Fundamentals of Crystallography

C. GIACOVAZZO, H. L. MONACO, D. VITERBO
F. SCORDARI, G. GILLI, G. ZANOTTI, M. CATTI

Edited by

C. GIACOVAZZO

Dipartimento Geomineralogico, University of Bari, Italy
and Istituto di Ricerca per lo Sviluppo delle Metodologie Cristallografiche,
CNR, Bari, Italy

INTERNATIONAL UNION OF CRYSTALLOGRAPHY
OXFORD UNIVERSITY PRESS
1992

Contents

List of contributors xiii

1 Symmetry in crystals **1**
Carmelo Giacovazzo

The crystalline state and isometric operations 1
Symmetry elements 3
Axes of rotational symmetry 3
Axes of rototranslation or screw axes 5
Axes of inversion 5
Axes of rotoreflection 5
Reflection planes with translational component (glide planes) 6
Lattices 6
The rational properties of lattices 7
Crystallographic directions 7
Crystallographic planes 8
Symmetry restrictions due to the lattice periodicity and vice versa 9
Point groups and symmetry classes 11
Point groups in one and two dimensions 16
The Laue classes 17
The seven crystal systems 17
The Bravais lattices 18
Plane lattices 18
Space lattices 19
The space groups 22
The plane and line groups 30
On the matrix representation of symmetry operators 32
Appendices: 1.A The isometric transformations 35
1.B Some combinations of movements 37
1.C Wigner–Seitz cells 41
1.D The space-group rotation matrices 43
1.E Symmetry groups 45
1.F Symmetry generalization 55
References 60

2 Crystallographic computing **61**
Carmelo Giacovazzo

Introduction 61
The metric matrix 61
The reciprocal lattice 63
Basic transformations 65
Transformation from triclinic to orthonormal axes 68
Rotations in Cartesian systems 69
Some simple crystallographic calculations 73
Torsion angles 73
Best plane through a set of points 74
Best line through a set of points 75
Principal axes of a quadratic form 75
Metric considerations on the lattices 77
Niggli reduced cell 77
Sublattices and superlattices 80
Coincidence-site lattices 81
Twins 83
Calculation of the structure factor 87
Calculation of the electron density function 88
The method of least squares 90
Linear least squares 90
Reliability of the parameter estimates 92
Linear least squares with constraints 92
Non-linear (unconstrained) least squares 93

Least-squares refinement of crystal structures 94
Practical considerations on crystallographic least squares 98
Constraints and restraints in crystallographic least squares 104
Alternatives to the method of least squares 108
Rietveld refinement 109
The basis of the technique 109
Some practical aspects of Rietveld refinement 112
Analysis of thermal motion 117
The effect of thermal motion on bond lengths and angles 120
About the accuracy of the calculated parameters 122
Appendices: 2.A Some metric relations between direct and reciprocal lattices 124
2.B Some geometrical calculations concerning directions and planes 125
2.C Some transformation matrices 127
2.D Reciprocity of F and I lattices 127
2.E Transformations of crystallographic quantities in rectilinear spaces 128
2.F Derivation of the normal equations 130
2.G Derivation of the variance–covariance matrix $\mathbf{M}_x$ 131
2.H Derivation of the unbiased estimate of $\mathbf{M}_x$ 131
2.I The FFT algorithm and its crystallographic applications 131
2.J Examples of twin laws 133
References 137

3 The diffraction of X-rays by crystals 141
Carmelo Giacovazzo

Introduction 141
Thomson scattering 142
Compton scattering 144
Interference of scattered waves 144
Scattering by atomic electrons 146
Scattering by atoms 147
The temperature factor 148
Scattering by a molecule or by a unit cell 150
Diffraction by a crystal 151
Bragg's law 154
The reflection and the limiting spheres 154
Symmetry in reciprocal space 155
Friedel law 155
Effects of symmetry operators in the reciprocal space 156
Determination of the Laue class 156
Determination of reflections with restricted phase values 157
Systematic absences 159
Unequivocal determination of the space group 161
Diffraction intensities 161
Anomalous dispersion 165
The Fourier synthesis and the phase problem 169
Modulated crystal structures 171
Appendices: 3.A Mathematical background 173
3.B Scattering and related topics 185
3.C Scattering of X-rays by gases, liquids, and amorphous solids 201
3.D About electron density mapping 216
3.E Modulated structures and quasicrystals 221
References 226

4 Experimental methods in X-ray crystallography 229
Hugo L. Monaco

X-ray sources 229
Conventional generators 229
Synchrotron radiation 234

Monochromatization, collimation, and focusing of X-rays 241
Data collection techniques for single crystals 245
The Weissenberg camera 247
The precession camera 254
The rotation (oscillation) method in macromolecular crystallography 259
Densitometry 268
The single-crystal diffractometer 273
Area detectors 281
Data collection techniques for polycrystalline materials 287
X-ray diffraction of polycrystalline materials 287
Cameras used for polycrystalline materials 289
Diffractometers used for polycrystalline materials 293
Uses of powder diffraction 297
Data reduction 301
Lorentz correction 301
Polarization correction 303
Absorption corrections 304
Radiation damage corrections 308
Relative scaling 310
Appendices: 4.A Determination of the number of molecules in the unit cell of a crystal 312
References 314

5 Solution and refinement of crystal structures 319
Davide Viterbo

Introduction 319
Statistical analysis of structure factor amplitudes 321
The Patterson function and its use 324
The heavy atom method 328
Advanced Patterson methods 335
Direct methods 335
Introduction 335
Structure invariants and semi-invariants 337
Probability methods 340
Fixing the origin and the enantiomorph 346
Phase determination procedures 351
Completing and refining the structure 365
Difference Fourier method 366
Least-squares method 367
Absolute configuration 374
Appendices: 5.A Structure factor probability distributions 375
5.B Patterson vector methods 377
5.C Two examples of deriving phase information from positivity 384
5.D Probability formulae for triplet invariants 385
5.E Pseudotranslational symmetry 387
5.F Magic integers 388
5.G New multisolution techniques 390
5.H Procedures for completing a partial model 393
References 397

6 Ionic crystals 403
Fernando Scordari

The structure of the atom 403
Atoms with a single electron 403
Atoms with more than one electron 404
Interactions between ions 406
Notes on chemical bonds 406
Ionic crystals 409
Lattice energy: the contributions of attractive and repulsive terms 410
Lattice energy: CFSE contribution 414
Applications of lattice energy calculations 417
Ionic radius 418
Maximum filling principle 424
Coordination polyhedra 425
Radius ratio rule 425
Applications of the concept of ionic radius 427

Closest packings 429
Pauling's rules 433
Pauling's first rule 433
Pauling's second rule 433
Pauling's third rule 435
Pauling's fourth rule 436
Pauling's fifth rule 436
Ideal and defect structures 436
MX structures 437
MX_2 and M_2X structures 438
MX_3 and M_2X_3 structures 440
$A_mB_nX_p$ structures 441
On the classification of silicates 445
Liebau's crystallochemical classification 447
Structural formulae 453
Relationship between classification parameters and properties of the cations 453
Appendices: 6.A Application of the concept of the packing coefficient (c_i) 456
6.B Structural inferences from crystallochemical parameters 459
References 463

7 Molecules and molecular crystals 465
Gastone Gilli

Chemistry and X-ray crystallography 465
Crystal and molecular structure 465
The growth of structural information 467
The nature of molecular crystals 468
Generalities 468
A more detailed analysis of intermolecular forces 473
Thermodynamics of molecular crystals 478
Free and lattice energy of a crystal from atom–atom potentials 480
Polymorphism and the prediction of crystal structures 482
Effect of crystal forces on molecular geometry 483
Elements of classical stereochemistry 484
Structure: constitution, configuration, and conformation 484
Isomerism 486
Ring conformations 490
Ring conformation and group theory 492
Computation of puckering coordinates 498
Molecular geometry and the chemical bond 499
An overview of bond theories 499
The VSEPR theory 501
Valence bond (VB) theory 502
Hybridization. The machinery 504
Molecular mechanics 506
Molecular hermeneutics: the interpretation of molecular structures 511
Correlative methods in structural analysis 511
Some three-centre–four-electron linear systems 512
Nucleophilic addition to organometallic compounds 514
Nucleophilic addition to the carbonyl group 515
A case of conformational rearrangement 516
Resonance assisted hydrogen bonding (RAHB) 521
References 529

8 Protein crystallography 535
Giuseppe Zanotti

Introduction 535
Protein crystals 536
Principles of protein crystallization 536
The solvent content of protein crystals 538
Preparation of isomorphous heavy-atom derivatives 538
How isomorphous are isomorphous derivatives? 540
The solution of the phase problem 540
The isomorphous replacement method 540
Anomalous scattering: a complementary (or alternative) approach to the solution of the phase problem 544
The use of anomalous scattering in the determination of the absolute configuration of the macromolecule 545
The treatment of errors 546

The refinement of heavy-atom parameters 549
Picking up minor heavy-atom sites: the difference-Fourier synthesis 551
A third approach to the resolution of the phase ambiguity: real-space filtering 551
Rotation and translation functions and the molecular replacement method 552
Direct methods and the maximum-entropy principle in macromolecular crystallography 560
The interpretation of electron density maps and the refinement of the model 562
The interpretation of electron density maps 562
Interactive computer graphics and model building 562
The refinement of the structure 563
Protein structure 572
General aspects 573
Levels of organization of proteins: secondary structure 574
Polypeptide chain description 577
Higher levels of organization: tertiary and quaternary structure, domains, and subunits 578
Groups other than amino acids 582
Thermal parameters and disordered structures 583
Solvent structure 583
The influence of crystal packing 584
Protein classification 585
Appendices: 8.A Some formulae for isomorphous replacement and anomalous dispersion 587
8.B Translation functions 588
8.C Macromolecular least-squares refinement and the conjugate-gradient algorithm 590
8.D Conventions and symbols for amino acids and peptides 591
References and further reading 594

9 Physical properties of crystals 599
Michele Catti

Introduction 599
Crystal anisotropy and tensors 600
Tensorial quantities 600
Symmetry of tensorial properties 603
Overview of physical properties 605
Electrical properties of crystals 605
Pyroelectricity 606
Dielectric impermeability and optical properties 607
Elastic properties of crystals 608
Crystal strain 609
Inner deformation 611
Stress tensor 613
Elasticity tensor 614
Examples and applications 617
Piezoelectricity 619
Symmetry properties of the piezoelectric tensor 620
Crystal defects 622
Experimental methods 623
Planar defects 625
Line defects: dislocations 628
The Burgers circuit 629
X-ray topography of dislocations 630
Energy of a dislocation 632
Motion and interaction of dislocations 633
Partial dislocations 634
Small-angle grain boundaries 635
Point defects 635
Thermal distribution of defects 636
Diffusion 637
Ionic conductivity 639
Appendix: 9.A Properties of second-rank tensors 640
Further reading 642
