing the comparative electron buildup regions for radiation of various energies.

Some D/Max Depths to Know

Beam Energy	D/Max Depth	
Cobalt 60	.5cm	
4Mv	1.0cm	
6Mv	1.5cm	
10Mv	2.5cm	
18Mv	3.5cm	

Remember: D/max Depth is Primarily dependent on *Beam Energy*

f Factor

- Roentgen (exposure in air) to cGy (absorbed dose) conversion factor
- Dependent on: Beam Energy and density of material

 Table 7.3. Roentgen to cGy Conversion Factors for Water Muscle, and Bone

		3	and the second	-
Description	Photon Energy	f _{med}		
		water	muscle	bone
Conventional	۲.		<u></u>	
x-rays:			-	
Grenz rays	10 keV	0.909	0.912	4.96
Superficial	30 keV	0.885	0.914	6.17
	100 keV	0.956	0.956	1.716
	Cs-137	0.971	0.962	0.900
Megavoltage	÷	× .		
x-rays:	1 MeV	0.970	0.961	0.898
	Co-60	0.967	0.958	0.922
	1.5 MeV	0.973	0.962	0.900
	5 MeV	0.958	0.948	0.933
	10 MeV	0.945	0.933	0.987
	100 MeV	0.888	0.873	1.049

f factor Problem

Table 7.3.	Roentgen to cGy Conversion Factors for Water Muscle, and Bone					
Description	Photon Energy	f _{med}				
		water	muscle	bone		
Conventional	·		<u></u>	<u>ada na</u> 1 <u> mara - mara - m</u>		
x-rays:						
Grenz rays	10 keV	0.909	0.912	4.96		
Superficial	30 keV	0.885	0.914	6.17		
	100 keV	0.956	0.956	1.716		
	Cs-137	0.971	0.962	0.900		
Megavoltage						
x-rays:	1 MeV	0.970	0.961	0.898		
	Co-60	0.967	0.958	0.922		
	1.5 MeV	0.973	0.962	0.900

	10 MeV	0.945	0.933	0.987		
	100 MeV	0.888	0.873	1.049		

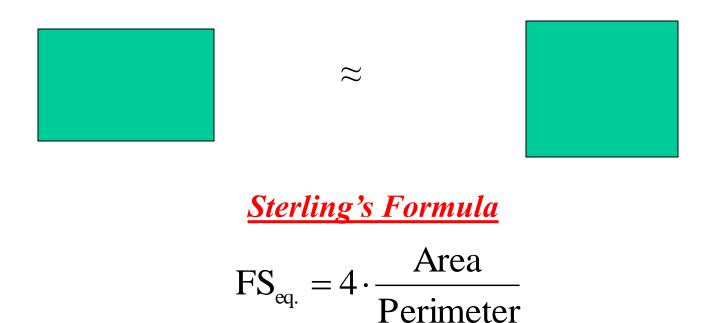

• For 100Kev photons, what is the dose delivered to muscle if the exposure to that muscle is 100R?

 $Dose_{muscle} = Exposure x f_{muscle}$ = 100R x 0.956

= **95.6 cGy**

Equivalent Square

Find the equivalent square for a rectangular treatment field

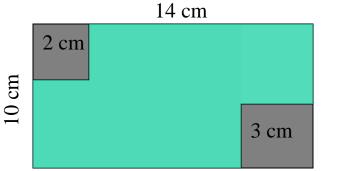

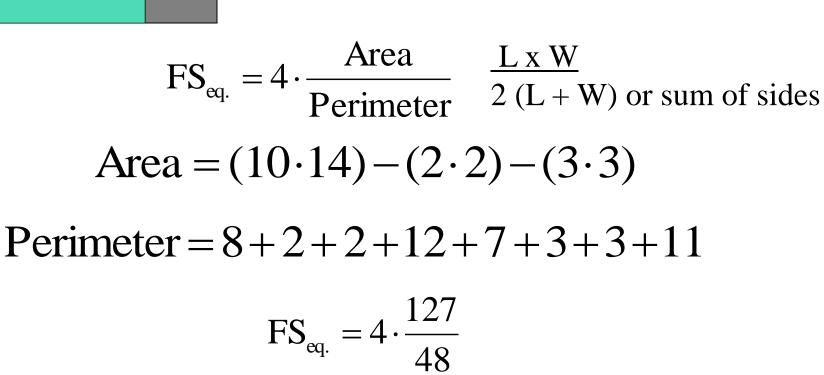

Example 1

 $FS_{eq.} = 4 \cdot \frac{Area}{Perimeter} \qquad \frac{L \times W}{2 (L + W)} \text{ or sum of sides}$ $\frac{10 \times 14}{2(10 + 14)} = \frac{140}{48} = 2.917$ $\frac{4 \times 2.917}{4}$

$$FS_{eq.} = 11.667 \, cm$$

10 cm

Example 2

$$FS_{eq.} = 10.58 \, cm$$

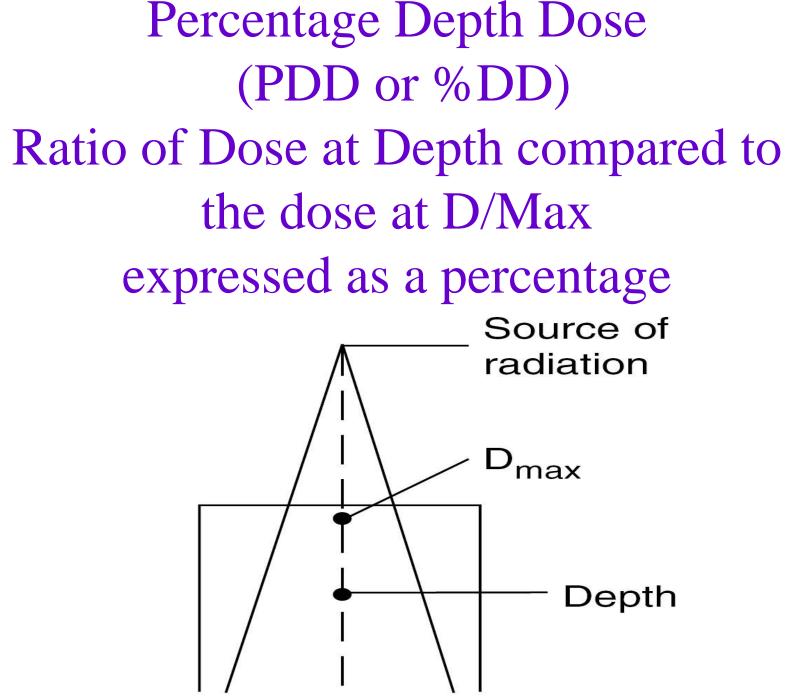

Calculations

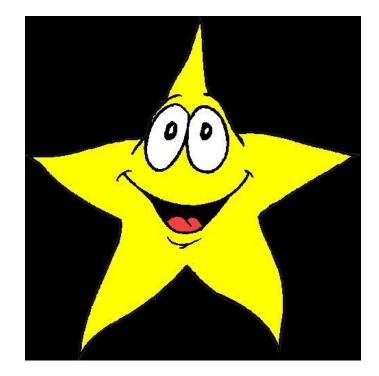

Monitor Unit

- PDDs
- TARs / TMRs

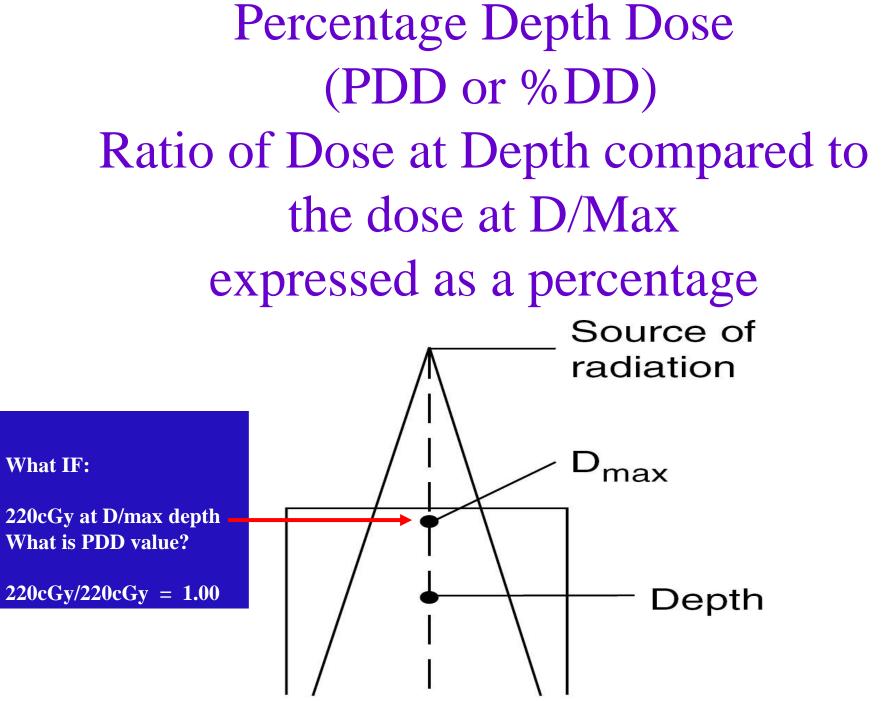

• Irregular Field (Clarkson)

Copyright @ 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

PDD at D/Max for ANY field Size, SSD, Beam Energy is 100% = 1.00 (decimal form)

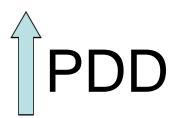

Copyright @ 2010 by Mosby, Inc., an affiliate of Elsevier Inc.

Mayneord's F Factor

Source to Skin Distance $-\uparrow$ SSD $\rightarrow\uparrow$ PDD (Mayneord's F Factor)

• This is used when there is a change in the SSD from the chart. It is an application of the INVERSE SQUARE LAW !!

• F = $(old SSD + depth)^2 X (new SSD + D/Max)^2$ $(old SSD + D/Max)^2 (new SSD + depth)^2$

• F x %DD value from chart = %DD at new SSD

Monitor Unit

Unit of Output Measure for Linear Accelerator

• Specific number of MUs needed for EACH patient's treatment

- Dependent on:
 - dose Field Size depth Beam Energy

Monitor Unit Calculations Using PDD

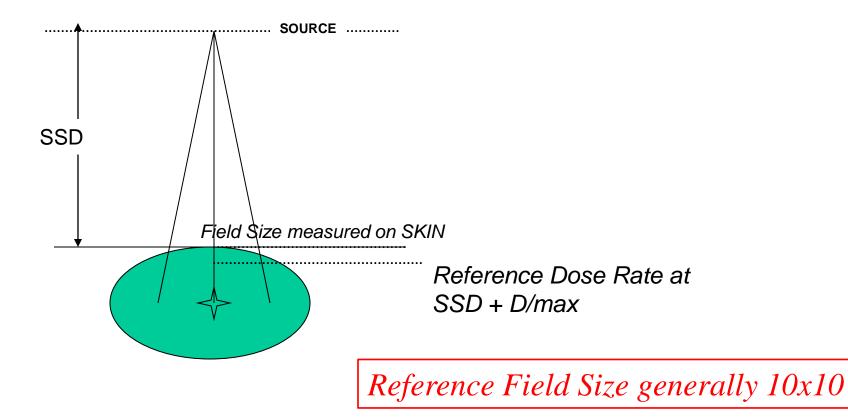

Monitor Unit =

Tumor Dose

Reference Dose Rate x Sc x Sp x PDD x (any other absorption factors)

(at distance of Rx SSD + D/Max

Monitor Unit Calculations Using PDD

Scatter (Output) Factor

- This factor adjusts the machine output when the Treatment Field Size is "different" than 10x10
- If the Field Size is greater than 10x10, the Output Factor will be GREATER than 1.0 (more scatter)
- If the Field Size is smaller than 10x10, the Output Factor will be Less than 1.0 (less scatter)
- The Output Factor can be subdivided into Collimator Scatter (Sc) and Phantom Scatter (Sp)

Tumor Dose

Reference Dose Rate $x \frac{S}{x} x \frac{S}{p} x$ PDD x (any other absorption factors)

)

PDD Monitor Unit Problem for 6Mv Linear Accelerator

200cGy

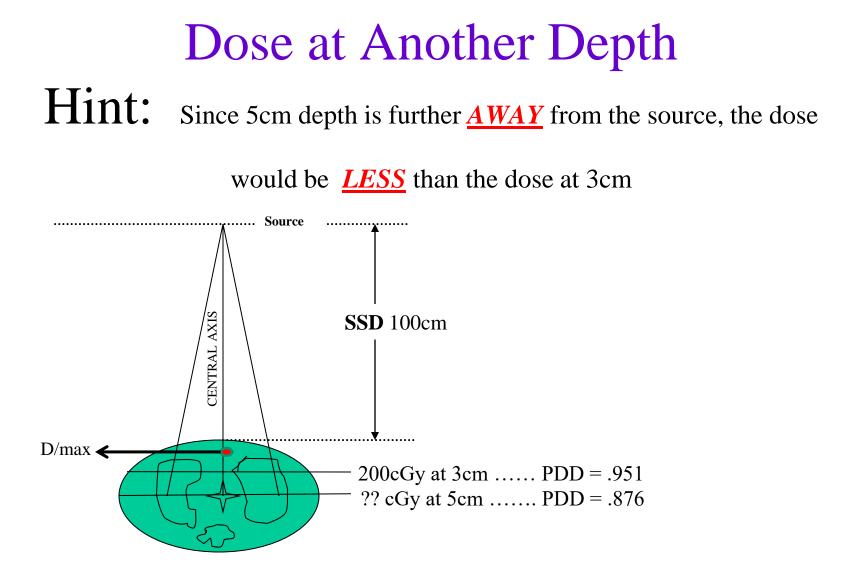

<mark>210.3 MU</mark>

1.0cGy/MU x 1.0 x 1.0 x .951

Reference Dose Rate atScSpPDD (in decimal form)Rx SSD + D/max (100 + 1.5cm)

Dose to Another Point Using PDD

- To calculate the dose at some point along the central axis use direct proportion.
- <u>Dose at Point A</u> = <u>Dose at Point B</u>
 %DD at Point A
 %DD at Point B
- **Problem**: For a 6Mv beam, what is the dose to the depth of 5cm when the dose at 3cm is 200cGy?
- PDD value at D3 = .951
- PDD value at D5 = .876

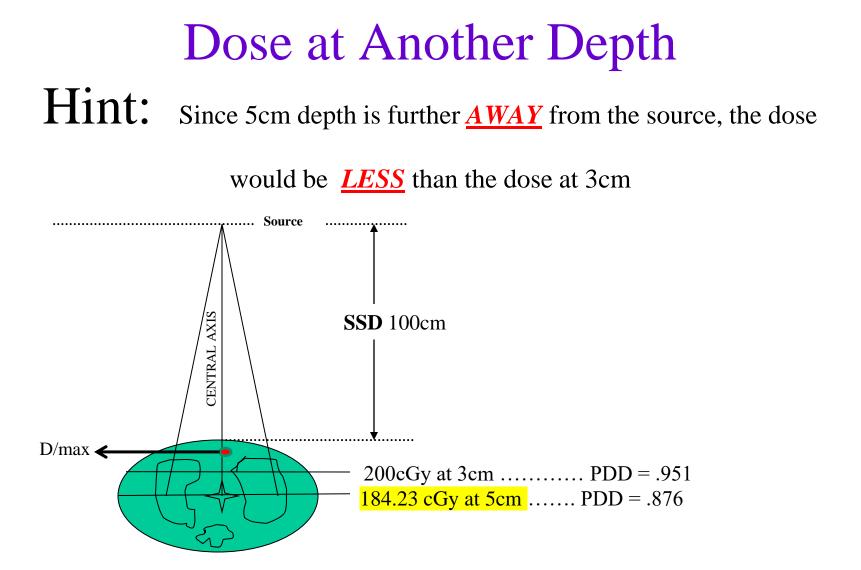

• PDD value at D3 = .951 PDD value at D5 = .876

• $\underline{\text{Dose at D3}}$ = $\underline{\text{Dose at D5}}$ PDD at D3 PDD at D5

<u>200cGy</u> = <u>x</u> .951 .876

dose at 5cm Depth x = 184.23 cGy

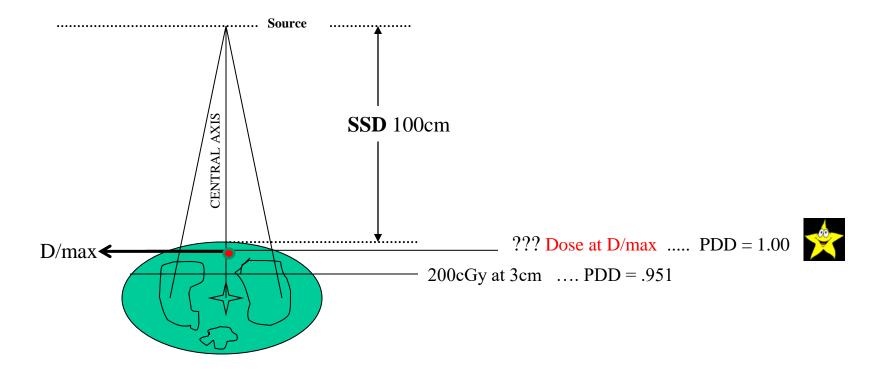

• **Problem**: For a 6Mv beam, what is the dose to the D/Max when the dose at 3cm is 200cGy?

• PDD value at D3 = .951

• $\underline{\text{Dose at D3}}$ = $\underline{\text{Dose at D/Max}}$ PDD at D3 PDD at D/Max

Hint: Since 1.5cm depth (D/max depth for 6MV) is closer <u>TOWARDS</u> the

source, the dose would be *MORE* than the dose at 3cm

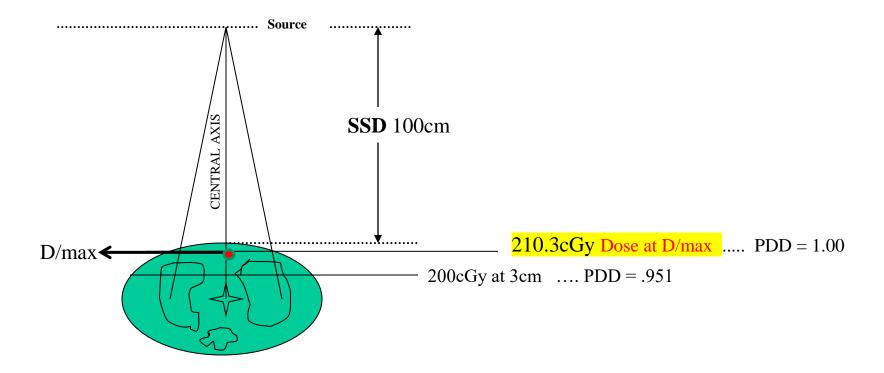

- **Problem:** For a 6Mv beam, what is the dose to the D/Max when the dose at 3cm is 200cGy? PDD value at D3 = .951
- $\underline{\text{Dose at D3}}$ = $\underline{\text{Dose at D/Max}}$ PDD at D3 PDD at D/Max

 $\begin{array}{c} \underline{200cGy} \\ .951 \end{array} = \underline{x} \\ 1.00 \end{array}$

dose at D/Max x = 210.30 cGy

Hint: Since 1.5cm depth (D/max depth for 6MV) is closer <u>TOWARDS</u> the

source, the dose would be <u>MORE</u> than the dose at 3cm

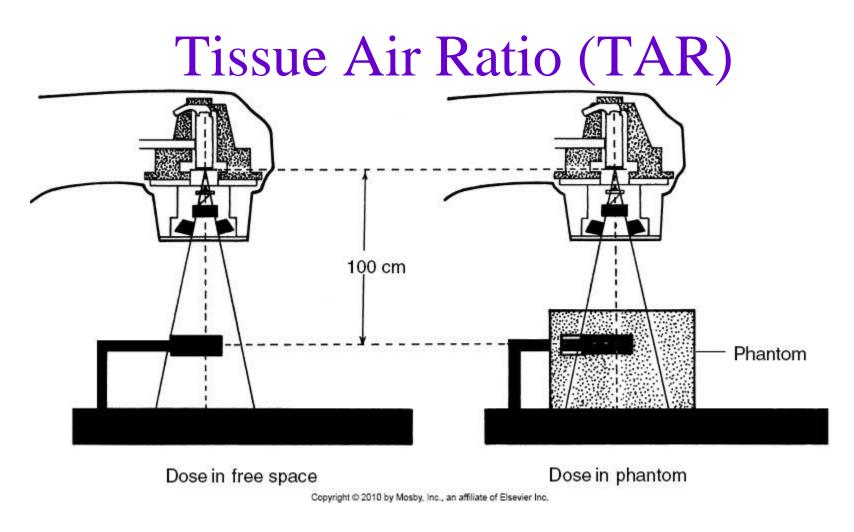

Tissue to Air Ratio (TAR)

- Developed by Johns to be used in Rotational Therapy
- Rotational Therapy has the gantry moving DURING the treatment while the beam is ON.

• A full 360⁰ treatment is called a "Rotation"

• Any treatment $< 360^{\circ}$ is called an "arc"

****TAR at D/Max is also called *Back Scatter Factor*****

Factors Affecting TAR

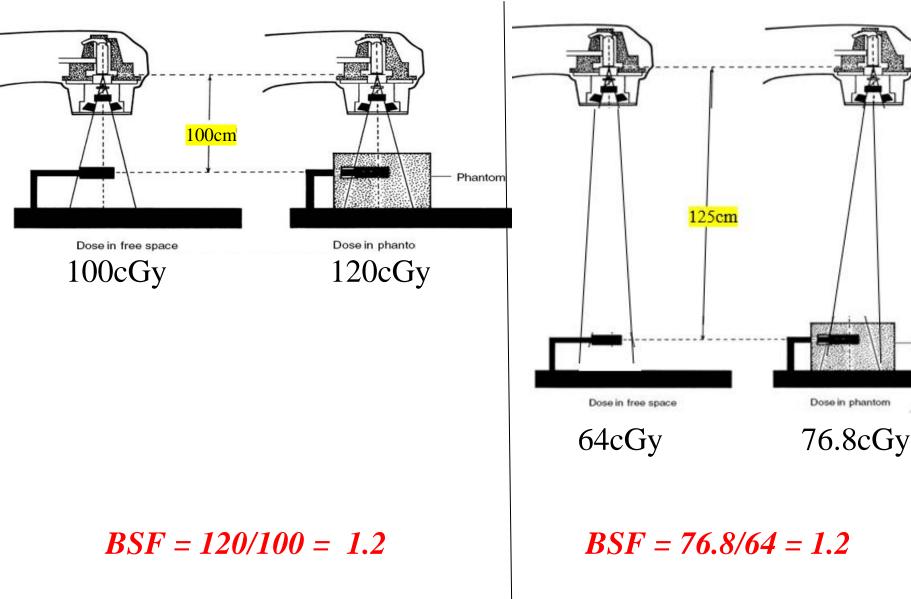

- Field Size \uparrow FS $\rightarrow\uparrow$ TAR
- Beam Energy \uparrow Energy $\rightarrow \uparrow$ TAR
- Go deeper into patient \downarrow TAR
- ***Source to Skin Distance
 <u>DOES NOT AFFECT</u> TAR
 (~2% accuracy)****

6Mv TAR

Gantry Speed for Rotational Treatments

Speed of Gantry for Rotational Treatment

• To set speed of gantry during a moving field treatment

<u>Treatment Monitor units</u> number of degrees of treatment arc

Problem for the Speed of the Gantry for Rotational Treatment

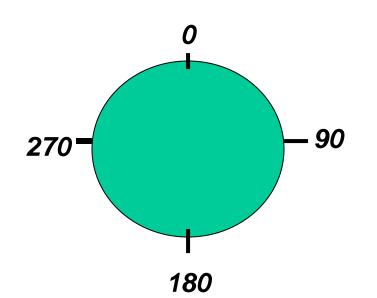

• What would be the monitor units per degree (aka speed of gantry) when

The monitor units is 255 for an anterior arc of 180 degrees?

<u>Treatment Monitor units</u> number of degrees of treatment arc

255/180 = 1.4166 = 1.42 MU/degree

Where is the **FINISHING** angle for the arc?

• If the MU are 255 and the MU/degree is 1.42 and the gantry starts at gantry angle of 270, travels clockwise.....WHERE is the FINISHING (aka STOP) gantry angle for this treatment?

Where is the **FINISHING** angle for the arc?

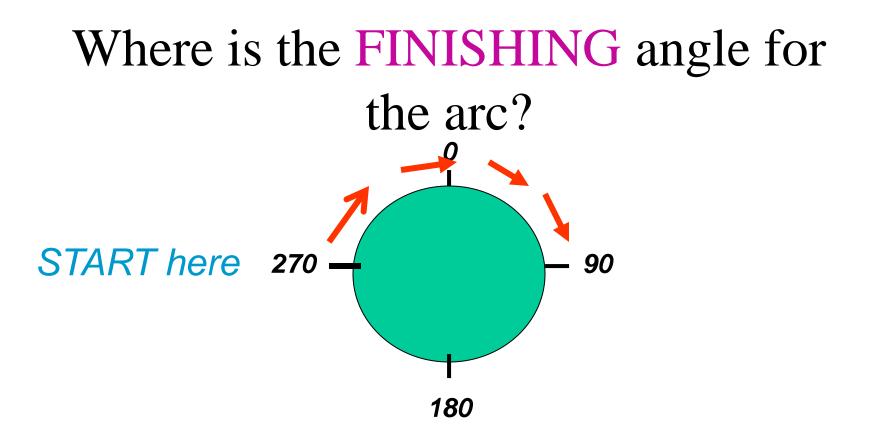

1. Determine the number of degrees in the arc

<u>Treatment Monitor units</u> = gantry speed number of degrees of treatment arc

$$\frac{255}{???} = 1.42$$

255 / 1.42 = ??? = 180 degrees in the arc

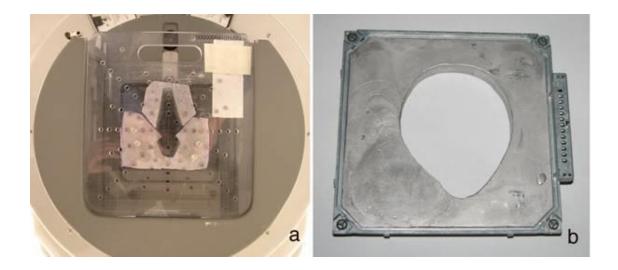

2. Look at gantry angle orientation AND direction of the gantry movement

AND....the FINISHING angle is

Blocking/MLC

Kahn's 4th Edition

BLOCKS

- Shape the Radiation Field to shield/protect normal tissues
- Must be at least 5 HVL thick to allow < 5% transmission
- Made of <u>Cerrobend</u> (Lipowitz's metal) Bismuth, Lead, Tin & Cadmium

• Main Advantage – Low Melting Point

Cerrobend Ratio to Lead

- Since cerrobend is a Lead alloy, we need MORE cerrobend to do the same shielding as Pure Lead
 1.25 cm Cerrobend ~ 1.00cm Pure Lead
- Problem: How much cerrobend is needed for blocks to be used on a machine whose HVL = 1.1cm Lead?
- $1.25 \ge 1.1 = 1.375 \text{ cm}$ cerrobend $\ge 5 = \frac{6.875 \text{ cm}}{6.875 \text{ cm}}$

Tray to Hold Blocks

Tray Factor

• Amount of <u>*Transmission*</u> through the plastic tray which holds the Cerrobend blocks

- Dose <u>*With*</u> Tray in place = 97cGy
- Dose <u>*Without*</u> Tray = 100cGy

• Transmission Factor = 97/100 = .97

(Same concept can be applied to compensator/physical wedges)

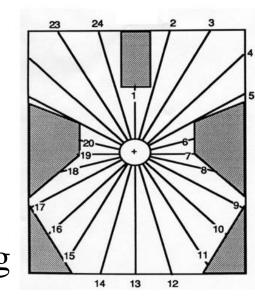

Clarkson Calculation

Also called "*Irregular Field Calculation*" corrects for the *lack of scatter* due to shielding

• The Tissue Air Ratio value needed to calculate the Monitor Unit, is made up of contributions from both the Primary radiation - 0x0 field size $(TAR_0) - when e-hits$ <u>target, photons produced = primary beam</u>

added to scatter (SAR)

 $TAR = TAR_0 + SAR$

.

- TAR for 15x15 (open field) at 10cm depth = .844
- TAR_0 for 0x0 at 10cm depth = .676

Clarkson Calculation

- 1. Divide Field into Segments
- 2. Look up SAR value for EACH Radius Length
- 3. Get Average SAR value
- 4. Add Average SAR value to TAR_0
- 5. Use "adjusted" TAR value for MU Calculation

Radius #

Length

SAR

Beam Weighting

When the dose from EACH beam is the same, the beams are said to be <u>Equally Weighted</u>

Different doses from EACH beam is called <u>Unequally Weighted</u>

For example: AP:PA :: 2:1 dose ratio

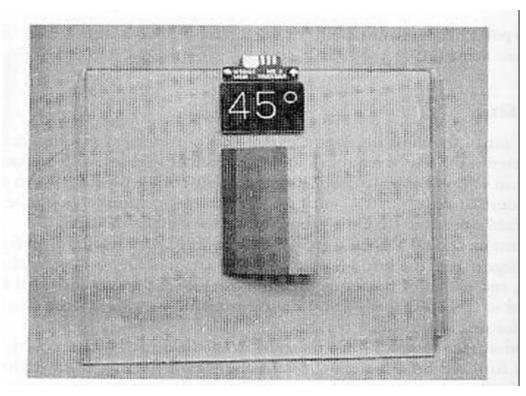

2x + 1x = 180cGy3x = 180cGyx = 60cGy

Anterior (120cGy)

Wedges

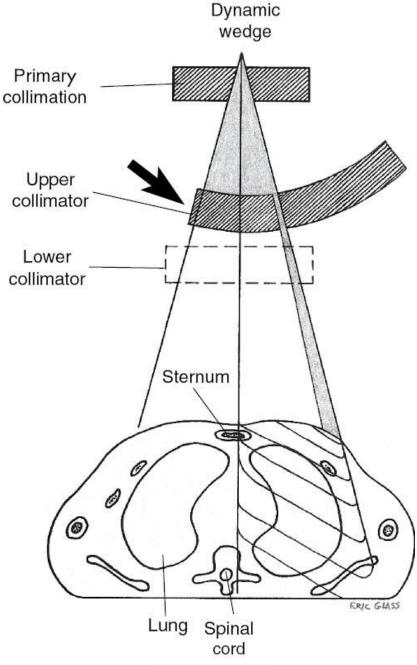

- The most **FREQUENTLY** used Beam Modifying Device
- The Physical wedges are shaped like a foot. Thick edge is called HEEL. Thin edge is called TOE

(Image from Kahn <u>The Physics of Radiation Therapy</u> 4th Edition p 182)

Dynamic Wedge

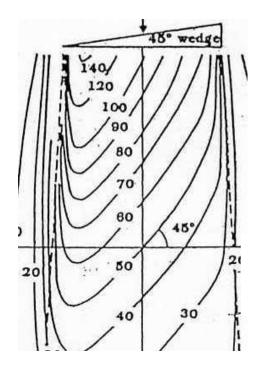

The upper collimator moves DURING the treatment – giving a "wedge effect"

(Courtesy Varian Medical Systems.)

Wedge Angle

- <u>Wedge Angle</u> angle through which an isodose curve is tilted at the central ray of a beam at a specified depth. The range of wedge angles is generally 15-60 degrees.
- wedge angle formula = 90 (.5 x hinge angle)

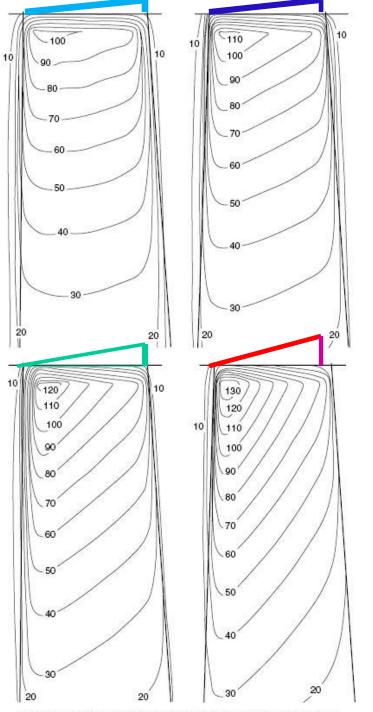

Kahn "wedge angle measurements recommended to be measured at <u>10cm depth</u>"

45 degree

wedge

(Redrawn from Bentel GC: Radiation therapy planning, ed 2, New York, 1996, McGraw-Hill.)

30 degree wedge

60 degree wedge

Hinge Angle

- <u>*Hinge Angle*</u> angle between the central rays of two fields
- **<u>optimum hinge angle</u>** = 180 (2 x wedge angle)

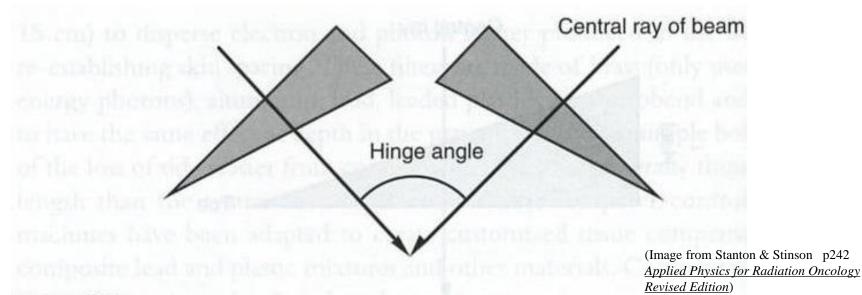

Figure 14.20

The hinge angle is the angle between the central rays of the two beams.

• Determine the wedge angle to be used with a 150° hinge angle wedge angle formula = $90 - (.5 \times \text{hinge angle})$ = $90 - (.5 \times 150)$ = 90 - (.75)= 15° wedge angle

- Determine the optimum hinge angle to be used with 15^0 wedges **optimum hinge angle** = $180 - (2 \times \text{wedge angle})$
 - $= 180 (2 \times 15)$
 - = 180 (30)
 - $= 150^{\circ}$ hinge angle

Wedge & Hinge Angles Table

Wedge Angle	Hinge Angle	
15	150	
30	120	
45	90	
60	60	

<u>ALMOST</u> Done.....

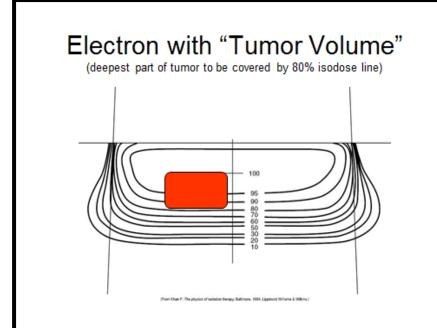

Electrons

- *Electrons* are "generally" used for boost treatments
- To determine the approximate depth of an electron isodose line to cover the deepest part of a tumor, the following "rules of thumb" can be used:
- - Mev/3.2 ~ depth of 90% isodose line
- - Mev/2.8 ~ depth of 80% isodose line
- - Mev/2 ~ depth of 10% isodose line

Therapeutic Range (info as per Kahn's 5th edition)

Practical range

Electron Problem

(Image from Stanton & Stinson p242 <u>Applied Physics for Radiation Oncology</u> <u>Revised Edition</u>) Determine the
appropriate electron
energy to treat a tumor
at 3cm depth if the
physician wants to
treat to the 80%
isodose line.

Electron Problem

3cm to be covered by 80% IDL

• Available electron Energies:

> 7Mev 10Mev 13Mev 16Mev

<u>Rule of Thumb</u>

Mev/2.8 ~ depth of 80% isodose line

7Mev/2.8 = 2.50cm

10 Mev/2.8 = 3.57 cm

13 Mev/2.8 = 4.64 cm
