<b>Preface</b>	xiii
<b>Introduction</b>	1
<b>1 Quantum Many Particle Physics</b>	7
<i>Pinaki Majumdar</i>	
1.1 Preamble . . . . .	8
1.2 Introduction . . . . .	8
1.3 Introduction to many particle physics . . . . .	10
1.3.1 Phases of many particle systems . . . . .	10
1.3.2 Quantities of physical interest . . . . .	12
1.3.3 Fermi and Bose liquids . . . . .	14
1.4 Phase transitions and broken symmetry . . . . .	22
1.4.1 Phase transitions and symmetry breaking .	22
1.4.2 Symmetry breaking and interactions in BEC	25
1.5 Normal Fermi systems: model problems . . . . .	31
1.5.1 Neutral fermions: dilute hardcore Fermi gas	34
1.5.2 Charged fermions: the electron gas . . . . .	39
1.6 Electrons and phonons: Migdal-Eliashberg theory .	46
1.6.1 Weak coupling theory: BCS . . . . .	48
1.6.2 The normal state: Migdal theory . . . . .	52
1.6.3 BCS theory: Greens function approach . . .	56
1.6.4 Superconductivity: Eliashberg theory . . . .	58
1.7 Conclusion: ‘field theory’ and many particle physics	63

<b>2 Critical Phenomena</b>	<b>69</b>
<i>Somendra M. Bhattacharjee</i>	
2.1 Preamble . . . . .	70
2.1.1 Large system: Thermodynamic limit . . . . .	72
2.2 Where is the problem? . . . . .	72
2.3 Recapitulation - A few formal stuff . . . . .	74
2.3.1 Extensivity . . . . .	74
2.3.2 Convexity: Stability . . . . .	76
2.4 Consequences of divergence . . . . .	78
2.5 Generalized scaling . . . . .	81
2.5.1 One variable: Temperature . . . . .	81
2.5.2 Solidarity with thermodynamics . . . . .	87
2.5.3 More variables: Temperature and field . . . . .	88
2.5.4 On exponent relations . . . . .	92
2.6 Relevance, irrelevance and universality . . . . .	93
2.7 Digression . . . . .	95
2.7.1 A first-order transition: $\alpha=1$ . . . . .	95
2.7.2 Example: Polymers : no “ordering” . . . . .	97
2.8 Exponents and correlations . . . . .	99
2.8.1 Correlation function . . . . .	99
2.8.2 Relations among the exponents . . . . .	101
2.8.3 Length-scale dependent parameters . . . . .	103
2.9 Models as examples: Gaussian and $\phi^4$ . . . . .	105
2.9.1 Specific heat for the Gaussian model . . . . .	106
2.9.2 Cut-off and anomalous dimensions . . . . .	107
2.9.3 Through correlations . . . . .	110
2.10 Epilogue . . . . .	112
<b>3 Phase Transitions and Critical Phenomena</b>	<b>119</b>
<i>Deepak Kumar</i>	
3.1 Introduction . . . . .	120
3.2 Thermodynamic stability . . . . .	121
3.3 Lattice gas : mean field approximation . . . . .	126
3.4 Landau theory . . . . .	134

3.5	Spatial correlations . . . . .	138
3.6	Breakdown of mean field theory . . . . .	141
3.7	Ginzburg-Landau free energy functional . . . . .	143
3.8	Renormalisation group (RG) . . . . .	144
3.9	RG for a one dimensional Ising chain . . . . .	146
3.10	RG for a two-dimensional Ising model . . . . .	150
3.11	General features of RG . . . . .	158
3.11.1	Irrelevant variables . . . . .	163
3.12	RG scaling for correlation functions . . . . .	164
3.13	RG for Ginzburg-Landau model . . . . .	167
3.13.1	Tree-level approximation . . . . .	170
3.13.2	Critical exponents for $d > 4$ . . . . .	172
3.13.3	Anomalous dimensions . . . . .	175
3.14	Perturbation series for $d < 4$ . . . . .	176
3.15	Generalisation to a n-component model . . . . .	183
<b>4</b>	<b>Topological Defects</b>	<b>189</b>
	<i>Ajit M. Srivastava</i>	
4.1	The subject of topological defect . . . . .	191
4.2	What is a topological defect? . . . . .	193
4.2.1	Meaning of order parameter . . . . .	194
4.2.2	Spontaneous symmetry breakdown(SSB) . .	195
4.2.3	SSB in particle physics . . . . .	197
4.2.4	Order parameter space . . . . .	197
4.3	The domain wall . . . . .	198
4.3.1	Why defect? . . . . .	200
4.3.2	Why topological? . . . . .	201
4.3.3	Energy considerations . . . . .	202
4.4	Examples of topological defects . . . . .	203
4.5	Condensed matter versus particle physics . .	209
4.6	Detailed understanding of a topological defect . .	213
4.6.1	Free homotopy of maps . . . . .	216
4.6.2	Based homotopy and the fundamental group	217
4.7	Classification of defects using homotopy groups .	219
4.8	Defect structure in liquid crystals . . . . .	227

4.8.1	Defects in nematics . . . . .	228
4.8.2	Non abelian $\pi_1$ - biaxial nematics . . . . .	230
4.9	Formation of topological defects . . . . .	231
<b>5</b>	<b>Introduction to Bosonization</b>	<b>239</b>
	<i>Sumathi Rao and Diptiman Sen</i>	
5.1	Fermi and Luttinger liquids . . . . .	240
5.2	Bosonization . . . . .	247
5.2.1	Bosonization of a fermion with one chirality	248
5.2.2	Bosonisation with two chiralities . . . . .	257
5.2.3	Field theory near the Fermi momenta . . . . .	265
5.3	Correlation functions and dimensions of operators	268
5.4	RG analysis of perturbed models . . . . .	272
5.5	Applications of bosonization . . . . .	281
5.6	Quantum antiferromagnetic spin 1/2 chain . . . . .	282
5.7	Hubbard model . . . . .	300
5.8	Transport in a Luttinger liquid - clean wire . . . . .	309
5.9	Transport in the presence of isolated impurities . .	319
5.10	Concluding remarks . . . . .	328
<b>6</b>	<b>Quantum Hall Effect</b>	<b>335</b>
	<i>R. Rajaraman</i>	
6.1	Classical Hall effect . . . . .	336
6.2	Quantized Hall effect . . . . .	337
6.3	Landau problem . . . . .	338
6.4	Degeneracy counting . . . . .	340
6.5	Laughlin wavefunction . . . . .	341
6.6	Plasma analogy . . . . .	342
6.7	Quasi-holes and their Laughlin wavefunction . . .	344
6.8	Localization physics and the QH plateaux . . . . .	345
6.9	Chern-Simons theory . . . . .	348
6.10	Vortices in the CS field and quasiholes . . . . .	354
6.11	Jain's theory of composite fermions . . . . .	355

<b>7 Low-dimensional Quantum Spin Systems</b>	<b>359</b>
<i>Indrani Bose</i>	
7.1 Introduction . . . . .	360
7.2 Ground and excited states . . . . .	365
7.3 Theorems and rigorous results for antiferromagnets . . . . .	369
7.3.1 Lieb-Mattis theorem . . . . .	369
7.3.2 Marshall's sign rule . . . . .	370
7.3.3 Lieb, Schultz and Mattis theorem . . . . .	372
7.3.4 Mermin-Wagner theorem . . . . .	376
7.4 Possible ground states and excitation spectra . . . . .	376
7.5 The Bethe Ansatz . . . . .	387
