# Efficient Computation of Radial Distribution Function on GPUs 

Yi-Cheng Tu * and Anand Kumar

Department of Computer Science and Engineering

University of South Florida, Tampa, Florida

## Overview

- Introduction and Motivation
- Spatial Distance Histogram (SDH)
- GPU Architecture
- Brute-force SDH Algorithm on GPU
- Advanced SDH Algorithms on GPU
- Conclusions and Future Work

## Introduction and Motivation

- Scientific databases: very large amount of data
- CERN Hadron Collider generates 15 PB every year
- Next Generation Genome Sequencer generates 100s of GB in few days
- Molecular / Particle simulations
- Study physical systems through simulations
- System state is stored at many time instances
- Each instance is named a frame
- Frame constitutes - system state
- Measurement of particle properties
- Physical location, velocity, charge, mass etc.
- Thousands of frames are generated in a simulation

## Introduction and Motivation

- Millions of particles / atoms are simulated
- Analytical query processing in MS data
- Center of mass
- System density, energy
- Mean square displacement
- Radial distribution function (RDF)

Spatial Distance Histogram (SDH)

- Key step for computing RDF and other queries
- Interesting and tough as compared to others - $\mathrm{O}\left(N^{2}\right)$

## Overview

- Introduction and Motivation
- Spatial Distance Histogram (SDH)
- GPU Architecture
- Brute-force SDH Algorithm on GPU
- Advanced SDH Algorithms on GPU
- Conclusions and Future Work

## SDH Algorithms on CPUs

- Naïve algorithm in simulation software (e.g., GROMACS)
- Space partitioning trees (kd-tree) [NIPS00]
- Process group of particles as one unit
- Density-Map SDH (DM-SDH) based on Quad/Oct-trees [ICDE09,VLDBJ11,EDBT12,TKDE13,TKDE14]
- Runs in $O\left(N^{(2 d-1) / d}\right)$ for $d$-dimensional data
- Approximate variants with running time independent of $N$
- Modern multicore hardware posses tremendous power
- Utilize the power for On-the-fly SDH computation
- All aforementioned algorithms are easily parallelizable

## Overview

- Introduction and Motivation
- Spatial Distance Histogram (SDH)
- GPU Architecture
- Brute-force SDH Algorithm on GPU
- Advanced SDH Algorithms on GPU
- Conclusions and Future Work

## GPU Architecture

- GPU host thousands of cores
- Hierarchy of memory with different access latency
- Process data in SIMD fashion
- Multiple threads access memory in parallel

Multi-Processor

## Overview

- Introduction and Motivation
- Spatial Distance Histogram (SDH)
- GPU Architecture
- Brute-force SDH Algorithm on GPU
- Advanced SDH Algorithms on GPU
- Conclusions and Future Work

## Brute-force SDH on GPU - Naïve Method

- Load all $N$ points into GPU global memory
- Compute all distances and generate histogram
for each point $p$
Compute distance with all other $N-1$ points

Addresses:

Read 4-byte word per thread

Each thread computes distance of
one point to other points on right

## SDH on GPU - Shared Memory Method

- To deal with:
- High access latency of global memory
- Histogram buckets are updated by all threads -> serialized writes into buckets

Device Level Global Memory

## Experimental Results

## - GeForce GTX TITAN

- CUDA Driver Version / Runtime Version:
- CUDA Capability Major/Minor version number:
- (14) Multiprocessors x (192) CUDA Cores/MP:
- Total amount of global memory:

$$
6.0 / 5.0
$$

- Total amount of shared memory per block:

2688 CUDA Cores
6144 Mbytes
49152 bytes

- SDH of various number of data points
- Histogram is assumed to fit in portion of shared memory
- All data is assumed to fit in global memory

## Experimental Results - Time

GPU running time Comparison

| Data <br> Points | CPU Main <br> Memory | Shared <br> Memory | Global <br> Memory |
| :--- | :---: | :--- | :--- |
| 100,000 | $424.7(7 \mathrm{~m})$ | 1.54 | 3.40 |
| 300,000 | $3812(1 \mathrm{~h})$ | 11.39 | 26.42 |
| 800,000 | $27142(7 \mathrm{~h})$ | 77.20 | 177.92 |
| $1,600,000$ | 1.5 Day | 316.01 | 699.16 |
| $3,200,000$ | Days | 1317.21 | 2771.21 |
| $6,400,000$ | Days | 5335.71 | 11036.78 |

## Experimental Results - Speedup

GPU Speedup Comparison with respect to CPU

| Data Points | Shared <br> Memory | Global <br> Memory |
| :--- | ---: | ---: |
| 100,000 | 275.7 | 124.9 |
| 300,000 | 334.6 | 144.2 |
| 800,000 | 351.5 | 152.5 |
| $1,600,000$ | 410.1 | 185.3 |
| $3,200,000$ |  |  |
| $6,400,000$ |  |  |

## Overview

- Introduction and Motivation
- Spatial Distance Histogram (SDH)
- GPU Architecture
- Brute-force SDH Algorithm on GPU
- Advanced SDH Algorithms on GPU
- Conclusions and Future Work

## Background of DM-SDH

- Main idea: avoid the calculation of pairwise distances
- Observation:
- two groups of points can be processed in one shot if the range of all inter-group distances falls into a histogram bucket
- We say these two groups are resolved into that bucket

## Background of DM-SDH

The simulation space

Density Map - DM 0

| Density Map - DM |  |  |  |
| :---: | :---: | :---: | :---: |
| 2 | 3 | 10 | 6 |
| 7 | 5 | 12 | 1 |
| 15 | 8 | 6 | 9 |
| 6 | 13 | 4 | 2 |

## Spatial Uniformity

- Closed from PDF of distances - approximate PDF is derived
- Monte-Carlo simulation is another approximation to PDF

Theorem: Number of distinct Monte-Carlo simulations performed for all pair of cells in density map of $M$ cells is $O(M)$

## DM-SDH on GPUs

- Load all density maps on global memory.
- Shared memory is loaded by threads in a CUDA block
- Each thread loads information about one cell
- Each thread processes a pair of cells
- Replacing only one cell in loop until all cell are processed
- Next a new cell is loaded and paired with distinct other cells

## DM-SDH Algorithm on GPUs

## DM-SDH Algorithm on GPUs

- Each CUDA thread
- Processes a pair of cells from DM
- If pair of cells contain uniformly distributed points
- Threads in each CUDA block perform Monte-Carlo simulations
- The probability distribution function for histogram buckets is hashed
- Now for each pair of cells
- If they have uniformly distributed points
- Retrieve information from hash and update histogram buckets
- Else
- Either compute pair-wise distance of all pairs of points in both cells by naïve way
- Or use some heuristics

## Experimental Results - Performance

MM: CPU version, GM: GPU version

## Experimental Results - Performance

MM: CPU version, GM: GPU Global Memory, SM: GPU Shared Memory

## Experimental Results - Energy Consumption

## DM-SDH vs. Brute-force

- Brute-force algorithm more suitable for GPU deployment
- Main problems for DM-SDH on GPUs:
- Code divergence (i.e., tree traverse)
- Size of a cell is much larger than size of a point

## Overview

- Introduction and Motivation
- Spatial Distance Histogram (SDH)
- GPU Architecture
- Brute-force SDH Algorithm on GPU
- Advanced SDH Algorithms on GPU
- Conclusions and Future Work

## Conclusions and Future Work

- Computing power of GPUs can be harnessed for SDH processing
- Speedup varies (3X - 400X) with the algorithm implemented and problem parameter
- Take advantage of new GPU/CUDA features
- Shuffle instruction
- Large register pool
- Read-only cache
- Extension to other correlation functions

## Background of DM-SDH

- The Approximate Algorithm (ADM-SDH)
- Organize all data into a Quad-tree (2D data) or Oct-tree (3D data).
- Cache the atoms counts of each tree node (cell)
- Density map: all counts in one tree level

```
start from one proper density map M
FOR every pair of cells A and B in Mo
    resolve A and B
    IF A and B are not resolvable
    THEN IF at desired density map level
        THEN distribute distances proportionally
        into overlapping buckets
        ELSE FOR each child cell A' of A
        FOR each child cell B' of B
        resolve A' and B'
```

## SDH on GPU - Using Registers

- GPU with compute capability 3.0 and up support the _shift__instruction.
- Load large number of registers with distinct point
- Compute the SDH by shifting one set of register
- While keeping another set constant
- All pairs of distances between the two sets will be computed

## SDH on GPU - Using Registers

Shift left after one iteration
of pair-wise computation

Points in global memory of device
