# Goat Farming Business Plan 

## Manual

## Acknowledgement

There is highly potentiality for livestock development due to climate and bio-diversity in Nepal. In the country, there is availability of 64 liter milk, 11 kilogram meat and 32 eggs. There shall be increased in the production of $35 \%$ milk, $25 \%$ meat and $45 \%$ eggs in the present production, to meet the minimum annual consumption of livestock production as 91 liter milk, 14 kilo meat and 48 eggs in the developed country.

In this way, there is important contribution of buffalo, goat, sheep, pig, poultry etc. for especially meat production in livestock production. Likewise, Gorkha district is very important from point of view of goat farming. There are more than 200 thousand goats, and establishment of nearly 250 commercial goat farms in the district at present. Especially, Jamunapari crossed, Khari crossed, Barbari crossed breeds goats are available here. In the recent time, it has also been started of importing Boer crossed goats in this district. District Livestock Development Office (DLSO) has already developed former Bakrang Village Development Committee (VDC) and Dhawa VDC as a resource center of Boer goat; whereas, rearing of Boer goat have also been started through Women's Cooperative in former Barpak VDC (Sulikot Rural Municipality- RM, Ward-1 \& 2) from the support of Japan International Cooperation Agency (JICA) Nepal from this year.

In this way, "Goat Farming Business Plan Manual" which is suitable and applicable for the Boer goat farming as well as other goat breeds, is going to be published by JICA Nepal, and this hand book shall be very useful to goat farmers in the future. This hand book has analytically covered goat production plan, cost plan, income plan, cost-benefits analysis etc. based on contemporary circumstance of Barpak. In this way, it is hoped that this upcoming publishing Business plan shall be helpful for the development and extension of goat farming business in the district, as it is useful as reference to farmers and stakeholders of this business to set up own business.

In addition to, it is very thankful to JICA Nepal for supporting to goat farming business by publishing "Goat Farming Business Plan Manual".

Dr. Jagat Bandhu Nepali

## 1 Introduction

JICA has implemented the Project on Rehabilitation and Recovery from Nepal Earthquake (RRNE Project) in Barpak, Gorkha- epicentre of devastating earthquake in 2015. One hundred sixty four Boer crossed goats as a revolving fund, and 11 buck of same breed have been distributed to Barpak Women Multipurpose Cooperative Ltd. for the sustainable recovery and development of local economy of Barpak through goat farming under livelihood program of this project. The beneficiary people are 78 women there at initial phase, and they have received the goat by borrowing a loan from the cooperative. The women need to pay the loan within 2 years, and to do so, they need to breed she-goat appropriately, produce quality kids and sell them.

Even after finishing the loan payback, there are still necessary costs for the continuation of goat farming. So, for the continuation of goat farming as a business, respective goat farmers have to recognize appropriate plan, and it is necessary to prepare income-expenditure plan accordingly. That's why, this "Goat Farming Business Plan" has demonstrated with different models for the goat farming business management, and it shall be helpful to farmers to apply any one suitable plan or formulate additional new plans.

Finally, this business plan shall be supportive to contribute for the establishment of the model women cooperative regarding goat farming, as well as for the sustainable recovery and development of local economy of Barpak through well-managed goat farming.

## 2 Production Plan

### 2.1 Preconditions of this plan

Some model cases of goat farming business management have been presented in this plan. The period of this simulation is for 5 years, and the number of initial she-goat is 1 or 2 head. The cases of keeping the first female kid as a new she-goat for breeding purpose have also been presented here. The farmers can utilize referring among the models presented here identifying own appropriateness. (See Appendix-1 for the other preconditions)

### 2.2 Production and breeding plan

The number of kids born is changed depending on the number of she-goat in farm. In addition to, the number of kid production is also largely changed according to your decision whether the new born female kid is kept for breeding purpose or not. Of cause, if farmer keeps many female kids as she-goats, the number of kid production is increased, but the feeding cost and labor cost shall also be increased at the same time. So, it is important for farmer to make appropriate plan suited to farm conditions such as the financial situation and scale of the goat shed. On the other hand, if farmer afford to increase the she-goat, it is better to keep new female kids at the early stage such as $1^{\text {st }}$ year or $2^{\text {nd }}$ year, because it would very helpful to farmers to increase the income effectively.

## <MODEL CASES>

(1) Initially 1 head of she-goat

1) Sell all born kids (CASE (1)-1)

- The number of she-goat is 1 head throughout 5 years
- Maximum 15 kids can be produced in 5 years.

Table 1: Breeding and production plan of keeping she-goats (A), and sell all born kid

## 3 Financial Plan

### 3.1 Cost headings

### 3.1.1 Fixed cost requirement

Fixed cost is the cost that is required to operate the business in every year, but it not directly inter-connection with production amount and sales of kids. The major fixed cost is such as Goat shed construction cost and She-goat procurement cost that are to be needed at the commencement of the goat farming business. According to this simulation, NPR 43,172/- is needed if farmer starts with 1 she-goat and NPR 60,664/- is needed if start with 2 she-goats. However, farmer shall not count these costs on the accounting book because the Goat shed cost should be depreciated in 5 years and the loan for goat would be paid after 2 years. It will be explained as followings:

Table 5: Fixed cost for goat farming business

|  | Particulars | Unit | Quantity | Rate | Total Amount | Remarks |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :--- |
| 1 Construction of Goat Shed |  |  |  |  |  |  |
|  | Bamboo 6-6.5 m long | no | 50 | 250 | 12,500 |  <br> pillar |
|  | CGI sheet 2 m. | no | 8 | 750 | 6,000 | roof |
|  | Nails | kg | 8 | 150 | 1,200 |  |
|  | Curved hooks and nut bolts | set. | 50 | 30 | 1,500 |  |
|  | Stall feeding construction | no | 1 | 2,000 | 2,000 |  |
|  | no | 5 | 500 | 2,500 |  |  |
| Sub Total |  |  |  |  |  |  |

|  | Particulars | Quantity | Rate | Total Amount | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | She-goat Purchasing | 1 | 17,472 | $\mathbf{1 7 , 4 7 2}$ | $21 \mathrm{~kg} @$ |
|  | 2 | 17,472 | $\mathbf{3 4 , 9 4 4}$ | NPR 832 |  |

### 3.1.2 Depreciation and Interest of fixed cost

As goat farmer has introduced goat shed and she-goat as the initial investment for goat farming business, it is shall be recorded these costs as depreciation and
interest on the accounting book every year. By the depreciation, the initial cost of the goat shed shall be divided into 5 years and the value of the shed becomes zero after that. In actual, goat shed can be used for about 10 years with its appropriate repair and management, but the depreciation cost will not be allocated from $6^{\text {th }}$ year.

Likewise, as the goat shed has been constructed by self investment of the farmer, it has not been counted as interest of investment; whereas, in regards to interest of goat loan, it has to be paid at the rate of $6 \%$ to women's cooperative within 2 years.

Table 6: Depreciation and interest of fixed cost

|  | Particulars | Rate | 1st Year | 2nd Year | 3rd Year | 4th Year | 5th Year |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Depreciation of <br> Goat Shed <br> (20\% depreciation <br> per year on NPR <br> $25,700)$ | $20 \%$ | 5,140 | 5,140 | 5,140 | 5,140 | 5,140 |

|  | Particulars | Rate | 1st Year | 2nd Year | 3rd Year | 4th Year | 5th Year |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | Interest (Loan for <br> 1 she-goat) <br> (6\% loan interest <br> per year on NPR <br> 17,472) | $6 \%$ | 1,048 | 1,048 | 0 | 0 | 0 |
|  | Interest (Loan for <br> 2 she-goats) <br> (6\% loan interest <br> per year on NPR <br> 34,944 ) | $6 \%$ | 2,097 | 2,097 | 0 | 0 | 0 |

|  | Particulars | 1st Year | 2nd Year | 3rd Year | 4th Year | 5th Year |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \frac{\pi}{0} \\ \end{gathered}$ | Depreciation and Interest cost (1 she-goat) | 6,188 | 6,188 | 5,140 | 5,140 | 5,140 |
|  |  | 27,797 |  |  |  |  |
|  | Depreciation and Interest cost (2 she-goats) | 7,237 | 7,237 | 5,140 | 5,140 | 5,140 |
|  |  | 29,893 |  |  |  |  |

### 3.1.3 Variable cost

Variable cost is changed depending on the number of she-goat. If the number of goat is increased, simultaneously the variable cost is also increased. However; if the number of goat is increased, the production of kids and income of farmer is also increased accordingly. In this way, the followings measures shall also be considered to increase the number of goats in the farm:

- The possibility to manage the goat by family members without hiring other person
- The scale of goat shed for the additional produced goats
- The situation of the location whether farmer can secure enough feed or not even in winter season

Table 7: Variable cost for goat farming

| S.N. | Particulars | Rate | Number of shegoat | $\begin{aligned} & \text { 1st } \\ & \text { Year } \end{aligned}$ | 2nd <br> Year | 3rd <br> Year | $\begin{aligned} & \text { 4th } \\ & \text { Year } \end{aligned}$ | $\begin{aligned} & 5 \text { th } \\ & \text { Year } \end{aligned}$ |

### 3.2 Income headings

### 3.2.1 Sales and Income plan

As it was explained in the previous section, depends on the number of shegoat, farmer can produce from 15 to 41 kids; whereas, 13 to 34 kids can be sold in 5 years. From selling those kids, farmer can earn from NPR 195,000/- to NPR 510,000/in total, except stock of mother goats and kids worth from NPR 30,000/- to NPR 90,000/- in the goat shed.

In addition to, the Boer-cross kids can be sold to the buyers not only for meat purpose, but also for breeding purpose. In general, if farmer can sell the kids for breeding purpose, the price would be about 2 times higher than for meat purpose. But, it also depends on the growth of the kids and the existence of the demand at that time. Thus, in this simulation, it has been premised that all the kids are sold only for the meat purpose. This is average price rate for 5 years duration.

Table 8: Goat selling for meat and its income (NPR $600 / \mathrm{kg}$, average weight 25 kg in 9 months)

| Production Plan |  | $\begin{aligned} & \text { Rate } \\ & \text { (NPR) } \end{aligned}$ | 1st Year |  | 2nd Year |  | 3rd Year |  | 4th Year |  | 5th Year |  | Total Sales (NPR) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Qty | Amount | Qty | Amount | Qty | Amount | Qty | Amount | Qty | Amount |  |
| 1-1 | 1 She-goat and sell all kids |  | 15,000 | 0 | 0 | 3 | 45,000 | 2 | 30,000 | 4 | 60,000 | 4 | 60,000 | 195,000 |

| 2-1 | 2 She-goat and sell all kids | 15,000 | 0 | 0 | 6 | 90,000 | 4 | 60,000 | 8 | 120,000 | 8 | 120,000 | 390,000 |
| 2-2 | 2 She-goat and keep 1st female kid for breeding | 15,000 | 0 | 0 | 5 | 75,000 | 7 | 105,000 | 10 | 150,000 | 12 | 180,000 | 510,000 |

### 3.2.2 Inventory of Assets

The sample of the inventory of assets in each pattern model is shown on the table below. The value of goat shed becomes zero by the depression after 5 years in terms of the accounting management. In general, she-goat can be used for more than 10 years for breeding purpose if it is healthy, and then it would be sold as meat. Regarding the kids, they would be sold after 9 months fattening, but if they are not sold by the close of accounting book (it is usually at the end of fiscal year), it should be taken inventory them as year-end assets. As there might be different weight of goats and kids, it has been assumed average value as NPR 10,000/-; however, the contemporary market price might be different.

Table 9: Sample inventory of assets (shed, she-goats, and not sold kids)

| Production Plan |  | Inventory price | 1st Year |  | 2nd Year |  | 3rd Year |  | 4th Year |  | 5th Year |  | Value at end of 5 year |

## 4 Analysis

### 4.1 Cost benefit analysis

Based on the cost and sales calculation shown in the previous section, the results of benefit analysis for each model of number of she-goat is shown in the below.
(1) Initially 1 head of she-goat

1) Sell all kids ( $\boldsymbol{C A S E}$ (1)-1)

In the model of $\boldsymbol{C A S E}$ (1)-1, farmer keeps only 1 she-goat throughout the 5 years, and the proportion of the cost is relatively high because the number of kid production is small. Therefore, the farmer can earn income only from $4^{\text {th }}$ year. The farmers can make net income NPR 118,116/- without labor cost in 5 years, except stock assets worth NPR 30,000/-.

Table 10: Cost benefits analysis of keeping she-goat (A), and sell all born kids

|  | Description | Note | 1st Year | 2nd <br> Year | $\begin{aligned} & \text { 3rd } \\ & \text { Year } \end{aligned}$ | $\begin{aligned} & \text { 4th } \\ & \text { Year } \end{aligned}$ | $\begin{aligned} & 5 \text { th } \\ & \text { Year } \end{aligned}$ | Total Amount in 5 years |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Expenditure |  |  |  |  |  |  |  |  |

1) Keep first female kid for breeding purpose (CASE (1)-2)

In the model of $\boldsymbol{C A S E}$ (1)-2, farmer keeps only 1 she-goat initially, and keeps 1 new female kid for breeding purpose from the middle of $1^{\text {st }}$ year. Here, farmer can earn income from $3^{\text {rd }}$ year, and the farmers can make net income NPR 206,501/without labor cost in 5 years, except stock assets worth NPR 70,000/-.

Table 11: Cost benefits analysis of keeping she-goat (A), and keeping $1^{\text {st }}$ female kid

|  |  | Without labor cost | 14,171 | 26,938 | 59,035 | 24,091 | 24,091 | 148,325 |
| Revenue |  |  |  |  |  |  |  |  |
| 1 | Goat selling for meat | 15,000 | 0 | 75,000 | 105,000 | 150,000 | 180,000 | 510,000 |
| Net Income |  | With labor cost | $(45,421)$ | 16,812 | 14,715 | 69,659 | 99,659 | 155,425 |
|  |  | Without labor cost | $(14,171)$ | 48,062 | 45,965 | 125,909 | 155,909 | 361,675 |

|  | Description | Note | 1st Year | 2nd <br> Year | 3rd <br> Year | 4th <br> Year | 5th <br> Year | Amount at <br> the end of 5 <br> years |
| :--- | :--- | :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Liabilities |  |  |  |  |  |  |  |  |
| 1 | Loan for she- <br> goat | 2 years | 43,200 | 43,200 | 0 | 0 | 0 | 0 |
| Assets |  |  |  |  |  |  |  |  |
| 1 | Goat shed | 25,700 | 20,560 | 15,420 | 10,280 | 5,140 | 0 | 0 |
| 2 | She-goat | 10,000 | 20,000 | 30,000 | 30,000 | 30,000 | 30,000 | 30,000 |

| 3 | Stock kids before selling | 10,000 | 20,000 | 50,000 | 100,000 | 80,000 | 60,000 | 60,000 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total Inventory |  |  | 17,360 | 52,220 | 140,280 | 115,140 | 90,000 | 90,000 |

Based on the above results, in order to earn income from early stage, it is important to keep the female kid of initial stage for breeding purpose. Then, farmer needs to operate the goat farming cycle of breeding, delivery and sales. According to this simulation, keeping total 3 she-goats make farmer possible to obtain standard income.

### 4.2 Break Even Point

The result of analysis on Break Even Point (BEP) for each model is shown in the below. BEP can be defined as a point where total costs (expenses) and total sales (revenue) are equal. It is used to analysis to know the point where there is no net profit or loss.

In this simulation, here is explained necessary number of kid to be sold in 5 years to secure the farmer's net income. The calculation formulas used for the analysis are as follows.

- Break Even Point (BEP) = Fixed Cost / Marginal Profit Ratio
= Fixed Cost / \{1- (Variable Cost /

$$
\text { Sales) }\}
$$

- Break Even Sales Number (BESN) = BEP / Average Sales Price
- Break Even Sales Rate (BESR) = BESN / Number of Production
- Break Even Mortality Rate (BEMR) $=(1-$ BESR $) \times 100$
(1) Initially 1 head of she-goat

1) Sell all kids (CASE (1)-1)

- $\mathbf{B E P}=45,269 /\{1-(31,615 / 195,000)\}=$ NPR 54,028/-
- Break Even Number of Goat Sales $=54,028 / 15,000=3.6=$ Avg. 4 heads
- Break Even Sales Ratio = $4 / 13=\mathbf{0 . 3 1}$
- Break Even Mortality Ratio $=(1-0.31) * 100=69 \%$

Here, BEP is NPR 58,993/-. It can be achieved if farmer could sell at least 4 kids out of 13 kids that would be produced in 5 years, results neither profit nor loss. In this sense, $69 \%$ ( 9 kids) were not sold or died among marketable 13 kids; the farmer will not be loss. As a result, if farmers could sell 9 kids, which is not sold or not died; the farmer will be in profit worth of those 9 kids.
2) Keep first female kid for breeding purpose (CASE (1)-2)

- $\mathrm{BEP}=45,269 /\{(1-(63,230 / 315,000)\}=$ NPR 56,637/-
- Break Even Number of Goat Sales $=56,637 / 15,000=3.6=$ Avg. 4 heads Break Even Sales Ratio $=4 / 21=\mathbf{0 . 1 9}$
- Break Even Mortality Ratio $=(1-0.19) * 100=\mathbf{8 1} \%$

Here, BEP is NPR 56,637/-. It can be achieved if farmer could sell at least 4 kids out of 21 kids that would be produced in 5 years, results neither profit nor loss. In this sense, $81 \%$ (17 kids) were not sold or died among marketable 21 kids; the farmer will not be loss. As a result, if farmers could sell 17 kids, which is not sold or not died; the farmer will be in profit worth of those 17 kids.
(2) Initially 2 heads of she-goat

1) Sell all kids (CASE (2)-1)

- $\mathrm{BEP}=64,837 /\{(1-(63,230 / 390,000)\}=$ NPR 77,383/-
- Break Even Number of Goat Sales $=77,383 / 15,000=5.2$ •Avg. 6 heads
- Break Even Sales Ratio = 6/26 = 0.23
- Break Even Mortality Ratio $=(1-0.23) * 100=77 \%$

Here, BEP is NPR 77,383/-. It can be achieved if farmer could sell at least 6 kids out of 26 kids that would be produced in 5 years, results neither profit nor loss. In this sense, $77 \%$ (20 kids) were not sold or died among marketable 26 kids; the farmer will not be loss. As a result, if farmers could sell 20 kids, which is not sold or not died; the farmer will be in profit worth of those 20 kids.
2) Keep first female kid for breeding purpose (CASE (2)-2)

- BEP $=64,837 /\{(1-(83,488 / 510,000)\}=$ NPR 77,529/-
- Break Even Number of Goat Sales $=77,729 / 15000=5.2$ • Avg. 6 heads
- Break Even Sales Ratio $=6 / 34=\mathbf{0 . 1 8}$
- Break Even Mortality Ratio $=(1-0.18) * 100=\mathbf{8 2} \%$

Here, BEP is NPR 77,529/-. It can be achieved if farmer could sell at least 6 kids out of 34 kids that would be produced in 5 years, results neither profit nor loss. In this sense, $82 \%$ ( 28 kids) were not sold or died among marketable 34 kids; the farmer will not be loss. As a result, if farmers could sell 28 kids, which is not sold or not died; the farmer will be in profit worth of those 28 kids.

### 4.3 Loan Payment

The loan which farmer has borrowed to buy she-goat has to be returned at the start of $3^{\text {rd }}$ year (after the end of $2^{\text {nd }}$ year) to women's cooperative. The loan repayment simulation of each model is shown in the table below.

Table 14: Loan payment status

| Production Plan |  | Loan <br> Amou nt | Net Income (without loan payment) |  |  |  |  | Loan Payment |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1st Year | 2nd <br> Year | 3rd Year | $\begin{gathered} \text { Total } \\ \text { of } \\ 2 \\ \text { years } \end{gathered}$ | Total of 3 years | If Pay at the end of 2nd year, income remains | If Pay at the end of 3rd year, income remains |
| $\begin{gathered} (1)- \\ 1 \end{gathered}$ | 1 She-goat and sell all kids |  | 17,472 | $(9,655)$ | 31,775 | 17,823 | 22,119 | 39,942 | 4,647 | 22,470 |
| (1)- | 1 She-goat and keep 1st female kid for breeding | 17,472 | $(13,122)$ | 9,738 | 55,786 | $(3,385)$ | 52,401 | $(20,857)$ | 34,929 |
| $\begin{gathered} (2)- \\ 1 \end{gathered}$ | 2 She-goat and sell all kids | 34,944 | $(14,171)$ | 68,689 | 40,786 | 54,519 | 95,305 | 19,575 | 60,361 |
| (2)- | 2 She-goat and keep 1st female kid for breeding | 34,944 | $(14,171)$ | 48,062 | 80,909 | 33,892 | 114,801 | $(1,052)$ | 79,857 |

From the above table, we can conclude as followings:

- Initially 1 head of she-goat, and sell all the born kids (CASE (1)-1): As the farmer has loan of NPR 17,472/- and able to make income worth NPR $22,470 /-$ at the end of second year, he/she can return the loan to cooperative at the end of $2^{\text {nd }}$ year and save NPR 4,647/- also. So, the kids sold from end of $2^{\text {nd }}$ year are the profits for respective farmers.
- Initially 1 head of she-goat, and keep the first female $\operatorname{kid}(\boldsymbol{C A S E}$ (1)-2): As the farmer has loan of NPR 17,472/- and still NPR 3,385 is in loss at the end of second year, he/she can return the loan to cooperative only from $3^{\text {rd }}$ year, and will be able to save money worth NPR 34,929/- within this duration. So, the kids sold from $3^{\text {rd }}$ year are the profits for respective farmers.
- Initially 2 head of she-goat, and sell all the born kids (CASE (2)-1): As the farmer has loan of NPR 34,944/- and able to make income worth NPR 54,519/- at the end of second year, he/she can return the loan to cooperative at the end of $2^{\text {nd }}$ year and save NPR 19,575/- also. So, the kids sold from end of $2^{\text {nd }}$ year are the profits for respective farmers.
- Initially 2 heads of she-goat, and keep the first female kid (CASE (2)-2): As the farmer has loan of NPR 34,944/- and only income worth NPR 33,892 within second year, he/she can return the loan to cooperative only from beginning of $3^{\text {rd }}$ year, and will be able to save money worth NPR 79,857/- at the end of $3^{\text {rd }}$ year. So, the kids sold from beginning of $3^{\text {rd }}$ year are the profits for respective farmers.

Table 15: Total capital and net income at the end of 5 years

|  |  | Revenue <br> Collectio <br> nin 5 <br> years | Capital <br> from <br> stock <br> goats <br> and kids <br> in 5 <br> years | Total <br> Capital <br> at the <br> end of 5 <br> years | Net income <br> with labor <br> cost and <br> other cost <br> after loan <br> pay back |
| :--- | ---: | ---: | ---: | ---: | :--- |
| Net <br> income <br> without <br> labor cost <br> but with <br> other cost <br> after loan <br> payback |  |  |  |  |  |
| $(1)-1$ | 1 She-goat and sell all <br> kids | 195,000 | 30,000 | 225,000 | $(19,356)$ |
| $(1)-2$ | 1 She-goat and keep <br> 1st female kid for <br> breeding | 315,000 | 70,000 | 385,000 | 62,154 |
| $(2)-1$ | 2 She-goat and sell all <br> kids | 390,000 | 60,000 | 450,000 | 259,029 |
| $(2)-2$ | 2 She-goat and keep <br> 1st female kid for <br> breeding | 510,000 | 90,000 | 600,000 | 210,481 |

Likewise, we can conclude the total capital remained in the hand of farmers at the end of 5 years as followings:

- Initially 1 head of she-goat, and sell all the born kids (CASE (1)-1): At the end of 5 years, the farmer can make income worth NPR 195,000/- by selling the kids, and have stock of mother goat and kids worth NPR 30,000/- in the shed. In this sense, the respective farmer has total income or capital worth NPR 225,000/-. Likewise, the farmer will be in loss worth NPR 19,356/- after loan pay back if labor cost and other running costs are included; whereas, the farmer will have net income worth NPR 130,644/- if only labor cost is excluded, even after loan pay back.
- Initially 1 head of she-goat, and keep first female kid (CASE (1)-2): At the end of 5 years, the farmer can make income worth NPR 315,000/- by selling the kids, and have stock of mother goat and kids worth NPR 70,000/- in the shed. In this sense, the respective farmer has total income or capital worth NPR 385,000/-. Likewise, the farmer will have net income worth NPR 62,154/- after loan pay back if labor cost and other running costs are included; whereas, the farmer will have net income worth NPR 259,029/- if only labor cost is excluded, even after loan pay back.
- Initially 2 heads of she-goat, and selling all born kids (CASE (2)-1): At the end of 5 years, the farmer can make income worth NPR 390,000/- by selling the kids, and have stock of mother goat and kids worth NPR 60,000/- in the shed. In this sense, the respective farmer has total income or capital worth NPR 450,000/-. Likewise, the farmer will have net income worth NPR 90,114/- after loan pay back if labor cost and other running costs are included; whereas, the farmer will have net income worth NPR 286,989/- if only labor cost is excluded, even after loan pay back
- Initially 2 heads of she-goat, and keep first female kid (CASE (2)-2): At the end of 5 years, the farmer can make income worth NPR 510,000/- by selling the kids, and have stock of mother goat and kids worth NPR 90,000/- in the shed. In this sense, the respective farmer has total income or capital worth NPR 600,000/-. Likewise, the farmer will have net income worth NPR 210,481/- after loan pay back if labor cost and other running costs are included; whereas, the farmer will
have net income worth NPR 416,731/- if only labor cost is excluded, even after loan pay back

## 5 <br> Conclusions

In general, the mortality rate in goat rearing is about 5 to $10 \%$. The result of above analysis among shows that profit will be secured in any 4 cases even if mortality rate is 69 to $82 \%$. In other words, the goat farming business is with considerable safety margin.

However, it is necessary to consider that the goat farming business becomes deficit inevitably at the initial stage because there is no sale of kids in $1^{\text {st }}$ year. Thus, at the beginning of the business, it is effective to suppress the initial investment by using the existing old goat shed or using scrap wood and bamboo that can be utilized freely instead of purchasing materials. Farmer can also consider ways to create base funds from other income sources, or to use a loan of women's cooperative.

As for the loan for she-goat, it is possible to repay it at the end of $2^{\text {nd }}$ year depending on the number of she-goat raised. However, the farmer has to wait to repay the loan by $3^{\text {rd }}$ year. In such situations, it is needs to apply for extension of loan repayment period to the women's cooperative according to "Goat Farming Group and Breed Management Policy-2017" of cooperative.

In this way, there may be some women struggling with cash flow at the beginning of the goat farming business. However, in all cases, it is expected that farmer can get profit within 5 years. After that, the production cycle can be operated efficiently and the business will become stable, so farmer can expect a large profit in the total 10 years of the average service period of she-goat. It is important to retain the production of quality goats, decrease the mortality rate, and sell goats as breeding purpose for better income. Finally, it is believed that the substantial goat farming will be led to commercial goat farming gradually, increasing the capacity of goat shed.

## Appendix-1

## Pre-conditions for preparing this business plan

1) Breeding: the goat gets breeding after 3 months of goat received by farmer, goat get delivery after 5 months of breeding, and re-breeding in $4^{\text {th }}$ month after delivery.
2) Twins rate: In the first time, there is born of 1 kid, and 2 kids from $2^{\text {nd }}$ time of delivery.
3) Proportion of male and female kids: 1:1
4) Average weight of the goat in nine months: 25 kg .
5) Average price rate of kids: NPR $600 / \mathrm{kg}$. (live weight)
6) Average price of mother goats and not sold kids: NPR 10,000/- per number
7) Interest rate of loan from cooperative: $6 \%$
8) Goat rearing capacity: $1,2,3$ mother goats, and from 1 to 10 kids
9) First female kid can be used as breeding purpose
10) Goats can be kept in stall feeding and grazing
11) Fodder has to buy in $1^{\text {st }}$ and $2^{\text {nd }}$ year, and cultivated fodder tree will start to give fodder from $3^{\text {rd }}$ year
12) The price of goat shed is NPR $25,700 /$-, and it is afford by respective farmer
13) The age of goat shed is 5 years
14) Depreciation rate of fixed cost is at the rate of $20 \%$
15) The feed is fed to the kids of 2 to 12 months at the rate of 100 gm per day
16) The feed is fed to pregnant goats from 2 months previous to 2 months back of delivery
17) Beyond the feed, the fodder/grass is given at the rate of $4 \%$ of total weight of goats every day
