What makes JAZ Poly Seats and Fuel Cells unique?

JAZ polyethylene seats and fuel cells feature hollow, one piece seamless construction with molded-in colors that won't fade, peel or scratch off. These seats and cells each have excellent high and low temperature impact. They will not corrode or rust.

They can be frozen, hit with a hammer and will not break. The double-walled construction of the seats deliver a comfortable, impact absorbing ride. The crosslinking process provides maximum strength and minimum weight with sufficient elasticity to resist shock and vibration damage.

Each seat has molded-in threaded inserts which will withstand a pull-out force of 1600lbs each. Installation is fast and trouble-free.

Aluminum Drag Seat

This seat is designed for serious door slammer applications. It is extremely rigid yet weighs only 9lbs with the cover. Made from 5052 grade .090 aluminum.

Push Rod Straightness Checker

\$139

Valve train failure is normally catastrophic and a bent push rod can be attributed as a culprit in many instances. A pushrod out-of-round as little as .010 will begin to flex. I'm sure you have seen the wear marks on the sides of your pushrods and wonders how they got there. With the Pushrod Checker, simply insert the pushrod into the spring loaded end, rotate 360 degrees and quickly check the roundness of a pushrod to less than .001.

Rod Bolt Stretch Checker

One simply inserts the rod bolt into the Bolt Stretch Checker and records the reading on the gauge. Bolts that are stretched more than .007 are usually discarded. A complete set of 16 bolts can be checked in less than 60 seconds. Might just be the best minute you invested in your engine assembly.

Rod-Piston Pusher

Here is a tool that allows one to safely and quickly install or remove the rod-piston combo out of the block. The pointed end of The Pusher is simply inserted into one of the two threaded holes in the connecting rod. The bend in the shaft allows easy navigation around the crankshaft journal. The diver with hot oil dripping onto his face will thank you profusely.

Hose Fitting Assembly

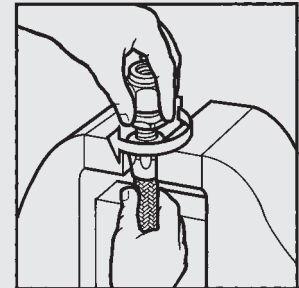

1. Wrap hose tightly with tape at cutting point. Using a fine tooth hacksaw, cable cutters or radiac wheel, cut the hose in the middle of the tape. Remove tape after cutting being careful not to fray the braid.

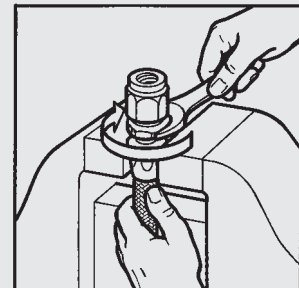

2. Slip hose into socket to the depth indicated by the hose insertion mark on the outside of the socket. This should be just short of the back of the threads. **VERY IMPORTANT** - Mark hose with tape or suitable marking device at rear of socket. This mark will later indicate to you if the hose has pushed out of the socket during assembly.

3. Using an anti-seize lubricant, liberally lubricate inside of hose and threads on the nipple. Holding nipple horizontally in a vise equipped with soft aluminum jaws, push socket end carefully with hose nipple with a turning motion and engage nipple threads into those of the socket. Continue tightening by hand as far as possible to make sure that the threads are properly mated and no cross threading has occurred.

4. Using an aluminum fitting wrench, finish tightening assembly. When properly assembled a small gap of .030" or less should exist between the socket and shoulder of nipple. **NOTE:** Check marks on hose in step 2 for any evidence of push out. Hose assembly must be cleaned and tested to twice the operating pressure.

Copper Head Gaskets

Benefits of Using Copper...

Conductivity. Copper is the standard by which all other conductors are measured, therefore a copper gasket provides superior thermal conductivity, acting to stabilize head and block temperatures which makes tuning easier.

25% Coefficient of Elasticity. One of the properties of copper is that it stretches before a catastrophic failure, thereby providing an extra measure of safety in case of severe detonation.

Strength. Copper (in the form SCE use) has a tensile strength of approximately 32,000 psi, compare this to the 1200 to 1800 psi tensile of most facing materials used on conventional performance head gaskets.
