9. (5 points) Balance the following equation with the smallest set of whole numbers.
10. (10 points) Nitric Oxide ( NO ) reacts with oxygen gas to form nitrogen dioxide $\left(\mathrm{NO}_{2}\right)$, a dark-brown gas:

$$
2 \mathrm{NO}(g)+\mathrm{O}_{2}(g) \rightarrow 2 \mathrm{NO}_{2}(g)
$$

In one experiment 0.886 mole of NO is mixed with 0.503 mole of $\mathrm{O}_{2}$. (a) Calculate which of the two reactants is the limiting reagent. (b) Calculate also the number of moles of $\mathrm{NO}_{2}$ produced.

This is a limiting reagent problem. Let's calculate the moles of $\mathrm{NO}_{2}$ produced assuming complete reaction for each reactant.

$$
\begin{aligned}
2 \mathrm{NO}(g)+\mathrm{O}_{2}(g) & \rightarrow 2 \mathrm{NO}_{2}(g) \\
& 0.886 \mathrm{~mol} \mathrm{NO} \times \frac{2 \mathrm{~mol} \mathrm{NO}_{2}}{2 \mathrm{~mol} \mathrm{NO}}=0.886 \mathrm{~mol} \mathrm{NO}_{2} \\
& 0.503 \mathrm{~mol} \mathrm{O}_{2} \times \frac{2 \mathrm{~mol} \mathrm{NO}_{2}}{1 \mathrm{~mol} \mathrm{O}_{2}}=1.01 \mathrm{~mol} \mathrm{NO}_{2}
\end{aligned}
$$

NO is the limiting reagent; it limits the amount of product produced. The amount of product produced is 0.886 mole $\mathrm{NO}_{2}$.
11. (10 points) Identify the element being oxidized, the element being reduced, the oxidizing agent, and the reducing agent in the following reaction.

$$
2 \mathrm{KI}+\mathrm{F}_{2} \rightarrow \mathrm{I}_{2}+2 \mathrm{KF}
$$

Element oxidized: $\mathrm{I}^{-}$

Oxidizing agent: $\quad \mathrm{F}_{2}$

Element reduced: $\mathrm{F}_{2}$

Reducing agent: $\mathrm{I}^{-}$
12. (10 points) Calculate the percent composition by mass of all the elements in $\mathrm{Na}_{2} \mathrm{CO}_{3}$.
$\mathrm{M}\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)=(2 \times 23)+(1 \times 12)+(3 \times 16)=106 \mathrm{~g} / \mathrm{mol}$
$\% N a=\frac{2 \times 23}{106}=0.434=43.4 \%$
$\% C=\frac{12}{106}=0.113=11.3 \%$
$\% O=\frac{3 \times 16}{106}=0.453=45.3 \%$
13. (10 points) A sample of unknown compound was analyzed and found to contain $44.4 \% \mathrm{C}$, $6.21 \% \mathrm{H}, 39.5 \% \mathrm{~S}$ and $9.86 \% \mathrm{O}$. What is the empirical formula of this compound?

Assume that we have 100 g of a substance. Then:

$$
\begin{aligned}
& n_{\mathrm{C}}=44.4 \mathrm{~g} \mathrm{C} \times \frac{1 \mathrm{~mol} \mathrm{C}}{12.01 \mathrm{~g} \mathrm{C}}=3.70 \mathrm{~mol} \mathrm{C} \\
& n_{\mathrm{H}}=6.21 \mathrm{~g} \mathrm{H} \times \frac{1 \mathrm{~mol} \mathrm{H}}{1.008 \mathrm{~g} \mathrm{H}}=6.16 \mathrm{~mol} \mathrm{H} \\
& n_{\mathrm{S}}=39.5 \mathrm{~g} \mathrm{~S} \times \frac{1 \mathrm{~mol} \mathrm{~S}}{32.07 \mathrm{~g} \mathrm{~S}}=1.23 \mathrm{~mol} \mathrm{~S} \\
& n_{\mathrm{O}}=9.86 \mathrm{~g} \mathrm{O} \times \frac{1 \mathrm{~mol} \mathrm{O}}{16.00 \mathrm{~g} \mathrm{O}}=0.616 \mathrm{~mol} \mathrm{O}
\end{aligned}
$$

Thus, we arrive at the formula $\mathrm{C}_{3.70} \mathrm{H}_{6.16} \mathrm{~S}_{1.23} \mathrm{O}_{0.616}$. Dividing by the smallest number of moles ( 0.616 mole) gives the empirical formula, $\mathbf{C}_{\mathbf{6}} \mathbf{H}_{\mathbf{1 0}} \mathbf{S}_{\mathbf{2}} \mathbf{O}$.
14. (10 points) Balance the following equation and write the corresponding ionic and net ionic equations.

$$

Balanced equation: $\mathrm{BaCl}_{2}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \rightarrow \mathrm{BaSO}_{4}(\mathrm{~s})+2 \mathrm{NaCl}(\mathrm{aq})$

Ionic equation: $\mathrm{Ba}^{2+}+2 \mathrm{Cl}^{-}+2 \mathrm{Na}^{+}+\mathrm{SO}_{4}{ }^{2-} \rightarrow \mathrm{BaSO}_{4}(\mathrm{~s})+2 \mathrm{Na}^{+}+2 \mathrm{Cl}^{-}$

Net ionic equation: $\mathrm{Ba}^{2+}+\mathrm{SO}_{4}{ }^{2-} \rightarrow \mathrm{BaSO}_{4}(\mathrm{~s})$
15. ( 10 points) What volume of concentrated nitric acid ( 4.0 M ) is required to make 60.0 mL of a 0.3 M nitric acid solution? What volume of water is required?

$$
\mathrm{M}_{\mathrm{i}} \mathrm{~V}_{\mathrm{i}}=\mathrm{M}_{\mathrm{f}} \mathrm{~V}_{\mathrm{f}}
$$

$\mathrm{M}_{\mathrm{i}}=4.0 \mathrm{~mol} / \mathrm{L}$
$\mathrm{M}_{\mathrm{f}}=0.2 \mathrm{~mol} / \mathrm{L}$
$\mathrm{V}_{\mathrm{f}}=60 \mathrm{~mL}$

$$
\begin{gathered}
\mathrm{M}_{\mathrm{i}} \mathrm{~V}_{\mathrm{i}}=\mathrm{M}_{\mathrm{f}} \mathrm{~V}_{\mathrm{f}} \\
4.0 \mathrm{~mol} / \mathrm{L} \times \mathrm{Vi}=0.2 \mathrm{~mol} / \mathrm{L} \times 60.0 \mathrm{~mL} \\
\mathrm{Vi}=0.2 \mathrm{~mol} / \mathrm{L} \times 60.0 \mathrm{~mL} / 4.0 \mathrm{~mol} / \mathrm{L}=3 \mathrm{~mL} \\
60 \mathrm{~mL}-3 \mathrm{~mL}=57.0 \mathrm{~mL}
\end{gathered}
$$

16. ( 10 points) Calculate the mass of KI in grams required to prepare $5.00 \times 10^{2} \mathrm{~mL}$ of a 2.80 M solution.

Convert the volume into Liters: $5.00 \times 10^{2} \mathrm{~mL}=0.5 \mathrm{~L}$
The number of moles of KI in 0.5 L of the 2.80 M solution will be:
$\mathrm{n}(\mathrm{KI})=0.5 \mathrm{~L} \times 2.80 \mathrm{~mol} / \mathrm{L}=1.40 \mathrm{~mol}$
Molar mass of KI is $M(\mathrm{KI})=39+127=166 \mathrm{~g} / \mathrm{mol}$
The mass of required KI will then be $\mathrm{m}=\mathrm{n} \times M=1.40 \mathrm{~mol} \times 166 \mathrm{~g} / \mathrm{mol}=232 \mathrm{~g}$.
