

FSA4480

USB Type-C Analog Audio Switch with Protection Function

FSA4480 is a high performance USB Type-C port multimedia switch which supports analog audio headsets. FSA4480 allows the sharing of a common USB Type-C port to pass USB2.0 signal, analog audio, sideband use wires and analog microphone signal. FSA4480 also supports high voltage on SBU port and USB port on USB Type-C receptacle side.

Features

- Power Supply: V_{CC} , 2.7 V to 5.5 V
- USB High Speed (480 Mbps) Switch:
 - ♦ SDD₂₁ -3dB bandwidth: 950 MHz
 - ♦ 3 Ω R_{ON} Typical
- Audio Switch
 - ♦ Negative Rail Capability: -3 V to +3 V
 - ♦ THD+N = -110 dB; 1 V_{RMS} , $f = 20 \text{ Hz} \sim 20 \text{ kHz}$, 32 W Load
 - ♦ 1 Ω R_{ON} Typical
- High Voltage Protection
 - ♦ 20 V DC Tolerance on Connector Side Pins
 - ♦ Over Voltage Protection: $V_{TH} = 5 \text{ V}$ (Typ)
- OMTF and CTIA Pinout Support
- Support Audio Sense Path
- 25-Ball WLCSP Package (2.24 mm x 2.28 mm)

Applications

- Mobile Phone, Tablet, Notebook PC, Media Player

2. Guaranteed by design, not production tested.

3. A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement t_{SU;DAT} ≥ ±250 ns must be met. This is automatically the case if the device does not stretch the LOW period of the I²C_SCL signal. If such a device does stretch the LOW period of the I²C_SCL signal, it must output the next data bit to the I²C_SDA line t_{r_max} + t_{SU;DAT} = 1000 + 250 = 1250 ns (according to the standard-mode I²C bus specification) before the I²C_SCL line is released.

APPLICATION INFORMATION

Over-Voltage Protection

FSA4480 features over-voltage protection (OVP) on receptacle side pins that switches off the internal signal routing path if the input voltage exceeds the OVP threshold.

If OVP is occurred, interrupt signal can be send by INT signal and FLAG data will provide information that which pin had OVP event.

Headset Detection

FSA4480 integrates headset unplug detection function by detecting the CC_IN voltage. The function is always active when device is enabling. DET will be high when CC_IN is low ($CC_IN < 1.2\text{ V}$). When CC_IN = High ($CC_IN > 1.5\text{ V}$), DET will be released to low.

	Device Disable	Device Enable
$CC_IN < V_{TH_L} = 1.2\text{ V}$	DET = 0	DET = 1
$CC_IN > V_{TH_H} = 1.5\text{ V}$	DET = 0	DET = 0

MIC Switch Auto-off Function

The function is active during control bit 0x12h bit[2] = 1. When CC_IN is high ($CC_IN > 1.5\text{ V}$) and L,R, Audio ground switches are under on status, MIC switch will be off and receptacle side pin will be connected to ground for 50 μS first. Then it shows high-Z status under MIC switch is set on status.

Audio Ground Detection and Configuration

The function is active when control bit 0x12h bit[0] = 1 and R, L AGND switches are set to be on status. For type-C interface analog headset, the audio ground could be SBU1 pin or SBU2 pin. The function will provide autonomous detection and configuration to route MIC and audio ground signal accordingly.

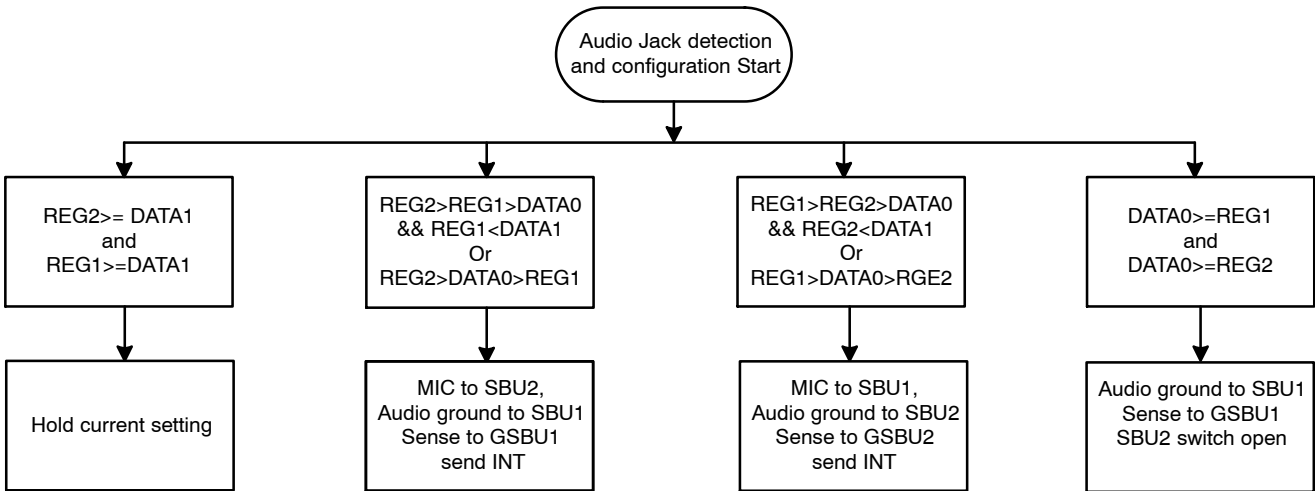

Figure 4.

During detection and configuration, the R, L, Sense, MIC and Audio ground switch will be off. After detection and configuration, R and L switches will turn on according to

switch configuration and timing setting. MIC, Sense and Audio ground will turn on according to detection results and timing control setting.

Resistance Detection

The function is active during control bit 0x12h bit[1] = 1. It will monitor the resistance between receptacle side pins and ground. During resistance detection, the switch which is monitored will be off. The detection result will be saved

in the resistance flag register. The measurement could be from 1 kΩ to 2.56 MΩ which is controlled by internal register. The detection interval can be set at 100 ms, 1 s or 10 s by register 0x16h.

Figure 5.

Manual Switch Control

The function is active during control bit 0x12h bit[4] = 1 and 0x04h = FF. It will provide manual control for device.

During this configuration, ADDR and INT pins will be set as logic control input.

MANUAL SWITCH CONTROL

(The function is active during control bit 0x12h bit[4] = 1 and 0x04h = FF. It will provide manual control for device. During this configuration, ADDR and INT pins will be set as logic control input.)

FSA4480

I²C INTERFACE

The FSA4480 includes a full I²C slave controller. The I²C slave fully complies with the I²C specification version 2.1 requirements. This block is designed for fast mode, 400 kHz, signals.

Examples of an I²C write and read sequence are shown in below figures respectively.

NOTE: Single Byte read is initiated by Master with P immediately following first data byte.

Figure 6. I²C Write Example

NOTE: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed

S	From Master to Slave	S	Start Condition	NA	NOT Acknowledge (SDA High)	RD	Read =1
A	From Slave to Master	A	Acknowledge (SDA Low)	WR	Write = 0	P	Stop Condition
