

Fractions: Number Meaning and Number Relationships Grade 3

Orcutt Union School District
January 28, 2020

Today's Agenda and Outcomes

Objective:

- Participants will unwrap the fraction standards to determine the concepts, procedures and type of problems students are expected to master. Participants will engage in learning activities that build meaning of fractions and fraction relationships using various tools and strategies.

□ Agenda:

- Unwrap standards
- Building meaning of fractions using areas, number lines, and sets
- Make fraction equivalencies using areas and number lines
- Compare fractions using the same whole by comparing same numerators, same denominators, or benchmark values.
- Instructional Planning

Introductions and Outcomes

☐ Nametags

- Name (write this big)
- Site
- Yrs. in education

☐ Introduction

- What is your favorite number?
* Write it as a multiplication fact.

☐ Talking Chips

- Take 4 coffee filters and put 3 chips in each one.

Multiplication and Division

Understanding Multiplication and Division

$$\begin{array}{ccc} \underline{\hspace{2cm}} & \times & \underline{\hspace{2cm}} & = & \underline{\hspace{2cm}} \\ \text{(# of} & & \text{(how many} & & \text{(Total # of} \\ \text{groups)} & & \text{items in} & & \text{items)} \\ & & \text{each} & & \\ & & \text{group)} & & \end{array}$$

Multiplication

□ What models are we asking students to use? How often?

Equal Groups Drawing

bags of lemons

$$4 \times 6 = 24 \quad 24 \div 4 = 6$$

Equal Shares Drawing

Array Drawing

$$4 \times 6 = 24$$

$$6 \times 4 = 24$$

Area Model

$$4 \times 6 = 24$$

4 Ways to Represent

- ❑ Fold your paper into 2 equal parts horizontally and then vertically to create 4 equal sections.
- ❑ You are given a fact to display in 4 different ways.
 - Write your fact in the center
 - 1) repeated addition equation
 - 2) number line
 - 3) an array
 - 4) equal groups

Repeated Addition	Number Line
$6 \times 9 = \underline{\quad}$	
Array	Equal groups

Multiplication Give Me 5

Array

Skip Counting

Start on zero.
Hop three spaces.
Do this four times.

$$\text{Equation: } 3 \times 4 = 12$$

My teacher brought ice cream to school. She is giving three scoops to each student. After she serves the first four students, how many scoops has she given away?

Word Problem

You can also make 3 groups of 4

Equal Groups

©2014 Light Bulb and Leaflet

What is Division?

How does it relate to multiplication?

What are fair shares? What does it mean to partition equally? (3.OA.2)

Division as an Operation

$$6 \div 2 =$$

Partitive – Finding the size of the group

The question: How do you divide or partition 6 things into 2 groups?

There are 3 in each group.

Measurement – Finding the number of groups of a specific size

The question: How many groups of 2 units are in 6?

There are 3 groups of 2 in 6.

Strategies

□ Counting on

□ Doubling

□ Combining two known facts

- **Strategy 1:** Start with 5×6 , and count by 6 from there.
 $5 \times 6 = 30$, the next count by 6 is 36. So, $6 \times 6 = 36$.
- **Strategy 2:** Double a 3s multiplication.
 6×6 is twice 6×3 , which is 18. So, $6 \times 6 = 18 + 18 = 36$.
- **Strategy 3:** Combine two multiplications you know.
 $4 \times 6 = 24$ 4 sixes are 24.
 $2 \times 6 = 12$ 2 sixes are 12.
 $6 \times 6 = 36$ 6 sixes are 36.

Here are two ways to show Strategy 3 with drawings.

unshaded area: $4 \times 6 = 24$
shaded area: $2 \times 6 = 12$
total area: $6 \times 6 = 36$

Explanation:
6 groups of 6 is
4 groups of 6 plus
2 groups of 6.

- **Strategy 4:** Add 6 on to the 6s multiplication before or subtract 6 from the multiplication ahead.
 $5 \times 6 = 30$, add 6 more to get 36. So, $6 \times 6 = 36$.

3's

tricycle

letters in

Reflection

What have you implemented to support students build the concepts of multiplication and division?

- *What is working?*
- *Where are students still getting stuck? With what specifically?*

What are you still doing consistently to build fluency and to measure fluency?

Start the presentation to see live content. Still no live content? Install the app or get help at PollEv.com/app

What have you implemented to support students build the concepts of multiplication and division that IS working?

Top

What have you implemented to support students with multiplication and division yet they still remain stuck? on what specifically are they they stuck?

What are you doing consistently to build fluency?

- A Building small sets of facts over time.
- B connecting facts with the real world, ex:
pairs or half dozen or days of the week
- C Using story problems
- D Having students use manipulatives,
graph paper, other tools
- E Using properties such as commutative,
distributive
- F. Using games
- G. Students are charting their own growth
- H. Measuring flexibility and accuracy but
not yet efficiency
- I. Timed tests

Critical Areas

Critical Areas Identified

Number Sense

- Number Meaning
- Number Relationships
- Number Magnitude
- Operations of Numbers

Problem Solving

- Problem Types
- Problem Structures
- Instructional Considerations for Solving Problem

Fluency

- Understanding Fluency
- Building Flexible Strategies
- Measured Progress

Critical Areas Identified

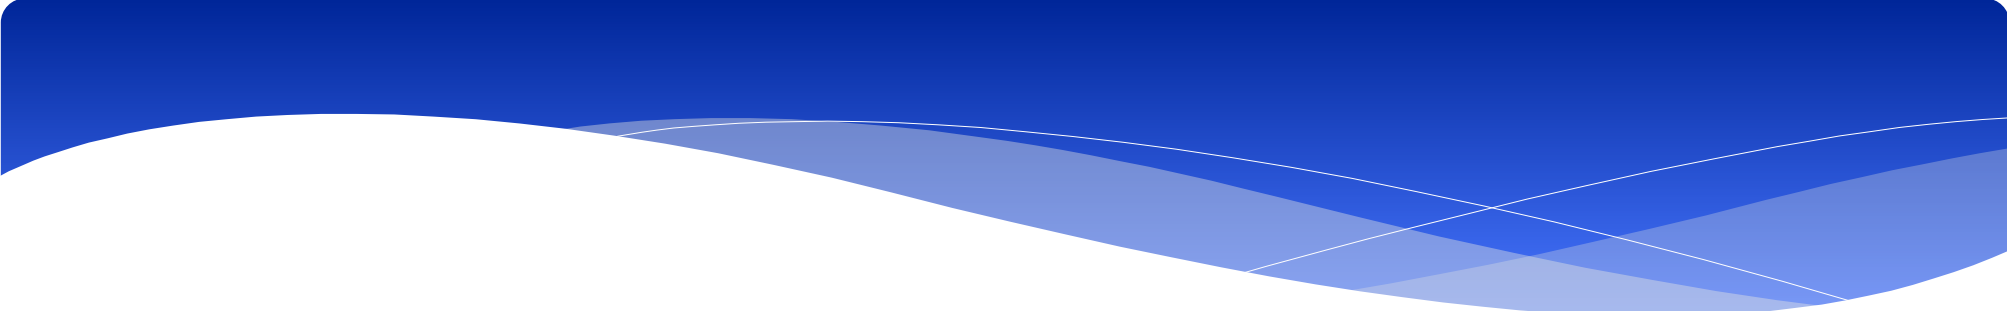

Grade 3	Operations and Algebraic Thinking		Numbers and Fractions		Measurement	
	3.OA.1 3.OA.2 Interpret products and interpret quotients	3.OA.7 Multiply and divide within 100	3.NF.1 Defining a fraction	3.NF.3 Equivalent fractions and comparing fractions	3.MD.2 Solve problems of mass and volume using all operations	3.MD.7 Concepts of area as it relates to multiplication and division.

Fractions

□ What do they say?

- How are you making sense of the expectations of the standards?
- How will the standards guide your instruction?

CONCEPTS What concepts do students need to understand?	PROCEDURES What procedures do students need to master?
PROBLEM SOLVING What types of problem solving are students expected to do?	TOOLS What tools should students use to making meaning of this concept?

“Current instruction that gives a brief introduction through part-whole fractions and then proceeds to introduce computation procedures *does not* give children the time they need to construct important ideas and ways of thinking.”

(Lamon, 1999; emphasis added)

Confusions and Misconceptions

Confusion results when students try to apply their understanding of whole numbers to fractions.

The textbook approach to teaching:

- **Moves too quickly over the major concepts**
- **Rushes to have students practice procedures, resulting in simplistic, mechanical problem solving**
- **Has limited representation, weakening conceptual understanding**

Confusions and Misconceptions

Fallout from Whole Numbers

What do you see?

- 2 and 6
- 2 and 8

**Is there a
relationship?**

Confusions and Misconceptions

Some Models Can Be Confusing

Is this $\frac{2}{8}$ or “2 green and 6 red”?

Say: “Two-eighths”

not “2 over 8” or “2 out of 8.”

Confusions and Misconceptions

☐ Fractions and the Concept of Infinity

Confusions and Misconceptions

□ Fractions and the Concept of Infinity

Confusions and Misconceptions

An Infinite Number of Fractions?

Confusions and Misconceptions

An Infinite Number of Fractions?

Confusions and Misconceptions

An Infinite Number of Fractions?

Confusions and Misconceptions

- ❑ **Take the time to develop the concept of fractions.**
 - Foundational to decimals, percentage, ratios, and proportions
- ❑ **Use visual representations and classroom talk.**
- ❑ **Develop a robust understanding of part-whole relationships.**
 - Avoid simplistic instruction
 - Before teaching operations on fractions

Confusions and Misconceptions

□ Students need to learn how to:

- Represent a fraction multiple ways.
- Show the value of a fraction based on different definitions of the whole.
- Work with equivalent fractions.
- Understand that comparisons can only occur when the wholes are equivalent.
- Use the meaning of numerator and denominator to compare fractions and reason about the size of a fraction.

Building Number Sense of Fractions

Number Meaning

- Counting, Writing, Naming, and Representing

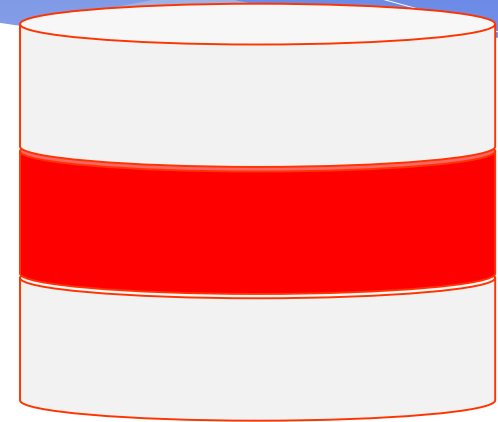

Number Relationships

Building a Sense of Operation

Number Magnitude and Size

Building Meaning of Fractions

Area Shapes

What does $\frac{1}{3}$ of this rectangle look like?

Building Meaning of Fractions

Length Models

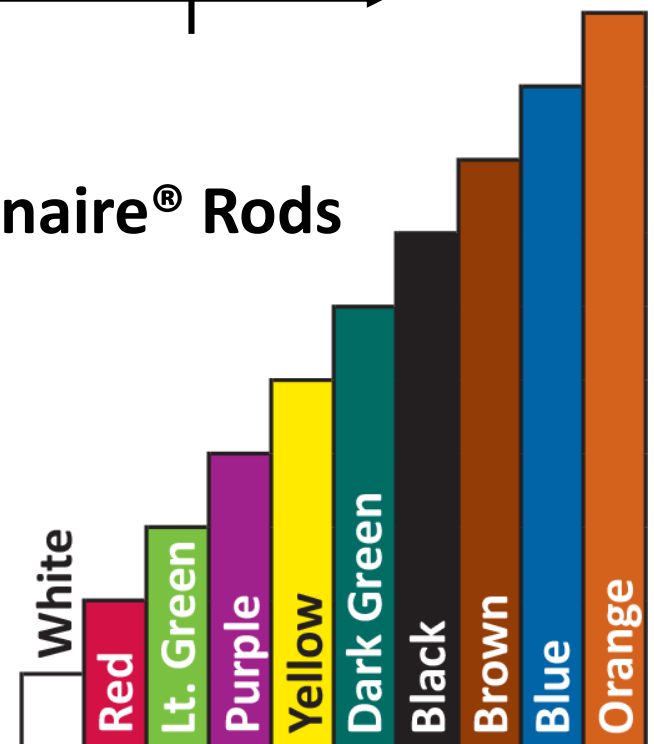

Number Line

Fraction Bars

Cuisenaire® Rods

Building Meaning of Fractions

Set Models

Symbolic Notation

These words are Level 3 vocabulary and don't have meaning or any common reference for children. The words themselves **will NOT help** students **understand their meaning**.

Numerator → $\frac{2}{8}$
(# of equal parts)
Means enumeration
or counting

← Denominator
(# of equal parts in the whole)
Means name of the class or
type of thing being
represented like a
denomination of money
being counted.

The Meaning of a/b

We have established the meaning of $1/3$

- A whole is partitioned into three equal sized pieces. When we want to reference only 1 of the 3 pieces, we call the size of $1/3$ of the whole.

The Meaning of a/b

What does $2/3$ really mean?

- There are 2 pieces in blue. They are each $1/3$ of the whole. So two $1/3$ pieces is the same as $2/3$ of the whole.

Building Meaning of Fractions

- Partitioning is a central mathematical idea, and it is central to equal shares
 - Begins in 1st grade
- Equal shares are not easy for students to draw, but they are essential for understanding (especially for addition and subtraction)
- The idea of relational is essential

Building Meaning of Fractions

Area Models are Particularly Useful for Showing Fair Shares

Fair Share Examples

Non-Examples of Fair Shares

Building Meaning of Fractions

Area Models are Particularly Useful for Showing Fair Shares

Fair Share Examples

Non-Examples of Fair Shares

Building Meaning of Fractions

Length Models and Fair Shares

Fair shares

Non-examples of fair shares

Building Meaning of Fractions

Each segment is equal in size so breaking up the number line this way shows fair shares.

Why are these called fourths?

Building Meaning of Fractions

What does equal shares look like in a **set model**?

Equal Shares

Non-Equal Shares

Building Meaning of Fractions

- A beaker is considered full when the liquid reaches the fill line shown near the top. Estimate the amount of water in the beaker by shading the drawing to the indicated amount. The first one is done for you.

1 half

1 fifth

1 sixth

- Each circle represents 1 whole pie. Estimate to show how you would cut the pie into the fractional unit that is given.

halves

thirds

sixths

Building Meaning of Fractions

Circle the figures that show fair shares.

Each shape is a whole divided into equal parts. Name the fractional unit. Then determines how many of those units are shaded.

The unit is 1 fourth.

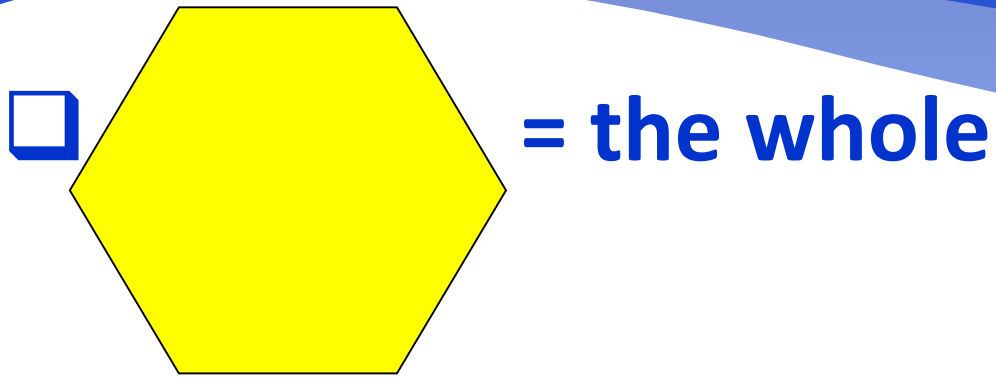

2 fourths are shaded.

Building Meaning of Fractions

Area Model

It takes two of the trapezoids to make the whole so one of them would be one-half of the whole.

Building Meaning of Fractions

What is the value of  ?

$\frac{1}{6}$

Building Meaning of Fractions

= the whole

- What is the value of

?

$\frac{1}{3}$

Building Meaning of Fractions

= the whole

What is the value of

?

$\frac{1}{4}$

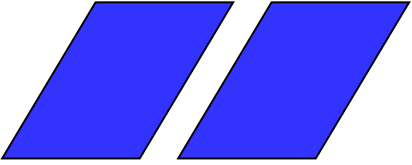

Building Meaning of Fractions

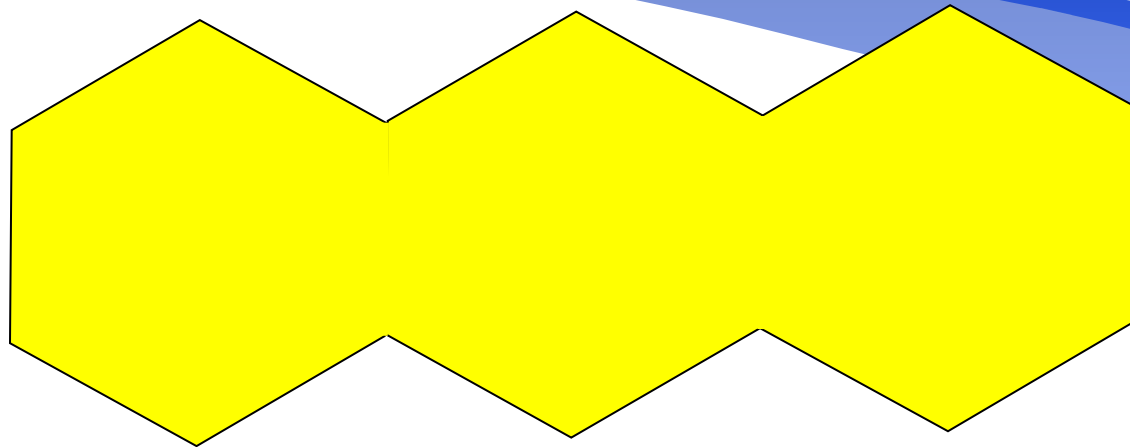

= the whole

What is the value of  ? $\frac{1}{12}$

What is the value of  ? $\frac{1}{6}$

What is the value of  ? $\frac{2}{6} = \frac{1}{3}$

Building Meaning of Fractions

= the whole

What is the value of  ? $\frac{1}{6}$

What shape(s) will show $\frac{1}{2}$ of this unit?

Building Meaning of Fractions

- Partitioning is a central mathematical idea, and it is central to equal shares
- Equal shares are not easy for students to draw, but they are essential for understanding (especially for addition and subtraction)
- Let's stop to work on how to build the idea of equal shares with areas using different shapes and questions.

The Meaning of a/b

- Lengths or numbers lines can also be used. Think about the red pieces. They show units of $\frac{1}{4}$ of the whole.

- Use these pieces as a reference to show a length that is $\frac{2}{4}$ or $\frac{3}{4}$. Why can they be called these lengths?

The Meaning of a/b

$\square \frac{3}{4}$ is the same as 3 units of $\frac{1}{4}$ in length.

$$\square \frac{3}{4} = \frac{1}{4} + \frac{1}{4} + \frac{1}{4}$$

Building Meaning of Fractions

Building Meaning of Fractions

□ Creating Paper Strips

- How do we use them to name fractions?
- How do they help students to make sense of part to whole relationships?

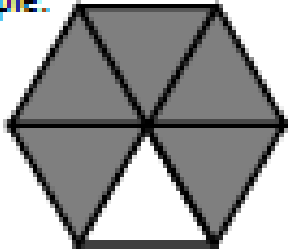

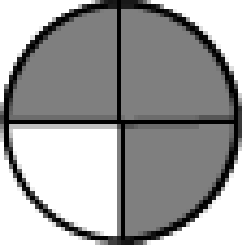

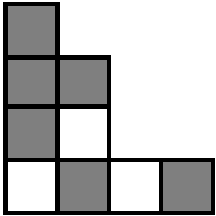

Building Meaning of Fractions

□ Use Paper Strips to build number lines

■ White board

- * Draw 5-8 lines of different lengths.
- * Choose one line. Fold your write board to match the endpoints of your line. Where is the middle? Open it up and mark this point on the line. It shows two equal segments or $\frac{1}{2}$ of the line.
- * Repeat with two other lines.
- * Now “eye-spy” on the next line where you think will be the point to represent $\frac{1}{2}$ of the line. Fold to see how close you are. REPEAT this until you find you are very close to finding the $\frac{1}{2}$ point for a given line.

Building Meaning of Fractions

	Total Number of Equal Parts	Total Number of Shaded Equal Parts	Unit Fraction	Fraction Shaded
Sample: 	6	5	$\frac{1}{6}$	$\frac{5}{6}$
a. 				
b. 				

Building Meaning of Fractions

1. Estimate to equally partition and label the unit fractions on the number line. Label the wholes as fractions and box them. The first one is done for you.

Building Meaning of Fractions

Locate and label the following fractions on the number line.

$$\frac{0}{6}$$

$$\frac{6}{6}$$

$$\frac{12}{6}$$

$$\frac{3}{6}$$

$$\frac{9}{6}$$

Locate and label the following fractions on the number line.

$$\frac{8}{4}$$

$$\frac{6}{4}$$

$$\frac{12}{4}$$

$$\frac{16}{4}$$

$$\frac{4}{4}$$

Building Meaning of Fractions

☐ Stations for Making Meaning of Fractions

☐ Each station will show the given fraction using each of the following:

- 1 meter of yarn
- Maroonish rectangular piece
- Green or blue rectangular piece
- brown square piece
- A number of cups

Building Meaning of Fractions

☐ Stations for Making Meaning of Fractions

☐ Museum Walk

- Answer the questions for the different shapes.
 - * What is the unit fraction? How do the units relate to each other from one station to the next?
 - * What is the same at each station?
 - * What do you notice about a fractional unit within a given station?
 - * What surprised you when you were looking at these fractional units?

An View from SBAC

Shade $\frac{4}{6}$ of the rectangle below. Use the line tool to divide the rectangle by creating horizontal and vertical lines.

An View from SBAC

Use the line tool to separate the rectangle below into 8 equal parts.

Use the shading tool to shade one part of the whole rectangle.

What fraction of the whole rectangle is represented by the part of the rectangle you shaded? Type your answer in the space provided.

An View from SBAC

The number line below is divided into equal parts. The zero (0) is already placed on the number line.

Place each of the following numbers in the proper place on number line. To place a number, click on a tile and then click on the number line. You may move and clear numbers as needed.

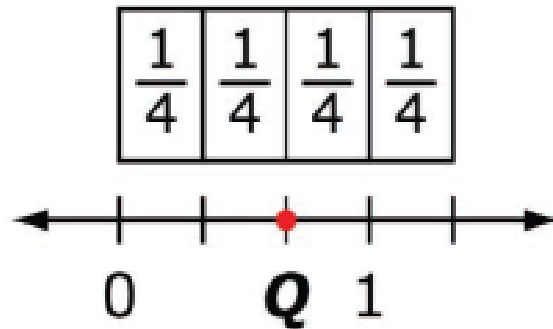

$$1$$

$$\frac{2}{1}$$

$$\frac{3}{5}$$

An View from SBAC

- Eva thinks that Q shows $\frac{2}{4}$ on the number line.
Eva labeled the number line with unit fractions to show how she determined her answer.

- Is Eva's drawing correct? Explain your reasoning in words, numbers, and /or pictures.

Reflection

What does it mean for students to have number meaning of fractions?

- What is it?
- What do you already do to support students construct number meaning for fractions?
- What do you need to add to your instruction and learning opportunities to add to their understanding of number meaning?

Fraction Relationships

How will you build the important concepts for students to compare fractions and find equivalency?

Building Number Sense of Fractions and Decimals

- **Number Meaning**
 - Counting, Writing, Naming, and Representing
- **Number Relationships and Number Magnitude and Size**
 - How are fractions expressed as equivalent values?
 - How do we compare fractions?
- **Building a Sense of Operation**

Fraction Relationships: Equivalency

Equivalent Fractions

1.

- Label each fraction and then circle the fractions that are equal.

Equivalent Fractions

- Which shapes show equivalent areas?
- What fraction would you use to describe each shape? Which ones are equivalent?

A.

B.

Equivalent Fractions

- **Katlynn and Ryan are measuring the length of a spider. Ryan measures and says the spider is $1\frac{2}{4}$ inches long. Katlynn measure the same spider and says it is $1\frac{1}{2}$ inches long.**
 - Who is correct? Why?
 - Explain your answer using words, pictures, and numbers.

Equivalent Fractions

- Katlynn walks $\frac{1}{2}$ a mile to school.
 - Ryan says he walks $\frac{2}{4}$ of a mile to school.
 - JC walks $\frac{4}{8}$ a mile to school.
-
- JC claims he walked the furthest to school. Do you agree or disagree? Why? Why not?
 - Explain your answer using words, pictures, and numbers.

Equivalent Fractions

Showing Equivalence with Area Models

Equivalent Fractions

$\frac{1}{3}$

Equivalent Fractions

$$\frac{2}{6}$$

Equivalent Fractions

Equivalent Fractions

Equivalent Fractions

□ Get out your pattern blocks.

- If a hexagon is the whole, what are all the ways to make the whole using the same shape? What does this tell us?
- How could we describe a whole using the paper strips?

Equivalent Fractions

□ Get out your pattern blocks.

- If a hexagon is the whole, what is the half? Is there another way to make this half?
- How can we make one-third? Is there more than one way?

Equivalent Fractions

- * **What equivalencies can we show using the Cuisenaire rods?**
 - **If the brown is the whole, then**
 - **What statements can you make that will show equivalent lengths?**

Equivalent Fractions

- * **What equivalencies can we show using the Cuisenaire rods?**
 - **If the blue is the whole, then**
 - **What statements can you make that will show equivalent lengths?**

Equivalent Fractions

□ Let's look at your fraction strips and the number line.

- Which strips show equivalence? Why?
- What does it mean for these strips to be equivalent? How is it the same as the pattern blocks? How is it different?

Equivalence

Equivalent Fractions

A Six Pack of Cola

The kids drank 3 cans of soda. What fraction of the six pack did they drink?

the whole

$$\frac{3}{6} = \frac{1}{2}$$

Equivalent Fractions

Soda Packaged as a Carton

□ There are two six packs in a carton. The kids drank 3 cans of soda. What fraction of the carton did they drink?

the whole

$$\frac{3}{12} = \frac{1}{4}$$

Equivalent Fractions

Use the tape diagram to model equivalent fractions. Fill in the blanks and answer the following questions.

4 sixths is equal to _____ thirds.

$$\frac{4}{6} = \frac{\square}{3}$$

The whole stays the same.

What happened to the size of the equal parts when there were less equal parts?

What happened to the number of equal parts when the equal parts became larger?

1 half is equal to _____ eighths.

$$\frac{1}{2} = \frac{\square}{8}$$

The whole stays the same.

What happened to the size of the equal parts when there were more equal parts?

What happened to the number of equal parts when the equal parts became smaller?

Reflection

□ What does it mean for students to have number relationships (equivalence) of fractions?

- What is it?
- What do you already do to support students construct number meaning for fractions?
- What do you need to add to your instruction and learning opportunities to add to their understanding of number meaning?

Fraction Relationships: Comparing Fractions

Comparing Fractions

□ Katlynn and Rylan have Valentine's day chocolate bars. Katlynn has eaten $\frac{1}{3}$ of her chocolate bar. Rylan has eaten $\frac{3}{6}$ of his chocolate bar.

- Who has eaten more?
- Explain your answer using words, pictures, and numbers.

What do students need to understand to answer this question?

Number Relationship: Comparing Fractions

❑ **First, comparing fractions is ONLY possible if the whole is the same.**

- $\frac{1}{2}$ of a king size candy bar is NOT equivalent to $\frac{1}{2}$ of the mini bar given out at Halloween
- $\frac{1}{3}$ of your kids allowance is NOT equal to $\frac{1}{3}$ of your superintendent's salary

❑ **Comparing fraction instruction should scaffold**

- Comparing like size pieces
- Comparing equal number of pieces
- Comparing to benchmark values

Comparing Fractions: Area Model

Area Models **Can Be Deceptive** when the whole is not the same.

Comparing Fractions: Linear Model

Length Models **Can Also Be Deceptive** when the whole is not the same.

Number Relationship: Comparing Fractions

□ Step 1: Comparing same size pieces

Comparing when the **size of the parts are the same** is a matter of knowing how many pieces are in one versus the other.

Number Relationship: Comparing Fractions

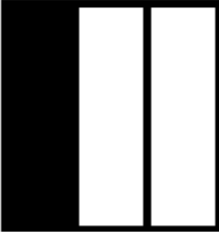

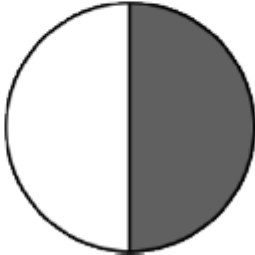

Which is greater in value? $\frac{5}{7}$ or $\frac{3}{7}$

$$\frac{5}{7} > \frac{3}{7}$$

Number Relationship: Comparing Fractions

Fill in the blank with a fraction to make the statement true and draw a matching model.

			
$\frac{1}{6}$ is greater than <input type="text"/>		$\frac{1}{5}$ is less than <input type="text"/>	
			
$\frac{1}{3}$ is less than <input type="text"/>		$\frac{1}{2}$ is greater than <input type="text"/>	

Comparing Fractions

What order will these values appear on a number line?

■ A. $\frac{5}{8}$ $\frac{6}{8}$ $\frac{3}{8}$ $\frac{1}{8}$

■ B. $\frac{5}{7}$ $\frac{3}{7}$ $\frac{6}{7}$ $\frac{10}{7}$

Number Relationship: Comparing Fractions

Step 2: Comparing same number of pieces.
The equal share area gets smaller as a whole is partitioned into more pieces.

$$\frac{1}{3}$$

$$\frac{1}{4}$$

$$\frac{1}{5}$$

$$\frac{1}{6}$$

$$\frac{1}{7}$$

Comparing **unit fractions** or fractions with the **same number of pieces** means **understanding the size of each part.**

Number Relationship: Comparing Fractions

Which is greater in value? $\frac{3}{4}$ or $\frac{3}{7}$

$$\frac{3}{4} > \frac{3}{7}$$

Comparing fractions with the same number of pieces means understanding the size of each part.

Comparing Fractions

Compare unit fractions and write $>$, $<$, or $=$.

a. 1 fourth 1 eighth

b. 1 seventh 1 fifth

c. 1 eighth $\frac{1}{8}$

d. 1 twelfth $\frac{1}{10}$

e. $\frac{1}{15}$ 1 thirteenth

f. 3 thirds 1 whole

Number Relationship: Comparing Fractions

What order will these values appear on a number line?

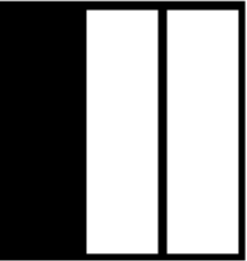

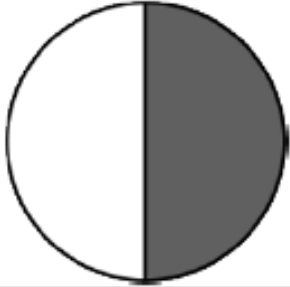

■ A. $\frac{4}{8}$ $\frac{4}{6}$ $\frac{4}{3}$

■ B. $\frac{4}{10}$ $\frac{4}{2}$ $\frac{4}{3}$ $\frac{4}{90}$

Number Relationship: Comparing Fractions

Do we ask these types of comparative questions?

Fill in the blank with a fraction to make the statement true and draw a matching model.

			
$\frac{1}{6}$ is greater than <input type="text"/>		$\frac{1}{5}$ is less than <input type="text"/>	
			
$\frac{1}{3}$ is less than <input type="text"/>		$\frac{1}{2}$ is greater than <input type="text"/>	

Number Relationship: Comparing Fractions

□ Step 3: Comparing to benchmarks: 0, $\frac{1}{2}$, 1

$\frac{2}{3}$ or $\frac{3}{10}$ Which is greater in value? Why?

Comparing when the **a benchmark** is a matter of knowing if a fraction is closer to one than another one.

Comparing Fractions

□ Which method can be used to compare the following sets of fractions? Do some have multiple ways they can be compared?

$$\frac{6}{4} \bigcirc \frac{9}{4}$$

$$\frac{3}{2} \bigcirc \frac{5}{2}$$

$$\frac{19}{8} \bigcirc \frac{16}{8}$$

$$\frac{16}{8} \bigcirc \frac{3}{2}$$

$$\frac{9}{4} \bigcirc \frac{19}{8}$$

$$\frac{4}{2} \bigcirc \frac{16}{8}$$

$$\frac{6}{4} \bigcirc \frac{16}{8}$$

$$\frac{5}{2} \bigcirc \frac{9}{4}$$

$$\frac{24}{8} \bigcirc \frac{11}{4}$$

An View from SBAC

Part A

What fraction is represented by the shaded area of Rectangle F?

Part B

What fraction is represented by the shaded area of Rectangle G?

Part C

Is the shaded area of Rectangle F equal to the shaded area of Rectangle G? Explain your thinking. Use what you know about the **area** of Rectangle F and Rectangle G to explain.

Developing A Plan

- What should instruction look like for students to develop the meaning and relationships of fractions?
- What will success look like?

Questions and Next Steps
