

PREMIUM

HELICAL GEAR UNITS

Information

Description

Horizontal or vertical, right angle or parallel, foot mounted or shaft mounted gear units

Premium Helical Gear units are fully metric and are suitable for most applications in both horizontal and vertical drives.

Based on a modular design and construction, the high degree of interchangeability of parts and sub-assemblies among all variants effect considerably economies of production, whilst maintaining the highest standard of component and unit elements. A wide choice of ratio is available based on recommendations laid down in AGMA standards with additional half ratio steps.

Profile ground helical gears together with spiral bevel gears lapped in pairs, ensure high standards of accuracy, surface finish and quiet running characteristics. Helical gears are fitted in parallel shaft units whilst units with shaft at right angle incorporate spiral bevel and helical gears. High quality alloy case hardening material provide long life wear resistance and fatigue strength.

The high power to weight ratio of all units combines with low volume to enable installation in the most difficult situations. Each of the two variants contains unique features suited to their own operating conditions.

Horizontal units feature optional right or left hand shaft arrangements from the same sub-assemblies and are available as foot mounted or foot / shaft mounted types.

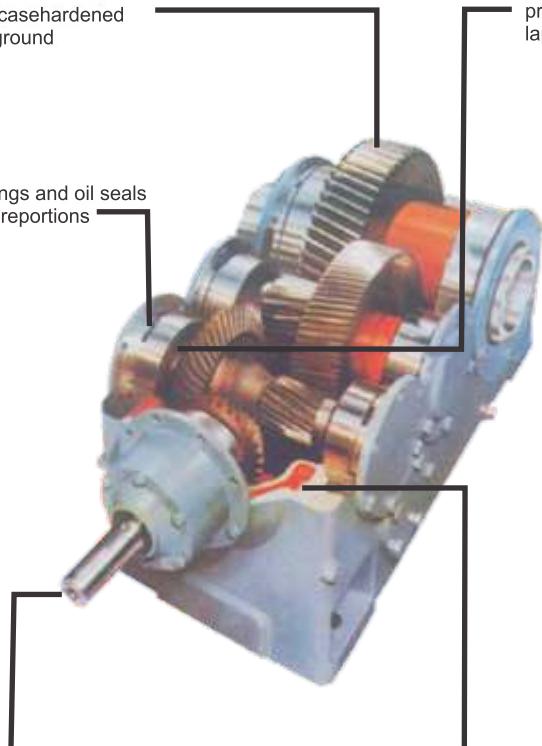

Vertical units are available in three versions : Standard units, heavy duty stirrer types and cooling tower drivers.

Units for heavy duty stirrer and cooling tower drives are derivatives of the standard unit by addition of housing on the output shaft line to increase the size of the shaft and the bearings.

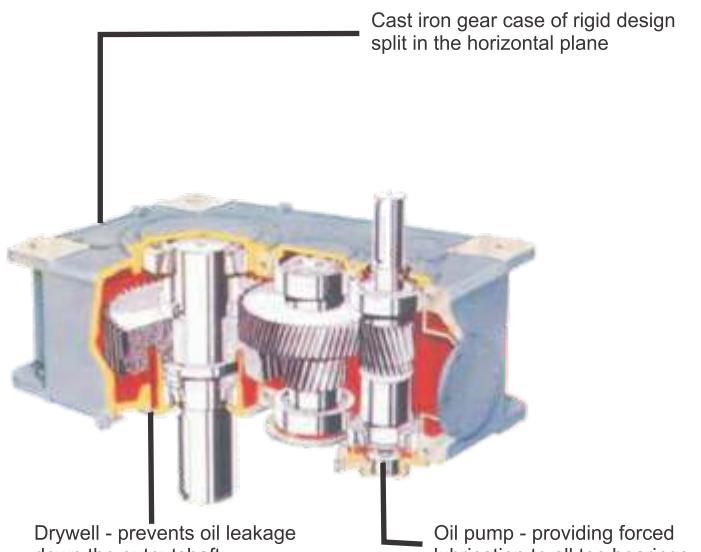

All types include the following features to provide the best solution to the needs of the vertical application and the high reliability which is most important in modern plant :

- Vertical case joints which allows easy maintenance and fitment of lubrication pipe work in one half of the gear case so that lubrication system is not disturbed when dismantling
- Drive and construction ensure freedom from leakage down output shaft.
- Forced lubrication of all top bearings.
- Taper roller bearings fitted to output shaft for high overhung load and axial thrust load capacities.

Helical Gears : Gear tooth profiles are casehardened and profile ground

Spiral Bevel Gears : Gears tooth profiles are casehardened and lapped

Tapped holes in all shaft extensions - couplings etc. are easily fitted or removed.

Type B-3 SF, horizontal right angle, foot/shaft mounted triple reduction gear unit

Cast iron gear case of rigid design split in the vertical plane

Drywell - prevents oil leakage down the output shaft

Oil pump - providing forced lubrication to all top bearings. All pipework is fitted in one half of the gear case only

Design Features

All Types

GEARS: High quality alloy case hardening materials provide long life wear resistance and fatigue strength.

Profile ground single helical gears and spiral bevel gears lapped in pairs ensure high standards of accuracy, surface finish and quiet running characteristics. Helical gears are fitted in parallel shaft units whilst units with shafts at right angles incorporate spiral bevel and helical gears.

BEARINGS: Roller bearings are used throughout.

GEAR CASES: Gear cases are of rigid cast iron construction with modern styling. MS Fabricated gear cases are available as optional.

Inspection covers are provided for viewing gear contacts. Oil level dipsticks, ventilators and drain plugs are fitted. Cases are split in horizontal plain for horizontal gearboxes and in the vertical plain for vertical gearboxes.

Gearcase Finish: Internal and external surfaces are painted with linear epoxy primer.

External surfaces are finished with alkyde semi-gloss blue paint. These paints are resistant to dilute acids and alkalis, oils and solvents, sea water and temperatures upto 140° C.

External Dimensions: Centre distances are chosen from ISO preferred number series.

Shafts extensions and hollow wheelshaft bores are to ISO metric standards.

Fasteners are metric.

Lubrication: In horizontal units, lubrication in most instances is by transfer of oil by gears dipping in the sumps of gear unit bases. Where high pitch line speeds could cause churning of the lubricant, case baffles are fitted as indicated on rating tables. Forced lubrication is necessary where shown and complete systems can be supplied when required.

In vertical units, lubrication in most instances is provided by a pump driven from the bottom of the high speed or second motion shaft. The low speed gears dip in the oil bath. In some cases, it is necessary to use a forced lubrication system with a separate oil tank. These are marked in the rating tables.

All units are provided with combined dipsticks and ventilators and drain plugs. Oil capacity are shown on HE-508. These are approximate as exact quantities vary with ratio.

Design Features

COOLING: Depending on the application, standard gear units are cooled by:

Normal heat dissipation by convection from external surfaces.

Fans fitted to high speed shafts.

Cooling water coil fitted in gear unit base.

Fan and cooling coil.

Separate oil cooler incorporated in forced lubrication system.

SHAFT MOUNTED UNITS: Shaft mounted units are of two designs, the first of which is mounted on the driven machine shaft extension and connected to the foundation by torque arm. Additionally foot/ shaft design is available for mounting on a base plate with motor and coupling, the complete assembly being mounted on the driven machine shaft extension and connected to the foundation by a torque arm.

MOTORISED GEAR UNITS: Gear units of double and triple reduction types are available as standard assemblies with flanged motors directly mounted on gear case input shaft housing by adaptors. Motor and gear unit shafts are connected by flexible coupling.

HOLD BACKS: Hold backs can be fitted to all horizontal, two and three stage gear units, where required to operate in non-reversing drives. They are located on horizontal pinion shaft and have adequate capacities to deal with full rated torque. Lubrication is provided automatically from the oil in the gear unit. Changing the direction of locking rotation is a simple operation.

PRESERVATION/ PROTECTION: Premium helical gear units are despatched without oil. Prior to despatch they are test run with a rust preventative oil giving adequate protection to internal parts for a period of 6 months, covering normal transport and covered storage.

NOTE: Where gear units are to operate in abnormal condition or where they are to stand for long period without running for e.g. in plant installation, Premium must be notified so that suitable protective arrangements can be made.

As improvements in design being made, this specification is not to be regarded as binding in detail and drawings and capacities are subject to alterations without notice. Certified drawings would be sent on request.

Selection

Selection Procedure - Horizontal Units

Gearbox Selection for Horizontal Units

1. Select Gearbox Type

- 1.1 Parallel Shafts (helical) or right angle drive (bevel/helical), foot mount, shaft mount with or without foot.

1.2 Calculate gearbox ratio =
$$\frac{\text{Input Speed}}{\text{Output Speed}}$$

2. Select Gearbox Size from Mechanical Capacity

- 2.1 Determine type of load from table 3 on page 10 (uniform, moderate shock or heavy shock).
- 2.2 Determine mechanical service factor from table 1.
- 2.3 Calculate the required mechanical power capacity (P_m)

$$(P_m) = \text{absorbed power (kW)} \times \text{mechanical service factor}$$
- 2.4 Select gearbox size from rating tables.
 P_m must be equal to or less than the mechanical rating of the gearbox.

3. Thermal Rating Check

- 3.1 Thermal ratings are given for the following four cases :
 Gearbox without additional cooling.
 Gearbox fitted with fan.
 Gearbox fitted with cooling water coil.
 Gearbox fitted with fan and coil.
- 3.2 Determine the thermal service factor from table 2.
- 3.3 Calculate the required thermal power capacity (P_t)

$$(P_t) = \text{absorbed power (kW)} + \text{thermal service factor.}$$
- 3.4 Specify the type of cooling required by referring to thermal rating tables.
 P_t must be equal to or less than the thermal capacity of the gearbox.

Additional Catalogue Information

1. Gearbox overload capacity at start.
 $2.5 \times \text{mechanical rating, 5 times per day or, } 2 \times \text{mechanical rating, 5 times per hour.}$
2. Intermittent duty.
 Higher power than catalogue mechanical ratings can be transmitted on very intermittent operation within the finite life of the gears. Consult us with specific application details.

Table 1: Mechanical Service Factors (Horizontal & Vertical)

Prime Mover	Duration of service Hrs.per day	Load Classifications-Driven			Machine Heavy Shock
		Uniform	Moderate Shock	Shock	
Electric Motor	Under 3	0.80	1.00	1.50	
Steam Turbine, or Hydraulic Motor	3 to 10	1.00	1.25	1.75	2.00
	Over 10	1.25	1.50		
Multi-Cylinder Internal Combustion Engine	Under 3	1.00	1.25	1.75	1.75

Selection

How to Order, Selection Examples

How to order-Information required when ordering standard gear units.

Prime Mover

1. Type - electric motor or engine, for example 4 cylinder internal combustion engine.
2. Power rating in kW.
3. Output speed. If variable, indicate speed range and frequency of variation.
4. Dimensions of prime mover.

Driven Machine.

1. Type, for example, kiln, conveyor, etc.
2. Power rating in kW.
3. Speed.
4. Service - hours per day, running time in any hour, details of reversals if applicable, type of loading, ambient temperature, etc.

Gear Unit

1. Type, for example, H2.
2. Size, for example, 315.
3. Ratio.

4. Shaft handing. Refer to dimension pages and quote reference.
5. Direction of rotation (for units with right angle shafts refer to handing diagrams on dimension pages). If holdback arrangement is to be fitted, please indicate the direction of rotation of low speed shaft looking towards it.

Shaft Connections

1. Couplings. Quote shaft diameters with tolerances or coupling bores.
2. Details of overhung loads, including diameter and type of sheave, sprocket or pinion and any thrust loads.

Shaft mounted units for High Inertia Drive

When used on Traverse drives with high inertia driven loads, e.g. crane drives (slewing, long travel and cross travel) bogie drives and selected high inertia load roller table drives, it is recommended that shaft mounted units should be fitted with shock absorbing Torque Arms. Consult us with specific application details.

Selection Examples:

Example 1

A foot mounted parallel shaft reducer is to be directly coupled to a 750kW, 1500 rpm motor. The output shaft is to rotate at 365 rpm and is coupled to a large industrial fan which absorbs 725 kW on 24 hours/ day service. The maximum ambient temperature is 30°C.

Selection

1. Gearbox Type

- 1.1 Parallel shaft type is specified - type H.
- 1.2 Ratio = $\frac{1500}{365} = 4.11$, type H1 (single reduction)

2. Mechanical Capacity

- 2.1 From table 3 on page 10 the application is moderate shock.
- 2.2 From table 1 on page 3 the service factor is 1.5.
- 2.3 The required mechanical capacity = $1.5 \times 725 = 1088 \text{ kW}$.
- 2.4 Under mechanical rating a unit size 315, normal ratio 4.13, has a capacity of 1293 kW

3. Thermal Rating Check

- 3.1 From table 2 on page 3 the thermal service factor for 30°C ambient temperature and 100% running time is 0.9 for a unit with fan cooling (reference to the thermal ratings shows that at least fan cooling is required.)
- 3.2 The required thermal capacity = $725 \div 0.9 = 806$.
- 3.3 Under thermal ratings, fan cooled, a size 315 has a capacity of 918 kW at 1500 rpm, ratio 4.15.
4. Check that the exact ratio is satisfactory from HE-506.
5. Order a gearbox type H1-315 exact ratio 4.15 with cooling fans fitted.

Example 2

A shaft mounted gear unit with right angle shafts is required to drive a belt conveyor running 24 hours/day at 80rpm. The unit must have feet for the attachment of a motor mounting baseplate. The motor is 500 kW at 1500 rpm and the absorbed power at the conveyor headshaft is 465 kW. The ambient temperature on site is 20°C.

Selection

1. Gearbox Type

- 1.1 Foot shaft mounted unit with right angle shafts.
- 1.2 Ratio = $\frac{1500}{80} = 18.8$, type B2SF or B3SF could be used.

80

2. Mechanical Capacity

- 2.1 From table 3 on page 10 the application is uniform load.
- 2.2 From table 1 on page 3 the service factor is 1.25.
- 2.3 The required mechanical capacity = $1.25 \times 465 = 581 \text{ kW}$.
- 2.4 Under mechanical ratings a unit size B3SF - 400, nominal ratio 18.9, has a capacity of 620 kW. The double reduction type B2SF - 400 ratio 18.9 has insufficient mechanical capacity.

3. Thermal Rating Check

- 3.1 From table 2 on page 3 the thermal service factor for 20°C ambient temperature and 100% running time is 1.0
- 3.2 The required thermal capacity = $465 \div 1.0 = 465 \text{ kW}$.
- 3.3 Under thermal ratings, fan cooled, a size 400 at 1500 rpm has a capacity of 484 kW.
4. Check that the exact ratio is satisfactory from HE-506.
5. Order a gearbox type B3SF - 400, exact ratio 19.218 with cooling fans fitted.

Selection

Overhung Loads / Axial Thrust Loads - Horizontal Units

Whenever a sprocket, gear, sheave or pulley is mounted on the shaft, a calculation should be made to determine the overhung load in kN on the shaft, using the formula :

$$P = \frac{kW \times 9545 \times K}{N \times R}$$

Where P = equivalent overhung load in kN.
 kW = power carried by the shaft,
 N = rpm of the shaft
 R = pitch radius of sprocket, pinion, sheave or pulley (mm).
 K = factor.

Overhung member	K factor
Sprocket for chain	1
Spur gear	1.25
V belt sheave	1.5
Flat belt pulley	3.0

Notes :

- Values are calculated for the most unfavourable direction of rotation. Consult us with specific application details.
- Overhung load values are for loads applied midway along shaft extension.
- For overhung load and axial thrust values for larger sizes consult us.

Table 4 : Permissible Overhung Load on Low Speed Shaft (kN)
(Horizontal Units)

Direction of Load	Output Speed (rpm)	Types H2-H3-B2-B3 Unit Size

Selection

Selection Procedure & Examples - Vertical Units

Gearbox Selection for Vertical Units

1. Select Gearbox Type

- 1.1 Parallel shafts (helical) or right angle drive (bevel/helical), foot mount, shaft mount with or without foot.

Input speed

1.2 Calculate gearbox ratio = $\frac{\text{Input speed}}{\text{Output speed}}$

Output speed

2. Select Gearbox Size from Mechanical Capacity

- 2.1 Determine type of load from table 3 on page 10. (Uniform, moderate shock or heavy shock).
- 2.2 Determine mechanical service factor from table 1 on page 3
- 2.3 Calculate the required mechanical power capacity (P_m)
 $P_m = \text{absorbed power (kW)} \times \text{mechanical service factor}$
- 2.4 Select gearbox size from rating tables
 P_m must be equal to or less than the mechanical rating of the gearbox.

3. Thermal Rating Check

- 3.1 Thermal ratings are given for the following two cases:
 Gearbox without additional cooling.
 Gearbox fitted with fan
- 3.2 Determine the thermal service factor from table 2 on page 3
- 3.3 Calculate the required thermal power capacity (P_t).
 $(P_t) = \text{absorbed power (kW)} \div \text{thermal service factor.}$
- 3.4 Specify the type of cooling required by referring to thermal rating tables.
 P_t must be equal to or less than the thermal capacity of the gearbox.

4. Axial Thrust Capacity Check

Values are given in tables 7 and 8, page 7 for Standard Units, Heavy Duty Stirrer Drives type SA and Cooling Tower Drives type CT

5. Overhung Load Capacity Check

Values are given in table 9 and 10, page 8 for Standard Units and Heavy Duty Stirrer Drives.

6. Bending Moment Capacity Check

Values are given in tables 12 and 13, page 9 for Standard Units and Heavy Duty Stirrer Drives, type SA.

Additional Catalogue Information

1. Gearbox overload capacity at start.
 $2.5 \times \text{mechanical rating, 5 times per day, or}$
 $2 \times \text{mechanical rating, 5 times per hour.}$
2. Intermittent duty.
 Higher power than catalogue mechanical ratings can be transmitted on very intermittent operation within the finite life of the gears. Consult us with specific application details.

Example 1

A gearbox is required to transmit power continuously from a horizontal foot mounted motor to a cooling tower fan, which is to be mounted directly on the output shaft and above the gearbox. The motor power is 250 kW and 1450 rpm and the fan speed is 191 rpm. The maximum ambient temperature is 30°C. The fan imparts an axial thrust of 17 kN to the gearbox output shaft. It is necessary to have added clearance for the fan, so a CT type is preferred.

Selection

1. Gearbox Type

- 1.1 Right angle shafts - type VB

1.2 Ratio = $\frac{1450}{191} = 7.59$ type VB2 CT
 (double reduction)

2. Mechanical Capacity

- 2.1 From table 1 on page 3 the required service factor is 1.75.

2.2 The required mechanical capacity
 $= 1.75 \times 250 = 437.5 \text{ kW}$

- 2.3 On page 21, under mechanical ratings, a unit size 315, nominal ratio 7.59 has a capacity of 713 kW at 1450 rpm input

3. Thermal Rating Check

- 3.1 From table 2 on page 3 the thermal service factor for 30°C ambient temperature and 100% running time is 0.9.

3.2 The required thermal capacity = $250 + 0.9 = 277.8 \text{ kW}$

- 3.3 On page 21, under thermal ratings, fan cooled, a size 315 unit has a capacity of 402 kW at 1450 rpm, ratio 7.59.

4. Axial Thrust Capacity Check

- 4.1 From table 7 on page 7 the allowable axial thrust limited by the cover bolts is 47.7 kN

- 4.2 From table 8 on page 7 the allowable axial thrust limited by bearing life is 39.3 kN at 200 rpm output shaft speed. The bearing life is more than 1,00,000 hours L 10.

5. Check exact ratio on page 79.

6. Order a gearbox type VB2-315 CT, exact ratio 7.685 with cooling fan fitted.

Selection

Note : Values are based on the most unfavourable direction of rotation.
 Higher values may be permitted after analysis by PREMIUM.

Selection

Overhung Loads - Vertical Units

Overhung Member	K Factor
Sprocket for Chain	1
Spur Gear	1.25
V belt sheave	1.5
Flat belt pulley	3.0

Whenever a sprocket, gear, sheave or pulley is mounted on the shaft, a calculation should be made to determine the overhung load in kN on the shaft, using the formula:

$$P = \frac{kW \times 9545 \times K}{N \times R}$$

Where P = equivalent overhung load in kN,
 kW = power carried by the shaft,
 N = rpm of the shaft,
 R = pitch radius of sprocket, pinion, sheave or pulley(mm)
 K = factor.

Notes :

1. Values are calculated for the most unfavourable direction of rotation. Consult PREMIUM for a detailed analysis in critical selections.

2. Overhung load values are for loads applied midway along shaft extension.

Selection

Standard and Heavy Duty - Vertical Units

To calculate the Bending Moment on the gearbox output shaft using the method recommended in The Engineering Equipment Users' Association Handbook No.9 :

$$\text{Bending Moment} = \frac{\text{Absorbed Power (kW)} \times 9.5 \times L}{\text{Shaft Speed} \times 0.75 R} = \text{kNm}$$

The above information is given for guidance. Where more precise bending moment values are available they should be used.

Check the Bending Moment Capacity of the Gearbox

Standard units and the Heavy Duty SA type are both suitable for supporting a paddle directly coupled to the gearbox output shaft and for accepting the bending moments and axial thrusts generated from the forces at the paddle. The SA type unit has an enlarged output shaft, extended bearing span and bigger bearings to accept higher loads than the standard unit. Check the standard unit first and, if this has insufficient capacity, use the SA type.

Check the Bending Moment Capacity limited by shaft stress, using Table 12.

Check the Bending Moment Capacity limited by bearing life, using Table 13.

Note : Bearing Capacities are based on 10,000 hours, L10 life. For other bearing lives multiply the values in Table 13 by the factors in Table 11.

Table 12 : Bending Moment Capacity (kNm)
Allowable Bending Moment at output shaft lower bearing, limited by SHAFT STRESS.

* Fan can be fitted for ratios 14.0 to 63.8 only.
See Sheet 2 of HD-322 for shaft and keyway details.
Sizes 140 to 315 have 4 facings U.

Sizes 355 to 500 have 6 facings and sizes 560 to 710 have 8.
Ventilator is located on top cover, sizes 500 to 710.
E is over ventilator on these sizes, and dipstick position is as shown.

Output Shaft & Shrink Disc Details (mm)

Types H2SF - H3SF - B2SF - B3SF

Each shaft mounted gear unit can be fitted with a 'shrink disc' device located on the hollow output shaft to provide a positive outer locking connection between gear unit and driven shaft. The 'shrink disc' is a friction device, without keys, which exerts an external clamping force on the hollow output shaft, thus establishing a mechanical shrink fit between the gear unit hollow shaft & driven shaft. 'Shrink disc' capacities have ample margins in dealing with transmitted torques and external loading imposed on gear units.

Working Principle

The 'shrink disc' consists of two locking collars, a double tapered inner ring, locking screws and a sealing ring. By tightening the

locking screws, the locking collars are pulled together, exerting radial forces on the inner ring, thus creating a positive friction connection between hollow shaft and driven shaft See fig.2.

As the tapered surfaces of locking collars and inner ring are lubricated with Molykote 321 R or similar and the taper angle is not self locking, locking collars will not seize on the inner ring and can be released easily when removal is necessary.

When the shrink disc is clamped in position the high contact pressures between tapered surfaces and screw heads and their seatings ensure hermetic sealing and eliminate the possibility of fretting corrosion.

For higher sizes — **REFER TO PREMIUM**

Shrink disc locking screws M must be tightened to the torque figures Ma shown in Nm.

*Tolerances for shaft diameters D and d are to h6 for diameters 95 to 165 and g6 for 165 and above.

As improvements in design are continually being made, this specification is not to be regarded as binding in detail and dimensions are subject to alteration without notice.

Output Shaft & Shrink Disc Details (mm)

Types H2SF - H3SF - B2SF - B3SF

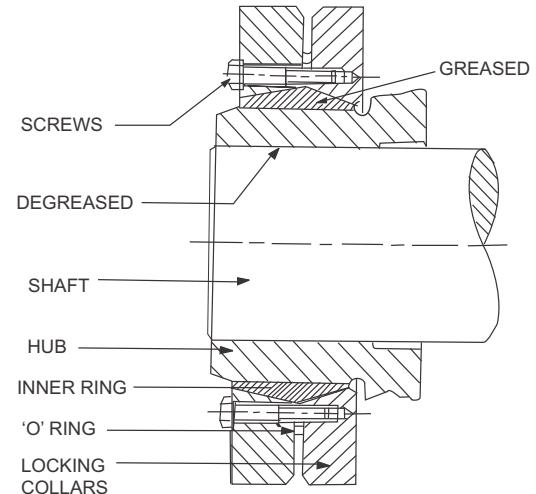

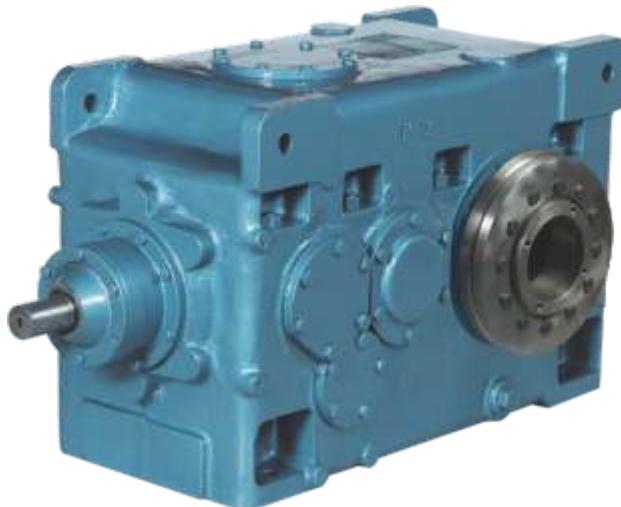

FIG. 2

Installation

'Shrink discs' are optionally supplied with shaft mounted units. The following procedures should be followed when fitting or removing units from driven shafts

- Release locking screws gradually and in succession. Initially a quarter of a turn on each screw will avoid tilting and jamming of collars.
- Remove collars and clean 'shrink disc' thoroughly.
- Clean and degrease locating diameters of gear unit hollow shaft, driven shaft and 'shrink disc' locating diameter on hollow shaft extension.
- Draw the gear unit onto the driven shaft. See Fig.3
- Grease tapered surfaces of locking collars and inner ring with Molykote 321 R or similar.
- Fit 'Shrink Disc' on gear unit hollow shaft to position shown in Fig.1.
- Tighten all locking screws gradually and in succession. Do not tighten in a diametrically opposite sequences. Several passes are required until all screws are tightened to the torque figures Ma shown in the table opposite in Nm. This is stamped on the inner face of the 'shrink disc.'

Locking collars must remain equidistant over 360°.

Note: When the hollow output shaft is to operate in a vertical position it is essential that the shaft of the driven machine is provided with a shoulder. When the thrust load is not taken by the shoulder on the driven shaft, a thrust plate, as shown in Fig.1 must be fitted.

It is recommended that customers shafts at the non-clamped end of the sleeve should be coated with Molykote 321 R or equivalent.

Removal

- Removal procedure is similar to the reverse of installation.
Note: Do not remove 'shrink disc' locking screws completely.
- Remove any rust and dirt from gear unit hollow shaft.
- Withdraw gear unit from driven shaft. See Fig.4.

Note: 'Shrink disc' should be removed and cleaned thoroughly, and Molykote 321 R or similar applied to the tapered surfaces of inner ring and locking collars before re-use. The 'O' ring should be replaced if worn or damaged.

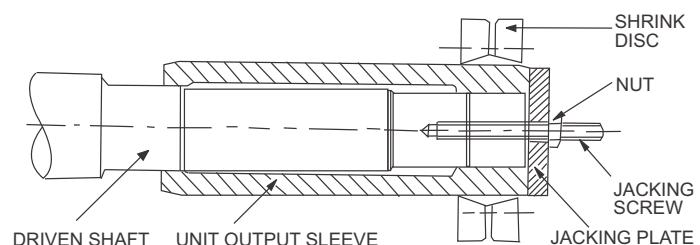

FIG.3 MOUNTING GEAR UNIT

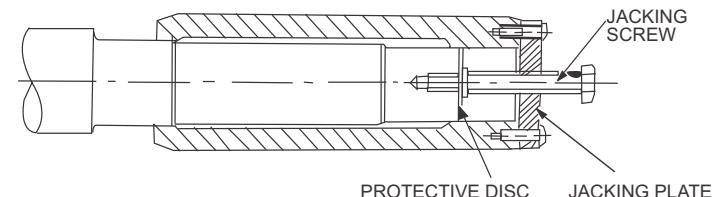

FIG.4 REMOVING GEAR UNIT

As improvements in design are continually being made, this specification is not to be regarded as binding in detail and dimensions are subject to alteration without notice.

TYPE B2S

TYPES H2S-H3S-B3S

Torque arms are available for double and triple reduction shaft mounted units with parallel or right angle shafts, type H2S, H3S, B2S and B3S. They are supplied as optional extras and are secured to gear cases as shown below.

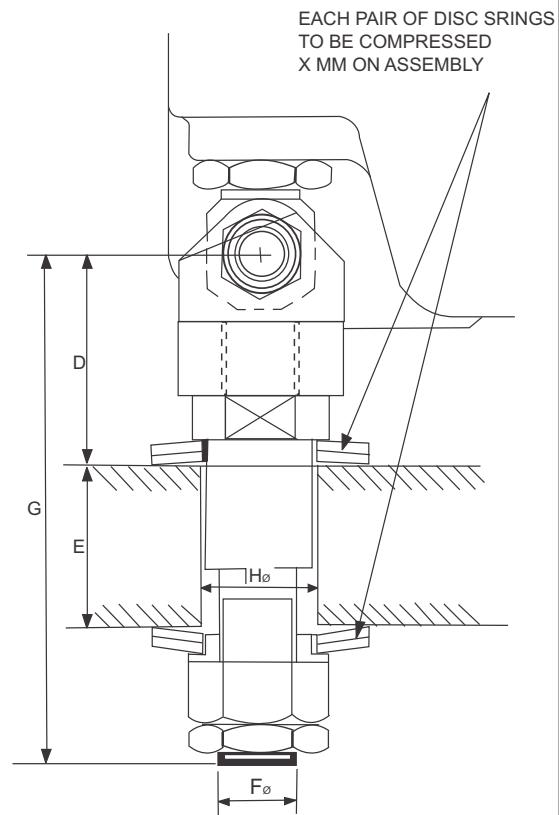

Torque arms must be secured to the chassis structure in a flexible mounting, as indicated, within a maximum angle of 30° between the vertical plane and a plane towards the gear unit output shaft as illustrated.

Shaft mounted units are designed to operate in the horizontal position. Reference must be made to Premium with full details, where units are required to operate in an inclined position or where torque arm mounting positions exceed the 30° maximum angle of inclination to the vertical plane.

Shaft mounted units for High Inertia Drive

When used on Traverse drives with high inertia driven loads, e.g. crane drives (slewing, long travel and cross travel) bogie drives and selected high inertia load roller table drives, it is recommended that shaft mounted units should be fitted with shock absorbing Torque Arms. Consult Premium with specific application details.

THE TORQUE ARM MUST BE FLEXIBLY MOUNTED TO THE CHASSIS STRUCTURE

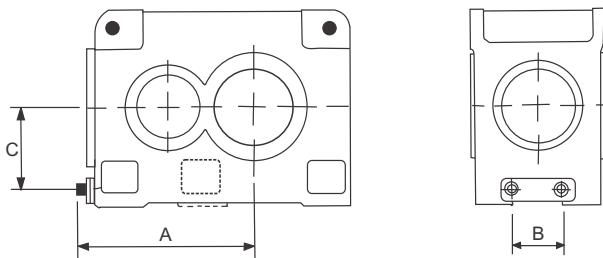

Cooling Coil Connections (mm)

ENGINEERING
HE-503

H1 - B2 - B2SF

H2 - H2SF - H3 - H3SF B3 B3SF

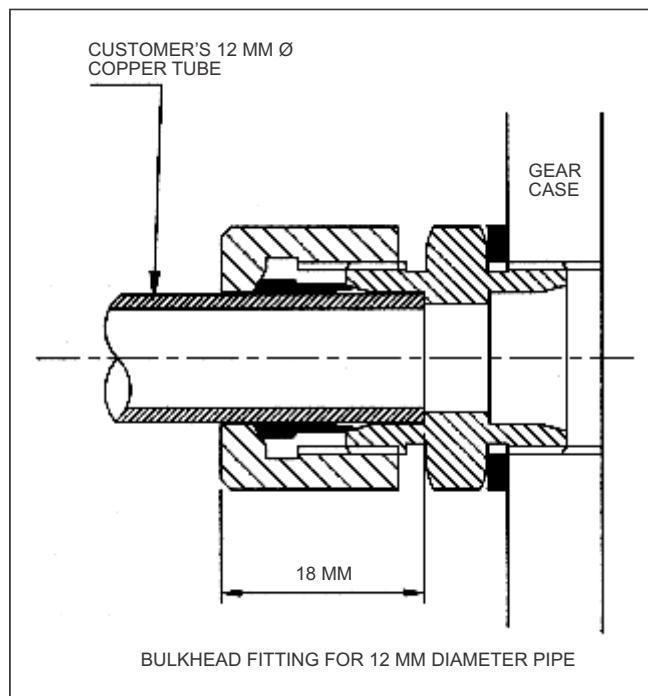

Cooling Coil connections for water inlet and outlet pipes are provided as indicated. One size of fitting is used for all gear unit sizes.

Fittings which are supplied with gear units fitted with cooling coils are to suit 12 mm diameter copper pipe which is provided by customers.

Cooling coils are suitable for fresh, brackish or sea water with flow in either direction. Connections are therefore interchangeable.

As improvement in design are continually being made, this specification is not to be regarded as binding in detail and dimensions are subject to alteration without notice.

Holbacks

Principle of Operation

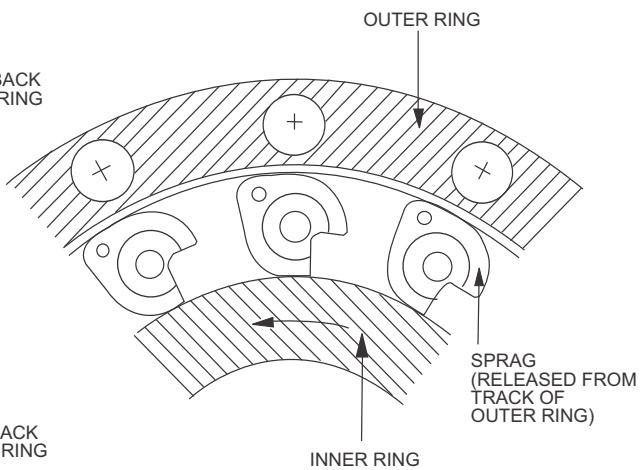

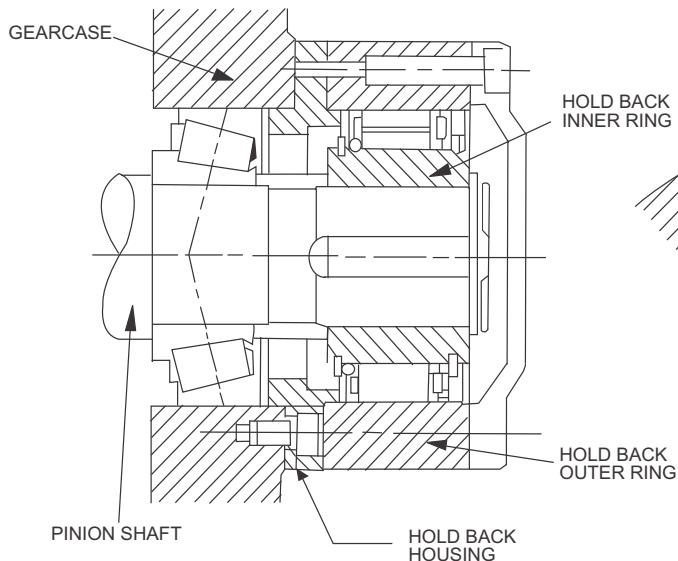

FIG.1

FIG.2

Holbacks can be fitted to all Helical Units, with the exception of H1 single reduction type, where required to operate in non-reversing drives. They are located on input pinion-shaft in case of H2/H2SF type units and on second reduction pinion-shaft in case of B2/B2SF, H3/H3SF and B2/B3SF type of units.

All the holbacks have adequate capacities to deal with full rated torque. Lubrication is provided automatically from the oil in the gear unit.

Holbacks are located externally as shown in Fig. 1 and are positioned on different units as shown on sheet 2 of HE-504.

Holbacks fitted on Helical units are of centrifugally released sprag type. In case of these holbacks the sprags rotate along with cage and inner ring of holdback in free direction of rotation. The sprags are so designed that they get released from track of outer ring of the holdback. (see fig.2) due to centrifugal force at normal running speed of gearbox. Contact between the sprag and the stationary outer race therefore takes place only during starting and stopping. Contact-free running during normal operating conditions reduces wear of the sprags and ensures the longer life.

Holbacks-Double & Triple Reduction Units

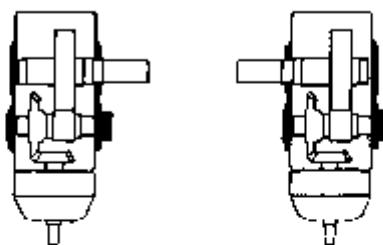

Positions

Holbacks can be fitted to all PREMIUM Helical gear unit types with the exception of H1 single reduction units. They are located externally on helical pinion shafts, positioned as indicated on the diagrams below.

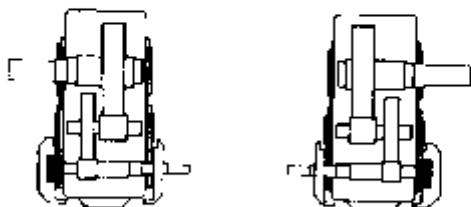

The holdback position for units with right angle shafts, types B2-B2SF-B3-B3SF depends on relative shaft rotations.

Position of holdback on types B2SF, sizes 225, 250, 280 and 315 is on the side opposite to the shrink disc for shaft handings 1 and 2A (see HD - 221 & HD - 222)

Approved Lubricants

Oil Capacities

**ENGINEERING
HE-508**

Premium gear units are supplied without oil. Before operating it is essential to ensure that they are filled to correct oil levels as indicated by markings on dipsticks, with lubricants recommended by Premium. Overfilling can cause overheating and leakage.

Correct lubricant is most important and it should be noted that EP oils are recommended in all instances.

Lubricants listed are suitable for normal ambient temperatures and operating duties. All gear units in this range are designed to operate under full load at a maximum temperature of 110°C. Higher temperature up to a maximum of 120°C are acceptable on the basis of peak periods of short duration only. In certain applications these maximum temperatures may be exceeded by the use of special lubricants. Such cases, or others where extreme conditions, are to be met, e.g. low temperature operation or unusual loading conditions, should be referred, with full details, to Premium for recommendations.

Recommended lubricants are based on information provided by oil suppliers and responsibility cannot be accepted for the quality or suitability of oil supplied, nor to any mechanical defect resulting from unsatisfactory lubrication due to the use of sub-standard oil.

Oil Capacities for Vertical Units in litres (approx.)

- NOTES:**
- a) These lubricants should not be used in units fitted with trailing sprag or holdback devices without prior agreement with the manufacturer; the additives, or the base fluids may modify the coefficient of friction which these devices depend on.
 - b) These lubricants have been tested for micro-pitting (FZG Type C), test results are available.
 - c) These oils contains solid lubricants (eg MOS₂ or graphite) and must NOT be used in units fitted with any type of hold-back device which relies on friction for its operation.
 - d) These lubricants contain additives which may adversely affect silvered or white metal components; consult oil supplier.
 - e) Minimum operating temperatures of these lubricants are based on worst case values, lower operating temperatures may be available, please check with local stockist.

DANGER

Numbers in brackets indicate recommended minimum operating temperature in °C.

THE UNIT MUST NOT RUN BELOW THIS TEMPERATURE.

Product safety

IMPORTANT

ENGINEERING
HE-508

Product Safety Information :

General - The following information is important in ensuring safety. It must be brought to the attention of personnel involved in the selection of Premium Transmission Limited power transmission equipment, those responsible for the design of the machinery in which it is to be incorporated and those involved in its installation, use and maintenance.

PREMIUM power transmission equipment will operate safely provided it is selected, installed, used and maintained properly. As with any power transmission equipment proper precautions must be taken as indicated in the following paragraphs, to ensure safety.

Potential Hazards - these are not necessarily listed in any order of severity as the degree of danger varies in individual circumstances. It is important therefore that the list is studied in its entirety:-

1) Fire/Explosion

- (a) Oil mists and vapour are generated within gear units. It is therefore dangerous to use naked lights in the proximity of gearbox openings, due to the risk of fire or explosion.
- (b) In the event of fire or serious overheating (over 300 °C), certain materials (rubber, plastics, etc.) may decompose and produce fumes. Care should be taken to avoid exposure to the fumes, and the remains of burned or overheated plastic/rubber materials should be handled with rubber gloves.

2) Guards - Rotating shafts and couplings must be guarded to eliminate the possibility of physical contact or entanglement of clothing. It should be of rigid construction and firmly secured.

3) Noise - High speed gearboxes and gearbox driven machinery may produce noise levels which are damaging to the hearing with prolonged exposure. Ear defenders should be provided for personnel in these circumstances. Reference should be made to the Department of Employment Code of Practice for reducing exposure of employed persons to noise.

4) Lifting - Where provided (on larger units) only the lifting points or eyebolts must be used for lifting operations (see maintenance manual or general arrangement drawing for lifting point positions). Failure to use the lifting points provided may result in personal injury and/or damage to the product or surrounding equipment. Keep clear of raised equipment.

5) Lubricants and Lubrication

- (a) Prolonged contact with lubricants can be detrimental to the skin. The manufacturer's instruction must be followed when handling lubricants.
- (b) The lubrication status of the equipment must be checked before commissioning. Read and carry out all instructions on the lubricant plate and in the installation and maintenance literature. Heed all warning tags. Failure to do so could result in mechanical damage and in extreme cases risk of injury to personnel.

6) Electrical Equipment - Observe hazard warnings on electrical equipment and isolate power before working on the gearbox or associated equipment, in order to prevent the machinery being started.

7) Installation, Maintenance and Storage

(a) In the event that equipment is to be held in storage, for a period exceeding 6 months, prior to installation or commissioning, Premium Transmission Limited must be consulted regarding special preservation requirements. Unless otherwise agreed, equipment must be stored in a building protected from extremes of temperature and humidity to prevent deterioration. The rotating components (gears and shafts) must be turned a few revolutions once a month (to prevent bearings brinelling).

(b) External gearbox components may be supplied with preservative materials applied, in the form of a "waxed" tape overwrap or wax film preservative. Gloves should be worn when removing these materials. The former can be removed manually, the latter using white spirit as a solvent. Preservatives applied to the internal parts of the gear units do not require removal prior to operation.

(c) Installation must be performed in accordance with the manufacturer's instructions and be undertaken by suitably qualified personnel.

(d) Before working on a gearbox or associated equipment, ensure that the load has been removed from the system to eliminate the possibility of any movement of the machinery and isolate power supply. Where necessary, provide mechanical means to ensure the machinery cannot move or rotate. Ensure removal of such devices after work is complete.

(e) Ensure the proper maintenance of gearboxes in operation. Use only the correct tools and Premium Transmission Limited approved spare parts for repair and maintenance. Consult the Maintenance Manual before dismantling or performing maintenance work.

8) Hot Surfaces and Lubricants

- (a) During operation, gear units may become sufficiently hot to cause skin burns. Care must be taken to avoid accidental contact.
- (b) After extended running the lubricant in gear units and lubrication systems may reach temperatures sufficient to cause burns. Allow equipment to cool before servicing or performing adjustments.

9) Selection and Design

- (a) Where gear units provide a holdback facility, ensure that back-up systems are provided if failure of the holdback device would endanger personnel or result in damage.
- (b) The driving and driven equipment must be correctly selected to ensure that the complete machinery installation will perform satisfactorily, avoiding system critical speeds, system torsional vibration, etc.
- (c) The equipment must not be operated in an environment or at speeds, powers, torques or with external loads beyond those for which it was designed.
- (d) As improvements in design are being made continually the contents of this catalogue are not to be regarded as binding in detail, and drawings and capacities are subject to alterations without notice.

The above guidance is based on the current state of knowledge and our best assessment of the potential hazards in the operation of the gear units.
