Classical Thinking

1. $\tan\theta = \frac{9}{2}$

$\Rightarrow \frac{\sin\theta}{\cos\theta} = \frac{9}{2}$

$\Rightarrow \cos\theta = \frac{2}{9}\sin\theta = \frac{2}{9}\times\frac{3}{4} = \frac{1}{6}$

2. $5\sin\theta = 3 \Rightarrow \sin\theta = \frac{3}{5}$

$\frac{\sec\theta+\tan\theta}{\sec\theta-\tan\theta} = \frac{1+\sin\theta}{1-\sin\theta}$

$= \frac{1+\frac{3}{5}}{1-\frac{3}{5}}$

$= 4$

3. $\frac{\sin\theta}{1-\cot\theta}+\frac{\cos\theta}{1-\tan\theta} = \frac{\sin\theta.\sin\theta}{\sin\theta-\cos\theta}+\frac{\cos\theta.\cos\theta}{\cos\theta-\sin\theta}$

$= \frac{\cos^2\theta-\sin^2\theta}{\cos\theta-\sin\theta}$

$= \cos\theta + \sin\theta$

4. $\sin\theta = -\frac{1}{\sqrt{2}}$ and $\tan\theta = 1$

Since, $\sin\theta$ is –ve and $\tan\theta$ is +ve in third quadrant,

$\therefore$ θ lies in the III[rd] quadrant.

5. Since, $\sin\theta$ is –ve and $\cos\theta$ is +ve

$\therefore$ θ lies in IV[th] quadrant.

7. $\sin^2\frac{\pi}{6}+\cos^2\frac{\pi}{3}-\tan^2\frac{\pi}{4} = \left(\frac{1}{2}\right)^2+\left(\frac{1}{2}\right)^2-(1)^2$

$= \frac{1}{4}+\frac{1}{4}-1 = -\frac{1}{2}$

8. $x\sin 45^\circ\cos^2 60^\circ = \frac{\tan^2 60^\circ \operatorname{cosec} 30^\circ}{\sec 45^\circ \cot^2 30^\circ}$

$\Rightarrow x.\frac{1}{\sqrt{2}}.\frac{1}{4} = \frac{3.2}{\sqrt{2}.3}$

$\Rightarrow \frac{x}{4\sqrt{2}} = \sqrt{2}$

$\Rightarrow x = 8$

9. $\sin\theta = \sqrt{3}\cos\theta$

$\Rightarrow \frac{\sin\theta}{\cos\theta} = \sqrt{3}$

$\Rightarrow \tan\theta = \sqrt{3} \Rightarrow \theta = 60^\circ$

10. $\sin(\alpha-\beta) = \frac{1}{2} = \sin 30^\circ$

$\Rightarrow \alpha-\beta = 30^\circ$ …..(i)

and $\cos(\alpha+\beta) = \frac{1}{2} = \cos 60^\circ$

$\Rightarrow \alpha+\beta = 60^\circ$ …..(ii)

On solving (i) and (ii), we get

$\alpha = 45^\circ$ and $\beta = 15^\circ$

11. $\tan\theta = \frac{20}{21}$

Since $1+\tan^2\theta = \sec^2\theta$

$\therefore$ $\sec^2\theta = 1+\frac{400}{441} = \frac{841}{441}$

$\Rightarrow \sec\theta = \pm\frac{29}{21}$

$\Rightarrow \cos\theta = \pm\frac{21}{29}$

12. $1+\tan^2\theta = \sec^2\theta$

$\Rightarrow 1+\frac{1}{10} = \sec^2\theta$

$\Rightarrow \sec^2\theta = \frac{11}{10} \Rightarrow \sec\theta = \sqrt{\frac{11}{10}}$

….[$\because$ θ lies in the fourth quadrant]

13. $\sec^2\theta = 1+\tan^2\theta = 1+\frac{1}{5} = \frac{6}{5}$

$\Rightarrow \cos^2\theta = \frac{5}{6}$

$\Rightarrow \cos\theta = \frac{\sqrt{5}}{\sqrt{6}}$ ….[$\because$ θ lies in the 1[st] quadrant]

14. $\sec\theta + \tan\theta = \dfrac{1+\sin\theta}{\cos\theta}$

$= \dfrac{1+\sin\theta}{-\sqrt{1-\sin^2\theta}}$

....[∵ θ lies in the second quadrant, ∴ cos θ < 0]

$= \dfrac{-\left(1+\frac{21}{29}\right)}{\sqrt{1-\left(\frac{21}{29}\right)^2}} = -\dfrac{5}{2}$

15. $\sec^4 x - \sec^2 x = \sec^2 x(\sec^2 x - 1)$
$= (1+\tan^2 x)\tan^2 x$
$= \tan^2 x + \tan^4 x$

16. $\tan^2\theta - \sin^2\theta = \sin^2\theta\left(\dfrac{1}{\cos^2\theta} - 1\right)$
$= \sin^2\theta(\sec^2\theta - 1)$
$= \sin^2\theta\tan^2\theta$
Also $\sec^2\theta\,\text{cosec}^2\theta \neq \sec^2\theta - \text{cosec}^2\theta$, and $\text{cosec}^2\theta + \cot^2\theta \neq \text{cosec}^2\theta\cot^2\theta$

17. $x = \sec\theta + \tan\theta$

∴ $x + \dfrac{1}{x} = \sec\theta + \tan\theta + \dfrac{1}{\sec\theta + \tan\theta}$

$= \sec\theta + \tan\theta + \dfrac{\sec\theta - \tan\theta}{\sec^2\theta - \tan^2\theta}$

$= \sec\theta + \tan\theta + \sec\theta - \tan\theta$

....[∵ $\sec^2\theta - \tan^2\theta = 1$]

$= 2\sec\theta$

18. $\cot x + \tan x = \dfrac{\cos x}{\sin x} + \dfrac{\sin x}{\cos x}$

$= \dfrac{\cos^2 x + \sin^2 x}{\sin x\cos x}$

$= \dfrac{1}{\sin x\cos x}$

$= \sec x\,\text{cosec}\,x$

19. $\dfrac{\sin^2 20° + \cos^4 20°}{\sin^4 20° + \cos^2 20°}$

$= \dfrac{\sin^2 20° + \cos^2 20°\left(1-\sin^2 20°\right)}{\sin^2 20°\left(1-\cos^2 20°\right) + \cos^2 20°}$

$= \dfrac{1-\sin^2 20°\cos^2 20°}{1-\sin^2 20°\cos^2 20°} = 1$

20. $x = a\cos\theta + b\sin\theta$ ....(i)
and $y = a\sin\theta - b\cos\theta$ ....(ii)

Squaring (i) and (ii) and adding, we get
$x^2 + y^2 = a^2\cos^2\theta + b^2\sin^2\theta + 2ab\cos\theta\sin\theta + a^2\sin^2\theta + b^2\cos^2\theta - 2ab\sin\theta\cos\theta$
$\Rightarrow x^2 + y^2 = a^2 + b^2$

21. $x = a\cos^3\theta$

$\Rightarrow \left(\dfrac{x}{a}\right)^{\frac{1}{3}} = \cos\theta$, and ....(i)

$y = b\sin^3\theta$

$\Rightarrow \left(\dfrac{y}{b}\right)^{\frac{1}{3}} = \sin\theta$ ....(ii)

Squaring (i) and (ii) and adding, we get

$\left(\dfrac{x}{a}\right)^{\frac{2}{3}} + \left(\dfrac{y}{b}\right)^{\frac{2}{3}} = \cos^2\theta + \sin^2\theta$

$= 1$

22. $\cos x + \cos^2 x = 1$
$\Rightarrow \cos x = \sin^2 x$ ....[∵ $1 - \cos^2 x = \sin^2 x$]
∴ $\sin^2 x + \sin^4 x = \cos x + \cos^2 x = 1$

23. $\sin x + \sin^2 x = 1$
$\Rightarrow \sin x = \cos^2 x$
∴ $\cos^8 x + 2\cos^6 x + \cos^4 x$
$= \sin^4 x + 2\sin^3 x + \sin^2 x$
$= (\sin x + \sin^2 x)^2$
$= (1)^2 = 1$

24. $\sec\theta = \dfrac{1}{2}$ is not possible as $|\sec\theta| \geq 1$

25. tan θ can have any value
sin θ and cos θ cannot be numerically greater than 1.
sec θ should be greater than 1.
∴ Option (D) is the correct answer.

26. Since, $-1 \leq \cos\theta \leq 1$
∴ $-5 \leq 5\cos\theta \leq 5$
$\Rightarrow -5 + 12 \leq 5\cos\theta + 12 \leq 5 + 12$
$\Rightarrow 7 \leq 5\cos\theta + 12 \leq 17$

Critical Thinking

1. $\dfrac{p\sin\theta - q\cos\theta}{p\sin\theta + q\cos\theta} = \dfrac{p\frac{\sin\theta}{\cos\theta} - q}{p\frac{\sin\theta}{\cos\theta} + q}$

$= \dfrac{p\tan\theta - q}{p\tan\theta + q}$

$= \dfrac{p^2 - q^2}{p^2 + q^2}$ ....$\left[\because \tan\theta = \dfrac{p}{q}\text{(given)}\right]$

2. $\cos^2\theta + \sec^2\theta = (\cos\theta - \sec\theta)^2 + 2 \ge 2$

3. $\sin x + \operatorname{cosec} x = 2$

$\Rightarrow \sin^2 x + 1 = 2\sin x$

$\Rightarrow (\sin x - 1)^2 = 0 \Rightarrow \sin x = 1$

$\therefore$ $\sin^n x + \operatorname{cosec}^n x = \sin^n x + \dfrac{1}{\sin^n x}$

$= (1)^n + \dfrac{1}{(1)^n} = 2$

4. Since, 1 radian = 57° nearly and sin 57° > sin 1°

$\therefore$ sin1 > sin1°

5. Since, 1 radian = 57° nearly

$\therefore$ 2 radians = 114° nearly

Since, 57° lies in I^st quadrant and 114° lies in II^nd quadrant.

$\therefore$ tan 1 > 0 and tan 2 < 0

$\therefore$ tan 1 > tan 2

6. $\cos A = \dfrac{\sqrt{3}}{2}$

$\Rightarrow \cos A = \cos 30°$

$\Rightarrow A = 30°$

$\therefore$ $\tan 3A = \tan 90° = \infty$

7. $\tan(A - B) = 1 = \tan\dfrac{\pi}{4}$

$\Rightarrow A - B = \dfrac{\pi}{4}$ ....(i)

and $\sec(A + B) = \dfrac{2}{\sqrt{3}}$

$\Rightarrow A + B = \dfrac{11\pi}{6}$ ....(ii)

From (i) and (ii), we get

$B = \dfrac{19\pi}{24}$

8. $\sin(A + B + C) = 1$

$\Rightarrow A + B + C = 90°$ ….(i)

$\tan(A - B) = \dfrac{1}{\sqrt{3}}$

$\Rightarrow A - B = 30°$ ....(ii)

$\sec(A + C) = 2$

$\Rightarrow A + C = 60°$ ….(iii)

From (i), (ii) and (iii), we get

B = 30°, A = 60°, C = 0°

9. $\cos A = \dfrac{3}{5}$ and $\cos B = \dfrac{4}{5}$

Both A and B lie in the fourth quadrant.

Hence, both sin A and sin B are negative.

$\therefore$ 2 sin A + 4 sin B

$= -2\sqrt{1-\cos^2 A} - 4\sqrt{1-\cos^2 B}$

$= -2\sqrt{1-\dfrac{9}{25}} - 4\sqrt{1-\dfrac{16}{25}} = -4$

10. $\sec\theta + \tan\theta = \sqrt{3}$ ….(i)

$\Rightarrow \sec\theta - \tan\theta = \dfrac{1}{\sqrt{3}}$ ….(ii)

….[$\because \sec^2\theta - \tan^2\theta = 1$]

Subtracting (ii) from (i), we get

$2\tan\theta = \sqrt{3} - \dfrac{1}{\sqrt{3}}$

$\Rightarrow \tan\theta = \dfrac{1}{\sqrt{3}}$ $\Rightarrow \theta = \dfrac{\pi}{6}$

11. $\sqrt{\dfrac{1-\sin\theta}{1+\sin\theta}} = \sqrt{\dfrac{(1-\sin\theta)^2}{1-\sin^2\theta}}$

$= \dfrac{1-\sin\theta}{|\cos\theta|}$

$= \dfrac{1-\sin\theta}{-\cos\theta}$ ….$\left[\because \dfrac{\pi}{2} < \theta < \dfrac{3\pi}{2} \Rightarrow \cos\theta < 0\right]$

$= -\sec\theta + \tan\theta$

12. $\sqrt{\left(\dfrac{1-\sin\theta}{1+\sin\theta}\right)} + \sqrt{\left(\dfrac{1+\sin\theta}{1-\sin\theta}\right)}$

$= \dfrac{1-\sin\theta+1+\sin\theta}{\sqrt{1-\sin^2\theta}} = \dfrac{2}{\sqrt{\cos^2\theta}}$

$= \dfrac{2}{-\cos\theta}$ ….[$\because$ θ lies in the 2^nd quadrant]

$= -2\sec\theta$

13. $\sqrt{\dfrac{1-\cos\alpha}{1+\cos\alpha}} + \sqrt{\dfrac{1+\cos\alpha}{1-\cos\alpha}}$

$= \dfrac{1-\cos\alpha+1+\cos\alpha}{\sqrt{1-\cos^2\alpha}}$

$= \dfrac{2}{-\sin\alpha}$ ….$\left[\because \pi < \alpha < \dfrac{3\pi}{2}\right]$

14. $3\tan A + 4 = 0 \Rightarrow \tan A = -\dfrac{4}{3}$

$1 + \tan^2 A = \sec^2 A$

$\Rightarrow \sec^2 A = 1 + \dfrac{16}{9}$

$\Rightarrow \sec A = \dfrac{-5}{3}$ ....[$\because$ θ lies in 2^{nd} quadrant]

$\Rightarrow \cos A = -\dfrac{3}{5}$

$\therefore$ $\sin A = \sqrt{1-\cos^2 A} = \sqrt{1-\dfrac{9}{25}}$

$= \dfrac{4}{5}$ ....[$\because$ A lies in 2^{nd} quadrant]

$\therefore$ $2 \cot A - 5 \cos A + \sin A$

$= 2\left(-\dfrac{3}{4}\right) - 5\left(-\dfrac{3}{5}\right) + \dfrac{4}{5}$

$= \dfrac{23}{10}$

15. $\sec\theta - \tan\theta = \dfrac{1}{2}$ ....(i)

$\Rightarrow \sec\theta + \tan\theta = 2$ ....(ii)

....[$\because \sec^2\theta - \tan^2\theta = 1$]

Adding (i) and (ii), we get

$2\sec\theta = \dfrac{5}{2} \Rightarrow \sec\theta = \dfrac{5}{4}$

Subtracting (ii) from (i), we get

$2\tan\theta = \dfrac{3}{2} \Rightarrow \tan\theta = \dfrac{3}{4}$

Since, both sec θ and tan θ are positive,

$\therefore$ θ lies in the first quadrant.

16. $\cos\theta + \sin\theta = \sqrt{2}\cos\theta$

Squaring both sides, we get

$\therefore$ $\cos^2\theta + \sin^2\theta + 2\sin\theta\cos\theta = 2\cos^2\theta$

$\Rightarrow 2\sin\theta\cos\theta = 2\cos^2\theta - 1$ ....(i)

Now

$(\cos\theta - \sin\theta)^2 = \cos^2\theta + \sin^2\theta - 2\sin\theta\cos\theta$

$= 1 - (2\cos^2\theta - 1)$

....[From (i)]

$= 2(1 - \cos^2\theta)$

$= 2\sin^2\theta$

$\therefore$ $\cos\theta - \sin\theta = \sqrt{2}\sin\theta$

17. $(\sin x - \cos x)^2 = \sin^2 x + \cos^2 x - 2\sin x\cos x$

$= 1 - \{(\sin x + \cos x)^2 - (\sin^2 x + \cos^2 x)\}$

$= 1 - (a^2 - 1)$ ....[$\because \sin x + \cos x = a$]

$= 2 - a^2$

$\therefore$ $|\sin x - \cos x| = \sqrt{2 - a^2}$

18. $3\sin\theta + 4\cos\theta = 5$

Squaring both sides, we get

$9\sin^2\theta + 16\cos^2\theta + 24\sin\theta\cos\theta = 25$

$\Rightarrow 9(1 - \cos^2\theta) + 16(1 - \sin^2\theta) + 24\sin\theta\cos\theta = 25$

$\Rightarrow 9\cos^2\theta + 16\sin^2\theta - 24\sin\theta\cos\theta = 0$

$\Rightarrow (3\cos\theta - 4\sin\theta)^2 = 0$

$\Rightarrow 3\cos\theta - 4\sin\theta = 0$

19. $2u_6 - 3u_4$

$= 2(\cos^6\theta + \sin^6\theta) - 3(\cos^4\theta + \sin^4\theta)$

$= 2(1 - 3\sin^2\theta\cos^2\theta) - 3(1 - 2\sin^2\theta\cos^2\theta)$

$= -1$

20. $\sin x + \sin^2 x = 1$

$\Rightarrow \sin x = 1 - \sin^2 x$

$\Rightarrow \sin x = \cos^2 x$

$\therefore$ $\cos^{12} x + 3\cos^{10} x + 3\cos^8 x + \cos^6 x - 2$

$= \sin^6 x + 3\sin^5 x + 3\sin^4 x + \sin^3 x - 2$

$= (\sin^2 x)^3 + 3(\sin^2 x)^2 \sin x + 3(\sin^2 x)(\sin x)^2 + (\sin x)^3 - 2$

$= (\sin^2 x + \sin x)^3 - 2$

$= (1)^3 - 2$ ....[$\because \sin x + \sin^2 x = 1$]

$= -1$

21. $10\sin^4\alpha + 15\cos^4\alpha = 6$

$\Rightarrow 10\sin^4\alpha + 15\cos^4\alpha = 6(\sin^2\alpha + \cos^2\alpha)^2$

$\Rightarrow 10\tan^4\alpha + 15 = 6(\tan^2\alpha + 1)^2$

$\Rightarrow (2\tan^2\alpha - 3)^2 = 0$

$\Rightarrow \tan^2\alpha = \dfrac{3}{2}$

$\therefore$ $27\operatorname{cosec}^6\alpha + 8\sec^6\alpha$

$= 27(1 + \cot^2\alpha)^3 + 8(1 + \tan^2\alpha)^3$

$= 27\left(1 + \dfrac{2}{3}\right)^3 + 8\left(1 + \dfrac{3}{2}\right)^3 = 250$

22. $\sec\alpha - \tan\alpha = \dfrac{1 - \sin\alpha}{\cos\alpha}$

$$= \frac{1 - \dfrac{2pq}{p^2 + q^2}}{\sqrt{1 - \left(\dfrac{2pq}{p^2 + q^2}\right)^2}}$$

$$= \frac{(p - q)^2}{\sqrt{(p^2 - q^2)^2}}$$

$$= \frac{(p - q)^2}{p^2 - q^2} = \frac{p - q}{p + q}$$

23. $\sec\theta - \tan\theta = \frac{a+1}{a-1}$ ....(i)

$\Rightarrow \sec\theta + \tan\theta = \frac{a-1}{a+1}$ ....(ii)

....[$\because \sec^2\theta - \tan^2\theta = 1$]

Adding (i) and (ii), we get

$2\sec\theta = \frac{a+1}{a-1} + \frac{a-1}{a+1}$

$\Rightarrow 2\sec\theta = \frac{(a+1)^2 + (a-1)^2}{a^2-1}$

$\Rightarrow 2\sec\theta = \frac{2(a^2+1)}{a^2-1}$

$\Rightarrow \sec\theta = \frac{a^2+1}{a^2-1}$

$\Rightarrow \cos\theta = \frac{a^2-1}{a^2+1}$

24. $\tan^2\theta = \sec^2\theta - 1$

$= \left(x + \frac{1}{4x}\right)^2 - 1 = \left(x - \frac{1}{4x}\right)^2$

$\Rightarrow \tan\theta = \pm\left(x - \frac{1}{4x}\right)$

$\Rightarrow \sec\theta + \tan\theta = x + \frac{1}{4x} \pm \left(x - \frac{1}{4x}\right)$

$\Rightarrow \sec\theta + \tan\theta = x + \frac{1}{4x} + \left(x - \frac{1}{4x}\right)$

or

$\sec\theta + \tan\theta = x + \frac{1}{4x} - \left(x - \frac{1}{4x}\right)$

$\Rightarrow \sec\theta + \tan\theta = 2x$ or $\frac{1}{2x}$

25. $\sin^6\left(\frac{\pi}{49}\right) + \cos^6\left(\frac{\pi}{49}\right) - 1 + 3\sin^2\left(\frac{\pi}{49}\right)\cos^2\left(\frac{\pi}{49}\right)$

$= \sin^6\left(\frac{\pi}{49}\right) + \cos^6\left(\frac{\pi}{49}\right)$

$+ 3\sin^2\left(\frac{\pi}{49}\right)\cos^2\left(\frac{\pi}{49}\right)\left(\sin^2\frac{\pi}{49} + \cos^2\frac{\pi}{49}\right) - 1$

$= \left(\sin^2\frac{\pi}{49} + \cos^2\frac{\pi}{49}\right)^3 - 1 = 1 - 1 = 0$

26. $\frac{1-\cos\alpha+\sin\alpha}{1+\sin\alpha} = \frac{1-\cos\alpha+\sin\alpha}{1+\sin\alpha}\cdot\frac{1+\cos\alpha+\sin\alpha}{1+\cos\alpha+\sin\alpha}$

$= \frac{(1+\sin\alpha)^2 - \cos^2\alpha}{(1+\sin\alpha)(1+\cos\alpha+\sin\alpha)}$

$= \frac{1+2\sin\alpha+\sin^2\alpha-(1-\sin^2\alpha)}{(1+\sin\alpha)(1+\cos\alpha+\sin\alpha)}$

$= \frac{2\sin\alpha(1+\sin\alpha)}{(1+\sin\alpha)(1+\cos\alpha+\sin\alpha)}$

$= \frac{2\sin\alpha}{1+\cos\alpha+\sin\alpha}$

$= x$

27. $1 - \frac{\sin^2 y}{1+\cos y} + \frac{1+\cos y}{\sin y} - \frac{\sin y}{1-\cos y}$

$= \frac{1+\cos y - \sin^2 y}{1+\cos y} + \frac{(1-\cos^2 y) - \sin^2 y}{\sin y(1-\cos y)}$

$= \frac{\cos^2 y + \cos y}{1+\cos y} + \frac{\sin^2 y - \sin^2 y}{\sin y(1-\cos y)}$

$= \frac{\cos y(1+\cos y)}{1+\cos y} + 0 = \cos y$

28. $\frac{2\sin\theta\tan\theta(1-\tan\theta) + 2\sin\theta\sec^2\theta}{(1+\tan\theta)^2}$

$= \frac{2\sin\theta}{(1+\tan\theta)^2}\{\tan\theta\,(1-\tan\theta) + \sec^2\theta\}$

$= \frac{2\sin\theta}{(1+\tan\theta)^2}(\tan\theta - \tan^2\theta + 1 + \tan^2\theta)$

$= \frac{2\sin\theta}{1+\tan\theta}$

29. $\frac{\sin^3 A - \cos^3 A}{\sin A - \cos A} + \frac{\sin A}{\sqrt{1+\tan^2 A}} - 2\tan A\cot A$

$= (\sin^2 A + \cos^2 A + \sin A\cos A) + \frac{\sin A}{|\sec A|} - 2$

$= 1 + \sin A\cos A - \sin A\cos A - 2$

....[$\because$ A is an obtuse angle $\Rightarrow \cos A < 0$]

$= -1$

30. $\frac{x}{a}\cos\theta + \frac{y}{b}\sin\theta = -1$ ....(i)

and $\frac{x}{a}\sin\theta - \frac{y}{b}\cos\theta = 1$ ....(ii)

Squaring (i) and (ii) and adding, we get

$$\frac{x^2}{a^2}\left(\sin^2\theta+\cos^2\theta\right)+\frac{y^2}{b^2}\left(\sin^2\theta+\cos^2\theta\right) = 2$$

$$\Rightarrow \frac{x^2}{a^2}+\frac{y^2}{b^2} = 2$$

31. $x\sin^3\alpha + y\cos^3\alpha = \sin\alpha\cos\alpha$ ….(i)
and $x\sin\alpha - y\cos\alpha = 0$
$\Rightarrow x\sin\alpha = y\cos\alpha$ ….(ii)
$\therefore$ From (i) and (ii), we get
$y\cos\alpha\sin^2\alpha + y\cos^3\alpha = \sin\alpha\cos\alpha$
$\Rightarrow y\cos\alpha(\sin^2\alpha + \cos^2\alpha) = \sin\alpha\cos\alpha$
$\Rightarrow y\cos\alpha = \sin\alpha\cos\alpha$
$\Rightarrow y = \sin\alpha$
$\therefore$ $x = \cos\alpha$
$\therefore$ $x^2 + y^2 = \cos^2\alpha + \sin^2\alpha = 1$

32. $m + n = a\cos^3\alpha + 3a\cos\alpha\sin^2\alpha + 3a\cos^2\alpha\sin\alpha + a\sin^3\alpha$
$= a(\cos\alpha + \sin\alpha)^3$
Similarly, $(m - n) = a(\cos\alpha - \sin\alpha)^3$
$\therefore$ $(m + n)^{2/3} + (m - n)^{2/3}$
$= a^{\frac{2}{3}}\{(\cos\alpha + \sin\alpha)^2 + (\cos\alpha - \sin\alpha)^2\}$
$= a^{\frac{2}{3}}\{2(\cos^2\alpha + \sin^2\alpha)\} = 2a^{\frac{2}{3}}$

33. $\sin^2\alpha + \sin^2\beta + \sin^2\gamma$

$$= \frac{\tan^2\alpha}{1+\tan^2\alpha}+\frac{\tan^2\beta}{1+\tan^2\beta}+\frac{\tan^2\gamma}{1+\tan^2\gamma}$$

$$= \frac{x}{1+x}+\frac{y}{1+y}+\frac{z}{1+z}$$

….[Let $x = \tan^2\alpha$, $y = \tan^2\beta$, $z = \tan^2\gamma$]

$$= \frac{(x+y+z)+(xy+yz+zx+2xyz)+xy+yz+zx+xyz}{(1+x)(1+y)(1+z)}$$

$$= \frac{x+y+z+1+xy+yz+zx+xyz}{(1+x)(1+y)(1+z)} = 1$$

34. $p + q = \dfrac{2\sin\theta}{1+\sin\theta+\cos\theta}+\dfrac{\cos\theta}{1+\sin\theta}$

$$= \frac{2\sin\theta(1+\sin\theta)+\cos\theta(1+\sin\theta+\cos\theta)}{(1+\sin\theta+\cos\theta)(1+\sin\theta)}$$

$$= \frac{2\sin\theta+2\sin^2\theta+\cos\theta+\cos\theta\sin\theta+\cos^2\theta}{1+2\sin\theta+\sin^2\theta+\cos\theta+\cos\theta\sin\theta}$$

$$= \frac{2\sin\theta+\sin^2\theta+(\sin^2\theta+\cos^2\theta)+\cos\theta+\cos\theta\sin\theta}{1+2\sin\theta+\sin^2\theta+\cos\theta+\cos\theta\sin\theta}$$

$\Rightarrow z = \dfrac{x(\cos^2\theta-\sin^2\theta)}{2\cos\theta}$ ....(i)

Similarly, by solving $y\cos\theta = \dfrac{2z\tan\theta}{1-\tan^2\theta}$, we get

$z = \dfrac{y(\cos^2\theta-\sin^2\theta)}{2\sin\theta}$ ....(ii)

From (i) and (ii), we get $\tan\theta = \dfrac{y}{x}$

$\therefore$ $x\sin\theta = \dfrac{2\dfrac{zy}{x}}{1-\dfrac{y^2}{x^2}} = \dfrac{2xyz}{x^2-y^2}$

Since, $\sin^2\theta + \cos^2\theta = 1$

$\therefore \quad \left(\dfrac{2yz}{x^2 - y^2}\right)^2 + \left(\dfrac{2xz}{x^2 - y^2}\right)^2 = 1$

Now, $\tan A = \dfrac{2\tan\frac{A}{2}}{1-\tan^2\frac{A}{2}}$ (Let $\tan\frac{A}{2} = P$)

$\Rightarrow -\frac{4}{3} = \frac{2P}{1-P^2}$

$\Rightarrow y = \dfrac{1+y^2}{2y} - \dfrac{2y}{1+y^2}$

$\Rightarrow 2y^2 (1 + y^2) = 1 + y^4 + 2y^2 - 4y^2$

$\Rightarrow 1 - y^4 - 4y^2 = 0 \Rightarrow y^4 + 4y^2 - 1 = 0$

$\Rightarrow y^2 = \dfrac{-4\pm\sqrt{16+4}}{2} = \dfrac{-4\pm\sqrt{20}}{2}$

$\Rightarrow \tan^2\left(\frac{x}{2}\right) = -2 \pm \sqrt{5}$

$\Rightarrow (2t-1)(mt-1) = 0$

$\Rightarrow t = \dfrac{1}{2}$ or $t = \dfrac{1}{m}$

If $t = \dfrac{1}{2}$, then

$\tan\theta = \dfrac{2t}{1-t^2} = \dfrac{1}{1-\dfrac{1}{4}} = \dfrac{4}{3}$

If $t = \dfrac{1}{m}$, then

$\Rightarrow 2\cos(\theta-\phi) = a^2 + b^2 - 2$

$\Rightarrow \cos(\theta-\phi) = \frac{a^2+b^2-2}{2}$

$\Rightarrow \frac{1-\tan^2\frac{\theta-\phi}{2}}{1+\tan^2\frac{\theta-\phi}{2}} = \frac{a^2+b^2-2}{2}$

$\Rightarrow (a^2 + b^2) + (a^2 + b^2)\tan^2\frac{\theta-\phi}{2} - 2$

$= \dfrac{\frac{5}{12} + \frac{5}{12}}{1 - \frac{25}{144}}$

$= \dfrac{(119+1)239 - 119}{119 \times 239 + 120}$

$= \dfrac{119 \times 239 + (239 - 119)}{119 \times 239 + 120} = 1$

6. Given, $\sec(\theta + \phi)$, $\sec\theta$ and $\sec(\theta - \phi)$ are in A. P.

$\therefore$ $2\sec\theta = \sec(\theta + \phi) + \sec(\theta - \phi)$

$\Rightarrow \dfrac{2}{\cos\theta} = \dfrac{1}{\cos(\theta + \phi)} + \dfrac{1}{\cos(\theta - \phi)}$

$\Rightarrow \dfrac{2}{\cos\theta} = \dfrac{\cos(\theta - \phi) + \cos(\theta + \phi)}{\cos(\theta + \phi)\cos(\theta - \phi)}$

$\Rightarrow \dfrac{2}{\cos\theta} = \dfrac{2\cos\theta\cos\phi}{\cos^2\theta - \sin^2\phi}$

....[$\because$ $\cos(A + B)\cos(A - B) = \cos^2 A - \sin^2 B$]

$\Rightarrow \cos^2\theta\cos\phi = \cos^2\theta - \sin^2\phi$

$\Rightarrow \cos^2\theta - \cos^2\theta\cos\phi = \sin^2\phi$

$\Rightarrow \cos^2\theta(1 - \cos\phi) = (1 - \cos^2\phi)$

$\Rightarrow \cos^2\theta = 1 + \cos\phi$

$\Rightarrow \cos^2\theta = 2\cos^2\frac{\phi}{2}$

$\Rightarrow \cos\theta = \pm\sqrt{2}\cos\frac{\phi}{2}$

Comparing with $\cos\theta = k\cos\frac{\phi}{2}$, we get

$k = \pm\sqrt{2}$

7. $\sin^2\theta + 3\sin\theta\cos\theta + 5\cos^2\theta$

$= \frac{1}{2}\{2\sin^2\theta + 3(2\sin\theta\cos\theta) + 5(2\cos^2\theta)\}$

$= \frac{1}{2}\{1 - \cos 2\theta + 3\sin 2\theta + 5(1 + \cos 2\theta)\}$

$= 3 + 2\cos 2\theta + \frac{3}{2}\sin 2\theta$

Now,

$-\sqrt{4 + \frac{9}{4}} \le 2\cos 2\theta + \frac{3}{2}\sin 2\theta \le \sqrt{4 + \frac{9}{4}}$

$\Rightarrow -\frac{5}{2} \le 2\cos 2\theta + \frac{3}{2}\sin 2\theta \le \frac{5}{2}$

$\Rightarrow \frac{1}{2} \le 3 + 2\cos 2\theta + \frac{3}{2}\sin 2\theta \le \frac{11}{2}$

$\Rightarrow \frac{1}{2} \le \sin^2\theta + 3\sin\theta\cos\theta + 5\cos^2\theta \le \frac{11}{2}$

$\Rightarrow \frac{2}{11} \le \dfrac{1}{\sin^2\theta + 3\sin\theta\cos\theta + 5\cos^2\theta} \le 2$

Hence, the maximum value of the given expression is 2.

8. $\sin\alpha + \sin\beta = -\frac{21}{65}$, $\cos\alpha + \cos\beta = -\frac{27}{65}$

$\therefore$ $(\sin\alpha + \sin\beta)^2 + (\cos\alpha + \cos\beta)^2$

$= \left(\frac{-21}{65}\right)^2 + \left(\frac{-27}{65}\right)^2$

$\Rightarrow (\sin^2\alpha + \cos^2\alpha) + (\sin^2\beta + \cos^2\beta)$
$+ 2\sin\alpha\sin\beta + 2\cos\alpha\cos\beta = \frac{441}{(65)^2} + \frac{729}{(65)^2}$

$\Rightarrow 2 + 2\sin\alpha\sin\beta + 2\cos\alpha\cos\beta$
$= \frac{441}{(65)^2} + \frac{729}{(65)^2}$

$\Rightarrow 2 + 2[\cos(\alpha - \beta)] = \frac{1170}{(65)^2}$

$\Rightarrow 2[1 + \cos(\alpha - \beta)] = \frac{1170}{(65)^2}$

$$\Rightarrow 2 \times 2\cos^2\left(\frac{\alpha-\beta}{2}\right) = \frac{1170}{(65)^2}$$

$$\therefore \quad \cos\left(\frac{\alpha-\beta}{2}\right) = -\frac{3\sqrt{130}}{130} \quad \ldots\left[\because \frac{\pi}{2} < \frac{\alpha-\beta}{2} < \frac{3\pi}{2}\right]$$

$$\Rightarrow \tan(\alpha+\beta) = \frac{2^x + 2.2^{x+x} + 2^x + 1}{1 + 2^x + 2.2^x + 2.2^{x+x} - 2^x}$$

$$\Rightarrow \tan(\alpha+\beta) = 1$$

$$\Rightarrow \tan(\alpha+\beta) = \tan\frac{\pi}{4}$$

$$\Rightarrow \alpha + \beta = \frac{\pi}{4}$$

10. We have, $\dfrac{3\sin A}{\sin B} = \dfrac{2\cos B}{\cos A}$

$$\ldots[\because 2\cos^2 B = 4 - 3\cos^2 A \text{ (given)}]$$

$$\Rightarrow \tan A = \tan 2B\,\frac{\sin^2 A}{\cos^2 A}$$

$$\ldots[\because 1 - \cos^2 A = \sin^2 A]$$

$$\Rightarrow \tan A = \tan 2B \tan^2 A$$

$$\Rightarrow \tan A \tan 2B = 1$$

$$\Rightarrow \tan A = \cot 2B$$

$$\Rightarrow \tan A = \tan\left(\frac{\pi}{2} - 2B\right)$$

$$\Rightarrow A = \frac{\pi}{2} - 2B$$

$$\Rightarrow A + 2B = \frac{\pi}{2}$$

11. $\dfrac{\sin^4 A}{a} + \dfrac{\cos^4 A}{b} = \dfrac{1}{a+b}$

$$\Rightarrow \frac{(1-\cos 2A)^2}{4a} + \frac{(1+\cos 2A)^2}{4b} = \frac{1}{a+b}$$

$$\Rightarrow b(a+b)(1 - 2\cos 2A + \cos^2 2A) + a(a+b)(1 + 2\cos 2A + \cos^2 2A) = 4ab$$

$$\Rightarrow \{b(a+b) + a(a+b)\}\cos^2 2A + 2(a+b)(a-b)\cos 2A + a(a+b) + b(a+b) - 4ab = 0$$

$$\Rightarrow (a+b)^2\cos^2 2A + 2(a+b)(a-b)\cos 2A + (a-b)^2 = 0$$

$$\Rightarrow \{(a+b)\cos 2A + (a-b)\}^2 = 0$$

$$\Rightarrow \cos 2A = \frac{b-a}{b+a} \quad \ldots(i)$$

$$\therefore \quad \frac{\sin^8 A}{a^3} + \frac{\cos^8 A}{b^3} = \frac{(1-\cos 2A)^4}{16a^3} + \frac{(1+\cos 2A)^4}{16b^3}$$

$= \dfrac{2\sin(A+45^{o})\cos(45^{o} - B)}{2\sin(45^{o} - A)\cos(45^{o} - B)}$

$= \dfrac{\sin(A+45^{o})}{\sin(45^{o} - A)} = \dfrac{\cos A + \sin A}{\cos A - \sin A}$

13. sin 4A – cos 2A = cos 4A – sin 2A

$\Rightarrow$ sin 4A + sin 2A = cos 4A + cos 2A

$\Rightarrow$ 2 sin 3A cos A = 2 cos 3A cos A

$\Rightarrow$ tan 3A = 1

$\Rightarrow 3A = \dfrac{\pi}{4}$

$\Rightarrow 4A = \dfrac{\pi}{3}$

$\therefore$ $\tan 4A = \tan\dfrac{\pi}{3}$

$= \sqrt{3}$

14. $\sin x + \sin y = \dfrac{1}{2}$

$\Rightarrow 2\sin\left(\dfrac{x+y}{2}\right)\cos\left(\dfrac{x-y}{2}\right) = \dfrac{1}{2}$ …. (i)

$\cos x + \cos y = 1$

$\Rightarrow 2\cos\left(\dfrac{x+y}{2}\right)\cos\left(\dfrac{x-y}{2}\right) = 1$ ….(ii)

Dividing (i) by (ii), we get

$\tan\left(\dfrac{x+y}{2}\right) = \dfrac{1}{2}$

Now, $\tan(x+y) = \dfrac{2\tan\left(\frac{x+y}{2}\right)}{1-\tan^2\left(\frac{x+y}{2}\right)}$

15. $\cos x = 3\cos y \Rightarrow \dfrac{\cos x}{\cos y} = \dfrac{3}{1}$

By componendo and dividendo, we get

$\dfrac{\cos x + \cos y}{\cos x - \cos y} = \dfrac{3+1}{3-1}$

$\Rightarrow \dfrac{2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)}{-2\sin\left(\frac{x+y}{2}\right)\sin\left(\frac{x-y}{2}\right)} = \dfrac{4}{2}$

$\Rightarrow -\cot\left(\dfrac{x+y}{2}\right)\cot\left(\dfrac{x-y}{2}\right) = 2$

$\Rightarrow \cot\left(\dfrac{x+y}{2}\right)\cot\left(\dfrac{y-x}{2}\right) = 2$

$\Rightarrow 2\tan\left(\dfrac{y-x}{2}\right) = \cot\left(\dfrac{x+y}{2}\right)$

16. Given that, cos A = m cos B

$= \cot\left(\dfrac{A+B}{2}\right)\cot\left(\dfrac{B-A}{2}\right)$

$\Rightarrow \cot\left(\dfrac{A+B}{2}\right) = \dfrac{m+1}{m-1}\tan\left(\dfrac{B-A}{2}\right)$

17. $S = \sin\theta + \sin 2\theta + \sin 3\theta + \ldots + \sin n\theta$

Since,

$$= \frac{\sin\frac{n\beta}{2}}{\sin\frac{\beta}{2}}\sin\left[\theta + \left(\frac{(n-1)}{2}\right)\beta\right]$$

Here, $n = 3$ and $\alpha = \frac{2\pi}{7}$

$$\therefore \quad \cos\frac{2\pi}{7} + \cos\frac{4\pi}{7} + \cos\frac{6\pi}{7}$$

$$= \frac{\cos\left(\frac{4\pi}{7}\right).\sin\left(\frac{3\pi}{7}\right)}{\sin\left(\frac{\pi}{7}\right)}$$

Since, the values of $\cos\left(\frac{4\pi}{7}\right)$, $\sin\left(\frac{3\pi}{7}\right)$ and $\sin\left(\frac{\pi}{7}\right)$ are –ve, +ve and +ve respectively.

$\Rightarrow \cos[\pi - (B+C)] = \cos B\cos C$

$\Rightarrow -\cos(B+C) = \cos B\cos C$

$\Rightarrow -[\cos B\cos C - \sin B\sin C] = \cos B\cos C$

$\Rightarrow \sin B\sin C = 2\cos B\cos C$

$\Rightarrow \tan B\tan C = 2$

28. $\cot(A+B) = \cot(\pi - C)$

$\Rightarrow \frac{\cot A\cot B - 1}{\cot A + \cot B} = -\cot C$

$\Rightarrow \cot A\cot B - 1 = -\cot A\cot C - \cot B\cot C$

$\Rightarrow \cot B\cot C + \cot C\cot A + \cot A\cot B = 1$

In Δ ABC, $\angle A + \angle B + \angle C = \pi$

$\Rightarrow \cos^2 B = \cos^2\left(\frac{\pi}{2} - C\right) = \sin^2 C$

$\therefore \cos^2 B + \cos^2 C = \sin^2 C + \cos^2 C = 1$

32. $A + B + C = 180°$

33. $A + B + C = \pi$

$\therefore \tan\left(\frac{A+B}{2}\right) = \tan\left(\frac{\pi}{2} - \frac{C}{2}\right)$

$\Rightarrow \frac{\tan\frac{A}{2} + \tan\frac{B}{2}}{1 - \tan\frac{A}{2}.\tan\frac{B}{2}} = \cot\frac{C}{2}$

$\Rightarrow \frac{\frac{1}{3} + \frac{2}{3}}{1 - \frac{1}{3}.\frac{2}{3}} = \cot\frac{C}{2}$

$\Rightarrow \frac{9}{7} = \cot\frac{C}{2}$

1. We have, $A + B + C = 180°$

$\Rightarrow \frac{A}{2} = 90° - \left(\frac{B+C}{2}\right)$

$\Rightarrow \cot\frac{A}{2} = \cot\left(90° - \left(\frac{B+C}{2}\right)\right)$

$\Rightarrow \cot\frac{A}{2} = \tan\left(\frac{B}{2} + \frac{C}{2}\right)$

$\Rightarrow \frac{1}{\tan\frac{A}{2}} = \frac{\tan\frac{B}{2} + \tan\frac{C}{2}}{1 - \tan\frac{B}{2}\tan\frac{C}{2}}$

$\Rightarrow 1 - \tan\frac{B}{2}\tan\frac{C}{2} = \tan\frac{A}{2}\tan\frac{B}{2} + \tan\frac{A}{2}\tan\frac{C}{2}$

$\Rightarrow \tan\frac{A}{2}\tan\frac{B}{2} + \tan\frac{B}{2}\tan\frac{C}{2} + \tan\frac{A}{2}\tan\frac{C}{2} = 1$

i.e., $\sum\tan\frac{A}{2}\tan\frac{B}{2} = 1$

$\Rightarrow \theta = \frac{n\pi}{8}$

4. Given, sin A + sin B = C
and cos A + cos B = D

$\therefore \quad \dfrac{\sin A+\sin B}{\cos A+\cos B}=\dfrac{C}{D}$

$\Rightarrow \dfrac{2\sin\left(\dfrac{A+B}{2}\right)\cos\left(\dfrac{A-B}{2}\right)}{2\cos\left(\dfrac{A+B}{2}\right)\cos\left(\dfrac{A-B}{2}\right)}=\dfrac{C}{D}$

$\Rightarrow \tan\left(\dfrac{A+B}{2}\right)=\dfrac{C}{D}$ ….(i)

Now, $\sin(A+B)=\dfrac{2\tan\left(\dfrac{A+B}{2}\right)}{1+\tan^2\left(\dfrac{A+B}{2}\right)}$

….$\left[\because \sin\theta=\dfrac{2\tan\dfrac{\theta}{2}}{1+\tan^2\dfrac{\theta}{2}}\right]$

$=\dfrac{2CD}{C^2+D^2}$

5. $\dfrac{\sin\alpha-\sin\gamma}{\cos\gamma-\cos\alpha}=\dfrac{2\cos\dfrac{\alpha+\gamma}{2}\sin\dfrac{\alpha-\gamma}{2}}{2\sin\dfrac{\alpha+\gamma}{2}\sin\dfrac{\alpha-\gamma}{2}}$

$=\cot\dfrac{\alpha+\gamma}{2}$

But α, β, γ are in A.P. $\Rightarrow \dfrac{\alpha+\gamma}{2}=\beta$

$\therefore \quad \dfrac{\sin\alpha-\sin\gamma}{\cos\gamma-\cos\alpha}=\cot\beta$

$=c_0+c_1\cos x+c_2\cos 2x+c_3\cos 3x$
$+\ldots+c_n\cos nx$ ….(ii)

But, $\sin^3 x\sin 3x=\sum_{m=0}^{n} c_m\cos mx$

∴ from (i) and (ii), we get n = 6.

7. Given, $\sin B=\dfrac{1}{5}\sin(2A+B)$

$\Rightarrow \dfrac{\sin(2A+B)}{\sin B}=\dfrac{5}{1}$

By componendo and dividendo, we get

$\dfrac{\sin(2A+B)+\sin B}{\sin(2A+B)-\sin B}=\dfrac{5+1}{5-1}$

$\Rightarrow \dfrac{2\sin(A+B)\cos A}{2\cos(A+B)\sin A}=\dfrac{6}{4}$

$\Rightarrow \dfrac{\tan(A+B)}{\tan A}=\dfrac{3}{2}$

8. $\sin A+\sin 2A+\sin 3A=\cos A+\cos 2A+\cos 3A$

∴ (sin 3A + sin A) + sin 2A = (cos 3A + cos A) + cos 2A

∴ 2 sin 2A.cos A + sin 2A = 2 cos 2A.cos A + cos 2A

∴ sin 2A(2 cos A + 1) = cos 2A(2 cos A + 1)

∴ tan 2A = 1

$\Rightarrow \tan\theta = -\frac{1}{\sqrt{3}}$

$\Rightarrow \theta = \tan^{-1}\left(-\frac{1}{\sqrt{3}}\right) = 150°$

3. The required equation is
$y + 6 = \tan 45°(x - 4)$
$\Rightarrow x - y - 10 = 0$

4. The required equation passing through (0, 0) and having gradient $m = \frac{1}{0}$, is $y = \frac{1}{0}x$

$\Rightarrow x = 0$

5. Midpoint is (3, 4) and slope of AB = $\frac{6}{4}$

$\therefore$ Slope of perpendicular $= \frac{-1}{6/4} = \frac{-2}{3}$

$\therefore$ the required equation is $y - 4 = \frac{-2}{3}(x - 3)$

$\Rightarrow 2x + 3y = 18$

6. $m = \frac{-1}{\frac{b'-b}{a'-a}} = \frac{a'-a}{b-b'}$

Midpoint is $\left(\frac{a+a'}{2}, \frac{b+b'}{2}\right)$

$\therefore$ the required equation is

$y - \left(\frac{b+b'}{2}\right) = \frac{a'-a}{b-b'}\left[x - \left(\frac{a+a'}{2}\right)\right]$

$\Rightarrow 2(b - b')y + 2(a - a')x = b^2 - b'^2 + a^2 - a'^2$

7. Midpoint $\equiv (4, -9)$ and slope $= \frac{-1}{\frac{3+1}{-1-5}} = \frac{3}{2}$

Hence, the required line is $y + 9 = \frac{3}{2}(x - 4)$

$\Rightarrow 3x - 2y = 30$

Slope of QR $= \frac{3\sqrt{3}-0}{3-0} = \sqrt{3}$ i.e., $\theta = 60°$

Clearly, $\angle PQR = 120°$

OQ is the angle bisector of the angle PQR, so line OQ makes 120° with the positive direction of X-axis.

Therefore, equation of the bisector of $\angle PQR$ is $y = \tan 120° x \Rightarrow y = -\sqrt{3}x \Rightarrow \sqrt{3}x + y = 0$

9. $m = \frac{5-0}{-4-0} = \frac{5}{-4}$

$\therefore$ the required equation is $5x + 4y = 0$.

10. Equation of a line passing through the given points is $\frac{y-(-6)}{-6-10} = \frac{x-(-5)}{-5-3}$

$\Rightarrow \frac{y+6}{-16} = \frac{x+5}{-8} \Rightarrow 2x - y + 4 = 0$

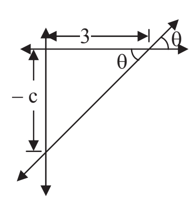
Thus, the equation of line passing through the points (0, 0) and (2, 2) is $y = x$.

12. Equation of line is $y = mx + c$
$\Rightarrow y = (\tan 135°)x - 5 \Rightarrow y = -x - 5$
$\Rightarrow x + y + 5 = 0$

13. From the figure, $m = \tan\theta = \frac{-c}{3}$

$\Rightarrow 3 = \frac{-c}{3}$

$\Rightarrow c = -9$



Hence, the required equation is $y = 3x - 9$

14. Here, intercept on X-axis is 3 and intercept on Y-axis is –2.
So, using double intercept form, the required equation of the line is $\frac{x}{3}-\frac{y}{2}=1$.

15. Using double intercept form, we get
$$\frac{x}{2a\sec\theta}+\frac{y}{2a\operatorname{cosec}\theta}=1$$
$\Rightarrow x\cos\theta + y\sin\theta = 2a$

16. Intersection point on X-axis is $(2x_1, 0)$ and on Y-axis is $(0, 2y_1)$. Thus, equation of line passing through these points is $\frac{x}{x_1}+\frac{y}{y_1}=2$.

17. Since, the given line passes through (2, –3) and (4, –5).
$\therefore$ $\frac{2}{a}-\frac{3}{b}=1$ and $\frac{4}{a}-\frac{5}{b}=1$
$\Rightarrow b=-1, a=-1$

20. The equation of line is $\frac{x}{a}+\frac{y}{a}=1$.
$\Rightarrow x+y-a=0$
$\therefore$ Slope $=-\frac{\text{coefficient of } x}{\text{coefficient of } y}=-1$

22. The required equation which passes through (c, d) and its gradient $-\frac{a}{b}$, is
$y-d=-\frac{a}{b}(x-c)$
$\Rightarrow a(x-c)+b(y-d)=0$

It passes through (a, b).
$\therefore$ $ab-ab+\lambda=0 \Rightarrow \lambda=0$
Putting $\lambda=0$ in (i), we get $bx-ay=0$ which is the required equation.

25. Slope of perpendicular $=\frac{-y'}{2a}$
$\therefore$ the required equation is $y-y'=-\frac{y'}{2a}(x-x')$
$\Rightarrow xy'+2ay-2ay'-x'y'=0$

26. $m_1=\sqrt{3}$, $m_2=0$
$\therefore$ $\tan\theta=\left|\frac{\sqrt{3}-0}{1+0}\right|$
$\Rightarrow \tan\theta=\sqrt{3}$
$\Rightarrow \theta=60^\circ$

27. $\theta=\tan^{-1}\left|\frac{2-\sqrt{3}-2-\sqrt{3}}{1+4-3}\right|=\tan^{-1}\left(\sqrt{3}\right)$
$\Rightarrow \theta=60^\circ$

28. $\theta=\tan^{-1}\left|\frac{-\cot 30^\circ+\cot 60^\circ}{1+\cot 30^\circ\cot 60^\circ}\right|$
$=\tan^{-1}\left|\frac{\tan 60^\circ-\tan 30^\circ}{1+\tan 30^\circ\tan 60^\circ}\right|=30^\circ$

29. Equation of lines are $\frac{x}{a}-\frac{y}{b}=1$ and $\frac{x}{b}-\frac{y}{a}=1$
$\Rightarrow m_1=\frac{b}{a}$ and $m_2=\frac{a}{b}$
$\therefore$ $\theta=\tan^{-1}\left|\frac{\frac{b}{a}-\frac{a}{b}}{1+\frac{b}{a}.\frac{a}{b}}\right|$
$=\tan^{-1}\frac{b^2-a^2}{2ab}$

30. Let $L_1 \equiv 2x+3y-7=0$ and
$L_2 \equiv 2x+3y-5=0$
Here, slope of L_1 = slope of $L_2=-\frac{2}{3}$
Hence, the lines are parallel.

31. Slope of given line is $\frac{1}{2}$
Thus, $\tan 45^\circ=\pm\frac{m-\frac{1}{2}}{1+m.\frac{1}{2}} \Rightarrow m=3$ or $\frac{-1}{3}$
Hence option (B) is correct.

33. Let $L_1 \equiv 2x+5y-7=0$ and $L_2 \equiv 2x-5y-9=0$,
so that $m_1=-\frac{2}{5}$, $m_2=\frac{2}{5}$
Lines are neither parallel nor perpendicular, also not coincident.
Hence, the lines are intersecting.

34. $\begin{vmatrix} m_1 & -1 & c_1 \\ m_2 & -1 & c_2 \\ m_3 & -1 & c_3 \end{vmatrix} = 0$

$\Rightarrow \begin{vmatrix} m_1 & m_2 & m_3 \\ -1 & -1 & -1 \\ c_1 & c_2 & c_3 \end{vmatrix}$

$\Rightarrow m_1(c_2 - c_3) + m_2(c_3 - c_1) + m_3(c_1 - c_2) = 0$

35. The lines are concurrent, if $\begin{vmatrix} 7 & -8 & 5 \\ 3 & -4 & 5 \\ 4 & 5 & k \end{vmatrix} = 0$

$\Rightarrow 7(-4k - 25) + 8(3k - 20) + 5(15 + 16) = 0$
$\Rightarrow k = -45$

36. consider $\begin{vmatrix} 15 & -18 & 1 \\ 12 & 10 & -3 \\ 6 & 66 & -11 \end{vmatrix}$

$= 15(-110 + 198) + 18(-132 + 18) + 1(792 - 60)$

$= 0$

37. $u = a_1x + b_1y + c_1 = 0$, $v = a_2x + b_2y + c_2 = 0$

let $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2} = c$

$\Rightarrow a_2 = \frac{a_1}{c}, b_2 = \frac{b_1}{c}, c_2 = \frac{c_1}{c}$

Given that, $u + kv = 0$

$\Rightarrow a_1x + b_1y + c_1 + k(a_2x + b_2y + c_2) = 0$

$\Rightarrow a_1x + b_1y + c_1 + k\left(\frac{a_1}{c}\right)x + k\left(\frac{b_1}{c}\right)y + k\left(\frac{c_1}{c}\right) = 0$

$\Rightarrow a_1x\left(1 + \frac{k}{c}\right) + b_1y\left(1 + \frac{k}{c}\right) + c_1\left(1 + \frac{k}{c}\right) = 0$

$\Rightarrow a_1x + b_1y + c_1 = 0 = u$

38. Required length $= \left|\frac{4(3) + 3(1) + 20}{5}\right| = 7$

39. Required distance $= \left|\frac{-2 - 3 - 5}{\sqrt{1+1}}\right| = \frac{10}{\sqrt{2}} = 5\sqrt{2}$

40. Required distance $= \left|\frac{-7}{\sqrt{12^2 + 5^2}}\right| = \frac{7}{13}$

41. Here, equation of line is $y = x \tan\alpha + c$, $c > 0$

Length of the perpendicular drawn on line from point $(a \cos\alpha, a \sin\alpha)$ is

$p = \left|\frac{-a\sin\alpha + a\cos\alpha\tan\alpha + c}{\sqrt{1 + \tan^2\alpha}}\right| = \frac{c}{\sec\alpha} = c\cos\alpha$

42. $p = \left|\frac{ab}{\sqrt{a^2 + b^2}}\right|$

$\Rightarrow \frac{a^2 + b^2}{a^2b^2} = \frac{1}{p^2}$

$\Rightarrow \frac{1}{a^2} + \frac{1}{b^2} = \frac{1}{p^2}$

43. Length of perpendicular is

$\left|\frac{\frac{b}{a} - \frac{a}{b} - 1}{\sqrt{\left(\frac{1}{a}\right)^2 + \left(-\frac{1}{b}\right)^2}}\right| = \left|\frac{b^2 - a^2 - ab}{\sqrt{a^2 + b^2}}\right|$

44. Straight line $y - y' = \frac{y'' - y'}{x'' - x'}(x - x')$

$\therefore$ Length of perpendicular

$= \left|\frac{x'(y'' - y') - y'(x'' - x')}{\sqrt{(x'' - x')^2 + (y'' - y')^2}}\right|$

$= \left|\frac{x'y'' - y'x''}{\sqrt{(x'' - x')^2 + (y'' - y')^2}}\right|$

45. Given lines are $5x + 3y - 7 = 0$ .....(i)

and $15x + 9y + 14 = 0$ or

$5x + 3y + \frac{14}{3} = 0$ ....(ii)

Lines (i) and (ii) are parallel.

$\therefore$ Required distance $= \left|\frac{c_1 - c_2}{\sqrt{a^2 + b^2}}\right| = \frac{\left|-7 - \frac{14}{3}\right|}{\left|\sqrt{5^2 + 3^2}\right|}$

$= \left|\frac{-35}{3\sqrt{34}}\right| = \frac{35}{3\sqrt{34}}$

Critical Thinking

1. The four vertices on solving are A(–3, 3), B(1, 1), C(1, –1) and D(–2, –2).

m_1 = slope of AC = –1,

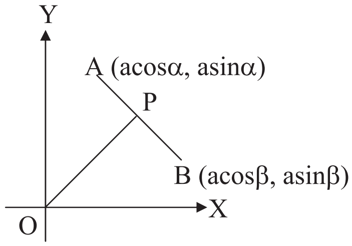
m_2 = slope of BD = 1

$\therefore$ $m_1m_2 = -1$

Hence, the angle between diagonals AC and BD is 90°.

2. Mid point of $(a \cos\alpha, a \sin\alpha)$ and $(a \cos\beta, a \sin\beta)$ is

$P\left(\frac{a(\cos\alpha + \cos\beta)}{2}, \frac{a(\sin\alpha + \sin\beta)}{2}\right)$



∴ Slope of line AB is

$\dfrac{a\sin\beta - a\sin\alpha}{a\cos\beta - a\cos\alpha} = \dfrac{\sin\beta - \sin\alpha}{\cos\beta - \cos\alpha} = m_1$

and slope of OP is $\dfrac{\sin\alpha + \sin\beta}{\cos\alpha + \cos\beta} = m_2$

Now, $m_1 \times m_2 = \dfrac{\sin^2\beta - \sin^2\alpha}{\cos^2\beta - \cos^2\alpha} = -1$

Hence, the lines are perpendicular.

3. Slope $= \dfrac{8-2}{3-1} = 3$

The diagonal is $y - 2 = 3(x - 1)$

$\Rightarrow 3x - y - 1 = 0$

4. S = midpoint of QR $= \left(\dfrac{6+7}{2}, \dfrac{-1+3}{2}\right) = \left(\dfrac{13}{2}, 1\right)$

∴ 'm' of $PS = \dfrac{2-1}{2-\dfrac{13}{2}} = -\dfrac{2}{9}$

∴ The required equation is $y + 1 = \dfrac{-2}{9}(x-1)$

i.e., $2x + 9y + 7 = 0$

5. Point P(a, b) is on $3x + 2y = 13$

So, $3a + 2b = 13$ .....(i)

Point Q(b, a) is on $4x - y = 5$

So, $4b - a = 5$ .....(ii)

By solving (i) and (ii), we get

a = 3, b = 2

Now, equation of PQ is

$y - y_1 = \dfrac{y_2 - y_1}{x_2 - x_1}(x - x_1)$

$\Rightarrow y - 2 = \dfrac{3-2}{2-3}(x-3) \Rightarrow y - 2 = -(x - 3)$

$\Rightarrow x + y = 5$

6. Here, slope of $AB = 1$

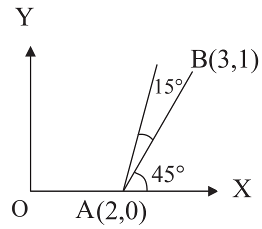
$\Rightarrow \tan\theta = m_1 = 1$

or $\theta = 45°$

∴ $\tan(45° + 15°) = \tan 60°$

[∵ It is rotated anticlockwise so the angle will be 45° + 15° = 60°]

Thus, slope of new line is $\sqrt{3}$

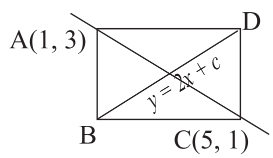


∴ The required equation of line passing through (2, 0) and m = $\sqrt{3}$ is $y = \sqrt{3}(x - 2)$

i.e., $y = \sqrt{3}x - 2\sqrt{3}$

7. Let ABCD be a rectangle.

Given, A (1, 3) and C (5, 1).



Intersecting point of diagonal of a rectangle is same or at midpoint.

∴ midpoint of AC is (3, 2).

Also, $y = 2x + c$ passes through (3, 2).

Hence, c = – 4

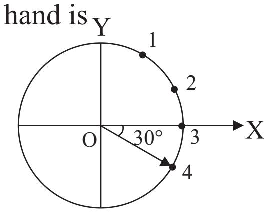
8. Since the hour, minute and second hands always pass through origin because one end of these hands is always at origin.

Now, at 4 O' clock, the hour hand makes 30° angle in fourth quadrant.

So, the equation of hour hand is

$y = mx \Rightarrow y = -\dfrac{1}{\sqrt{3}}x$

$\Rightarrow x + \sqrt{3}y = 0$



9. Let the co-ordinates of axes are A (a, 0) and B(0, b), but the point (–5, 4) divides the line AB in the ratio of 1 : 2.

∴ the co-ordinates of axes are $\left(\dfrac{-15}{2}, 0\right)$ and (0, 12).

Therefore, the equation of line passing through these coordinate axes is given by

$8x - 5y + 60 = 0$

10. Let the intercept be a and 2a, then the equation of line is $\dfrac{x}{a} + \dfrac{y}{2a} = 1$, but it also passes through (1, 2), therefore a = 2.

Hence, the required equation is $2x + y = 4$

11. Take two perpendicular lines as the coordinate axes. If a, b be the intercepts made by the moving line on the coordinate axes, then the equation of the line is

$\frac{x}{a}+\frac{y}{b}=1$ .....(i)

Let $\frac{1}{a}+\frac{1}{b}=\frac{1}{k}$

i.e., $\frac{k}{a}+\frac{k}{b}=1$ .....(ii)

The result (ii) shows that the straight line (i) passes through a fixed point (k, k).

12. Given, a + b = 14 ⇒ a = 14 – b

Hence, the equation of straight line is $\frac{x}{14-b}+\frac{y}{b}=1$

Also, it passes through (3, 4)

∴ $\frac{3}{14-b}+\frac{4}{b}=1$

⇒ b = 8 or 7

Therefore, equations are $4x + 3y = 24$ and $x+y=7$

13. Let the equation of the line be $\frac{x}{a}+\frac{y}{b}=1$

The co-ordinates of the mid point of the intercept AB between the axes are $\left(\frac{a}{2},\frac{b}{2}\right)$

∴ $\frac{a}{2}=1, \frac{b}{2}=2 \Rightarrow a=2, b=4$

Hence, the equation of the line is

$\frac{x}{2}+\frac{y}{4}=1 \Rightarrow 2x+y=4$

14. A line perpendicular to the line $5x - y = 1$ is given by $x + 5y - \lambda = 0 = L$

In intercept form $\frac{x}{\lambda}+\frac{y}{\lambda/5}=1$

So, area of triangle is $\frac{1}{2}$ × (Multiplication of intercepts)

$\Rightarrow \frac{1}{2}(\lambda)\times\left(\frac{\lambda}{5}\right) = 5$

$\Rightarrow \lambda = \pm 5\sqrt{2}$

Hence, the equation of required line is $x + 5y = \pm 5\sqrt{2}$

15. Given form is $3x + 3y + 7 = 0$

$\Rightarrow \frac{3}{\sqrt{3^2+3^2}}x+\frac{3}{\sqrt{3^2+3^2}}y+\frac{7}{\sqrt{3^2+3^2}}=0$

$\Rightarrow \frac{3}{3\sqrt{2}}x+\frac{3}{3\sqrt{2}}y=\frac{-7}{3\sqrt{2}}$

∴ $p=\left|\frac{-7}{3\sqrt{2}}\right|=\frac{7}{3\sqrt{2}}$

16. Let p be the length of the perpendicular from the origin on the given line. Then its equation in normal form is

$x \cos 30° + y \sin 30° = p$ or $\sqrt{3}x+y=2p$

This meets the coordinate axes at $A\left(\frac{2p}{\sqrt{3}},0\right)$ and B(0, 2p)

∴ Area of $\Delta OAB=\frac{1}{2}\left(\frac{2p}{\sqrt{3}}\right)2p=\frac{2p^2}{\sqrt{3}}$

$\Rightarrow \frac{2p^2}{\sqrt{3}}=\frac{50}{\sqrt{3}} \Rightarrow p=\pm 5$

Hence, the lines are $\sqrt{3}x+y\pm 10=0$

17. The equation of line passing through A(– 5, –4) is $\frac{x+5}{\cos\theta}=\frac{y+4}{\sin\theta}$

Let $AB = r_1$, $AC = r_2$, $AD = r_3$

The co-ordinate of B is

$(r_1 \cos\theta - 5, r_1\sin\theta - 4)$

which lies on $x + 3y + 2 = 0$

∴ $r_1=\frac{15}{\cos\theta+3\sin\theta}$

Similarly, $\frac{10}{AC}=2\cos\theta+\sin\theta$ and

$\frac{6}{AD}=\cos\theta-\sin\theta$

Putting in the given relation, we get $(2\cos\theta+3\sin\theta)^2=0$

$\Rightarrow \tan\theta=-\frac{2}{3}$

∴ The equation of line is $y+4=-\frac{2}{3}(x+5)$

$\Rightarrow 2x + 3y + 22 = 0$

18. Let the required line through the point (1,2) be inclined at an angle θ to the axis of X Then its equation is $\frac{x-1}{\cos\theta}=\frac{y-2}{\sin\theta}=r$ .....(i)

The co-ordinates of a point on the line (i) are $(1 + r\cos\theta, 2 + r\sin\theta)$

If this point is at a distance $\frac{\sqrt{6}}{3}$ form (1, 2),

then $r = \frac{\sqrt{6}}{3}$

Therefore, the point is

$$\left(1+\frac{\sqrt{6}}{3}\cos\theta,\ \ 2+\frac{\sqrt{6}}{3}\sin\theta\right).$$

But this point lies on the line $x + y = 4$

$\Rightarrow \frac{\sqrt{6}}{3}(\cos\theta + \sin\theta) = 1$ or

$\sin\theta+\cos\theta=\frac{3}{\sqrt{6}}$

$\Rightarrow \frac{1}{\sqrt{2}}\sin\theta+\frac{1}{\sqrt{2}}\cos\theta=\frac{\sqrt{3}}{2}$

….(Dividing both sides by $\sqrt{2}$)

$\Rightarrow \sin(\theta+45^\circ)=\sin 60^\circ$ or $\sin 120^\circ$

$\Rightarrow \theta = 15^\circ$ or 75°

19. The slope of line $x + y = 1$ is -1.

$\therefore$ It makes an angle of 135° with X axis.
The equation of line passing through (1, 1) and making an angle of 135° is,

$\frac{x-1}{\cos 135^\circ}=\frac{y-1}{\sin 135^\circ}=r$

$\Rightarrow \frac{x-1}{-1/\sqrt{2}}=\frac{y-1}{1/\sqrt{2}}=r$

$\therefore$ Co-ordinates of any point on this line are $\left(1-\frac{r}{\sqrt{2}},1+\frac{r}{\sqrt{2}}\right)$

If this point lies on $2x - 3y = 4$, then

$2\left(1-\frac{r}{\sqrt{2}}\right)-3\left(1+\frac{r}{\sqrt{2}}\right)=4$

$\Rightarrow r = \sqrt{2}$

21. $\left(\frac{-2}{3a}\right)\left(\frac{-3}{4}\right)=-1$ or $a=\frac{-1}{2}$

22. $x\cos\theta - y\sin\theta = a(\cos^4\theta - \sin^4\theta) = a\cos 2\theta$

23. Mid point $\equiv\left(\frac{1+1}{2},\frac{3-7}{2}\right)=(1,-2)$

Therefore, required line is

$y + 2 = \frac{2}{3}(x - 1) \Rightarrow 2x - 3y = 8$

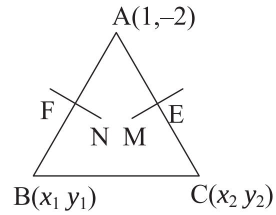
24. Given, line AB makes 0 intercepts on X axis and Y axis so, $(x_1, y_1) = (0, 0)$

Slope of perpendicular = $\frac{4}{3}$

$\therefore$ Equation is $y - 0 = \frac{4}{3}(x - 0)$

$\Rightarrow 4x - 3y = 0$

25. Let the equation of perpendicular bisector FN of AB is $x - y + 5 = 0$ ......(i)



The middle point F of AB is $\left(\frac{x_1+1}{2},\frac{y_1-2}{2}\right)$ Which lies on line (i).

$\therefore$ $x_1 - y_1 = -13$ …..(ii)

Also AB is perpendicular to FN. So the product of their slopes is –1.

i.e , $\frac{y_1+2}{x_1-1}\times 1=-1$ or $x_1+y_1=-1$ ….(iii)

On solving (ii) and (iii), we get B(–7, 6)

Similarly, C $\left(\frac{11}{5},\frac{2}{5}\right)$

Hence, the equation of BC is $14x + 23y - 40 = 0$

26. The equation of any line parallel to $2x + 6y + 7 = 0$ is $2x + 6y + k = 0$.

This meets the axes at $A\left(-\frac{k}{2},0\right)$ and $B\left(0,-\frac{k}{6}\right)$

Since, AB = 10

$\Rightarrow \sqrt{\frac{k^2}{4}+\frac{k^2}{36}}=10 \Rightarrow \sqrt{\frac{10k^2}{36}}=10$

$\Rightarrow 10k^2 = 3600 \Rightarrow k = \pm 6\sqrt{10}$

Hence, there are two lines given by $2x + 6y \pm 6\sqrt{10} = 0$

27. $\theta=\tan^{-1}\left|\frac{-\cot\alpha_1+\cot\alpha_2}{1+\cot\alpha_1\cot\alpha_2}\right|$

$=\tan^{-1}\left|\frac{\tan\alpha_1-\tan\alpha_2}{1+\tan\alpha_2\tan\alpha_1}\right|=\alpha_1-\alpha_2$

28. Here, equation of AB is
$x + 4y - 4 = 0$ .....(i)
and equation of BC is
$2x + y - 22 = 0$ .....(ii)
Thus angle between (i) and (ii) is given by
$$\tan^{-1}\left(\frac{-\frac{1}{4}+2}{1+\left(-\frac{1}{4}\right)(-2)}\right) = \tan^{-1}\frac{7}{6}$$

29. $\dfrac{k-(2+\sqrt{3})}{1+k(2+\sqrt{3})} = \sqrt{3}$
$\Rightarrow k - 2 - \sqrt{3} = \sqrt{3} + 2k\sqrt{3} + 3k$
$\Rightarrow k = \dfrac{-2(1+\sqrt{3})}{2(1+\sqrt{3})} = -1$

30. Let θ be the acute angle which the line $y = mx + 4$ makes with the lines $y = 3x + 1$ and $2y = x + 3$.
Then,
$$\tan\theta = \left|\frac{m-3}{1+3m}\right| \text{ and } \tan\theta = \left|\frac{m-\frac{1}{2}}{1+\frac{m}{2}}\right|$$
$\Rightarrow \left|\dfrac{m-3}{1+3m}\right| = \left|\dfrac{2m-1}{m+2}\right|$
$\Rightarrow m^2 - m - 6 = \pm(6m^2 - m - 1)$
$\Rightarrow 5m^2 + 5 = 0$ or $7m^2 - 2m - 7 = 0$
$\Rightarrow 7m^2 - 2m - 7 = 0$
$\Rightarrow m = \dfrac{1 \pm 5\sqrt{2}}{7}$

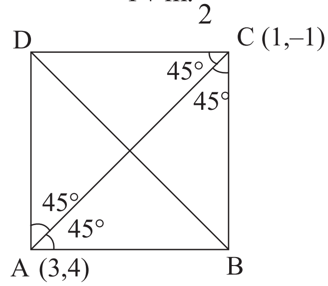
31. Any line through (1, –10) is given by
$y + 10 = m(x - 1)$
Since, it makes equal angle say 'α' with the given lines $7x - y + 3 = 0$ and $x + y - 3 = 0$
∴ $\tan\alpha = \dfrac{m-7}{1+7m} = \dfrac{m-(-1)}{1+m(-1)}$
$\Rightarrow m = \dfrac{1}{3}$ or -3
Hence, the two possible equations of third side are $3x + y + 7 = 0$, $x - 3y - 31 = 0$.

32. Here,
Slope of I[st] diagonal = $m_1 = \dfrac{2-0}{2-0} = 1$
$\Rightarrow \theta_1 = 45°$
Slope of II[nd] diagonal = $m_2 = \dfrac{2-0}{1-1} = \infty$
$\Rightarrow \theta_2 = 90°$
$\Rightarrow \theta_2 - \theta_1 = 45° = \dfrac{\pi}{4}$

33. Intersection point of the line is $\left(\dfrac{ab}{a+b}, \dfrac{ab}{a+b}\right)$, which is satisfying all the equations given in options (A), (B) and (C).
Hence, (D) is correct.

34. Putting k = 1, 2, we get
$3x + 2y = 12$ .....(i)
$4x + 3y = 19$ .....(ii)
The given lines are not parallel.
Hence on solving them, we get
$x = -2, y = 9$
Therefore, the lines pass through (–2, 9)

35. Slope of AC = 5/2.
Let m be the slope of a line inclined at an angle of 45° to AC,
Then $\tan 45^\circ = \pm\dfrac{m-\frac{5}{2}}{1+m.\frac{5}{2}} \Rightarrow m = -\dfrac{7}{3}, \dfrac{3}{7}$



Thus, let the slope of AB or DC be $\dfrac{3}{7}$ and that of AD or BC be $-\dfrac{7}{3}$.
Then, equation of AB is $3x - 7y + 19 = 0$.
Also the equation of BC is $7x + 3y - 4 = 0$
On solving these equations, we get B $\left(-\dfrac{1}{2}, \dfrac{5}{2}\right)$
Now let the co-ordinates of the vertex D be (h, k). Since the middle points of AC and BD are same
∴ $\dfrac{1}{2}\left(h - \dfrac{1}{2}\right) = \dfrac{1}{2}(3+1) \Rightarrow h = \dfrac{9}{2}$
$\Rightarrow \dfrac{1}{2}\left(k + \dfrac{5}{2}\right) = \dfrac{1}{2}(4-1)$
$\Rightarrow k = \dfrac{1}{2}$
Hence, $D = \left(\dfrac{9}{2}, \dfrac{1}{2}\right)$

36. $\begin{vmatrix} p-q & q-r & r-p \\ q-r & r-p & p-q \\ r-p & p-q & q-r \end{vmatrix} = \begin{vmatrix} 0 & q-r & r-p \\ 0 & r-p & p-q \\ 0 & p-q & q-r \end{vmatrix} = 0$

….[By $C_1 \to C_1 + C_2 + C_3$]

Hence, the lines are concurrent.

37. Given lines are $3x + 4y = 5$, $5x + 4y = 4$, $\lambda x + 4y = 6$. These lines meet at a point if the point of intersection of first two lines lies on the third line.

From $3x + 4y = 5$ and $5x + 4y = 4$

We get $x = \frac{-1}{2}$, $y = \frac{13}{8}$

This lies on $\lambda x + 4y = 6$, if $\lambda\left(-\frac{1}{2}\right) + 4\left(\frac{13}{8}\right) = 6$

$\Rightarrow \lambda = 1$

38. If the given lines are concurrent, then

$\begin{vmatrix} a & 1 & 1 \\ 1 & b & 1 \\ 1 & 1 & c \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} a & 1-a & 1-a \\ 1 & b-1 & 0 \\ 1 & 0 & c-1 \end{vmatrix} = 0$

[By $C_2 \to C_2 - C_1$ and $C_3 \to C_3 - C_1$]

$\Rightarrow a(b-1)(c-1) - (b-1)(1-a) - (c-1)(1-a) = 0$

$\Rightarrow \frac{a}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} = 0$

….[Divide by $(1-a)(1-b)(1-c)$]

$\Rightarrow \frac{1}{1-a} + \frac{1}{1-b} + \frac{1}{1-c} = 1$

39. From option (B),

$\begin{vmatrix} 1 & 2 & -10 \\ 2 & 1 & 5 \\ 5 & 4 & 0 \end{vmatrix} = 1(0-20) - 2(-25) - 10(3) = 0$

Hence, option (B) is the correct answer.

40. From option (B), we get

$\begin{vmatrix} 3 & 4 & 6 \\ 6 & 5 & 9 \\ 3 & 3 & 5 \end{vmatrix} = 3(25-27) - 4(3) + 6(3) = 0$

41. The three lines are concurrent, if

$\begin{vmatrix} 1 & 2 & -9 \\ 3 & 5 & -5 \\ a & b & -1 \end{vmatrix} = 0$

$\Rightarrow 35a - 22b + 1 = 0$

which is true if the line $35x - 22y + 1 = 0$ passes through (a, b).

42. By the given condition of $a + b + c = 0$, the three lines reduce to

$x - y = \frac{p}{a}$ or $\frac{p}{b}$ or $\frac{p}{c}$ $(p \neq 0)$.

All these lines are parallel. Hence, they do not intersect in finite plane.

43. The point of intersection of the lines is (1, 1). and slope of the line $2y - 3x + 2 = 0$ is $\frac{3}{2}$

Hence, the equation is $y - 1 = \frac{3}{2}(x - 1)$

$\Rightarrow 3x - 2y = 1$

44. The intersection point of lines $x - 2y = 1$ and $x + 3y = 2$ is $\left(\frac{7}{5}, \frac{1}{5}\right)$ and the slope of required line $= -\frac{3}{4}$

$\therefore$ Equation of required line is

$y - \frac{1}{5} = \frac{-3}{4}\left(x - \frac{7}{5}\right)$

$\Rightarrow \frac{3x}{4} + y = \frac{21}{20} + \frac{1}{5} \Rightarrow 3x + 4y = 5$

$\Rightarrow 3x + 4y - 5 = 0$

45. The point of intersection of $5x - 6y - 1 = 0$ and $3x + 2y + 5 = 0$ is $(-1, -1)$.

Now the line perpendicular to $3x - 5y + 11 = 0$ is $5x + 3y + k = 0$, but it passes through $(-1, -1)$

$\Rightarrow -5 - 3 + k = 0 \Rightarrow k = 8$

Hence, required line is $5x + 3y + 8 = 0$.

46. Equation of line passing through point of intersection of $x + 2y + 3 = 0$ and $3x + 4y + 7 = 0$ is

$(x + 2y + 3) + k(3x + 4y + 7) = 0$

$\Rightarrow (1 + 3k)x + (2 + 4k)y + 3 + 7k = 0$ ....(i)

Slope of equation (i) is $m_1 = \frac{-(1+3k)}{2+4k}$

and slope of given line is $m_2 = \frac{-1}{-1} = 1$ ....(ii)

Since (i) and (ii) represent perpendicular lines.

$\therefore$ $m_1 m_2 = -1$

$\therefore$ $\frac{-(1+3k)}{(2+4k)} \times 1 = -1$

$\therefore$ equation of required line is

$(x + 2y + 3) - 1(3x + 4y + 7) = 0$

$\Rightarrow x + y + 2 = 0$

47. Equation of line passing through point of intersection of u = 0 and v = 0 is u + kv = 0

$\therefore$ $(x + 2y + 5) + k(3x + 4y + 1) = 0$

It is passing through (3, 2)

$\therefore$ $(3 + 2 \times 2 + 5) + k(3 \times 3 + 4 \times 2 + 1) = 0$

$\therefore$ $k = -\dfrac{2}{3}$

$\therefore$ equation of line will be

$(x + 2y + 5) - \dfrac{2}{3}(3x + 4y + 1) = 0$

$\Rightarrow 3x + 2y - 13 = 0$

48. Equation of line through the point of intersection of lines $2x + 3y + 1 = 0$ and $3x - 5y - 5 = 0$ is given by

$(2 + 3k)x + (3 - 5k)y + (1 - 5k) = 0$

Slope of line is given by

$\tan 45° = -\dfrac{(2+3k)}{3-5k}$

$\Rightarrow k = \dfrac{5}{2}$

$\therefore$ Equation of line is $19x - 19y - 23 = 0$

49. Required line should be

$(3x - y + 2) + \lambda(5x - 2y + 7) = 0$ .....(i)

$\Rightarrow (3 + 5\lambda)x - (2\lambda + 1)y + (2 + 7\lambda) = 0$

$\Rightarrow y = \dfrac{3+5\lambda}{2\lambda+1}x + \dfrac{2+7\lambda}{2\lambda+1}$ .....(ii)

As the equation (ii), has infinite slope,

$2\lambda + 1 = 0$

$\Rightarrow \lambda = -1/2$

Putting $\lambda = -1/2$ in equation (i) we have

$(3x - y + 2) + (-1/2)(5x - 2y + 7) = 0$

$\Rightarrow x = 3$

Alternate Method:

The point of intersection of $3x - y + 2 = 0$ and $5x - 2y + 7 = 0$ is (3, 11)

....[By solving equations simultaneously]

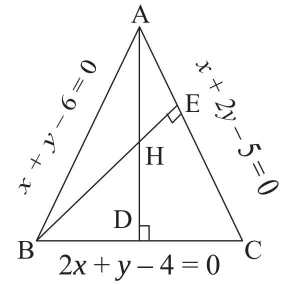
The required line has infinite slope (i.e. parallel to Y - axis) and passes through (3, 11).

$\Rightarrow x = 3$ is required equation.

50. Equation of AD is

$(x + y - 6) + k(x + 2y - 5) = 0$

$\Rightarrow (1 + k)x + (1 + 2k)y - (6 + 5k) = 0$ ....(i)



$\therefore$ Slope of AD = $m_1 = \dfrac{-(1+k)}{(1+2k)}$

and Slope of BC = $m_2 = -2$

$\therefore$ $m_1 m_2 = -1$ ....[$\because$ AD $\perp$ BC]

$\therefore$ $k = -\dfrac{3}{4}$

$\therefore$ From (i), equation of AD is

$x - 2y = 9$ .....(ii)

Similarly, equation of BE is

$2x - y = -12$ .....(iii)

By solving equation (ii) and (iii), we get

$x = -11, y = -10$

$\therefore$ H $\equiv$ (–11, –10)

51. Lengths of perpendicular from (0,0) on the given lines are each equal to 2.

52. $p_1.p_2 = \left(\dfrac{b\sqrt{a^2-b^2}\cos\theta + 0 - ab}{\sqrt{b^2\cos^2\theta + a^2\sin^2\theta}}\right) \times \left(\dfrac{-b\sqrt{a^2-b^2}\cos\theta - ab}{\sqrt{b^2\cos^2\theta + a^2\sin^2\theta}}\right)$

$= \dfrac{-[b^2(a^2-b^2)\cos^2\theta - a^2b^2]}{(b^2\cos^2\theta + a^2\sin^2\theta)}$

$= \dfrac{b^2[a^2 - a^2\cos^2\theta + b^2\cos^2\theta]}{b^2\cos^2\theta + a^2\sin^2\theta}$

$= \dfrac{b^2[a^2\sin^2\theta + b^2\cos^2\theta]}{b^2\cos^2\theta + a^2\sin^2\theta} = b^2$

53. Here, $p = \left|\dfrac{-k}{\sqrt{\sec^2\alpha + \text{cosec}^2\alpha}}\right|$

and $p' = \left|\dfrac{-k\cos 2\alpha}{\sqrt{\cos^2\alpha + \sin^2\alpha}}\right|$

$\therefore$ $4p^2 + p'^2 = \dfrac{4k^2}{\sec^2\alpha + \text{cosec}^2\alpha} + \dfrac{k^2(\cos^2\alpha - \sin^2\alpha)^2}{1}$

$= 4k^2 \sin^2\alpha \cos^2\alpha + k^2 (\cos^4\alpha + \sin^4\alpha)$
$\quad - 2k^2 \cos^2\alpha \sin^2\alpha$
$= k^2(\sin^2\alpha + \cos^2\alpha)^2$
$= k^2$

54. Let the point be (h, k), then h + k = 4.….(i) and

$$1 = \left|\frac{4h + 3k - 10}{\sqrt{4^2 + 3^2}}\right|$$

$\Rightarrow 4h + 3k = 15$ …..(ii)
and $4h + 3k = 5$ …..(iii)
On solving (i) and (ii), and (i) and (iii), we get the required points (3, 1) and (–7, 11).

55. $|AD| = \left|\frac{2 - 2 - 1}{\sqrt{1^2 + 2^2}}\right|$

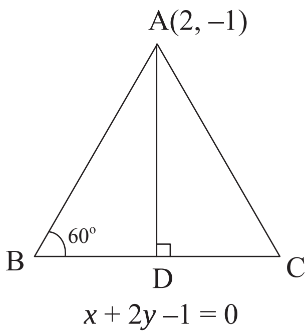
$= \frac{1}{\sqrt{5}}$

$\tan 60^\circ = \frac{AD}{BD}$

$\Rightarrow \sqrt{3} = \frac{1/\sqrt{5}}{BD}$

$\Rightarrow BD = \frac{1}{\sqrt{15}}$

$\therefore$ $BC = 2BD = 2/\sqrt{15}$



56. Equation of any line through (0, a) is
$y - a = m(x - 0)$ or $mx - y + a = 0$ …..(i)
If the length of perpendicular from (2a, 2a) to the line (i) is 'a', then $a = \pm\frac{m(2a) - 2a + a}{\sqrt{m^2 + 1}}$

$\Rightarrow m = 0, \frac{4}{3}$

Hence, the required equations of lines are
$y - a = 0$, $4x - 3y + 3a = 0$

57. The equation of lines passing through (1, 0) is given by $y = m(x - 1)$.

Its distance from origin is $\frac{\sqrt{3}}{2}$.

$\Rightarrow \left|\frac{-m}{\sqrt{1+m^2}}\right| = \frac{\sqrt{3}}{2} \Rightarrow m = \pm\sqrt{3}$

Hence, the lines are $\sqrt{3}x + y - \sqrt{3} = 0$ and $\sqrt{3}x - y - \sqrt{3} = 0$

58. Point of intersection is (2, 3).
Therefore, the equation of line passing through (2, 3) is $y - 3 = m(x - 2)$
or $mx - y - (2m - 3) = 0$
According to the condition,

$$\left|\frac{3m - 2 - (2m - 3)}{\sqrt{1 + m^2}}\right| = \frac{7}{5} \Rightarrow m = \frac{3}{4}, \frac{4}{3}$$

Hence, the equations are $3x - 4y + 6 = 0$ and $4x - 3y + 1 = 0$.

59. Slope $= -\sqrt{3}$

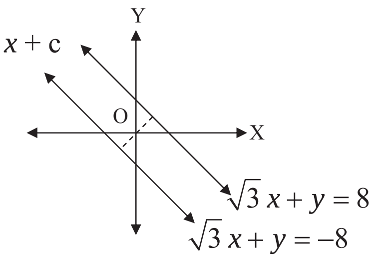
$\therefore$ Line is $y = -\sqrt{3}\,x + c$

$\Rightarrow \sqrt{3}\,x + y = c$

Now $\frac{c}{2} = |4|$

$\Rightarrow c = \pm 8$

$\Rightarrow x\sqrt{3} + y = \pm 8$



60. $d = \left|\frac{8 - 3}{\sqrt{(3)^2 + (4)^2}}\right| = 1$

61. If the given lines represent the same line, then the length of the perpendiculars from the origin to the lines are equal, so that

$$\frac{c}{\sqrt{1+m^2}} = \frac{p}{\sqrt{\cos^2\alpha + \sin^2\alpha}}$$

$\Rightarrow c = p\sqrt{1+m^2}$

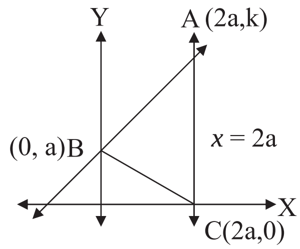
62. Lines $3x + 4y + 2 = 0$ and $3x + 4y + 5 = 0$ are on the same side of the origin. The distance between these lines is $d_1 = \left|\frac{2 - 5}{\sqrt{3^2 + 4^2}}\right| = \frac{3}{5}$.

Lines $3x + 4y + 2 = 0$ and $3x + 4y - 5 = 0$ are on the opposite sides of the origin. The distance between these lines is $d_2 = \left|\frac{2 + 5}{\sqrt{3^2 + 4^2}}\right| = \frac{7}{5}$.

Thus, $3x + 4y + 2 = 0$ divides the distance between $3x + 4y + 5 = 0$ and $3x + 4y - 5 = 0$ in the ratio $d_1 : d_2$ i.e., 3 : 7.

63. Since, the distance between the parallel lines $x + my + n = 0$ and $x + my + n' = 0$ is same as the distance between parallel lines $mx + y + n = 0$ and $mx + y + n' = 0$. Therefore, the parallelogram is a rhombus. Since, the diagonals of a rhombus are at right angles, therefore the required angle is $\frac{\pi}{2}$.

64. Line AB will pass through (0, a) and (2a, k)

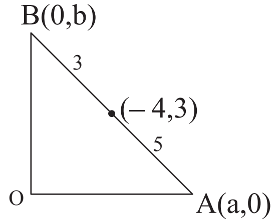


But as we are given AB = AC

$\Rightarrow k = \sqrt{4a^2 + (k-a)^2} \Rightarrow k = \dfrac{5a}{2}$

Hence, the required equation is $3x - 4y + 4a = 0$

65.



By the section formula, we get $a = -\dfrac{32}{3}$ and $b = \dfrac{24}{5}$

Hence, the required equation is given by

$\dfrac{x}{-(32/3)} + \dfrac{y}{(24/5)} = 1$

$\Rightarrow 9x - 20y + 96 = 0$

66. It is given that the lines $ax + 2y + 1 = 0$, $bx + 3y + 1 = 0$ and $cx + 4y + 1 = 0$ are concurrent, therefore $\begin{vmatrix} a & 2 & 1 \\ b & 3 & 1 \\ c & 4 & 1 \end{vmatrix} = 0$

$\Rightarrow -a + 2b - c = 0 \Rightarrow 2b = a + c$

$\Rightarrow$ a, b, c are in A. P.

67. The two lines will be identical if there exists some real number k such that

$b^3 - c^3 = k(b - c)$, $c^3 - a^3 = k(c - a)$,

$a^3 - b^3 = k(a - b)$

$\Rightarrow b - c = 0$ or $b^2 + c^2 + bc = k$

$\Rightarrow c - a = 0$ or $c^2 + a^2 + ac = k$

$\Rightarrow a - b = 0$ or $a^2 + b^2 + ab = k$

$\Rightarrow b = c, c = a, a = b$

or $b^2 + c^2 + bc = c^2 + a^2 + ca$

$\Rightarrow b^2 - a^2 = c(a - b)$

$\Rightarrow b = a$ or $a + b + c = 0$

68. $2p = \left| \dfrac{0 + 0 - 1}{\sqrt{\dfrac{1}{a^2} + \dfrac{1}{b^2}}} \right|$

$\Rightarrow \dfrac{1}{a^2} + \dfrac{1}{b^2} = \dfrac{1}{4p^2} \Rightarrow \dfrac{1}{a^2} + \dfrac{1}{b^2} = \dfrac{2}{8p^2}$

$\Rightarrow a^2, 8p^2, b^2$ are in H.P.

Competitive Thinking

1. Since, the line makes an angle of measure 30° with Y-axis. Therefore, the line will make an angle of measure 60° or – 60° with X-axis.

$\therefore$ Slope of line = tan 60° or tan(–60°)

$= \sqrt{3}$ or $-\sqrt{3} = \pm\sqrt{3}$

2. Here, the straight line is parallel to X-axis. So, the slope of such a line = 0.

3. $m_1 = \dfrac{6+4}{-2-3} = \dfrac{10}{-5} = -2$ and $m_2 = \dfrac{-18-6}{9-(-3)} = -2$

Hence, the lines are parallel.

4. Midpoint of the line joining the points (4, –5) and (–2, 9) is $\left(\dfrac{4-2}{2}, \dfrac{-5+9}{2}\right)$ i.e., (1, 2)

$\therefore$ Inclination of straight line passing through point (–3, 6) and midpoint (1, 2) is

$m = \dfrac{2-6}{1+3} \Rightarrow \tan\theta = -1$

$\Rightarrow \theta = \dfrac{3\pi}{4}$

5. The required equation of line passing through (a, b) and having gradient $m = \dfrac{-b}{a}$, is

$(y - b) = \dfrac{-b}{a}(x - a)$

i.e. $\dfrac{x}{a} + \dfrac{y}{b} = 2$

6. The required equation of line passing through (–2, 3) and gradient $m = \dfrac{3}{4}$, is

$y - 3 = \dfrac{3}{4}[x - (-2)]$

i.e. $3x - 4y + 18 = 0$

7. Slope of line passing through (1, 0) and (–4, 1) = $\frac{1-0}{-4-1} = \frac{-1}{5}$

Slope of line perpendicular to the given line is m = 5

Equation of line passing through (–3, 5) and having slope 5 is

$y - 5 = 5(x + 3)$

$\Rightarrow 5x - y + 20 = 0$

8. Midpoint ≡ (2, 7)

Slope of perpendicular = – 6

∴ the required equation is $y - 7 = -6(x - 2)$

$\Rightarrow 6x + y - 19 = 0$

9. Midpoint of given line segment ≡ (2, –1)

Now, slope of the line segment = $\frac{-8}{8} = -1$

Slope of the required line segment is 1

∴ the required equation of line is $y + 1 = 1(x - 2)$

$\Rightarrow x - y = 3$

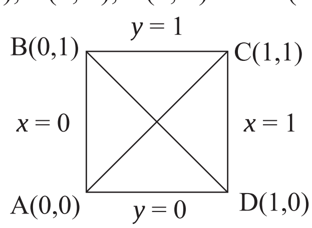
10. Midpoint ≡ (3, 2).

∴ the required equation is $y - 2 = 2(x - 3)$

$\Rightarrow 2x - y - 4 = 0$

11. The required diagonal passes through the midpoint of AB and is perpendicular to AB. So, its equation is $y - 2 = -3(x - 2)$ or $y + 3x - 8 = 0$.

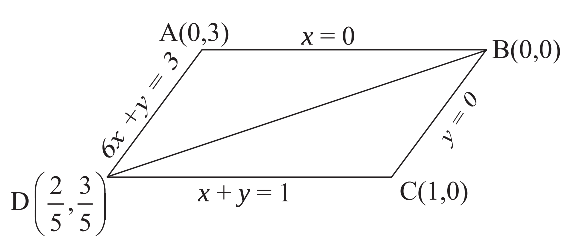
12. Co-ordinates of the vertices of the square are A(0, 0), B(0, 1), C(1, 1) and D(1, 0).



Now, the equation of AC is $y = x$ and of BD is

$y - 1 = -\frac{1}{1}(x - 0) \Rightarrow x + y = 1$

13.



From figure, diagonal BD is passing through origin, therefore its equation is given by

$$\left(y - \frac{3}{5}\right) = \frac{-(3/5)}{-(2/5)}\left(x - \frac{2}{5}\right)$$

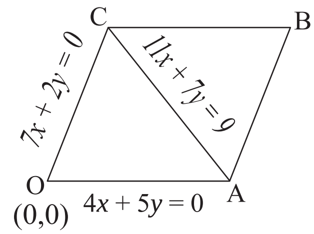
$\Rightarrow 3x - 2y = 0$

14. Since, the required line will be a line passing through A and B.

∴ $\frac{y-6}{6-(-4)} = \frac{x-1}{1-3}$

$\Rightarrow 10x - 10 = -2y + 12 \Rightarrow 5x + y - 11 = 0$

15. Since, equation of diagonal $11x + 7y = 9$ does not pass through origin, so it cannot be the equation of the diagonal OB. Thus, on solving the equation AC with the equations OA and OC, we get $A\left(\frac{5}{3}, -\frac{4}{3}\right)$ and $C\left(\frac{-2}{3}, \frac{7}{3}\right)$



Therefore, the midpoint of AC is $\left(\frac{1}{2}, \frac{1}{2}\right)$.

Hence, the equation of OB is $y = x$ i.e. $x - y = 0$.

16. Point of intersection of $x - y + 1 = 0$ and $7x - y - 5 = 0$ is (1, 2)

Equation of diagonal passing through (–1, –2) and (1, 2) is

$y + 2 = \frac{4}{2}(x + 1)$

$\Rightarrow 2x + 2 = y + 2$

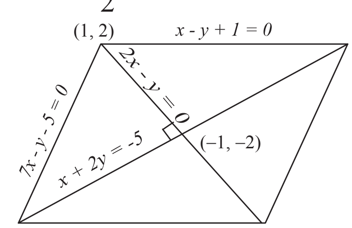
$\Rightarrow 2x - y = 0$

Equation of another diagonal passing through (–1, –2) and having slope $\frac{-1}{2}$ is

$y + 2 = \frac{-1}{2}(x + 1)$

$\Rightarrow 2y + 4 = -x - 1$

$\Rightarrow x + 2y = -5$



Point of intersection of $7x - y - 5 = 0$ and $x + 2y = -5$ is $\left(\frac{1}{3}, \frac{-8}{3}\right)$

∴ Answer is option (C)

17. Slope = $\frac{(2-1)}{1-\left(-\frac{1}{2}\right)} = \frac{1}{\left(\frac{3}{2}\right)} = \frac{2}{3}$

So, equation of the line is $y - 2 = \frac{2}{3}(x - 1)$

$\Rightarrow y = \frac{2}{3}x + \frac{4}{3}$

Putting $y = 0$, to find x-intercept, $\frac{2}{3}x + \frac{4}{3} = 0$

$\Rightarrow x = -2$

$\therefore$ x-intercept = – 2

18. Let the equation be $\frac{x}{a} + \frac{y}{-a} = 1$.

$\Rightarrow x - y = a$ ….(i)

But, it passes through (–3, 2)

$\therefore$ a = –3 – 2 = –5

Putting the value of a in (i), we get

$x - y + 5 = 0$

19. Let the equation of the line be $\frac{x}{a} + \frac{y}{b} = 1$.

Given, a = b

So, equation of line is $x + y = a$

Since, this line passes through (2, 4).

$\therefore$ 2 + 4 = a

$\Rightarrow$ a = 6

$\therefore$ the required equation of line is $x + y = 6$ i.e., $x + y - 6 = 0$

20. Here, a + b = –1

$\therefore$ required line is $\frac{x}{a} - \frac{y}{1+a} = 1$ .....(i)

Since, line (i) passes through (4, 3).

$\therefore$ $\frac{4}{a} - \frac{3}{1+a} = 1$

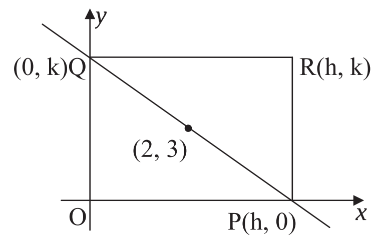
$\Rightarrow 4 + 4a - 3a = a + a^2$

$\Rightarrow a^2 = 4$

$\Rightarrow a = \pm 2$

$\therefore$ the required lines are $\frac{x}{2} - \frac{y}{3} = 1$ and $\frac{x}{-2} + \frac{y}{1} = 1$.

21. Let the equation of PQ be $\frac{x}{h} + \frac{y}{k} = 1$.



Since, the line passes through the fixed point (2, 3).

$\Rightarrow \frac{2}{h} + \frac{3}{k} = 1$

$\Rightarrow$ Locus of R(h, k) is $\frac{2}{x} + \frac{3}{y} = 1$

$\Rightarrow 3x + 2y = xy$

22. Equation of the line has its intercepts on the X-axis and Y-axis in the ratio 2 : 1 i.e., 2a and a

$\therefore$ $\frac{x}{2a} + \frac{y}{a} = 1 \Rightarrow x + 2y = 2a$ .....(i)

Line (i) also passes through midpoint of (3, – 4) and (5, 2) i.e., (4, –1)

$\therefore$ 4 + 2(– 1) = 2a $\Rightarrow$ a = 1

Hence, the equation of required line is

$x + 2y = 2$

23. Let the points of the required line on X-axis and Y-axis be A(a, 0) and B(0, b) respectively.

Since, $\left(\frac{3}{2}, \frac{5}{2}\right)$ is midpoint of AB.

$\therefore$ $\frac{a+0}{2} = \frac{3}{2}$ and $\frac{0+b}{2} = \frac{5}{2} \Rightarrow a = 3$ and $b = 5$

$\therefore$ the equation of line is $\frac{x}{3} + \frac{y}{5} = 1$

$\Rightarrow 5x + 3y - 15 = 0$

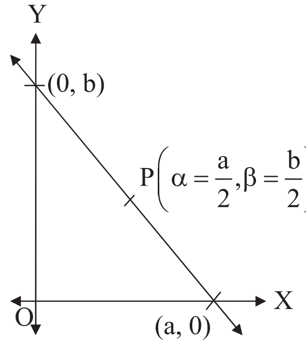
24. The required equation of line is

$\frac{x}{6} + \frac{y}{8} = 1 \Rightarrow 4x + 3y = 24$

25. Let $P\left(\alpha = \frac{a}{2}, \beta = \frac{b}{2}\right)$ be the midpoint of the line joining (a, 0) and (0, b).

$\therefore$ $\alpha = \frac{a}{2} \Rightarrow a = 2\alpha$ ….(i)

and $\beta = \frac{b}{2} \Rightarrow b = 2\beta$ ….(ii)



∴ Equation of a straight line cutting off intercepts a and b on X-axis and Y-axis respectively is

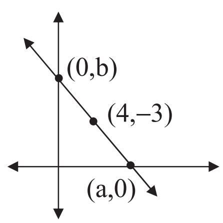
$\frac{x}{a} + \frac{y}{b} = 1$

$\Rightarrow \frac{x}{2\alpha} + \frac{y}{2\beta} = 1$ ....[From (i) and (ii)]

$\Rightarrow \frac{x}{\alpha} + \frac{y}{\beta} = 2$

26. $\frac{a+0}{2} = 4 \Rightarrow a = 8$

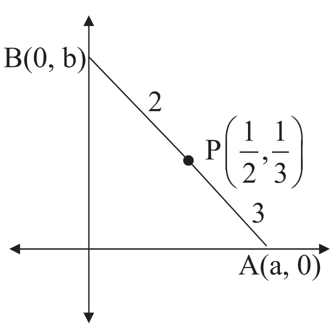
and $\frac{b+0}{2} = -3 \Rightarrow b = -6$



∴ the required equation of the line is $\frac{x}{8} + \frac{y}{-6} = 1$

$\Rightarrow \frac{3x - 4y}{24} = 1 \Rightarrow 3x - 4y = 24$

27.



Point P divides AB in the ratio 2:3

∴ $\left(\frac{1}{2}, \frac{1}{3.}\right) = \left(\frac{0+2a}{5}, \frac{3b+0}{5}\right)$

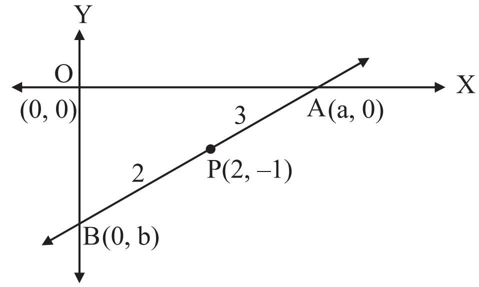
$\Rightarrow a = \frac{5}{4}$ and $b = \frac{5}{9}$

∴ equation of line AB is

$\frac{x}{a} + \frac{y}{b} = 1$

i.e., $4x + 9y = 5$

28.



Point P divides AB in the ratio 3:2

∴ $(2, -1) = \left(\frac{0+2a}{5}, \frac{3b+0}{5}\right)$

$\Rightarrow a = 5$ and $b = \frac{-5}{3}$

∴ Equation of the line AB is

$\frac{x}{a} + \frac{y}{b} = 1$

$\Rightarrow x - 3y - 5 = 0$

29. Since, $px - qy = r$ intersects at X-axis and Y-axis.

∴ $a = \frac{r}{p}$ and $b = -\frac{r}{q}$

∴ $a + b = \frac{r}{p} - \frac{r}{q} = r\left(\frac{q-p}{pq}\right)$

30. Any line through the middle point M(1, 5) of the intercept AB may be taken as

$\frac{x-1}{\cos\theta} = \frac{y-5}{\sin\theta} = r$ …..(i)

Since, the points A and B are equidistant from M and on the opposite sides of it.

Therefore, if the co-ordinates of A are obtained by putting r = d in (i), then the co-ordinates of B are given by putting r = –d.

Now, the point A(1 + d cosθ, 5 + d sinθ) lies on the line $5x - y - 4 = 0$ and

point B(1 – d cosθ, 5 – d sinθ) lies on the line $3x + 4y - 4 = 0$.

∴ $5(1 + d\cos\theta) - (5 + d\sin\theta) - 4 = 0$

and $3(1 - d\cos\theta) + 4(5 - d\sin\theta) - 4 = 0$

Eliminating ‘d’, we get $\frac{\cos\theta}{35} = \frac{\sin\theta}{83}$

Hence, the required line is $\frac{x-1}{35} = \frac{y-5}{83}$ or

$83x - 35y + 92 = 0$.

31. Since, $m_1m_2 = (2)\left(-\frac{1}{2}\right) = -1$

$\therefore$ the lines are perpendicular.

32. Here, $m_1 = -1$, $m_2 = -\frac{1}{k}$.

For orthogonal lines,

$m_1m_2 = -1 \Rightarrow \frac{1}{k} = -1 \Rightarrow k = -1$

33. Here, $m_1 = \frac{-2}{3}$ and $m_2 = \frac{-1}{k}$

for perpendicular lines

$m_1m_2 = -1$

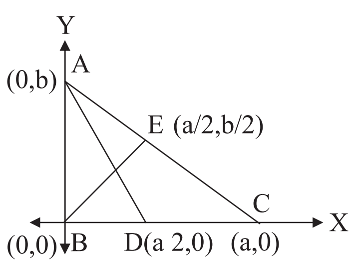
$\therefore \frac{-2}{3} \times \frac{-1}{k} = -1$

$\Rightarrow k = \frac{-2}{3}$

34. $m_1m_2 = -1$

$\Rightarrow \left(\frac{k-3}{2-4}\right)(2) = -1 \Rightarrow 2k - 6 = 2 \Rightarrow k = 4$

35.



From figure,

$\left(\frac{b/2}{a/2}\right)\left(\frac{b}{-a/2}\right) = -1$

$\Rightarrow a^2 = 2b^2 \Rightarrow a = \pm\sqrt{2}b$

36. Since, the point (–4, 5) does not lie on the diagonal $7x - y + 8 = 0$, so point will lie on the other diagonal.

Also, diagonals are perpendicular.

$\therefore$ Slope of other diagonal $= \frac{-1}{7}$

$\therefore$ equation of the other diagonal is

$y - 5 = -\frac{1}{7}(x + 4) \Rightarrow 7y + x = 31$

37. The equation of lines in intercept form are

$\frac{x}{-8/a} + \frac{y}{-8/b} = 1$

$\frac{x}{-3} + \frac{y}{2} = 1$

According to the given condition,

$-\frac{8}{a} = -(-3)$ and $-\frac{8}{b} = -2$

$\Rightarrow a = -\frac{8}{3}$ and $b = 4$

38. The equation of a line perpendicular to $x - y = 0$ is $-x - y + c = 0$ ….(i)

Since, the line passes through (3, 2).

$\therefore -3 - 2 + c = 0$

$\therefore c = 5$

Putting c = 5 in (i), we get

$x + y = 5$

39. The equation of a line perpendicular to $x + y + 1 = 0$ is $x - y + \lambda = 0$.

Since, the line passes through the point (1, 2).

$\therefore 1 - 2 + \lambda = 0$

$\Rightarrow \lambda = 1$

Hence, required equation of line is

$y - x - 1 = 0$

40. Slope of $y = 3x - 1$ is 3

$\therefore$ Slope of line perpendicular to the above line is

$m = \frac{-1}{3}$

Equation of line passing through (1, 2) and having slope (m) $= \frac{-1}{3}$ is

$(y - 2) = \frac{-1}{3}(x - 1)$

$\Rightarrow 3y - 6 = -x + 1$

$\Rightarrow x + 3y - 7 = 0$

41. The required equation passing through (–1, 1) and having gradient $\frac{3}{2}$ is

$y - 1 = \frac{3}{2}(x + 1) \Rightarrow 2(y - 1) = 3(x + 1)$

42. $5x - 6y - 1 = 0$ …(i)

$3x + 2y + 5 = 0$ …(ii)

On solving (i) and (ii), we get $x = -1$, $y = -1$

Slope of line $3x - 5y + 11 = 0$ is $\frac{3}{5}$.

Slope of line perpendicular to above line $= \frac{-5}{3}$

$\therefore$ Equation of line passing through (–1, –1) and having slope $-\frac{5}{3}$ is

$(y + 1) = -\frac{5}{3}(x + 1)$

$\Rightarrow 3y + 3 = -5x - 5$

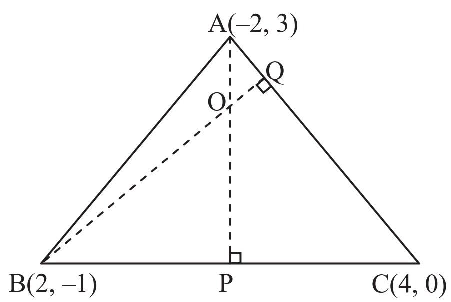
$\Rightarrow 5x + 3y + 8 = 0$

43. The given line is $bx - ay = ab$ ....(i)
It cuts X-axis at (a, 0).
The equation of a line perpendicular to (i) is $ax + by = k$.
Since, the line passes through (a, 0) $\Rightarrow k = a^2$
Hence, required equation of line is $ax + by = a^2$
i.e., $\frac{x}{b} + \frac{y}{a} = \frac{a}{b}$

44. The equation of a line passing through (2, 2) and perpendicular to $3x + y = 3$ is $y - 2 = \frac{1}{3}(x - 2)$ or $x - 3y + 4 = 0$.
Putting $x = 0$ in this equation, we get $y = \frac{4}{3}$

$\therefore$ y – intercept = $\frac{4}{3}$

45.



In ΔABC;

slope of BC = $\frac{0-(-1)}{4-2} = \frac{1}{2}$

slope of AC = $\frac{0-3}{4-(-2)} = \frac{-3}{6} = \frac{-1}{2}$

Since, AP ⊥ BC and BQ ⊥ AC,

$\therefore$ slope of AP = –2,
slope of BQ = 2

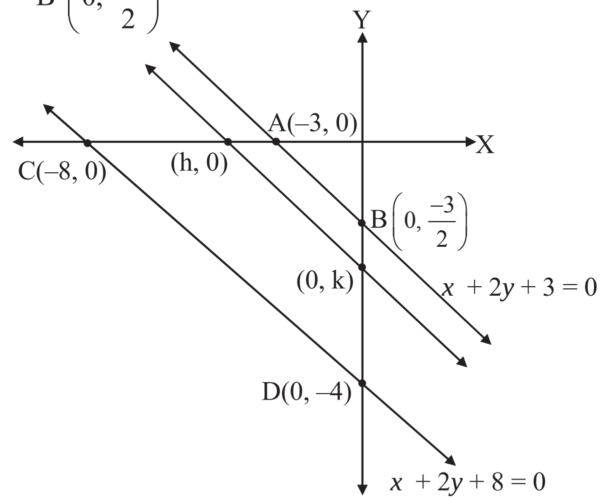
$\therefore$ Equation of AP is $2x + y + 1 = 0$ and equation of BQ is $2x - y - 5 = 0$
Solving the above equations, we get orthocentre, O = (1, –3)
Also, centroid of the triangle,

$C = \left(\frac{-2+2+4}{3}, \frac{3-1+0}{3}\right)$

i.e. $C = \left(\frac{4}{3}, \frac{2}{3}\right)$

$\therefore$ Equation of line OC is $11x - y - 14 = 0$

46. Line; $x + 2y + 3 = 0$
intersects the co-ordinate axes at A (–3, 0) and B $\left(0, \frac{-3}{2}\right)$



Line: $x + 2y + 8 = 0$ intersects the coordinate axes at C(–8, 0) and D(0, –4)
Since the required line divides the distance between the two lines in the ratio 1 : 2

$\therefore$ (h, 0) divides the distance between A(–3, 0) and C(–8, 0) in the ratio 1 : 2

$\therefore$ $(h, 0) = \left(\frac{1(-8) + 2(-3)}{3}, 0\right)$

$\therefore$ $(h, 0) = \left(\frac{-14}{3}, 0\right)$

$\therefore$ the required equation of line passing through $\left(\frac{-14}{3}, 0\right)$ and having gradient $m = \frac{-1}{2}$, is

$(y - 0) = \frac{-1}{2}\left(x + \frac{14}{3}\right)$

$\therefore$ $-3x - 6y = 14$
Writing in normal form,

$\frac{-3x}{\sqrt{45}} - \frac{6y}{\sqrt{45}} = \frac{14}{\sqrt{45}}$

i.e. $x \cos a + y \sin a = \frac{14}{\sqrt{45}}$

where, $\cos a = \frac{-3}{\sqrt{45}}$, $\sin a = \frac{-6}{\sqrt{45}}$

$\therefore$ $a = \pi + \tan^{-1}\frac{\frac{-6}{\sqrt{45}}}{\frac{-3}{\sqrt{45}}}$

i.e. $a = \pi + \tan^{-1} 2$

47. Here, $m_1 = -\cot\alpha$, $m_2 = \tan\beta$

$\therefore$ $\tan\theta = \left|\frac{-\cot\alpha - \tan\beta}{1 - \cot\alpha\tan\beta}\right|$

$\therefore$ $\tan\theta = -\cot(\alpha - \beta)$

$\therefore$ $\theta = \frac{\pi}{2} - \beta + \alpha$

48. The lines are $bx + ay - ab = 0$ and $bx - ay - ab = 0$.
Hence, the required angle is

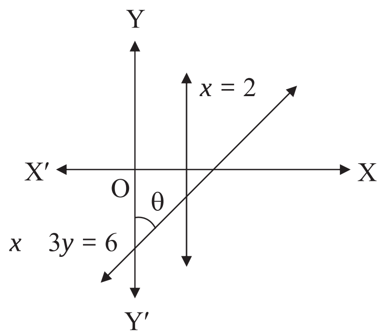
$$\theta = \tan^{-1}\left|\frac{\frac{-b}{a} - \frac{b}{a}}{1 - \frac{b^2}{a^2}}\right| = \tan^{-1}\left|\frac{2ab}{b^2 - a^2}\right|$$

$$= 2\tan^{-1}\frac{b}{a} \quad \ldots\left[\because 2\tan^{-1}\frac{y}{x} = \tan^{-1}\left|\frac{2xy}{y^2 - x^2}\right|\right]$$

49. $\theta = 90^\circ - \tan^{-1}\left(\frac{1}{3}\right)$

$\Rightarrow \tan\theta = \cot\left[\tan^{-1}\left(\frac{1}{3}\right)\right] = 3$

$\Rightarrow \theta = \tan^{-1}(3)$



50. Given lines are $ax + by + c = 0$
and $x = \alpha t + \beta$, $y = \gamma t + \delta$
After eliminating t, we get
$\gamma x - \alpha y + \alpha\delta - \gamma\beta = 0$
For parallelism condition,
$\frac{a}{\gamma} = \frac{b}{-\alpha} \Rightarrow a\alpha + b\gamma = 0$

51. The given lines are perpendicular because $m_1m_2 = (2)\left(\frac{-1}{2}\right) = -1$

Hence, the angle between the two lines is 90°.

52. The slopes of the lines are $m_1 = \frac{-1}{2}$, $m_2 = 2$

$\therefore$ $m_1m_2 = -1$
So, the lines are perpendicular i.e., $\theta = 90^\circ$

53. Slopes of lines $\frac{x}{a} + \frac{y}{b} = 1$ and $\frac{x}{b'} + \frac{y}{a'} = 1$

are $\frac{-b}{a}$ and $\frac{-a'}{b'}$ respectively

$\therefore$ Product of slopes is $\frac{a'b}{ab'}$

But $\frac{1}{ab'} + \frac{1}{ba'} = 0$
$\Rightarrow ab' = -a'b$
$\Rightarrow$ Product of slopes $= -1$
Hence option (C)

54. The equation of a straight line passing through $(3, -2)$ is
$y + 2 = m(x - 3)$ …..(i)
The slope of the line $\sqrt{3}\,x + y = 1$ is $-\sqrt{3}$

So, $\tan 60^\circ = \pm\frac{m - (-\sqrt{3})}{1 + m\,(-\sqrt{3})}$

On solving, we get
$m = 0$ or $\sqrt{3}$
Putting the values of m in (i), the required equation of lines are $y + 2 = 0$ and
$\sqrt{3}x - y - 2 - 3\sqrt{3} = 0$

55. Here the lines are $x - 3 = 0$, $y - 4 = 0$ and $4x - 3y + a = 0$.
These will be concurrent, if

$$\begin{vmatrix} 1 & 0 & -3 \\ 0 & 1 & -4 \\ 4 & -3 & a \end{vmatrix} = 0 \Rightarrow a = 0$$

56. Lines are concurrent, if $\begin{vmatrix} 4 & 3 & -1 \\ 1 & -1 & 5 \\ b & 5 & -3 \end{vmatrix} = 0$

$\Rightarrow 4(3 - 25) - 3(-3 - 5b) - 1(5 + b) = 0$
$\Rightarrow -88 + 9 + 15b - 5 - b = 0$
$\Rightarrow -84 + 14b = 0$
$\Rightarrow b = 6$

57. Given lines are concurrent, if $\begin{vmatrix} 2 & 1 & -1 \\ a & 3 & -3 \\ 3 & 2 & -2 \end{vmatrix} = 0$

$$\Rightarrow -\begin{vmatrix} 2 & 1 & 1 \\ a & 3 & 3 \\ 3 & 2 & 2 \end{vmatrix} = 0$$

This is true for all values of a because C_2 and C_3 are identical.

58. Here, the given lines are
$ax + by + c = 0$
$bx + cy + a = 0$
$cx + ay + b = 0$
The lines will be concurrent, if $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = 0$
$\Rightarrow a^3 + b^3 + c^3 - 3abc = 0$

59. Dividing both sides of relation 3a+ 2b+ 4c = 0 by 4, we get $\frac{3}{4}a + \frac{1}{2}b + c = 0$, which shows that for all values of a, b and c each member of the set of lines $ax + by + c = 0$ passes through the point $\left(\frac{3}{4}, \frac{1}{2}\right)$

60. Since, lines $x + 3y - 9 = 0$, $4x + by - 2 = 0$, and $2x - y - 4 = 0$ are concurrent
$\begin{vmatrix} 1 & 3 & -9 \\ 4 & b & -2 \\ 2 & -1 & -4 \end{vmatrix} = 0$
∴ $1(-4b - 2) - 3(-16 + 4) - 9(-4 - 2b) = 0$
$\Rightarrow b = -5$
∴ the required line passes through (–5, 0)
Now, consider option (D) and $x + 3y - 9 = 0$, $4x - 5y - 2 = 0$
∴ $\begin{vmatrix} 1 & 3 & -9 \\ 4 & -5 & -2 \\ 1 & -4 & 5 \end{vmatrix} = 0$
∴ option (D) is correct

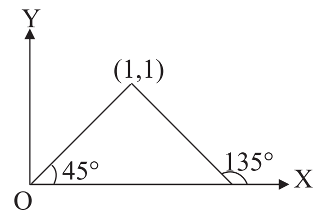
61. Required equation of line which is parallel to $x + 2y = 5$ is $x + 2y + k = 0$ ….(i)
Given equation of lines are
$x + y = 2$ ….(ii)
$x - y = 0$ ….(iii)
Adding (ii) and (iii), we get $2x = 2 \Rightarrow x = 1$
From (iii), we get $y = 1$
∴ Point of intersection is (1, 1).
Putting $x = 1$, $y = 1$ in (i), we get $k = -3$
∴ the required equation of line is $x + 2y = 3$.

62. Point of intersection is $y = -\frac{21}{5}$ and $x = \frac{23}{5}$
∴ $3x + 4y = \frac{3(23) + 4(-21)}{5} = \frac{69 - 84}{5} = -3$
Hence, required line is $3x + 4y + 3 = 0$

63. The lines passing through the intersection of the lines $ax + 2by + 3b = 0$ and $bx - 2ay - 3a = 0$ is
$ax + 2by + 3b + \lambda(bx - 2ay - 3a) = 0$
$\Rightarrow (a + b\lambda)x + (2b - 2a\lambda)y + 3b - 3\lambda a = 0$ …(i)
Line (i) is parallel to X-axis,
$a + b\lambda = 0 \Rightarrow \lambda = \frac{-a}{b}$
Putting the value of λ in (i), we get
$ax + 2by + 3b - \frac{a}{b}(bx - 2ay - 3a) = 0$
$\Rightarrow y\left(2b + \frac{2a^2}{b}\right) + 3b + \frac{3a^2}{b} = 0$
$\Rightarrow y\left(\frac{2b^2 + 2a^2}{b}\right) = -\left(\frac{3b^2 + 3a^2}{b}\right)$
$\Rightarrow y = \frac{-3(a^2 + b^2)}{2(b^2 + a^2)} = \frac{-3}{2}$
So, it is 3/2 unit below X-axis.

64. Point of intersection of the lines is (3, –2)
Also, slope of perpendicular = $\frac{2}{7}$
Hence, the equation is $y + 2 = \frac{2}{7}(x - 3)$
$\Rightarrow 2x - 7y - 20 = 0$

65. Slopes of the lines are 1 and –1



Since, the point of intersection is (1, 1)
Hence, the required equations are
$y - 1 = \pm 1(x - 1)$

66. The point of intersection of the lines $3x + y + 1 = 0$ and $2x - y + 3 = 0$ are $\left(\frac{-4}{5}, \frac{7}{5}\right)$.
The equation of line which makes equal intercepts with the axes is $x + y = a$.
∴ $-\frac{4}{5} + \frac{7}{5} = a \Rightarrow a = \frac{3}{5}$
∴ the required equation of the line is
$x + y - \frac{3}{5} = 0$ i.e., $5x + 5y - 3 = 0$

67. $(a-2b)x + (a+3b)y + 3a + 4b = 0$
or $a(x + y + 3) + b(-2x + 3y + 4) = 0$, which represents a family of straight lines through point of intersection of $x + y + 3 = 0$ and $-2x + 3y + 4 = 0$ i.e, $(-1, -2)$.

68. Required distance $= \left|\dfrac{3(3)-5(-4)-26}{\sqrt{9+16}}\right| = \dfrac{3}{5}$

69. Since, $L(p, q) = \dfrac{ap + bq + c}{\sqrt{a^2 + b^2}}$

and $L\left(\dfrac{2}{3}, \dfrac{1}{3}\right) + L\left(\dfrac{1}{3}, \dfrac{2}{3}\right) + L(2, 2) = 0$

$\therefore \dfrac{a\left(\frac{2}{3}\right) + b\left(\frac{1}{3}\right) + c}{\sqrt{a^2 + b^2}} + \dfrac{a\left(\frac{1}{3}\right) + b\left(\frac{2}{3}\right) + c}{\sqrt{a^2 + b^2}} + \dfrac{a(2) + b(2) + c}{\sqrt{a^2 + b^2}} = 0$

$\therefore \dfrac{3a + 3b + 3c}{\sqrt{a^2 + b^2}} = 0$

$\therefore$ $a + b + c = 0$ …(i)
Comparing equation (i) with $ax + by + c = 0$, we get
$a + b + c = ax + by + c$
i.e. $x = 1$ and $y = 1$

$\therefore$ The line $ax + by + c = 0$ passes through the point $(1, 1)$.

70. The line is $4x - 3y - 12 = 0$.

$\therefore$ Required length $= \left|\dfrac{-12}{\sqrt{4^2 + (-3)^2}}\right| = \dfrac{12}{5} = 2\dfrac{2}{5}$

71. Given, equation of line is
$\dfrac{x\sin\alpha}{b} - \dfrac{y\cos\alpha}{a} - 1 = 0$

$\therefore$ perpendicular distance from origin

$= \left|\dfrac{0.\frac{\sin\alpha}{b} - \frac{0.\cos\alpha}{a} - 1}{\sqrt{\frac{\sin^2\alpha}{b^2} + \frac{\cos^2\alpha}{a^2}}}\right| = \dfrac{|ab|}{\sqrt{a^2\sin^2\alpha + b^2\cos^2\alpha}}$

72. Equation of the line is
$y - 0 = \left(\dfrac{3-0}{-5}\right)(x-5)$

$\Rightarrow 3x + 5y - 15 = 0$

$\therefore$ $d = \left|\dfrac{3(4)+5(4)-15}{\sqrt{3^2+5^2}}\right| = \dfrac{17}{\sqrt{34}} = \sqrt{\dfrac{17}{2}}$

73. Distance of $(1, 1)$ from $3x + 4y + c = 0$ is
$d = \left|\dfrac{3(1) + 4(1) + c}{\sqrt{9+16}}\right|$

$\Rightarrow \pm 7 = \dfrac{7+c}{5}$

$\Rightarrow c = -42, 28$

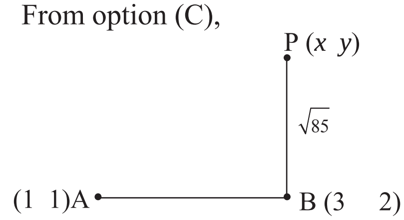
74. Let the point be $(h, 0)$, then $a = \left|\dfrac{bh + 0 - ab}{\sqrt{a^2 + b^2}}\right|$

$\Rightarrow bh = \pm a\sqrt{a^2 + b^2} + ab$

$\Rightarrow h = \dfrac{a}{b}(b \pm \sqrt{a^2 + b^2})$

Hence, the points are $\left\{\dfrac{a}{b}(b \pm \sqrt{a^2 + b^2}), 0\right\}$.

75. From option (C),



$BP = \sqrt{(5-3)^2 + (7+2)^2}$
$= \sqrt{4 + 81} = \sqrt{85}$

Hence, option (C) is correct.

76. $L_{12} \equiv x - 3y + 1 = 0$
$L_{23} \equiv 2x + y - 12 = 0$
$L_{13} \equiv 3x - 2y - 4 = 0$
Therefore, the required distances are

$D_3 = \left|\dfrac{4 - 3\times4 + 1}{\sqrt{10}}\right| = \dfrac{7}{\sqrt{10}}$

$D_1 = \left|\dfrac{4 + 1 - 12}{\sqrt{5}}\right| = \dfrac{7}{\sqrt{5}}$

$D_2 = \left|\dfrac{3\times5 - 2\times2 - 4}{\sqrt{9+4}}\right|$

$= \dfrac{7}{\sqrt{13}}$

77. Let p be the length of the perpendicular from the vertex $(2, -1)$ to the base $x + y = 2$.

Then, $p = \left|\dfrac{2 - 1 - 2}{\sqrt{1^2 + 1^2}}\right| = \dfrac{1}{\sqrt{2}}$

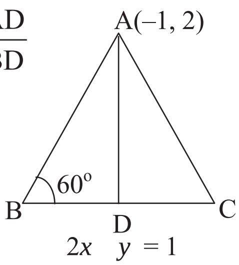
If 'a' is the length of the side of triangle, then
$p = a\sin 60^\circ$

$\Rightarrow \dfrac{1}{\sqrt{2}} = \dfrac{a\sqrt{3}}{2}$

$\Rightarrow a = \sqrt{\dfrac{2}{3}}$

78. $AD = \left|\dfrac{-2-2-1}{\sqrt{(2)^2+(-1)^2}}\right| = \left|\dfrac{-5}{\sqrt{5}}\right| = \sqrt{5}$

Since, $\tan 60° = \dfrac{AD}{BD}$



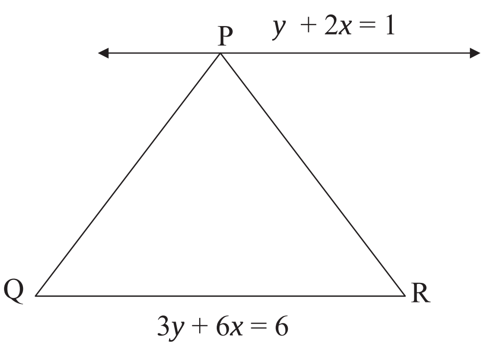
$\Rightarrow \sqrt{3} = \dfrac{\sqrt{5}}{BD}$

$\Rightarrow BD = \sqrt{\dfrac{5}{3}}$

∴ BC = 2BD

$= 2\sqrt{\dfrac{5}{3}} = \sqrt{\dfrac{20}{3}}$

79.



lines $y + 2x = 1$ and $3y + 6x = 6$ are parallel to each other

∴ $d = \left|\dfrac{-1+2}{\sqrt{4+1}}\right|$

$d = \dfrac{1}{\sqrt{5}}$

Side of equilateral triangle $= \dfrac{2}{\sqrt{3}} \times d$

$= \dfrac{2}{\sqrt{3}} \times \dfrac{1}{\sqrt{5}} = \dfrac{2}{\sqrt{15}}$

80. Point of intersection is (1, 2)
Therefore, the equation of line passing through (1, 2) is $(y - 2) = m(x - 1)$
or $mx - y + 2 - m = 0$
Since, the line is at distance of $\sqrt{5}$ from origin i.e. (0, 0),

$\left|\dfrac{(0)m-(0)+2-m}{\sqrt{m^2+1}}\right| = \sqrt{5}$

$\Rightarrow m = \dfrac{-1}{2}$

∴ Equation of the line is $x + 2y - 5 = 0$

81. Given b = 2a

∴ The equation of the line is $\dfrac{x}{a} + \dfrac{y}{b} = 1$

$\Rightarrow \dfrac{x}{a} + \dfrac{y}{2a} = 1$

$\Rightarrow 2x + y = 2a$

Distance of the line from (0, 0) is

$d = \left|\dfrac{2(0)+1(0)-2a}{\sqrt{4+1}}\right|$

$\Rightarrow 1 = \left|\dfrac{-2a}{\sqrt{5}}\right|$

$\Rightarrow a = \pm\dfrac{\sqrt{5}}{2}$

∴ Equation of line is $2x + y = \pm\sqrt{5}$

82. Gradient of BC = –1 and its equation is $x + y + 4 = 0$. Therefore, the equation of line parallel to BC is $x + y + \lambda = 0$.
Also, it is $\dfrac{1}{2}$ unit distant from origin.

Thus, $\dfrac{\lambda}{\sqrt{2}} = \dfrac{1}{2} \Rightarrow \lambda = \dfrac{\sqrt{2}}{2}$

Hence, the required equation of line is $2x + 2y + \sqrt{2} = 0$

83. Equation of straight line parallel to $4x - 3y = 5$ is $4x - 3y = \lambda$
According to the given condition,

$\dfrac{4(-1)-3(-4)-\lambda}{\sqrt{16+9}} = \pm 1$

$\Rightarrow 8 - \lambda = \pm 5$

$\Rightarrow \lambda = 3, 13$

∴ the equation of one of the lines is $4x - 3y - 3 = 0$

84. Equation of AB: $4x - 3y - 17 = 0$
Equation of BC: $3x + 4y - 19 = 0$
If P(x, y) is a point on the bisector of ∠ABC then,

$\left|\dfrac{4x-3y-17}{\sqrt{(4)^2+(-3)^2}}\right| = \left|\dfrac{3x+4y-19}{\sqrt{(3)^2+(4)^2}}\right|$

∴ $7y = x + 2$ is the required equation of the angle bisector.

85. Let point (x_1, y_1) be at distance $\sqrt{5}$ from $x - 2y + 1 = 0$

$\therefore$ $\sqrt{5} = \left|\dfrac{x_1 - 2y_1 + 1}{\sqrt{1+4}}\right|$

$\therefore$ $x_1 - 2y_1 + 1 = \pm 5$ ....(i)

Let point (x_2, y_2) be at distance $\sqrt{13}$ from $2x + 3y - 1 = 0$

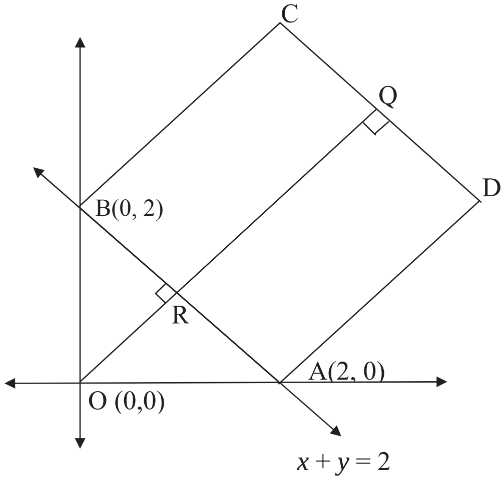
$\therefore$ $\sqrt{13} = \left|\dfrac{2x_2 + 3y_2 - 1}{\sqrt{4+9}}\right|$

$\therefore$ $2x_2 + 3y_2 - 1 = \pm 13$ ....(ii)

$\therefore$ Equation (i) and (ii) will give us total 4 points.

$\therefore$ answer is option (C)

86.



$(AB) = (RQ) = \sqrt{(2-0)^2 + (0-2)^2}$

$= \sqrt{8} = 2\sqrt{2}$

$(OR) = \left|\dfrac{1(0) + 1(0) - 2}{\sqrt{1+1}}\right| = \left|\dfrac{-2}{\sqrt{2}}\right| = \sqrt{2}$

$\therefore$ Perpendicular distance (p) = OR + RQ

$= \sqrt{2} + 2\sqrt{2}$

$= 3\sqrt{2}$

87. Slope of given line $ax + by + c = 0$ is $-\dfrac{a}{b}$.

$\therefore$ $-\dfrac{a}{b} = \pm 1 \Rightarrow a = \pm b$ ....(i)

Distance of line $ax + by + c = 0$ from $(1, -2)$

$= \dfrac{|a - 2b + c|}{\sqrt{a^2 + b^2}}$

Distance of line $ax + by + c = 0$ from $(3, 4)$

$= \dfrac{|3a + 4b + c|}{\sqrt{a^2 + b^2}}$

According to the given condition,

$\dfrac{|a - 2b + c|}{\sqrt{a^2 + b^2}} = \dfrac{|3a + 4b + c|}{\sqrt{a^2 + b^2}}$

$\Rightarrow 3a + 4b + c = \pm(a - 2b + c)$

$\Rightarrow a + 3b = 0$ (taking +ve) ....(ii)

$\Rightarrow 2a + b + c = 0$ (taking–ve) ....(iii)

From, (i) and (ii), we get a = b = 0 which is not possible so taking (i) and (iii), (taking a = – b) we get

$a + c = 0 \Rightarrow c = -a$

$a : b : c = a : -a : -a = 1 : -1 : -1$

or $a = 1, b = -1, c = -1$

From (i) and (iii) (taking a = b), we get

$3a + c = 0 \Rightarrow c = -3a$

$a : b : c = a : a : -3a = 1 : 1 : -3$

$\therefore$ option (B) is the correct answer.

88. Here, the lines are $3x + 4y - 9 = 0$ and $6x + 8y - 15 = 0$ or $3x + 4y - \dfrac{15}{2} = 0$.

$\therefore$ Required distance = $\left|\dfrac{-9 - \left(\dfrac{-15}{2}\right)}{\sqrt{3^2 + 4^2}}\right| = \left|\dfrac{-3}{10}\right| = \dfrac{3}{10}$

89. Given equation of parallel lines are $x - y + a = 0$, $x - y + b = 0$

$\therefore$ required distance = $\left|\dfrac{a - b}{\sqrt{(1)^2 + (-1)^2}}\right| = \dfrac{|a - b|}{\sqrt{2}}$

90. Line L passes through (13, 32).

$\therefore$ $\dfrac{13}{5} + \dfrac{32}{b} = 1$

$\Rightarrow b = -20$

So, equation of L is $\dfrac{x}{5} - \dfrac{y}{20} = 1 \Rightarrow 4x - y = 20$

Slope of L is $m_1 = 4$.

Slope of $\dfrac{x}{c} + \dfrac{y}{3} = 1$ is $m_2 = -\dfrac{3}{c}$

$\Rightarrow -\dfrac{3}{c} = 4$

$\Rightarrow c = -\dfrac{3}{4}$

Equation of line K is $-\dfrac{4x}{3} + \dfrac{y}{3} = 1$

$\Rightarrow 4x - y = -3$

Distance between L and K is $\left|\dfrac{20 + 3}{\sqrt{16+1}}\right| = \dfrac{23}{\sqrt{17}}$

91. Distance between lines $-x + y = 2$ and $x - y = 2$ is $\alpha = \left|\frac{2+2}{\sqrt{2}}\right| = 2\sqrt{2}$ ....(i)

Distance between lines $4x - 3y = 5$ and $6y - 8x = 1$ is

$$\beta = \left|\frac{5 - \left(\frac{-1}{2}\right)}{5}\right| = \frac{11}{10} \quad ....(ii)$$

From (i) and (ii), we get

$$\frac{\alpha}{\beta} = \frac{2\sqrt{2}}{11/10}$$

$\Rightarrow 20\sqrt{2}\beta = 11\alpha$

92. $(K + 1)^2x + Ky - 2K^2 - 2 = 0$

$\therefore$ $(K^2 + 2K + 1)x + Ky - 2K^2 - 2 = 0$

$\therefore$ $K^2(x - 2) + K(2x + y) + (x - 2) = 0$

$\therefore$ $(K^2 + 1)(x - 2) + K(2x + y) = 0$

$\therefore$ $x - 2 = 0$ i.e. $x = 2$

and $2x + y = 0$

$\therefore$ $2(2) + y = 0$

$\therefore$ $y = -4$

$\therefore$ The fixed point is (2, –4)

$\because$ The required line has slope 2 and passes through the point (2, –4)

$\therefore$ Equation of line;

$y - (-4) = 2(x - 2)$

$\therefore$ $y + 4 = 2x - 4$

$\therefore$ $y = 2x - 8$

93. $ax + by + c = 0$ always passes through (1, –2).

$\therefore$ $a - 2b + c = 0 \Rightarrow 2b = a + c$

Therefore, a, b and c are in A.P.

94. Since, , m, n are in A.P.

$\therefore$ 2m = + n

Given equation of line is $x + my = n = 0$

Consider, option (B),

If the point (1, –2) satisfy the given equation.

$\therefore$ – 2m + n = 0 $\Rightarrow$ 2m = + n

$\Rightarrow$, m, n are A.P.

95. a, b, c are in H. P., then $\frac{2}{b} = \frac{1}{a} + \frac{1}{c}$ .....(i)

Given, line is $\frac{x}{a} + \frac{y}{b} + \frac{1}{c} = 0$ .....(ii)

From (i) and (ii), we get

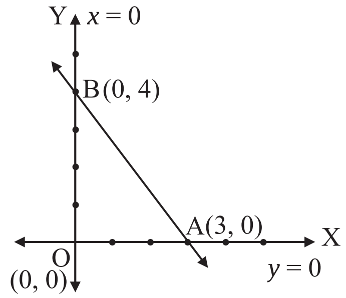
$$\frac{1}{a}(x - 1) + \frac{1}{b}(y + 2) = 0$$

Since, $a \neq 0$, $b \neq 0$

So, $(x - 1) = 0$ and $(y + 2) = 0$

$\Rightarrow x = 1$ and $y = -2$

96.



For a triangle with side lengths a, b and c and vertices at points opposite to these sides (x_1, y_1), (x_2, y_2) and (x_3, y_3) respectively, the incentre is given by,

$$(x_i, y_i) = \left(\frac{ax_1 + bx_2 + cx_3}{a + b + c}, \frac{ay_1 by_2 + cy_3}{a + b + c}\right)$$

For the given triangle,

OA = 3 units

OB = 4 units

AB = $\sqrt{(4-0)^2 + (0-3)^2}$ = 5 units

$\therefore$ Incentre

$$= \left(\frac{3(0) + 4(3) + 5(0)}{3 + 4 + 5}, \frac{3(4)4(0)5(0)}{3 + 4 + 5}\right)$$

$$= \left(\frac{12}{12}, \frac{12}{12}\right)$$

= (1, 1)

$\therefore$ Incentre is (1, 1)

97. Two sides $x - 3y = 0$ and $3x + y = 0$ of the given triangle are perpendicular to each other. Therefore, its orthocentre is the point of intersection of $x - 3y = 0$ and $3x + y = 0$ i.e., (0, 0).

98. The vertices of triangle are the intersection points of these given lines. The vertices of Δ are A(0, 4), B(1, 1), C(4, 0)

Now,

$$AB = \sqrt{(0-1)^2 + (4-1)^2} = \sqrt{10}$$

$$BC = \sqrt{(1-4)^2 + (1-0)^2} = \sqrt{10}$$

$$AC = \sqrt{(0-4)^2 + (4-0)^2} = 4\sqrt{2}$$

$\because$ AB = BC

$\therefore$ Δ is isosceles.

99. The point of intersection of the given lines are (–1, 1), (1, –1) and (2/3, 2/3) which is the vertices of an isosceles triangle.

Evaluation Test

1. Given, $f(\alpha) = x \cos \alpha + y \sin \alpha - p(\alpha)$

$\therefore$ $f(\beta) = x \cos \beta + y \sin \beta - p(\beta)$

Since, both the lines are perpendicular to each other.

$\therefore$ $a_1a_2 + b_1b_2 = 0$

$\Rightarrow \cos \alpha \cos \beta + \sin \alpha \sin \beta = 0$

$\Rightarrow \cos (\alpha - \beta) = 0 \Rightarrow |\alpha - \beta| = \dfrac{\pi}{2}$

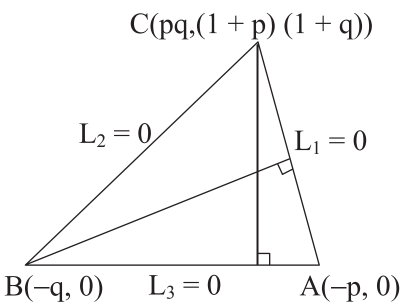
2. The equations of the sides of the triangle are

$L_1 \equiv \dfrac{x}{p} - \dfrac{y}{1+p} = -1,$

$L_2 \equiv \dfrac{x}{q} - \dfrac{y}{1+q} = -1,$

$L_3 \equiv y = 0$

The coordinates of vertices are A(–p, 0), B(–q, 0) and C(pq,(1 + p) (1 + q)).



The equation of the altitude through C is $x = pq$ and the equation of the altitude through B is $(1 + p)\, y + px + pq = 0$.

Solving these equations, we get

$x = pq$ and $y = -pq$

Let (h, k) be the coordinates of the orthocentre. Then,

$h = pq$ and $k = -pq \Rightarrow k = -h$

Hence, the locus of (h, k) is $y = -x$, which is a straight line.

3. The line $ax + by + c = 0$ meets the coordinate axes at $A\left(-\dfrac{c}{a}, 0\right)$ and $B\left(0, -\dfrac{c}{b}\right)$.

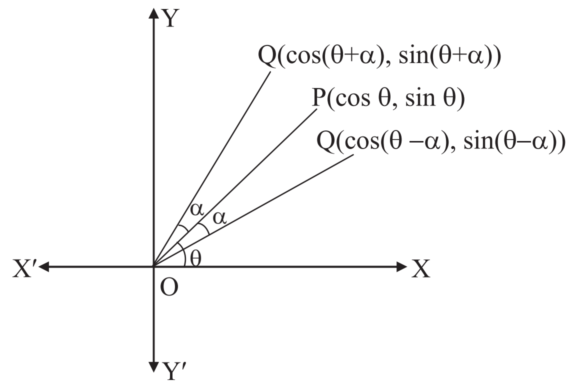
$\therefore$ Area of $\Delta OAB = \dfrac{1}{2} \times OA \times OB$

$= \dfrac{1}{2} \times \left|-\dfrac{c}{a}\right|\left|-\dfrac{c}{b}\right| = \dfrac{c^2}{2ab}$

This will be constant, if a, c, b are in G.P.

4. The clockwise rotation of the point P(cos θ, sin θ) through an angle α takes it to the point (cos(θ – α), sin(θ – α)) and anticlockwise rotation through angle α takes P to the point (cos(θ + α), sin(θ + α)).

$\therefore$ options (A) and (B) are not correct.



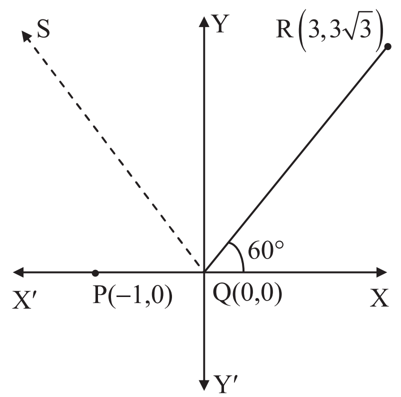
Slope of PQ $= \dfrac{\sin(\alpha - \theta) - \sin\theta}{\cos(\alpha - \theta) - \cos\theta}$

$= -\dfrac{2\sin\left(\dfrac{\alpha}{2} - \theta\right)\cos\dfrac{\alpha}{2}}{2\sin\left(\dfrac{\alpha}{2} - \theta\right)\sin\dfrac{\alpha}{2}}$

$= -\cot\dfrac{\alpha}{2}$

This shows that PQ is perpendicular to a line with slope $\tan\dfrac{\alpha}{2}$. Thus, Q can be obtained from P by taking its reflection in the line through origin with slope $\tan\dfrac{\alpha}{2}$.

5. Let QS be the bisector of ∠PQR.



Slope of QR $= \dfrac{3\sqrt{3} - 0}{3 - 0} = \sqrt{3}$

∴ $\angle XQR = 60°$

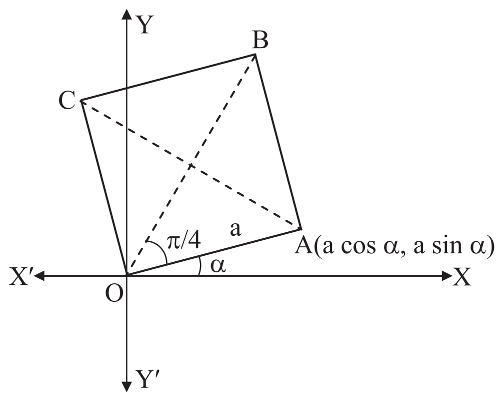
$\Rightarrow \angle PQR = 120°$

$\Rightarrow \angle PQS = \angle SQR = 60° \Rightarrow \angle XQS = 120°$

∴ Slope of QS = tan 120° = $-\sqrt{3}$

∴ the equation of QS is $y = -\sqrt{3}x$ i.e., $\sqrt{3}x + y = 0$

6.



Slope of OB = $\tan\left(\frac{\pi}{4}+\alpha\right)$

∴ Slope of AC = $-\cot\left(\frac{\pi}{4}+\alpha\right)$

$= -\left(\frac{\cos\alpha - \sin\alpha}{\cos\alpha + \sin\alpha}\right)$

$= \frac{\sin\alpha - \cos\alpha}{\sin\alpha + \cos\alpha}$

∴ the equation of AC is

$y - a\sin\alpha = \frac{\sin\alpha - \cos\alpha}{\sin\alpha + \cos\alpha}(x - a\cos\alpha)$

$\Rightarrow y(\sin\alpha + \cos\alpha) + x(\cos\alpha - \sin\alpha) = a$

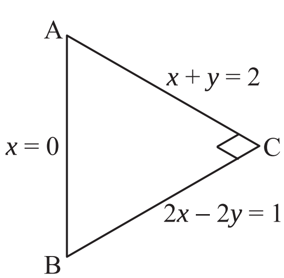
7. Equation of line L passing through (1, 1) and (2, 0) is

$y - 1 = \frac{0-1}{2-1}(x - 1)$

$\Rightarrow x + y = 2$ ….(i)

∴ Slope of L = –1

Also, slope of L′ = 1 ….[∵ L ⊥ L′]



Equation of line L′ passing through $\left(\frac{1}{2}, 0\right)$ and having slope 1 is

$y - 0 = 1\left(x - \frac{1}{2}\right)$

$\Rightarrow 2x - 2y = 1$ ….(ii)

Equation of Y axis, $x = 0$ ….(iii)

From (i), (ii) and (iii),

the vertices of the triangle are $A(0, 2), B\left(0, -\frac{1}{2}\right)$ and $C\left(\frac{5}{4}, \frac{3}{4}\right)$.

∴ the area of the triangle is

$$\frac{1}{2}\begin{vmatrix} 0 & 2 & 1 \\ 0 & -\frac{1}{2} & 1 \\ \frac{5}{4} & \frac{3}{4} & 1 \end{vmatrix} = \frac{25}{16} \text{ square units}$$

8. By solving $3x + 4y = 9$, $y = mx + 1$, we get $x = \frac{5}{3+4m}$.

Now, x is an integer, if 3 + 4m = 1, – 1, 5, – 5

∴ $m = \frac{-2}{4}, \frac{-4}{4}, \frac{2}{4}, \frac{-8}{4}$.

Since, m = $\frac{-2}{4}, \frac{2}{4}$ do not give integral values of m.

∴ m has two integral values.

9. Given, the lines $ax + by + p = 0$ and $x\cos\alpha + y\sin\alpha - p = 0$ are inclined at an angle $\frac{\pi}{4}$.

∴ $\tan\frac{\pi}{4} = \left|\frac{-\frac{a}{b} + \frac{\cos\alpha}{\sin\alpha}}{1 + \frac{a\cos\alpha}{b\sin\alpha}}\right|$

$\Rightarrow a\cos\alpha + b\sin\alpha = -a\sin\alpha + b\cos\alpha$ .....(i)

Also, the lines $ax + by + p = 0$, $x\cos\alpha + y\sin\alpha - p = 0$ and $x\sin\alpha - y\cos\alpha = 0$ are concurrent.

$\therefore \quad \begin{vmatrix} a & b & p \\ \cos\alpha & \sin\alpha & -p \\ \sin\alpha & -\cos\alpha & 0 \end{vmatrix} = 0$

$\Rightarrow -\text{ap}\cos\alpha - \text{bp}\sin\alpha - p = 0$

$\Rightarrow a\cos\alpha + b\sin\alpha = -1$ ....(ii)

From (i) and (ii), we get

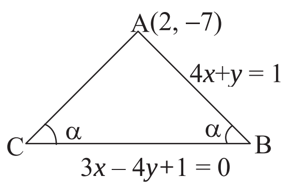
$-a\sin\alpha + b\cos\alpha = -1$ ….(iii)

Squaring (ii) and (iii) and adding, we get

$(a\cos\alpha + b\sin\alpha)^2 + (-a\sin\alpha + b\cos\alpha)^2 = 2$

$\Rightarrow a^2 + b^2 = 2$

10. Slopes of AB and BC are -4 and $\frac{3}{4}$ respectively.



Let α be the angle between AB and BC.

Then, $\tan\alpha = \left|\dfrac{-4-\frac{3}{4}}{1-4\left(\frac{3}{4}\right)}\right| = \dfrac{19}{8}$ .....(i)

Since, AB = AC

$\Rightarrow \angle ABC = \angle ACB = \alpha$

$\therefore$ the line AC also makes an angle α with BC.

If m is the slope of the line AC, then its equation is $y + 7 = m(x - 2)$ .....(ii)

Now, $\tan\alpha = \pm\left[\dfrac{m-\frac{3}{4}}{1+m.\frac{3}{4}}\right]$

$\Rightarrow \dfrac{19}{8} = \pm\dfrac{4m-3}{4+3m}$ ….[From (i)]

$\Rightarrow m = -4 \text{ or } -\dfrac{52}{89}$

But slope of AB is -4, so slope of AC is $-\dfrac{52}{89}$.

Therefore, the equation of line AC given by (ii) is $52x + 89y + 519 = 0$.

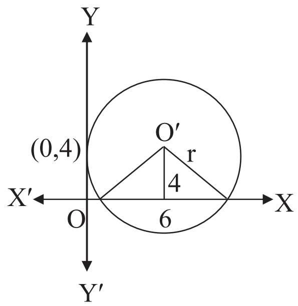
Classical Thinking

2. Required equation is $(x-a)^2 + (y-a)^2 = a^2$
$\Rightarrow x^2 + y^2 - 2ax - 2ay + a^2 = 0$

3. The equation of circle with centre (x_1, y_1) is
$(x-x_1)^2 + (y-y_1)^2 = r^2$
since, the circle touches both the axes,
$x_1 = y_1 = r$
$\therefore$ $(x-x_1)^2 + (y-x_1)^2 = x_1^2$
$\Rightarrow x^2 + y^2 - 2x_1(x+y) + x_1^2 = 0$

4. Since, the circle touches X axis
$\therefore$ Radius = 2.
$\therefore$ the equation of the circle is
$(x-1)^2 + (y-2)^2 = 2^2$
$\Rightarrow x^2 + y^2 - 2x - 4y + 1 = 0$

5. Let O′ be the centre



Now, from the figure
Radius (r) $= \sqrt{(4)^2 + (3)^2} = 5$

6. Extremities of diameter are (5, 7) and (1, 4)
Radius is half of the distance between them
$\therefore$ Radius $= \dfrac{1}{2}\sqrt{(4)^2 + (3)^2}$
$= \dfrac{5}{2}$

7. Using condition of point circle
Radius $= \sqrt{g^2 + f^2 - c} = 0$
$\Rightarrow g^2 + f^2 = c$

8. $(\text{Radius})^2 = g^2 + f^2 - c$
$\Rightarrow 121 = 81 + 36 - k \Rightarrow k = -4$

9. If c = 0; circle passes through origin.

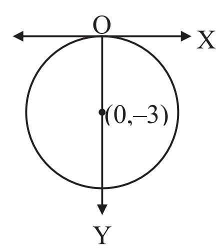
10. Intercept made by the circle on the X-axis
$= 2\sqrt{g^2 - c}$
$= 2\sqrt{9-9} = 0$
$\therefore$ Intercept cut on X-axis is zero.
Hence, circle touches X-axis.

11. Circle $x^2 + y^2 + 2gx + 2fy + c = 0$ touches X axis
$\therefore$ radius = ordinate of centre
$\Rightarrow \sqrt{g^2 + f^2 - c} = (-f)$
$\Rightarrow g^2 = c$

12. Required conditions are g = f = r and
$\sqrt{g^2 + f^2 - c} = r$
$\Rightarrow g = \sqrt{c} = f = r$

13. Both axis, as centre is (– 2, 2) and radius is 2.

14. Centre is (0, – 3) and radius $= \sqrt{0^2 + 9 - 0} = 3$



Hence, circle touches X-axis at the origin.

15. Centre (3, 4) of the given circle is satisfying only $x + y = 7$
$\therefore$ Correct answer is the option (C)

16. Here, the centre of circle (3, – 1) must lie on the line $x + 2by + 7 = 0$.
$\therefore$ $3 - 2b + 7 = 0$
$\Rightarrow b = 5$

17. Centre of the required circle is (– 4, – 5) and it passes through (2, 3)
$\therefore$ Radius $= \sqrt{(-4-2)^2 + (-5-3)^2}$
$= 10$
$\therefore$ Equation of the required circle is
$(x+4)^2 + (y+5)^2 = (10)^2$
$\Rightarrow x^2 + y^2 + 8x + 10y - 59 = 0$

18. The equation of circle in third quadrant touching the coordinate axes with centre (–a, –a) and radius 'a' is
$x^2+y^2+2ax+2ay+a^2 = 0$ ….(i)
Since, line $3x - 4y + 8 = 0$ touches the circle
∴ perpendiular distance from centre of the circle to the line = radius
∴ $\left|\frac{3(-a)-4(-a)+8}{\sqrt{9+16}}\right| = a$
$\Rightarrow a = 2$
Substituting a = 2 in equation (i), we get
$x^2 + y^2 + 4x + 4y + 4 = 0$
This is the required equation of the circle

19. Radius of circle = $\left|\frac{2(1)-1(-3)-4}{\sqrt{4+1}}\right| = \frac{1}{\sqrt{5}}$
∴ Equation is $(x-1)^2 + (y+3)^2 = \left(\frac{1}{\sqrt{5}}\right)^2$
$\Rightarrow x^2 + y^2 - 2x + 6y + 10 = \frac{1}{5}$
$\Rightarrow 5x^2 + 5y^2 - 10x + 30y + 49 = 0$

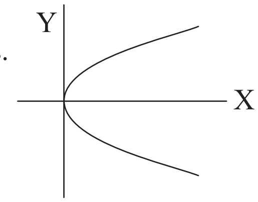
20. $4x^2 + 4y^2 = 9$
$\Rightarrow x^2 + y^2 = \frac{9}{4} \Rightarrow x^2 + y^2 = \left(\frac{3}{2}\right)^2$
∴ $x = \frac{3}{2}\cos\theta, y = \frac{3}{2}\sin\theta$

21. $(x-3)^2 + (y+4)^2 = 5^2$
Comparing with $(x-h)^2 + (y-k)^2 = r^2$, we get
h = 3, k = – 4, r = 5
∴ Parametric equations are
$x = 3 + 5\cos\theta, y = -4 + 5\sin\theta$

22. Given equation can be written as
$(x^2 + 2x + 1 - 1) + (y^2 - 4y + 4 - 4) - 4 = 0$
$\Rightarrow (x+1)^2 + (y-2)^2 = 3^2$
∴ h = – 1, k = 2 and r = 3
∴ Parametric form of equation are
$x = -1 + 3\cos\theta, y = 2 + 3\sin\theta$

23. $\frac{x+1}{2} = \cos\theta$ ….(i)
and $\frac{y-3}{2} = \sin\theta$ ….(ii)
Squaring (i) and (ii) and adding, we get
$\left(\frac{x+1}{2}\right)^2 + \left(\frac{y-3}{2}\right)^2 = 1$
$\Rightarrow (x+1)^2 + (y-3)^2 = 4,$
∴ centre is (– 1, 3)

24. Parabola $y^2 = x$ is symmetric about X-axis.



25. S ≡ (5,0)
Therefore, latus rectum = 4a = 20

26. Since, parabola $y^2 = 4ax$ passes through (– 3, 2)
∴ 4 = – 12a
$\Rightarrow 4a = -\frac{4}{3} = \frac{4}{3}$ ....[Taking positive sign]

27. Let the equation of parabola be $x^2 = -4ay$
Since, parabola passing through the point (– 4, – 2).
∴ $(-4)^2 = -4a(-2)$
$\Rightarrow a = 2$
∴ equation becomes $x^2 = -8y$ and
latus rectum = 4a = 8

29. $y^2 = 4.\frac{1}{5}x \Rightarrow a = \frac{1}{5}$
co-ordinates of latus rectum are (a, 2a) and (a, – 2a)
i.e., $\left(\frac{1}{5}, \frac{2}{5}\right)$ and $\left(\frac{1}{5}, \frac{-2}{5}\right)$

30. $x^2 = -8y$
$\Rightarrow a = 2$
So, focus = (0, – 2)
∴ Ends of latus rectum = (4, – 2),(– 4, – 2).

31. $y^2 = 12x$
∴ a = 3
$\Rightarrow$ abscissa is 4 – 3 = 1 and $y^2 = 12, y = \pm 2\sqrt{3}$
Hence, points are $(1, 2\sqrt{3})$, $(1, -2\sqrt{3})$

32. We have, $y = 3x$
According to given condition,
$(3x)^2 = 36x$
$\Rightarrow x = 4$ and $y = 12$
∴ Required point is (4, 12)

34. $y^2 + 2y + x = 0$
$\Rightarrow y^2 + 2y + 1 = -x + 1$
$(y+1)^2 = -(x-1)$
Hence, vertex is (1, – 1), which lies in IVth quadrant.

35. Vertex = (2, 0)
$\Rightarrow$ focus is (2 + 2, 0) = (4, 0)

36. $y^2 = 4y - 4x$
$\Rightarrow y^2 - 4y + 4 = -4x + 4$
$\Rightarrow (y-2)^2 = -4(x-1)$
Comparing this equation with $Y^2 = -4aX$, we get
a = 1, X = $x - 1$ and Y = $y - 2$
Focus of the parabola is
X = – a, Y = 0
$\Rightarrow x - 1 = -1, y - 2 = 0$
$\Rightarrow x = 0, y = 2$
$\therefore$ focus = (0, 2)

37. Equation of parabola is $x^2 - 4x - 8y + 12 = 0$
$\Rightarrow x^2 - 4x + 4 = 8y - 8$
$\Rightarrow (x-2)^2 = 8(y-1) \Rightarrow X^2 = 8Y$
Comparing with $X^2 = 4aY$, we get a = 2
$\therefore$ Directrix is $Y = -a \Rightarrow y - 1 = -2 \Rightarrow y = -1$.

38. The parabola is $(x-2)^2 = (3y-6)$
Hence, axis is $x - 2 = 0$.

39. The given equation of parabola is $x^2 - 4x - 8y + 12 = 0$
$\Rightarrow x^2 - 4x = 8y - 12$
$\Rightarrow x^2 - 4x + 4 = 8y - 12 + 4$
$\Rightarrow (x-2)^2 = 8(y-1)$
Hence, the length of latus rectum = 4a = 8.

40. $x^2 + 5y = 0 \Rightarrow x^2 = -5y$
On comparing with $x^2 = -4ay$, we get
$a = \frac{5}{4}$
End points of latus rectum of the parabola are
$(\pm 2a, -a) = \left(\pm\frac{5}{2}, \frac{-5}{4}\right)$

41. Here, ae = 4 and $e = \frac{4}{5}$
$\Rightarrow$ a = 5
Now, $b^2 = a^2(1 - e^2)$
$\Rightarrow b^2 = 25\left(1 - \frac{16}{25}\right) = 9$
$\therefore$ Equation of the ellipse is $\frac{x^2}{25} + \frac{y^2}{9} = 1$.

42. Since, $e^2 = 1 - \frac{b^2}{a^2}$
$\Rightarrow \left(\frac{2}{3}\right)^2 = 1 - \frac{b^2}{a^2}$
$\Rightarrow b^2 = \frac{5a^2}{9}$ ….(i)
Given length of latus rectum = 5
$\Rightarrow \frac{2b^2}{a} = 5$
$\Rightarrow b^2 = \frac{5a}{2}$ ….(ii)
From (i) and (ii), we get
$\Rightarrow a^2 = \frac{81}{4}, b^2 = \frac{45}{4}$
$\therefore$ Equation of ellipse is $\frac{4x^2}{81} + \frac{4y^2}{45} = 1$

43. $e^2 = 1 - \frac{b^2}{a^2} = 1 - \frac{28}{64}$
$\Rightarrow e^2 = \frac{36}{64} \Rightarrow e = \frac{3}{4}$

44. $\frac{x^2}{\frac{112}{16}} + \frac{y^2}{\frac{112}{7}} = 1$
$\therefore$ $e = \sqrt{1 - \frac{a^2}{b^2}} = \sqrt{1 - \frac{112}{16} \cdot \frac{7}{112}} = \frac{3}{4}$

45. According to the condition, $\frac{2a}{e} = 3(2ae)$
$\Rightarrow e = \frac{1}{\sqrt{3}}$

46. Foci are (±ae, 0)
$\therefore$ According to the condition, 2ae = 2b
$\Rightarrow$ ae = b ….(i)
Also, $b^2 = a^2(1 - e^2)$
$\Rightarrow e^2 = (1 - e^2)$ ….[From (i)]
$\Rightarrow e = \frac{1}{\sqrt{2}}$

47. We have, ae = 1 and a = 2
$\Rightarrow e = \frac{1}{2}$
Also, $b^2 = a^2(1 - e^2)$
$\Rightarrow b = 2\sqrt{1 - \frac{1}{4}} = \sqrt{3}$
$\therefore$ Minor axis = 2b = $2\sqrt{3}$

49. $3x^2 + 4y^2 = 12$
$\Rightarrow \frac{x^2}{4} + \frac{y^2}{3} = 1$
$\therefore$ Latus rectum = $\frac{2b^2}{a} = 3$

50. Here, $a^2 = 36$, $b^2 = 49$
Since, b > a
∴ the length of the latus rectum
$= \frac{2a^2}{b} = 2 \times \frac{36}{7} = \frac{72}{7}$

51. We have, $e = \frac{1}{\sqrt{2}}$
∴ Latus rectum $= \frac{2b^2}{a} = \frac{2}{a} \times a^2 \left(1 - e^2\right)$
$= 2a \left(1 - \frac{1}{2}\right) = a$
i.e., semi-major axis

52. We have, $2ae = 10 \Rightarrow a = \frac{10}{\frac{2 \times 5}{8}} = 8$
Also, $b^2 = a^2 (1 - e^2)$
$\Rightarrow b = 8\sqrt{1 - \frac{25}{64}} = \sqrt{39}$
Now, Latus rectum $= \frac{2b^2}{a} = \frac{2 \times 39}{8} = \frac{39}{4}$

53. Focal distance of any point P (x,y) on the ellipse is equal to $SP = a + ex$.
Here, $x = a \cos \theta$
∴ $SP = a + ae \cos \theta$
$= a(1 + e \cos \theta)$

54. $4x^2 + 9y^2 - 16x - 54y + 61 = 0$
$\Rightarrow 4x^2 - 16x + 9y^2 - 54y = -61$
$\Rightarrow 4(x^2 - 4x + 4 - 4) + 9(y^2 - 6y + 9 - 9) = -61$
$\Rightarrow 4(x - 2)^2 + 9(y - 3)^2 = 36$
$\Rightarrow \frac{(x-2)^2}{9} + \frac{(y-3)^2}{4} = 1$
Hence, the centre is (2, 3)

55. Distance between foci is 4 = 2ae
$\Rightarrow a^2 = \frac{9}{4}$
Also, $e^2 = 1 + \frac{b^2}{a^2}$
$\Rightarrow \frac{16}{9} - 1 = \frac{b^2}{a^2} \quad \Rightarrow b^2 = \frac{7}{4}$
Centre is (0, 4)
Hence, equation of hyperbola is
$\frac{x^2}{9} - \frac{4\left(y-4\right)^2}{7} = 1$

56. Let S(1, – 1) be the focus and P ≡ (x, y) be any point on conic.
Now, PS = e PM
$\Rightarrow \sqrt{(x-1)^2 + (y+1)^2} = \sqrt{2}\left|\frac{x-y+1}{\sqrt{1+1}}\right|$
$\Rightarrow \sqrt{x^2 - 2x + 1 + y^2 + 2y + 1} = |x - y + 1|$
Squaring both sides, we get
$4x - 4y - 2xy - 1 = 0$
$\Rightarrow 2xy - 4x + 4y + 1 = 0$

57. 2a = 8, 2b = 6
Difference of focal distances of any point of the hyperbola = 2a = 8

58. The equation of hyperbola is $9x^2 - 16y^2 = 144$
$\Rightarrow \frac{x^2}{16} - \frac{y^2}{9} = 1$
$e = \frac{\sqrt{a^2 + b^2}}{a} = \frac{\sqrt{16+9}}{4} = \frac{5}{4}$
Hence, foci are $(\pm ae, 0) \Rightarrow \left(\pm 4 \times \frac{5}{4}, 0\right)$
i.e., $(\pm 5, 0)$.

59. Since, e > 1 always for hyperbola and $\frac{2}{3} < 1$.

60. $\frac{x^2}{25} - \frac{y^2}{25} = 1$
∴ Eccentricity $= \sqrt{2}$ as a = b.

61. $\frac{y^2}{k^2} - \frac{x^2}{-k} = 1$
Also, $a^2 = b^2 (e^2 - 1)$
$\Rightarrow -k = k^2 (e^2 - 1) \Rightarrow -\frac{1}{k} = e^2 - 1$
$\Rightarrow e^2 = 1 - \frac{1}{k} \quad \Rightarrow e = \sqrt{1 - \frac{1}{k}}$

62. Vertices (± 4, 0) ≡ (± a, 0)
$\Rightarrow a = 4$
Foci (± 6, 0) ≡ (± ae, 0)
$\Rightarrow e = \frac{6}{4} = \frac{3}{2}$

63. The given equation of hyperbola is
$16x^2 - 9y^2 = 144 \Rightarrow \frac{x^2}{9} - \frac{y^2}{16} = 1$
∴ L.R. $= \frac{2b^2}{a} = \frac{2 \times 16}{3} = \frac{32}{3}$

64. Length of latus rectum = $\frac{2b^2}{a} = \frac{2 \times 4}{\frac{2}{\sqrt{3}}} = 4\sqrt{3}$

66. Equation of hyperbola is
$x = 8 \sec\theta, y = 8 \tan\theta$
$\Rightarrow \frac{x}{8} = \sec\theta, \frac{y}{8} = \tan\theta$
$\because$ $\sec^2\theta - \tan^2\theta = 1$
$\Rightarrow \frac{x^2}{8^2} - \frac{y^2}{8^2} = 1$
Here, a = 8, b = 8
Here, a = b
$\therefore$ it is rectangular hyperbola
$\Rightarrow$ e = $\sqrt{2}$
$\therefore$ Distance between directrices $= \frac{2a}{e}$
$= \frac{2 \times 8}{\sqrt{2}}$
$= 8\sqrt{2}$

67. The given equation of hyperbola is
$9x^2 - 36x - 16y^2 + 96y - 252 = 0$
Partially differentiating with respect to x, we get
$18x - 36 = 0$
$\Rightarrow x = 2$
Now partially differentiating with respect to y, we get
$-32y + 96 = 0$
$\Rightarrow -32y = -96 \Rightarrow y = 3$
$\therefore$ Centre $\equiv (2, 3)$

68. Given equation of hyperbola is
$5x^2 - 4y^2 + 20x + 8y = 4$
$\Rightarrow 5(x^2 + 4x + 4) - 4(y^2 - 2y + 1) = 4 + 20 - 4$
$\Rightarrow 5(x + 2)^2 - 4(y - 1)^2 = 20$
$\Rightarrow \frac{(x+2)^2}{4} - \frac{(y-1)^2}{5} = 1$
$\Rightarrow a^2 = 4, b^2 = 5$
$e = \frac{\sqrt{a^2 + b^2}}{a} = \frac{\sqrt{4+5}}{2} = \frac{3}{2}$

69. $2x = e^{t} + e^{-t}$ and $2y = e^{t} - e^{-t}$
$\Rightarrow 4x^2 = e^{2t} + 2 + e^{-2t}$ .... (i)
and $4y^2 = e^{2t} - 2 + e^{-2t}$ .... (ii)
Subtracting (ii) from (i), we get
$4x^2 - 4y^2 = 4$
$\Rightarrow x^2 - y^2 = 1$
The equation represents hyperbola.

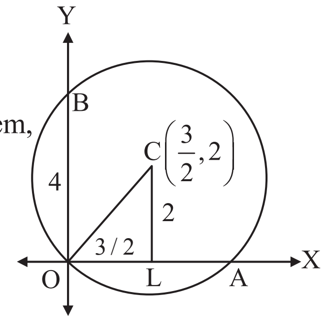
70. The equation is $(x - 0)^2 + (y - 0)^2 = a^2$

Critical Thinking

1. Radius = $\sqrt{\cos^2\theta + \sin^2\theta + 8} = 3$

2. The point of intersection of $3x + y - 14 = 0$ and $2x + 5y - 18 = 0$ is (4, 2).
Centre of the circle is (1, –2).
$\therefore$ radius = $\sqrt{(4-1)^2 + (2+2)^2} = 5$
$\therefore$ the equation of the circle is
$(x - 1)^2 + (y + 2)^2 = 5^2$
$\therefore$ $x^2 + y^2 - 2x + 4y - 20 = 0$.

3. Given, OA = 3 and
OB = 4
$\therefore$ OL = $\frac{3}{2}$ and CL = 2
By pythagoras theorem,
$OC^2 = OL^2 + LC^2$
$\therefore$ $OC^2 = \left(\frac{3}{2}\right)^2 + 2^2$
$= \frac{25}{4}$
$\therefore$ OC $= \frac{5}{2}$



The centre of the circle is $\left(\frac{3}{2}, 2\right)$ and radius = $\frac{5}{2}$.
$\therefore$ the equation of the circle is
$\left(x - \frac{3}{2}\right)^2 + (y - 2)^2 = \left(\frac{5}{2}\right)^2$
$\therefore$ $x^2 + y^2 - 3x - 4y = 0$

4. Here, r = 10 (radius)
Centre will be the point of intersection of the diameters, i.e., (8, – 2).
Hence, required equation is
$(x - 8)^2 + (y + 2)^2 = 10^2$
$\Rightarrow x^2 + y^2 - 16x + 4y - 32 = 0$

5. Let its centre be (h, k), then
h – k = 1 ....(i)
Also, radius a = 3
$\therefore$ Equation of the circle is
$(x - h)^2 + (y - k)^2 = 9$
Also, it passes through (7, 3)
i.e., $(7 - h)^2 + (3 - k)^2 = 9$ ....(ii)
From (i) and (ii), we get
h = 4, k = 3
$\therefore$ Equation is $x^2 + y^2 - 8x - 6y + 16 = 0$

6. Centre is (– 4, 3)
Radius = Distance between centres – Radius of other circle = 5 – 1 = 4
Hence, equation of circle is $x^2+y^2+8x–6y+9= 0$

7. Centre of the given circle is (0, – 1)
∴ the required circle passes through (0, – 1).
∴ $r = \sqrt{(0-1)^2+(-1+2)^2} = \sqrt{2}$
Hence, the required equation is
$(x-1)^2 + (y+2)^2 = (\sqrt{2})^2$
$\Rightarrow x^2 + y^2 - 2x + 4y + 3 = 0$.

8. Centre of the circle
$x^2 + y^2 - 4x - 6y - 3 = 0$ is C(2,3).
Since, it touches the Y-axis
∴ r = 2
Hence, required equation of the circle is
$(x-2)^2 + (y-3)^2 = 2^2$
$\Rightarrow x^2 + y^2 - 4x - 6y + 9 = 0$

9. Let centre of circle be (h, k).
Since it touches both axes, therefore h = k = a
Hence, equation can be $(x-a)^2 + (y-a)^2 = a^2$
But it also touches the line $3x + 4y = 4$
∴ $\left|\frac{3a+4a-4}{\sqrt{9+16}}\right| = a$
$\Rightarrow a = 2$
Hence, the required equation of circle is
$(x-2)^2 + (y-2)^2 = 2^2$
$\Rightarrow x^2 + y^2 - 4x - 4y + 4 = 0$

10. Let the centre of the required circle be (x_1, y_1).
Centre of given circle is (1, 2) and
$r = \sqrt{1+4+20} = 5$
∴ radii of both circles are same.
∴ Point of contact (5, 5) is the mid point of the line joining the centres of both circles.
∴ $\frac{x_1+1}{2} = 5$ and $\frac{y_1+2}{2} = 5$
$\Rightarrow x_1 = 9, y_1 = 8$
Hence, the required equation is
$(x-9)^2 + (y-8)^2 = 25$
$\Rightarrow x^2 + y^2 - 18x - 16y + 120 = 0$

11. Equation of circle concentric to given circle is
$x^2 + y^2 - 6x + 12y + k = 0$
Since, area of required circle = 2 (area of given circle)
$\Rightarrow \sqrt{9+36-k} = \sqrt{2}\ \sqrt{9+36-15}$
$\Rightarrow 45 - k = 60$
$\Rightarrow k = -15$
Hence, the required equation of circle is
$x^2 + y^2 - 6x + 12y - 15 = 0$.

12. We have the equation of circle
$x^2 + y^2 + 2gx + 2fy + c = 0$
But it passes through (0, 0) and (2, 1)
∴ c = 0
$5 + 4g + 2f = 0$ ….(i)
Also $\sqrt{g^2+f^2-c} = |g|$
$\Rightarrow f = 0$ ….[∵ c = 0]
∴ $g = -\frac{5}{4}$ ….[From (i)]
Hence, the equation will be $2x^2 + 2y^2 - 5x = 0$.

13. since, X–intercept = 2a
∴ $2\sqrt{g^2-c} = 2a$ ….(i)
Also, Y-intercept = 2b
∴ $2\sqrt{f^2-c} = 2b$ ….(ii)
On squaring (i) and (ii) and then subtracting (ii) from (i), we get
$g^2 - f^2 = a^2 - b^2$
Hence, the locus is
$x^2 - y^2 = a^2 - b^2$

14. Let the equation of circle be
$x^2 + y^2 + 2gx + 2fy + c = 0$.
Now on passing through the given points, we get three equations
c = 0 ….(i)
$a^2 + 2ga + c = 0$ ….(ii)
$b^2 + 2fb + c = 0$ ….(iii)
solving equations (i), (ii) and (iii), we get
$g = -\frac{a}{2}, f = -\frac{b}{2}$
Hence, the centre is $\left(\frac{a}{2}, \frac{b}{2}\right)$.

15. The equation of circle through points (0, 0), (1, 3) and (2, 4) is
$x^2 + y^2 - 10x = 0$
Point (k, 3) will be on the circle, if
$k^2 + 9 - 10k = 0$
$\Rightarrow k^2 - 10k + 9 = 0$
$\Rightarrow k^2 - 9k - k + 9 = 0$
$\Rightarrow (k-1)(k-9) = 0$
$\Rightarrow k = 1$ or $k = 9$

16. Given, $x = 2 + 3\cos\theta$
i.e, $x - 2 = 3\cos\theta$ ....(i)
and $y = 3 - 3\sin\theta$
i.e., $y - 3 = -3\sin\theta$ ....(ii)
Squaring and adding equation (i) and (ii), we get

$(x-2)^2 + (y-3)^2 = 9\cos^2\theta + 9\sin^2\theta$

$\therefore \quad (x-2)^2 + (y-3)^2 = 3^2$

$\therefore$ centre $\equiv (2, 3)$, radius = 3 units

17. $x = 2a\left(\dfrac{1-t^2}{1+t^2}\right)$ ….(i)

$y = \dfrac{4at}{1+t^2}$ ….(ii)

Squaring and adding (i) and (ii), we get

$x^2 + y^2 = 4a^2 . \dfrac{(1-t^2)^2}{(1+t^2)^2} + \dfrac{16a^2t^2}{(1+t^2)^2}$

$= \dfrac{4a^2}{(1+t^2)^2}[1 - 2t^2 + t^4 + 4t^2]$

$= \dfrac{4a^2}{(1+t^2)^2}(1+t^2)^2$

$\therefore \quad x^2 + y^2 = (2a)^2$

$\therefore$ Radius = 2a

18. The point of intersection is

$x = a\cos\theta + b\sin\theta$

$y = a\sin\theta - b\cos\theta$

$\therefore \quad x^2 + y^2 = a^2 + b^2$

Hence, it is equation of a circle.

19. Since, the axis of parabola is Y axis

$\therefore$ Equation of parabola $x^2 = 4ay$

Since, it passes through (6, – 3)

$\therefore \quad 36 = -12a$

$\Rightarrow a = -3$

$\therefore$ Equation of parabola is $x^2 = -12y$

20. Since, the axis of parabola is vertical and it's vertex is (–1, –2).

$\therefore$ equation of parabola is

$(x+1)^2 = 4a(y+2)$

Also, it passes through (3, 6)

$\therefore \quad 16 = 4a \times 8$

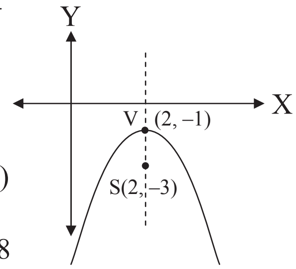
$\Rightarrow a = \dfrac{1}{2} \Rightarrow (x+1)^2 = 2(y+2)$

$\Rightarrow x^2 + 2x - 2y - 3 = 0$

21. a = VS

$= \sqrt{(2-2)^2 + (-3+1)^2}$

$= 2$



Since,

$(x-h)^2 = -4a(y-k)$

$\therefore \quad (x-2)^2 = -4 \times 2(y+1)$

$\Rightarrow (x-2)^2 = -8(y+1)$

$\Rightarrow x^2 + 4 - 4x = -8y - 8$

$\Rightarrow x^2 - 4x + 8y + 12 = 0$

22. Let any point on required parabola be P(x, y), then from definition of parabola, we get

PS = PM

$\Rightarrow \sqrt{(x+8)^2 + (y+2)^2} = \left|\dfrac{2x-y-9}{\sqrt{5}}\right|$

$\Rightarrow 5(x^2 + 16x + 64 + y^2 + 4y + 4)$

$= 4x^2 + y^2 + 81 - 4xy + 18y - 36x$

$\Rightarrow x^2 + 4y^2 + 4xy + 116x + 2y + 259 = 0$

23. Let (x, y) be any point on the required parabola

$\therefore$ by using definition of parabola, we get

$(x-a)^2 + (y-b)^2 = \left(\dfrac{bx + ay - ab}{\sqrt{a^2+b^2}}\right)^2$

$\Rightarrow (a^2 + b^2)(x^2 - 2ax + a^2 + y^2 - 2yb + b^2)$

$= b^2x^2 + a^2y^2 + a^2b^2 + 2abxy - 2a^2yb - 2ab^2x$

$\Rightarrow a^2x^2 - 2a^3x + a^4 + a^2b^2 + b^2y^2 - 2yb^3 + b^4$

$= 2abxy$

$\Rightarrow a^2x^2 - 2abxy + b^2y^2 - 2a^3x - 2b^3y$

$+ a^4 + a^2b^2 + b^4 = 0$

$\Rightarrow (ax - by)^2 - 2a^3x - 2b^3y + a^4 + a^2b^2 + b^4 = 0$

24. By using definition of parabola, we get

SP = PM

$\Rightarrow SP^2 = PM^2$

$\Rightarrow x^2 + y^2 = \left(\dfrac{x+y-4}{\sqrt{2}}\right)^2$

$\Rightarrow 2x^2 + 2y^2 = x^2 + y^2 + 16 + 2xy - 8y - 8x$

$\Rightarrow x^2 + y^2 - 2xy + 8x + 8y - 16 = 0$

25. $(13x-1)^2 + (13y-1)^2 = k(5x - 12y + 1)^2$

$\Rightarrow 169\left[\left(x - \dfrac{1}{13}\right)^2 + \left(y - \dfrac{1}{13}\right)^2\right] = k(5x - 12y + 1)^2$

Taking square root, we get

$\sqrt{\left(x - \dfrac{1}{13}\right)^2 + \left(y - \dfrac{1}{13}\right)^2} = \dfrac{\sqrt{k}(5x - 12y + 1)}{13}$

Now, condition for eccentricity is PS = ePM

$\Rightarrow PS = \sqrt{k}PM$

$\Rightarrow \sqrt{k} = 1 \Rightarrow k = 1$

26. $9x^2 - 6x + 36y + 9 = 0$

$\Rightarrow x^2 - \dfrac{2}{3}x + 4y + 1 = 0$

$\Rightarrow x^2 - \dfrac{2}{3}x + \dfrac{1}{9} + 4y + 1 - \dfrac{1}{9} = 0$

$\Rightarrow \left(x - \dfrac{1}{3}\right)^2 = -4\left(y + \dfrac{2}{9}\right).$

Hence, the vertex is $\left(\dfrac{1}{3}, -\dfrac{2}{9}\right)$

27. $y^2 + 8x - 12y + 20 = 0$
$\Rightarrow y^2 - 12y = -8x - 20$
$\Rightarrow y^2 - 12y + 36 = -8x - 20 + 36$
$\Rightarrow (y-6)^2 = -8x + 16$
$\Rightarrow (y-6)^2 = -8(x-2)$
$\Rightarrow$ Vertex is (2, 6)

28. The given equation can be written as $(x-4)^2 = 1[y - (c - 16)]$
Therefore, the vertex of the parabola is (4, c – 16).
The point lies on X-axis.
$\Rightarrow c - 16 = 0$
$\Rightarrow c = 16$

29. Given, equation can be written as
$$y^2 = \frac{4k}{4}\left(x - \frac{8}{k}\right)$$
The standard equation of parabola is
$y^2 = 4ax$
$$\Rightarrow a = \frac{k}{4}$$
$\therefore$ Equation of directrix is $X + \frac{k}{4} = 0$
$$\Rightarrow x - \frac{8}{k} + \frac{k}{4} = 0$$
But the given equation of directrix is $x - 1 = 0$.
Since, both equation are same
$$\therefore \quad \frac{8}{k} - \frac{k}{4} = 1$$
$\Rightarrow 32 - k^2 = 4k \Rightarrow k = -8, 4$

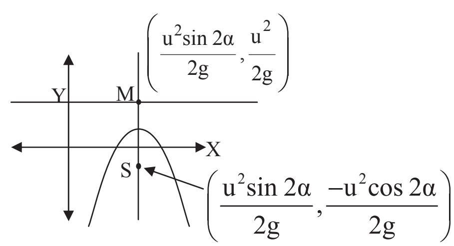
30. Since, $9y^2 - 16x - 12y - 57 = 0$
$$\Rightarrow y^2 - \frac{16}{9}x - \frac{4}{3}y - \frac{57}{9} = 0$$
$$\Rightarrow y^2 - \frac{4}{3}y + \frac{4}{9} = \frac{16}{9}x + \frac{57}{9} + \frac{4}{9}$$
$$\Rightarrow \left(y - \frac{2}{3}\right)^2 = \frac{16}{9}\left(x + \frac{61}{16}\right)$$
this equation can be written as
$$Y^2 = 4\left(\frac{4}{9}\right)X$$
Axis of the parabola is Y = 0
$$\Rightarrow y - \frac{2}{3} = 0$$
$\Rightarrow 3y = 2$

31. Distance between focus and directrix is
$$= \left|\frac{3-4-2}{\sqrt{2}}\right| = \frac{3}{\sqrt{2}}$$
Hence, latus rectum is $3\sqrt{2}$
….[Since, latus rectum is two times the distance between focus and directrix].

32. Since, a = distance between tangent at vertex and latus rectum
$$\therefore \quad a = \left|\frac{-8-(-12)}{\sqrt{1+1}}\right| = \frac{4}{\sqrt{2}}$$
$\therefore$ Length of latus rectum $= 4a = 4 \times \frac{4}{\sqrt{2}} = 8\sqrt{2}$

33. $y^2 + 2Ax + 2By + C = 0$
$\Rightarrow y^2 + 2By + B^2 = -2Ax - C + B^2$
$$\Rightarrow (y+B)^2 = -2A\left(x + \frac{C}{2A} - \frac{B^2}{2A}\right)$$
$$\therefore \quad \text{focus} \equiv \left(\frac{-C+B^2}{2A} - \frac{A}{2}, -B\right)$$
Equation of latus rectum is $x = -a$
$$= \frac{-C+B^2}{2A} - \frac{A}{2} = \frac{B^2 - A^2 - C}{2A}$$

34.



According to the figure, the length of latus rectum is
$$2(SM) = 2 \times \frac{u^2}{2g}(1 + \cos 2\alpha) = \frac{2u^2\cos^2\alpha}{g}$$

35. Given t = –2
$2y^2 = 7x$
$$\Rightarrow y^2 = \frac{7}{2}x$$
Comparing with $y^2 = 4ax$, we get
$$4a = \frac{7}{2} \Rightarrow a = \frac{7}{8}$$
$\therefore$ the point is
$$P = (at^2, 2at) = \left(\frac{7}{8} \times 4, 2 \times \frac{7}{8} \times (-2)\right)$$
$$\therefore \quad P = \left(\frac{7}{2}, \frac{-7}{2}\right)$$

36. Here, $\frac{y}{2} = t$ and $x - 2 = t^2$

$\Rightarrow (x - 2) = \left(\frac{y}{2}\right)^2 \Rightarrow y^2 = 4(x - 2)$

37. $x = 2 + t^2$ and $y = 2t + 1$

$\Rightarrow t^2 = (x - 2)$ and $t^2 = \left(\frac{y-1}{2}\right)^2 = \frac{(y-1)^2}{4}$

$\Rightarrow \frac{(y-1)^2}{4} = (x - 2) \Rightarrow (y - 1)^2 = 4(x - 2)$

$\therefore$ Vertex is (2, 1)

38. $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

Since, it passes through (– 3, 1) and (2, – 2)

$\therefore$ $\frac{9}{a^2} + \frac{1}{b^2} = 1$ and $\frac{1}{a^2} + \frac{1}{b^2} = \frac{1}{4}$

$\Rightarrow a^2 = \frac{32}{3}, b^2 = \frac{32}{5}$

Hence, required equation of ellipse is $3x^2 + 5y^2 = 32$

39. Let point P (x_1, y_1)

$\therefore$ $\sqrt{(x_1+2)^2 + y_1^2} = \frac{2}{3}\left(x_1 + \frac{9}{2}\right)$

$\Rightarrow (x_1 + 2)^2 + y_1^2 = \frac{4}{9}\left(x_1 + \frac{9}{2}\right)^2$

$\Rightarrow 9(x_1^2 + y_1^2 + 4x_1 + 4) = 4\left(x_1^2 + \frac{81}{4} + 9x_1\right)$

$\Rightarrow 5x_1^2 + 9y_1^2 = 45 \Rightarrow \frac{x_1^2}{9} + \frac{y_1^2}{5} = 1$

$\therefore$ Locus of (x_1, y_1) is $\frac{x^2}{9} + \frac{y^2}{5} = 1$, which is equation of an ellipse.

40. Foci = (3, – 3)

$\Rightarrow ae = 3 - 2 = 1$

Vertex = (4, – 3)

$\Rightarrow a = 4 - 2 = 2$

$\Rightarrow e = \frac{1}{2}$

$\Rightarrow b = 2\sqrt{\left(1 - \frac{1}{4}\right)} = \frac{2}{2}\sqrt{3} = \sqrt{3}$

Therefore, equation of ellipse with centre (2, – 3) is

$\frac{(x-2)^2}{4} + \frac{(y+3)^2}{3} = 1$

41. Vertices $(\pm 5, 0) \equiv (\pm a, 0)$

$\Rightarrow a = 5$

Foci $(\pm 4, 0) \equiv (\pm ae, 0)$

$\Rightarrow e = \frac{4}{5}$

$\therefore$ $b = \sqrt{a^2(1-e^2)} = \sqrt{25 \times \frac{9}{25}} = 3$

Hence, equation is $\frac{x^2}{25} + \frac{y^2}{9} = 1$

i.e., $9x^2 + 25y^2 = 225$

42. Foci $(\pm 5, 0) \equiv (\pm ae, 0)$,

$\Rightarrow ae = 5$ ….(i)

Equation of directrix is $x = \frac{a}{e}$

Given, $x = \frac{36}{5}$

$\Rightarrow \frac{a}{e} = \frac{36}{5}$ ….(ii)

$\Rightarrow a = 6$ and $e = \frac{5}{6}$ ….[From (i) and (ii)]

$\therefore$ $b = a\sqrt{1-e^2} = 6\sqrt{1 - \frac{25}{36}} = \sqrt{11}$

Hence, equation is $\frac{x^2}{36} + \frac{y^2}{11} = 1$

43. Vertex (0,7) and directrix $y = 12$

$\therefore$ $b = 7$ and $\frac{b}{e} = 12$

$\Rightarrow e = \frac{7}{12}$

Also, $a = b\sqrt{1-e^2}$

$\Rightarrow a = 7\sqrt{\frac{95}{144}}$

$\Rightarrow a^2 = \frac{4655}{144}$

Hence, equation of ellipse is

$\frac{x^2}{4655/144} + \frac{y^2}{49} = 1$ i.e, $144x^2 + 95y^2 = 4655$

44. Let the equation of ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$\because$ It passes through (– 3, 1)

$\therefore$ $\frac{9}{a^2} + \frac{1}{b^2} = 1$

$\Rightarrow 9 + \frac{a^2}{b^2} = a^2$ .....(i)

Given, eccentricity is $\sqrt{\frac{2}{5}}$

$\therefore \quad \frac{2}{5} = 1 - \frac{b^2}{a^2}$

$\Rightarrow \frac{b^2}{a^2} = \frac{3}{5}$ .....(ii)

From equation (i) and (ii), we get

$a^2 = \frac{32}{3}, b^2 = \frac{32}{5}$

Hence, required equation of ellipse is $3x^2 + 5y^2 = 32$

45. Given, $\frac{2b^2}{a} = 10 \Rightarrow b^2 = 5a$ and $2b = 2ae$

$\Rightarrow \frac{b}{a} = e$

Also, $b^2 = a^2(1 - e^2)$

$\Rightarrow e^2 = (1 - e^2)$ ....$\left[\because \ e = \frac{b}{a}\right]$

$\Rightarrow e = \frac{1}{\sqrt{2}}$

$\Rightarrow b = \frac{a}{\sqrt{2}}$ or $b = 5\sqrt{2}$, $a = 10$

Hence, equation of ellipse is

$\frac{x^2}{(10)^2} + \frac{y^2}{(5\sqrt{2})^2} = 1$

i.e., $x^2 + 2y^2 = 100$

46. We have, $2ae = 8$, $\frac{2a}{e} = 18$

$\Rightarrow ae \times \frac{a}{e} = 4 \times 9$

$\Rightarrow a = \sqrt{4 \times 9} = 6$ and $e = \frac{2}{3}$

Also, $b = a\sqrt{1 - e^2}$

$\Rightarrow b = 6\sqrt{1 - \frac{4}{9}} = \frac{6}{3}\sqrt{5} = 2\sqrt{5}$

Hence, the required equation is $\frac{x^2}{36} + \frac{y^2}{20} = 1$

i.e., $5x^2 + 9y^2 = 180$

47. $\frac{x^2}{2 - r} + \frac{y^2}{r - 5} + 1 = 0$

$\Rightarrow \frac{x^2}{r - 2} + \frac{y^2}{5 - r} = 1$

Hence, $r > 2$ and $r < 5$

$\Rightarrow 2 < r < 5$

48. $16x^2 + 25y^2 = 400$

$\Rightarrow \frac{x^2}{25} + \frac{y^2}{16} = 1$

$\Rightarrow e = \sqrt{1 - \frac{16}{25}} = \frac{3}{5}$

Therefore, directrices are $x = \pm \frac{5}{\frac{3}{5}}$ or $3x = \pm 25$

49. Given that, $\frac{a}{e} - ae = 8$ and $e = \frac{1}{2}$

$\Rightarrow a = \frac{8e}{(1 - e^2)}$

$= \frac{8.4}{2(3)} = \frac{16}{3}$

$\therefore \quad b = \frac{16}{3}\sqrt{\left(1 - \frac{1}{4}\right)}$

$= \frac{16}{3}\frac{\sqrt{3}}{2} = \frac{8\sqrt{3}}{3}$

Hence, the length of minor axis is $\frac{16\sqrt{3}}{3}$

50. $3x^2 + 4y^2 = 48$

$\Rightarrow \frac{x^2}{16} + \frac{y^2}{12} = 1$

$\therefore \quad a^2 = 16, b^2 = 12$

$\Rightarrow e = \sqrt{1 - \frac{b^2}{a^2}} = \sqrt{1 - \frac{12}{16}} = \frac{1}{2}$

$\therefore$ Distance between the foci = 2ae

$= 2 \times 4 \times \frac{1}{2}$

$= 4$

51. We have, $\frac{2b^2}{a} = 2ae$

$\Rightarrow b^2 = a^2e$

$\Rightarrow e = \frac{b^2}{a^2}$ ....(i)

Also, $e = \sqrt{1 - \frac{b^2}{a^2}}$

$\Rightarrow e^2 = 1 - e$ ....[From (i)]

$\Rightarrow e^2 + e - 1 = 0$

$\therefore \quad e = \frac{-1 \pm \sqrt{5}}{2}$

$\therefore \quad e = \frac{\sqrt{5} - 1}{2}$

52. $a = 6, b = 2\sqrt{5}$

Now, $b^2 = a^2(1 - e^2)$

$\Rightarrow \frac{20}{36} = (1 - e^2)$

$\Rightarrow e = \sqrt{\frac{16}{36}} = \frac{2}{3}$

Distance between directrix $= \frac{2a}{e} = \frac{2 \times 6}{\frac{2}{3}} = 18$

53. Comparing $\frac{x^2}{16} + \frac{y^2}{9} = 1$ with $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, we get

$a^2 = 16, b^2 = 9$

$\Rightarrow a = 4, b = 3$

Now, $b^2 = a^2(1 - e^2)$

$\Rightarrow \frac{9}{16} = 1 - e^2$

$\Rightarrow e^2 = 1 - \frac{9}{16} = \frac{7}{16}$

$\therefore$ $e = \frac{\sqrt{7}}{4}$

$\therefore$ $S = (ae, 0) \equiv (\sqrt{7}, 0)$

$\therefore$ radius of the circle $= \sqrt{\left(0-\sqrt{7}\right)^2 + \left(3-0\right)^2}$

$= \sqrt{16} = 4$

54. $x = 3(\cos t + \sin t)$, $y = 4(\cos t - \sin t)$

$\Rightarrow \frac{x}{3} = \cos t + \sin t$, $\frac{y}{4} = \cos t - \sin t$

$\Rightarrow \frac{x^2}{9} = 1 + \sin 2t$, $\frac{y^2}{16} = 1 - \sin 2t$

$\Rightarrow \frac{x^2}{9} + \frac{y^2}{16} = 2$

$\Rightarrow \frac{x^2}{18} + \frac{y^2}{32} = 1$ which is an ellipse.

55. $9x^2 + 4y^2 - 6x + 4y + 1 = 0$

$\Rightarrow 9\left(x^2 - \frac{2}{3}x + \frac{1}{9}\right) + 4\left(y^2 + y + \frac{1}{4}\right) = -1 + 1 + 1$

$\Rightarrow 9\left(x - \frac{1}{3}\right)^2 + 4\left(y + \frac{1}{2}\right)^2 = 1$

$\Rightarrow \frac{\left(x-\frac{1}{3}\right)^2}{\frac{1}{9}} + \frac{\left(y+\frac{1}{2}\right)^2}{\frac{1}{4}} = 1$

Here, $a = \frac{1}{3}$, $b = \frac{1}{2}$

$\Rightarrow 2a = \frac{2}{3}$, $2b = 1$

$\therefore$ Length of axes are $1, \frac{2}{3}$.

56. $3x^2 - 12x + 4y^2 - 8y = -4$

$\Rightarrow 3(x^2 - 4x + 4) + 4(y^2 - 2y + 1) = -4 + 12 + 4$

$\Rightarrow 3(x - 2)^2 + 4(y - 1)^2 = 12$

$\Rightarrow \frac{(x-2)^2}{4} + \frac{(y-1)^2}{3} = 1$

$\Rightarrow \frac{X^2}{4} + \frac{Y^2}{3} = 1$

$\therefore$ $e = \sqrt{1 - \frac{3}{4}} = \frac{1}{2}$

Foci are $x = \pm ae$, $y = 0$

$\Rightarrow x - 2 = \pm 1$, $y - 1 = 0$

$\Rightarrow x = 3$ or 1, $y = 1$

i.e., (3, 1) and (1, 1)

57. $4(x^2 + 2x + 1) + 9(y^2 + 4y + 4) = 36$

$\Rightarrow 4(x + 1)^2 + 9(y + 2)^2 = 36$

$\Rightarrow \frac{(x+1)^2}{9} + \frac{(y+2)^2}{4} = 1$

Comparing with standard form, we get $a^2 = 9, b^2 = 4$

Now, condition for eccentricity is $b^2 = a^2(1 - e^2)$

$\Rightarrow 4 = 9(1 - e^2)$

$\Rightarrow e^2 = 1 - \frac{4}{9} = \frac{5}{9}$

$\Rightarrow e = \frac{\sqrt{5}}{3}$

58. Given, $2a = 6$, $2b = 4$

i.e., $a = 3$, $b = 2$

Also, $e^2 = 1 - \frac{b^2}{a^2} = \frac{5}{9}$

$\Rightarrow e = \frac{\sqrt{5}}{3}$

$\therefore$ Distance between the pins $= 2ae = 2\sqrt{5}$ cm and length of string $= 2a + 2ae = 6 + 2\sqrt{5}$ cm

59. $2a = 7$ or $a = \frac{7}{2}$

Also (5, –2) satisfies $\frac{4}{49}(25) - \frac{51}{196}(4) = 1$

and $a^2 = \frac{49}{4}$

$\Rightarrow a = \frac{7}{2}$

∴ option (C) is correct answer

60. Centre (0, 0), vertex (4, 0) ⇒ a = 4 and focus (6, 0)

$\Rightarrow ae = 6$

$\Rightarrow e = \frac{3}{2}$

Also, $b^2 = a^2(e^2 - 1)$

$= 20$

Hence, required equation is $\frac{x^2}{16} - \frac{y^2}{20} = 1$

i.e., $5x^2 - 4y^2 = 80$

61. Given that, $e = \frac{3}{2}$

foci = (± 2, 0) = (± ae, 0)

$\Rightarrow ae = 2$

$\Rightarrow a = \frac{4}{3}$

$\Rightarrow a^2 = \frac{16}{9}$

Now, condition for eccentricity is

$b^2 = a^2(e^2 - 1)$

∴ $b^2 = \frac{16}{9}\left(\frac{9}{4} - 1\right) = \frac{16}{9}\left(\frac{5}{4}\right) = \frac{20}{9}$

Now, equation of hyperbola is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$\Rightarrow \frac{9x^2}{16} - \frac{9y^2}{20} = 1 \Rightarrow \frac{x^2}{4} - \frac{y^2}{5} = \frac{4}{9}$

62. Given, $\frac{2b^2}{a} = 8$ and $\frac{3}{\sqrt{5}} = \sqrt{1 + \frac{b^2}{a^2}}$

$\Rightarrow \frac{4}{5} = \frac{b^2}{a^2}$

$\Rightarrow a = 5, b = 2\sqrt{5}$

Hence, the required equation of hyperbola is

$\frac{x^2}{25} - \frac{y^2}{20} = 1$

i.e., $4x^2 - 5y^2 = 100$

63. Conjugate axis is 5 and distance between foci = 13

$\Rightarrow 2b = 5$ and $2ae = 13$

Also, $b^2 = a^2(e^2 - 1)$

$\Rightarrow \frac{25}{4} = \frac{(13)^2}{4e^2}(e^2 - 1)$

$\Rightarrow \frac{25}{4} = \frac{169}{4} - \frac{169}{4e^2}$

$\Rightarrow e = \frac{13}{12}$

$\Rightarrow a = 6, b = \frac{5}{2}$

Hence, the required equation of hyperbola is

$\frac{x^2}{36} - \frac{y^2}{\frac{25}{4}} = 1$

i.e., $25x^2 - 144y^2 = 900$

64. Equation of hyperbola passes through (x_1, y_1)

$\Rightarrow \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} = 1 \Rightarrow \frac{x_1^2}{a^2} - 1 = \frac{y_1^2}{b^2}$

$\Rightarrow \frac{x_1^2 - a^2}{a^2} = \frac{y_1^2}{b^2} \Rightarrow \frac{b^2}{a^2} = \frac{y_1^2}{x_1^2 - a^2}$

Now, $\frac{b^2}{a^2} = e^2 - 1$

$\Rightarrow \frac{y_1^2}{x_1^2 - a^2} = e^2 - 1$

$\Rightarrow e^2 = \frac{y_1^2 + (x_1^2 - a^2)}{x_1^2 - a^2}$

$\Rightarrow e = \sqrt{\frac{x_1^2 - a^2 + y_1^2}{x_1^2 - a^2}} = \sqrt{\frac{a^2 - x_1^2 - y_1^2}{a^2 - x_1^2}}$

65. Center of the hyperbola is midpoint of foci.

Hence, its center is (1, 5) also distance between foci is 2ae = 10

$\Rightarrow a = 4$ ....$\left[\because \; e = \frac{5}{4}\right]$

$\Rightarrow a^2 = 16$

Now, $b^2 = a^2(e^2 - 1)$

$= a^2e^2 - a^2 = 25 - 16 \Rightarrow b^2 = 9$

Hence, equation of hyperbola is

$\frac{(x-1)^2}{16} - \frac{(y-5)^2}{9} = 1$

66. Let S(1, 1) be the focus and P(x, y) be a point on the hyperbola
Now, PS = ePM
$$\Rightarrow \sqrt{(x-1)^2+(y-1)^2} = \sqrt{3}\left|\frac{2x+y-1}{\sqrt{2^2+1^2}}\right|$$
Squaring both sides, we get
$$(x-1)^2 + (y-1)^2 = \frac{3}{5}(2x+y-1)^2$$
On simplification, the required equation is
$7x^2 + 12xy - 2y^2 - 2x + 4y - 7 = 0$

67. For ellipse, e < 1 and also e′ < 1
∴ $e^2 + e'^2 < 2$
For parabola, e = 1 and e′ = 1
∴ $e^2 + e'^2 = 2$
For hyperbola, e > 1 and e′ > 1
∴ $e^2 + e'^2 > 2$
Hence, it can be 3 in case of hyperbola.

68. $96x^2 - 16y^2 - 36x + 96y - 252 = 0$
$$\Rightarrow \frac{(x-2)^2}{16} - \frac{(y-3)^2}{9} = 1$$
$$\Rightarrow \frac{X^2}{16} - \frac{Y^2}{9} = 1$$
∴ Vertices are (X = ± a, Y = 0)
i.e., ($x - 2 = \pm 4$, $y - 3 = 0$)
∴ The vertices of the hyperbola are (6, 3) and (– 2, 3)

69. $(x + 1)^2 - y^2 - 1 + 5 = 0$
$$\Rightarrow -\frac{(x+1)^2}{4} + \frac{y^2}{4} = 1$$
Equation of directrices of $\frac{y^2}{b^2} - \frac{x^2}{a^2} = 1$ are
$$y = \pm\frac{b}{e}$$
Here, b = 2, e = $\sqrt{1+1} = \sqrt{2}$
Hence, $y = \pm\frac{2}{\sqrt{2}}$
$\Rightarrow y = \pm\sqrt{2}$

70. Given, equation of hyperbola is
$9x^2 - 16y^2 + 72x - 32y - 16 = 0$
$\Rightarrow 9(x^2 + 8x) - 16(y^2 + 2y) - 16 = 0$
$\Rightarrow 9(x + 4)^2 - 16(y + 1)^2 = 144$
$$\Rightarrow \frac{(x+4)^2}{16} - \frac{(y+1)^2}{9} = 1$$
∴ Latus rectum = $\frac{2b^2}{a} = 2 \times \frac{9}{4} = \frac{9}{2}$

71. Squaring and subtracting, we get
$a^2x^2 - b^2y^2 = a^2 - b^2$, which is the equation of hyperbola.

72. $2x = t + \frac{1}{t}$ and $2y = t - \frac{1}{t}$
$\Rightarrow 4x^2 = t^2 + 2 + \frac{1}{t^2}$ ….(i)
and $4y^2 = t^2 - 2 + \frac{1}{t^2}$ ….(ii)
Subtracting (ii) from (i), we get
$4x^2 - 4y^2 = 4 \Rightarrow x^2 - y^2 = 1$
The equation is of hyperbola.

73. Multiplying both, we get
$(bx)^2 - (ay)^2 = (ab)^2$
$$\Rightarrow \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$
which is the standard equation of hyperbola.

74. $e^2 = 1 - \frac{b^2}{a^2} = \frac{4}{9}$
$\Rightarrow e = \frac{2}{3}$
and $e'^2 = 1 + \frac{b^2}{a^2} = 1 + \frac{\frac{45}{4}}{9} = \frac{9}{4}$
$\Rightarrow e' = \frac{3}{2}$
∴ ee′ = 1

75. Centres of the circles are (0, 0), (– 3, 1) and (6, – 2) respectively. Line passing through any two points say (0, 0) and (– 3, 1) is $y = -\frac{1}{3}x$
point (6, –2) lies on it.
Hence, points are collinear.

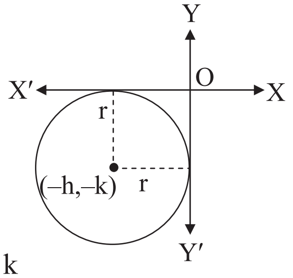
$\therefore$ equation of the circle is

$(x-5)^2 + (y-5)^2 = (5)^2$

$\Rightarrow x^2 + y^2 - 10x - 10y + 25 = 0$

5. Since, circle touches the co-ordinate axes in III quadrant.



$\therefore$ Radius = – h = – k

Hence, h = k = – 5

$\therefore$ $(3-3)^2 + (k-0)^2 = (3-1)^2 + (k-4)^2$

$\therefore$ $k^2 = 4 + k^2 - 8k + 16$

$\therefore$ $k = \frac{5}{2}$

$\therefore$ the required equation of circle is

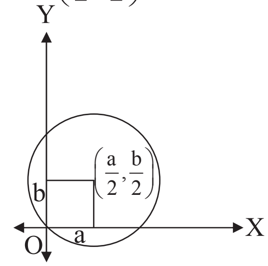
$\therefore$ Radius of circle = $\left|\frac{(1)-(2)}{\sqrt{(1)^2 + (-1)^2}}\right|$

$= \frac{1}{\sqrt{2}}$

$\therefore$ Area of circle = $\pi \times \left(\frac{1}{\sqrt{2}}\right)^2 = \frac{\pi}{2}$

8. Centre is $\left(\frac{a}{2}, \frac{b}{2}\right)$ and radius = $\sqrt{\frac{a^2+b^2}{4}}$



Hence, equation of circle is

$= \sqrt{6^2 + 8^2}$

$= 10$

Centre $\equiv \left(\frac{4+(-2)}{2}, \frac{7+(-1)}{2}\right) \equiv (1, 3)$

$\therefore$ equation of the circle is

$(x-1)^2 + (y-3)^2 = (5)^2$

If this circle cuts X-axis, then

$(x-1)^2 + (0-3)^2 = 25$

$\Rightarrow (x-1)^2 = 16$

$\Rightarrow (x-1) = \pm 4$

$\Rightarrow x = 5, -3$

$\therefore$ the points on X-axis are A(5, 0) and B(–3, 0)

$\therefore$ AB = $\sqrt{(5+3)^2 + 0^2} = 8$

10. Since, the centre always lies on the diameter.
Solving $2x + 3y + 1 = 0$ and $3x - y - 4 = 0$,
the co-ordinates of the centre are (1, –1).
Given, circumference = 10π

$\therefore$ $2\pi r = 10\pi \Rightarrow r = 5$

$\Rightarrow x^2 + y^2 - 2x + 2y - 23 = 0$

11. Centre of circle = Point of intersection of diameters = (1, – 1)
Now, area = 154

$\Rightarrow \pi r^2 = 154 \Rightarrow r = 7$

Hence, the equation of required circle is

$(x-1)^2 + (y+1)^2 = 7^2$

$\Rightarrow x^2 + y^2 - 2x + 2y = 47$

12. $3x - y - 4 = 0$ ….(i)

$x + 3y + 2 = 0$ ….(ii)

solving equation (i) and (ii), we get

$(x, y) = (1, -1)$

Since, $\pi r^2 = 154$

$\therefore$ $r = 7$

$\Rightarrow x^2 + y^2 - 2x + 2y - 47 = 0$

13. Since, the centre always lies on the diameter.
Solving $2x + 3y = 3$ and $16x - y = 4$, we get co-ordinates of the centre $= \left(\frac{3}{10}, \frac{4}{5}\right)$.
The circle passes through (4, 6).

$\therefore$ $r^2 = \left(4 - \frac{3}{10}\right)^2 + \left(6 - \frac{4}{5}\right)^2$
$= \left(\frac{37}{10}\right)^2 + \left(\frac{26}{5}\right)^2 = \frac{4073}{100}$

$\therefore$ the equation of the circle is
$\left(x - \frac{3}{10}\right)^2 + \left(y - \frac{4}{5}\right)^2 = \frac{4073}{100}$
$\Rightarrow 100x^2 + 100y^2 - 60x - 160y = 4000$
$\Rightarrow 5(x^2 + y^2) - 3x - 8y = 200$

$\Rightarrow 4h + 4k - 28 = 0$
$\Rightarrow h + k - 7 = 0$ ....(i)
Since, centre lies on the given line.
$\therefore$ $k - 4h + 3 = 0$ ....(ii)
Solving (i) and (ii), we get
(h, k) = (2, 5)
$\therefore$ centre is (2, 5) and
radius $= \sqrt{(2-2)^2 + (5-3)^2} = 2$
$\therefore$ the required equation of the circle is
$(x-2)^2 + (y-5)^2 = (2)^2$
$\Rightarrow x^2 + y^2 - 4x - 10y + 25 = 0$

Let CD be the perpendicular drawn from centre (3, –1) to AB.

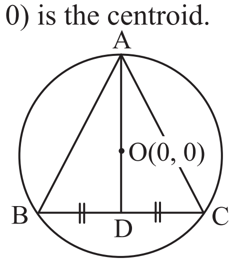
$\therefore$ $CD = \left|\frac{2(3) - 5(-1) + 18}{\sqrt{2^2 + (-5)^2}}\right| = \sqrt{29}$

and AD = 3

$\therefore$ $CA^2 = AD^2 + CD^2 = 3^2 + \left(\sqrt{29}\right)^2 = 38$

$\therefore$ the equation of the circle is
$(x-3)^2 + (y+1)^2 = 38$.

16. ΔABC is equilateral.
$\therefore$ O(0, 0) is the centroid.



O divides AD in the ratio 2 : 1

$\therefore$ $\frac{AO}{OD} = \frac{2}{1}$
$\Rightarrow \frac{AO}{AD - AO} = \frac{2}{1} \Rightarrow \frac{AO}{9 - AO} = \frac{2}{1}$
$\Rightarrow AO = 18 - 2\,AO \Rightarrow AO = 6$ units
$\therefore$ radius = 6 units
$\therefore$ equation of circle is $x^2 + y^2 = 36$.

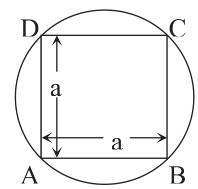
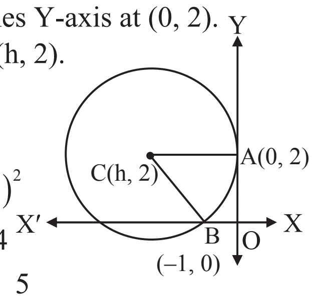
and centre is $\left(\frac{a}{2}, \frac{a}{2}\right)$.



$\therefore$ the equation of the circle is
$\left(x - \frac{a}{2}\right)^2 + \left(y - \frac{a}{2}\right)^2 = \frac{a^2}{2}$
$\Rightarrow x^2 + y^2 - ax - ay = 0$

18. Since, the circle touches Y-axis at (0, 2).
$\therefore$ centre of the circle is (h, 2).
Now, $CA^2 = CB^2$



$\therefore$ $(h-0)^2 + (2-2)^2$
$= (h - (-1))^2 + (2-0)^2$
$\Rightarrow h^2 = h^2 + 2h + 1 + 4$
$\Rightarrow 2h + 5 = 0 \Rightarrow h = -\frac{5}{2}$

$\therefore$ equation of circle is
$\left(x + \frac{5}{2}\right)^2 + (y-2)^2 = \left(-\frac{5}{2}\right)^2$
$\Rightarrow x^2 + \frac{25}{4} + 5x + y^2 - 4y + 4 = \frac{25}{4}$
$\Rightarrow x^2 + y^2 + 5x - 4y + 4 = 0$
Point (–4, 0) satisfies this equation.

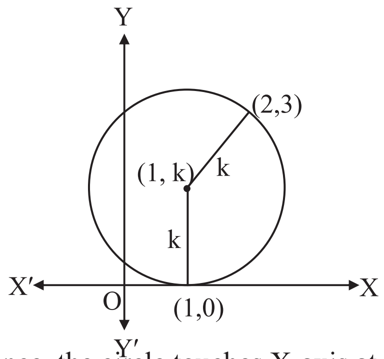
19.



Since, the circle touches X-axis at (1, 0).

∴ centre of the circle is (1, k) and radius = k

∴ equation of the circle is $(2-1)^2 + (3-k)^2 = k^2$

$\Rightarrow 1 + k^2 - 6k + 9 = k^2$

$\Rightarrow k = \frac{5}{3}$

∴ diameter = $2k = \frac{10}{3}$

20. The equation of circle touching the coordinate axes with centre (a, a) and radius 'a' is

$x^2 + y^2 - 2ax - 2ay + a^2 = 0$ ...(i)

Since, line $3x - 4y - 12 = 0$ touches the circle

∴ perpendicular distance from centre of the circle to the line = radius

∴ $\left|\frac{3(a)-4(a)-12}{\sqrt{9+16}}\right| = a$

$\Rightarrow a = 3$

Substituting, a = 3 in equation (i), we get

$x^2 + y^2 - 6x - 6y + 9 = 0$

This is the required equation of the circle.

21. The given equation represents a circle having line segment joining (x_1, y_1) and (x_2, y_2) as a diameter.

∴ the coordinates of its centre are $\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$.

22. By diameter form,

the required equation is

$(x-x_1)(x-x_2)+(y-y_1)(y-y_2)=0$

∴ $(x+4)(x-12)+(y-3)(y+1)=0$

∴ $x^2+y^2-8x-2y-51=0$

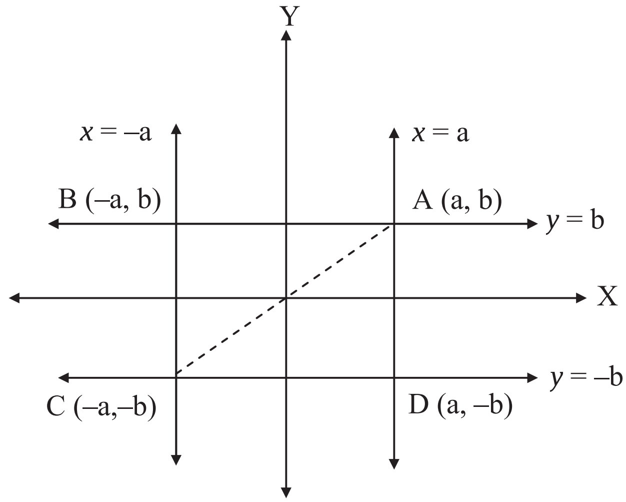
23. Circle whose diametric end points are (1, 0) and (0, 1) will be of smallest radius.

∴ By using diameter form, equation of circle is

$(x-1)(x-0) + (y-0)(y-1) = 0$

$\Rightarrow x^2 + y^2 - x - y = 0$

24.



Here, the diagonals AC and BD of rectangle ABCD are diameters of the circle passing through the vertices A, B, C and D. Considering diagonal AC with end points A(a, b) and C (–a, –b), we get

Equation of circle in diameter form as,

$(x-a)(x-(-a)) + (y-b)(y-(-b)) = 0$

∴ $x^2 - a^2 - y^2 - b^2 = 0$

∴ $x^2 + y^2 = a^2 + b^2$

26. The given equation represents a circle, if coeff. of x^2 = coeff. of y^2 and coeff. of $xy = 0$

∴ a = 2 and b = 0

Also, it passes through origin.

∴ c = 0

27. Here, g = 2, f = 3 and c = 13

∴ $r = \sqrt{g^2 + f^2 - c}$

∴ $r = \sqrt{4+9-13} = 0$

∴ option (D) is the correct answer.

28. Consider option (A),

$x^2 + y^2 + 2ax + 2by + 2b^2 = 0$

Centre = (–a, –b)

∴ option (A) is the correct answer.

29. The given equation represents a circle, if coeff. of x^2 = coeff. of y^2

After solving the given equation , we get

$\frac{K}{3} = \frac{1}{4} \Rightarrow K = \frac{3}{4}$

30. The given equation represents a circle, if coeff. of $xy = 0$.

∴ $2k - 1 = 0 \Rightarrow k = \frac{1}{2}$

radius = $\sqrt{(-1)^2 + (2)^2 - 3} = \sqrt{2}$

31. The given equation represents a circle, if coeff. of $xy = 0$.

$\therefore$ h = 0

and $\sqrt{(-3)^2 + (-1)^2 - k} = 2$

$\Rightarrow 10 - k = 4$

$\Rightarrow k = 6$

32. Circle $x^2 + y^2 + 2gx + 2fy + c = 0$ is concentric with $x^2 + y^2 - 2x + 4y + 20 = 0$.

$\therefore$ centre is (1, –2) and

radius = $\sqrt{(4-1)^2 + (-2+2)^2} = \sqrt{3^2 + 0^2} = 3$

Also, r = $\sqrt{g^2 + f^2 - c}$

$\therefore 3 = \sqrt{(-1)^2 + (2)^2 - c}$

$\therefore 9 = 1 + 4 - c$

$\therefore c = -4$

33. Here, $g = \frac{-1}{4}$, f = 0 and c = 0

$\therefore$ centre $(-g, -f) = \left(\frac{1}{4}, 0\right)$

and $r = \sqrt{\frac{1}{16} + 0 - 0} = \frac{1}{4}$

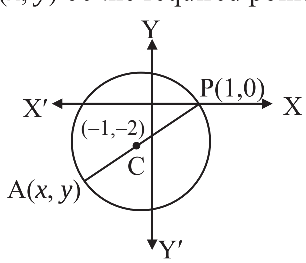
34. Let another end of the diameter be (x, y).
Centre of the given circle is (2, 3).
Since, centre is the midpoint of the diameter

$\therefore 2 = \frac{3+x}{2}, 3 = \frac{4+y}{2}$

$\Rightarrow x = 1, y = 2$

$\Rightarrow (x, y) = (1, 2)$

35. Let A(x, y) be the required point.



given equation of circle is

$x^2 + y^2 + 2x + 4y - 3 = 0$

$\therefore$ Centre = (–1, –2)

Since, C is the midpoint of AP.

$\therefore$ A= (–3, –4)

36. Here, the centre of circle $(3, -1)$ must lie on the line $x + 2by + 7 = 0$.

$\therefore 3 - 2b + 7 = 0$

$\Rightarrow b = 5$

37. Given equation of circle is

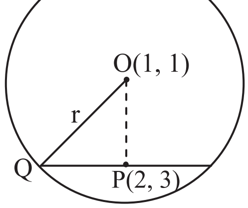
$x^2 + y^2 - 4x - 6y + 9 = 0$

$\Rightarrow x^2 - 4x + 4 + y^2 - 6y + 9 - 4 = 0$

$\Rightarrow (x-2)^2 + (y-3)^2 = 4$

$\therefore$ centre = (2, 3), radius = 2

The diameter of this circle is a chord of circle with centre O(1, 1).

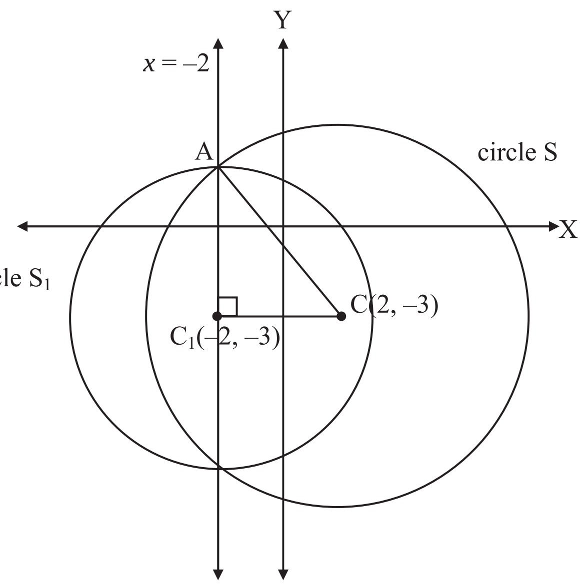


OP = $\sqrt{(3-1)^2 + (2-1)^2} = \sqrt{5}$

QP = 2

$\therefore r^2 = \left(\sqrt{5}\right)^2 + 2^2 \Rightarrow r = 3$

38.



Given circle S_1, $x^2 + y^2 + 4x + 6y - 12 = 0$

$\therefore$ Its centre $C_1 = (-2, -3)$

radius, $r_1 = 5$

centre of circle S, is C = (2, –3)

From the figure, we have

Diameter, $x = -2$ of circle S_1 is the chord of circle S.

$\therefore$ In ΔCC_1A,

$C_1A = r = 5$ unit

$CC_1 = \sqrt{\left(-2-2\right)^2 + \left(3-3\right)^2} = 4$ unit

$\therefore (CA)^2 = (CC_1)^2 + (C_1A)^2$

$= (4)^2 + (5)^2 = 16 + 25 = 41$

$\therefore CA = \sqrt{41}$ unit

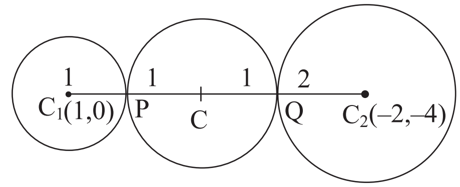
$\therefore$ Radius of circle S is $\sqrt{41}$ unit.

39. Consider option (A)
$x^2 + y^2 + 8x + 2y - 8 = 0$
Point (–1, 3) is common to both circle and lies on above circle also
Since, point (–1, 3) satisfies the equation of circle in option (A)
$\therefore$ correct answer is option (A)

40. $C_1 : x^2 + y^2 - 6x = 0$ ....(i)
$C_2 : x^2 + y^2 - 6y = 0$ ....(ii)
Solving (i) and (ii), we get
$x = y$ ....(iii)
Substituting (iii) in (i), we get
$y = 3$
$\therefore$ $x = 3$
Point on circle is P(3, 3) and
centre = $\left(\frac{3}{2}, \frac{3}{2}\right)$
$\therefore$ Radius $= \sqrt{\left(3-\frac{3}{2}\right)^2 + \left(3-\frac{3}{2}\right)^2}$
$= \frac{3}{\sqrt{2}}$
$\therefore$ equation of the circle is
$\left(x-\frac{3}{2}\right)^2 + \left(y-\frac{3}{2}\right)^2 = \frac{9}{2}$
$\Rightarrow x^2 + y^2 - 3x - 3y = 0$

41. Putting $y = x$ in $x^2 + y^2 - 2x = 0$, we get
$2x^2 - 2x = 0$
$\Rightarrow x(x-1) = 0 \Rightarrow x = 0$ or $x = 1$
$\therefore$ $y = 0$ or $y = 1$
$\therefore$ Points of intersection are (0, 0) and (1, 1).
These are end points of a diameter of required circle.
$\therefore$ equation of required circle is
$(x-0)(x-1) + (y-0)(y-1) = 0$
$\Rightarrow x^2 + y^2 - x - y = 0$

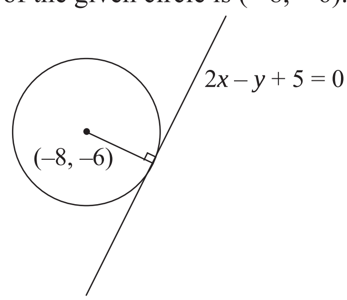
42. The centres of two circles are $C_1(1, 0)$ and $C_2(-2, -4)$ and their radii are 1 and 2 units respectively.
Let C be the centre of the required circle. Then, CP = CQ = 1.
$\therefore$ $CC_1 = 2$ and $CC_2 = 3$.
Clearly, C divides C_1C_2 in the ratio 2 : 3. Therefore, coordinates of C are
$\left(\frac{-4+3}{2+3}, \frac{-8+0}{2+3}\right) = \left(-\frac{1}{5}, -\frac{8}{5}\right)$.



Hence, equation of the required circle is
$\left(x+\frac{1}{5}\right)^2 + \left(y+\frac{8}{5}\right)^2 = 1^2$
$\Rightarrow 5x^2 + 5y^2 + 2x + 16y + 8 = 0$

43. Let, P = (x, y)
$\therefore$ according to the given condition
$\frac{\sqrt{x^2+y^2-2x+4y-20}}{\sqrt{x^2+y^2-2x-8y+1}} = \frac{2}{1}$
$\Rightarrow \frac{x^2+y^2-2x+4y-20}{x^2+y^2-2x-8y+1} = 4$
$\Rightarrow x^2 + y^2 - 2x - 12y + 8 = 0$

44. Equation of the tangent at (1, 7) to $x^2 = y - 6$ is $2x - y + 5 = 0$
Centre of the given circle is (– 8, – 6).

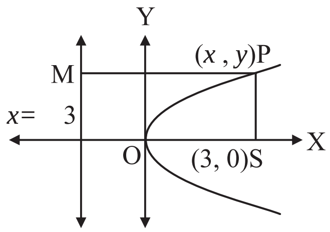


Perpendicular from the centre (– 8, – 6) to $2x - y + 5 = 0$ is equal to the radius of the circle.
$\Rightarrow \left|\frac{2(-8)-(-6)+5}{\sqrt{2^2+1^2}}\right| = \sqrt{8^2+6^2-c}$
$\Rightarrow \left|\frac{-5}{\sqrt{5}}\right| = \sqrt{100-c} \Rightarrow c = 95$

45. Let, $x^2 + y^2 + 2gx + 2fy + c = 0$ be the required circle.
This circle passes through (1, 0)
$\therefore$ $1 + 2g + c = 0$
i.e. $2g + c = -1$ …(i)
Also, this circle is orthogonal to the circle $x^2 + y^2 - 2x + 4y + 1 = 0$ and $x^2 + y^2 + 6x - 2y + 1 = 0$
$\therefore$ $2g + 4f + c = -1$ …(ii), and
$6g - f - c = 1$ …(iii)
Solving, (i), (ii) and (iii), we get
$g = f = 0$ and $c = -1$
$\therefore$ Centre = $(-g, -f) = (0, 0)$

46. $x^2 + y^2 - 4x - 6y - 12 = 0$
$C_1 = (2, 3)$, $r = \sqrt{2^2 + 3^2 + 12} = 5$
$x^2 + y^2 + 6x + 18y + 26 = 0$
$C_2 = (-3, -9)$, $r = \sqrt{9 + 81 - 26} = \sqrt{64} = 8$
$(C_1C_2) = r_1 + r_2$
∴ The circles touch externally at a single point
∴ Number of common tangents is 3.

47.



∵ $SP^2 = PM^2$

$\Rightarrow (x-3)^2 + y^2 = \left|\dfrac{x+3}{\sqrt{1}}\right|^2$

$\Rightarrow x^2 + 9 - 6x + y^2 = x^2 + 9 + 6x$
$\Rightarrow y^2 = 12x$

48. $\sqrt{(x-1)^2 + (y+1)^2} = \left|\dfrac{x_1 + y_1 + 3}{\sqrt{1+1}}\right|$

$x^2 + y^2 - 10x - 2y - 2xy - 5 = 0$

49. Equation of parabola having vertex (p, q) and focus (p, b + q) is given by;
$(x - p)^2 = 4b(y - q)$
Given, vertex A = (1, 1) and focus S = (1, –1)
∴ p = 1, q = 1, b = –2
∴ Equation of parabola is;
$(x - 1)^2 = 4(-2)(y - 1)$
i.e. $x^2 - 2x + 8y - 7 = 0$
Only $\left(3, \dfrac{1}{2}\right)$ satisfies the above equation of parabola.

50. a = 4, vertex = (0, 0), focus = (0, – 4)

51. Given, equation is $x^2 = -8ay$
Here, A = 2a
Focus of parabola (0, – A) i.e., (0, – 2a)
Directrix y = A i.e., y = 2a

52. $y^2 - 4y - x + 3 = 0$
$\Rightarrow y^2 - 4y + 4 - x + 3 - 4 = 0$
$\Rightarrow (y-2)^2 - (x+1) = 0$
$\Rightarrow (y-2)^2 = (x+1)$
Comparing with $Y^2 = 4aX$, we have
$a = \dfrac{1}{4}$, $Y = y - 2$, $X = x + 1$
Focus of the parabola is Y = 0, X = a
$\Rightarrow y - 2 = 0, x + 1 = \dfrac{1}{4} \Rightarrow y = 2, x = \dfrac{-3}{4}$
∴ focus = $\left(\dfrac{-3}{4}, 2\right)$

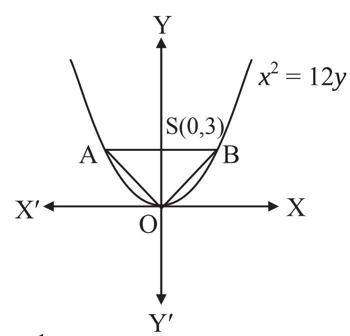
53. $(y + 1)^2 = -8(x + 2)$
Comparing this equation with $Y^2 = -4aX$, we get
a = 2, X = x + 2 and Y = y + 1
Focus of the parabola is,
X = –a, Y = 0
$\Rightarrow x + 2 = -2, y + 1 = 0 \Rightarrow x = -4, y = -1$
∴ focus = (–4, –1)

54. Parabola is $y^2 = -4ax$ (left handed parabola).
∴ its focus is (–a, 0).
∴ option (B) is false.

56. Since, (a, –2a) ≡ (2, –8)
∴ another end (a, 2a) ≡ (2, 8)

57. Given $y^2 = 5x$
here $(x_1, y_1) = (a, 2a)$ and $(x_2, y_2) = (a, -2a)$
∴ $x_1x_2 = a^2 = \left(\dfrac{25}{16}\right)$
∴ $a = \dfrac{5}{4}$
$y_1 y_2 = -4a^2 = \dfrac{-25}{4}$
∴ $4 x_1 x_2 + y_1y_2 = 0$

58. $x^2 = 12y$
$\Rightarrow$ 4a = 12
$\Rightarrow$ a = 3



Area of triangle = $\dfrac{1}{2}$ (base) (height)
$= \dfrac{1}{2} \times AB \times OS = \dfrac{1}{2} \times 4a \times a$
$= \dfrac{1}{2}(12)(3) = 18$ sq. units

59. Equation of parabola is $y^2 = 12x$

$\therefore$ a = 3

Given $y = 6$

$\therefore$ substituting $y = 6$ in $y^2 = 12x$, we get

$36 = 12x$

$\Rightarrow x = 3$

Now, focal distance = $|x + a| = |3 + 3| = 6$

60. Given, $y = 3x$

Substituting $y = 3x$ in $y^2 = 18x$, we get

$(3x)^2 = 18x$

$\Rightarrow 9x^2 = 18x$

$\Rightarrow x = 2$ and $y = 6$

61. Vertex = (0, 4), focus = (0, 2)

$\Rightarrow$ a = 2

Hence, equation of parabola is

$(x - 0)^2 = -4 \times 2(y - 4)$

i.e., $x^2 + 8y = 32$

62. Given, vertex of parabola (h, k) $\equiv$ (1,1) and its focus (a + h, k) $\equiv$ (3, 1) or a + h = 3 or a = 2. The y coordinates of vertex and focus are same, therefore axis of parabola is parallel to X-axis.Thus, equation of the parabola is $(y - k)^2 = 4a(x - h)$ or $(y - 1)^2 = 4 \times 2(x - 1)$ or $(y - 1)^2 = 8(x - 1)$

63. Directrix = $x + 5 = 0$

Focus is (–3, 0)

$\Rightarrow 2a = (5 - 3) = 2$

$\Rightarrow$ a = 1

Vertex is $\left(\frac{-3+(-5)}{2}, 0\right) = (-4, 0)$

Therefore, equation is $(y - 0)^2 = 4(x + 4)$

i.e., $y^2 = 4(x + 4)$

64. Let P(x, y) be any point on the parabola.

$\therefore$ $SP^2 = PM^2$

$\Rightarrow (x - 5)^2 + (y - 3)^2 = \left|\frac{3x - 4y + 1}{\sqrt{9+16}}\right|^2$

$\Rightarrow 25(x^2 + 25 - 10x + y^2 + 9 - 6y)$

$= 9x^2 + 16y^2 + 1 - 24xy + 6x - 8y$

$\Rightarrow 16x^2 + 9y^2 - 256x - 142y + 24xy + 849 = 0$

$\Rightarrow (4x + 3y)^2 - 256x - 142y + 849 = 0$

65. Equation will be of the form $y^2 = 4A(x - a)$, where $A = (a' - a)$ or $y^2 = 4(a' - a)(x - a)$.

66. Equation of parabola

$\therefore$ a = 2

P($2t^2$, 4t) A(1, 0)

Mid point = $(x, y) = \left(\frac{2t^2+1}{2}, \frac{4t+0}{2}\right)$

$\Rightarrow \frac{2x-1}{2} = t^2$ and $\frac{y^2}{4} = t^2$

$\Rightarrow \frac{y^2}{4} = \frac{2x-1}{2} \Rightarrow y^2 = 4\left(x - \frac{1}{2}\right)$

67. Eccentricity of parabola is always 1 i.e., e = 1.

68. Since, vertex is the midpoint of focus and directrix.

$\therefore$ vertex = $\left(\frac{0+2}{2}, \frac{0+0}{2}\right) = (1, 0)$

69. $y^2 - 4y - x + 3 = 0$

$\Rightarrow y^2 - 4y + 4 - x + 3 - 4 = 0$

$\Rightarrow (y - 2)^2 - (x + 1) = 0 \Rightarrow (y - 2)^2 = (x + 1)$

Comparing with $(y - k)^2 = 4a(x - h)$, we get h = –1, k = 2

$\therefore$ vertex = (–1, 2)

70. $x^2 + 4x + 2y - 7 = 0$

$\Rightarrow x^2 + 4x + 4 = -2y + 7 + 4$

$\Rightarrow (x + 2)^2 = -2y + 11$

$\Rightarrow (x + 2)^2 = -2\left(y - \frac{11}{2}\right)$

Hence, vertex is $\left(-2, \frac{11}{2}\right)$

71. The given equation of parabola is

$y = 2x^2 + x$

$\Rightarrow x^2 + \frac{x}{2} = \frac{y}{2}$

$\Rightarrow \left(x + \frac{1}{4}\right)^2 = \frac{y}{2} + \frac{1}{16} \Rightarrow \left(x + \frac{1}{4}\right)^2 = \frac{1}{2}\left(y + \frac{1}{8}\right)$

Let $X^2 = \frac{1}{2}Y$ ....(i)

Here $A = \frac{1}{8}$, focus of (i) is $\left(0, \frac{1}{8}\right)$

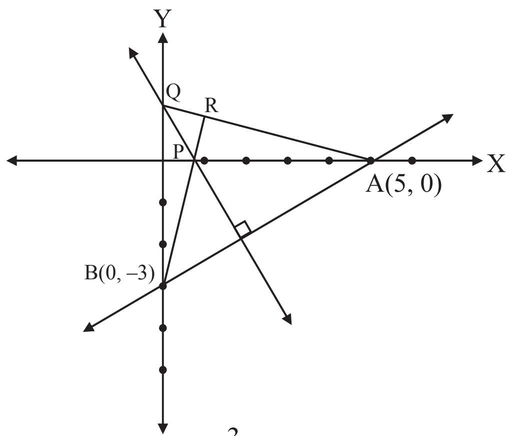
i.e., $X = 0$, $Y = \frac{1}{8}$

$\Rightarrow x + \frac{1}{4} = 0$, $y + \frac{1}{8} = \frac{1}{8} \Rightarrow x = -\frac{1}{4}$, $y = 0$

$\therefore$ focus of given parabola is $\left(-\frac{1}{4}, 0\right)$.

72. Given equation of conic
$x^2 - 6x + 4y + 1 = 0$
$\Rightarrow x^2 - 6x + 9 + 4y + 1 - 9 = 0$
$\Rightarrow (x - 3)^2 + 4(y - 2) = 0$
$\Rightarrow (x - 3)^2 = -4(y - 2)$
Comparing with $X^2 = -4aY$, we get
$a = 1, X = x - 3, Y = y - 2$
Focus of the parabola is $X = 0, Y = -a$
$\Rightarrow x - 3 = 0, y - 2 = -1 \Rightarrow x = 3, y = 1$
∴ Focus = (3, 1)

73.



Slope of AB = $\frac{-3}{5}$
∴ Slope of PQ = $\frac{5}{3}$
∴ Equation of PQ: $y = \frac{5}{3}x + c$
i.e. $5x - 3y = -3c$
At P, $y = 0 \Rightarrow x = \frac{-3c}{5}$
At Q, $x = 0 \Rightarrow y = c$
∴ $P = \left(\frac{-3c}{5}, 0\right)$ and Q = (0, c)
∴ Equation of AQ: $\frac{y}{-c} = \frac{x-5}{5}$

Equation of BP: $\frac{y+3}{3} = \frac{x}{\frac{3c}{5}}$
i.e. $c = \frac{5x}{y+3}$ ...(ii)
Since, lines AQ and BP intersect,
∴ $\frac{-5y}{x-5} = \frac{5x}{y+3}$
∴ $x^2 + y^2 - 5x + 3y = 0$ is the required locus of R.

$\Rightarrow y^2 + 6y + 9 = 2x - 5 + 9$
$\Rightarrow (y + 3)^2 = 2(x + 2)$
∴ vertex = (–2, –3)
Here, $a = \frac{1}{2}$
∴ Equation of directix is $x + 2 = -\frac{1}{2}$

$m_{PC} = \dfrac{16-0}{16-4} = \dfrac{16}{12} = \dfrac{4}{3}$

$m_{PB} = \dfrac{16-0}{16-24} = \dfrac{16}{-8} = -2$

$\tan\theta = \left|\dfrac{\frac{4}{3} - (-2)}{1 + \left(\frac{4}{3}\right)(-2)}\right| = 2$

82. Given, $y = \pm x$ ….(i)

$\dfrac{x^4}{16a^2} = 4ax$

$\Rightarrow x(x^3 - 64a^3) = 0$

$\Rightarrow\ x = 0, 4a$

From (ii), $y = 0, 4a$

Let $A \equiv (0, 0)$, $B \equiv (4a, 4a)$

84. $\dfrac{x^2}{36} + \dfrac{y^2}{16} = 1$

Here $a^2 = 36$, $b^2 = 16$

$b^2 = a^2(1 - e^2)$

$\Rightarrow 16 = 36(1 - e^2)$

$\Rightarrow e = \dfrac{\sqrt{5}}{3} = \dfrac{2\sqrt{5}}{6}$

85. $4x^2 + y^2 - 8x + 4y - 8 = 0$

$\Rightarrow 4(x^2 - 2x) + y^2 + 4y = 8$

$\Rightarrow 4(x^2 - 2x + 1) + y^2 + 4y + 4 = 16$

$\Rightarrow 4(x - 1)^2 + (y + 2)^2 = 16$

$\Rightarrow \dfrac{(x-1)^2}{4} + \dfrac{(y+2)^2}{16} = 1$

which is an ellipse with $a^2 = 4$ and $b^2 = 16$

$\therefore \quad e = \sqrt{1 - \dfrac{a^2}{b^2}} = \sqrt{1 - \dfrac{4}{16}} = \sqrt{\dfrac{12}{16}}$

$\therefore \quad e = \dfrac{\sqrt{3}}{2}$

86. $x^2 + 2y^2 - 2x + 3y + 2 = 0$

$\therefore$ $(x^2 - 2x + 1) + 2\left(y^2 + \frac{3}{2}y + \frac{9}{16}\right) = \frac{1}{8}$

$\therefore$ $(x-1)^2 + 2\left(y + \frac{3}{4}\right)^2 = \frac{1}{8}$

$\therefore$ $\frac{(x-1)^2}{\frac{1}{8}} + \frac{\left(y+\frac{3}{4}\right)^2}{\frac{1}{16}} = 1$

$\therefore$ Comparing this with $\frac{X^2}{a^2} + \frac{Y^2}{b^2} = 1$, we get

$a^2 = \frac{1}{8}$, $b^2 = \frac{1}{16}$

$\therefore$ $e = \sqrt{1-\frac{b^2}{a^2}} = \sqrt{1-\frac{\frac{1}{16}}{\frac{1}{8}}} = 1 - \frac{8}{16}$

$\therefore$ $e = \frac{1}{\sqrt{2}}$

87. Here, given that 2b = 10, 2a = 8

$\Rightarrow$ b = 5, a = 4

Hence, the required equation is $\frac{x^2}{16} + \frac{y^2}{25} = 1$

88. Given, centre (0,0), focus (0,3), b = 5

Focus (0,3)

$\Rightarrow$ be = 3

$\Rightarrow e = \frac{3}{5}$

Also, $a = b\sqrt{1-e^2} = 5\sqrt{1-\frac{9}{25}} = 4$

Hence, the required equation is $\frac{x^2}{16} + \frac{y^2}{25} = 1$

89. Given, foci = (± 2, 0) = (± ae, 0)

$\Rightarrow$ ae = 2

and $e = \frac{1}{2}$

$\therefore$ a = 4

Now, $b^2 = a^2(1 - e^2)$

$\Rightarrow b^2 = 16\left(1 - \frac{1}{4}\right)$

$\Rightarrow b^2 = 12$

Hence, equation of ellipse is $\frac{x^2}{16} + \frac{y^2}{12} = 1$

$\Rightarrow 3x^2 + 4y^2 = 48$

90. We have, $ae = \pm\sqrt{5}$

$\Rightarrow a = \pm\sqrt{5}\left(\frac{3}{\sqrt{5}}\right)$ .... $\left[\because e = \frac{\sqrt{5}}{3}\right]$

$\Rightarrow a = \pm 3$

$\Rightarrow a^2 = 9$

Now, $b^2 = a^2(1 - e^2) = 9\left(1 - \frac{5}{9}\right) = 4$

Hence, equation of ellipse is $\frac{x^2}{9} + \frac{y^2}{4} = 1$

$\Rightarrow 4x^2 + 9y^2 = 36$

91. $b^2 = a^2(1 - e^2) = a^2\left(1 - \frac{2}{5}\right) = \frac{3a^2}{5}$

Let the equation of ellipse be

$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$\Rightarrow \frac{9}{a^2} + \frac{5}{3a^2} = 1$

$\Rightarrow a^2 = \frac{32}{3}$

$\therefore$ $b^2 = \frac{32}{5}$

$\therefore$ the required equation of ellipse is

$3x^2 + 5y^2 - 32 = 0$

92. Since point (–3, 1) satisfies equations in options (C) and (D) writing them in standard form, we have,

For option (C):

$\frac{x^2}{\frac{32}{3}} + \frac{y^2}{\frac{32}{5}} = 1$, here $a^2 > b^2$

For option (D):

$\frac{x^2}{\frac{48}{5}} + \frac{y^2}{16} = 1$, here, $a^2 < b^2$

Since, the ellipse has its major axis along Y-axis,

$\therefore$ $a^2 < b^2$

$\therefore$ Option (D) is correct

93. Since, directrix is parallel to Y-axis, hence axes of the ellipse are parallel to X-axis.

Let the equation of the ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, (a > b)

Now, $e^2 = 1 - \frac{b^2}{a^2}$

$\Rightarrow \frac{b^2}{a^2} = 1 - e^2 = 1 - \frac{1}{4} \Rightarrow \frac{b^2}{a^2} = \frac{3}{4}$

Also, one of the directrices is $x = 4$

$\Rightarrow \frac{a}{e} = 4 \Rightarrow a = 4e = 4 \times \frac{1}{2} = 2$;

$b^2 = \frac{3}{4}a^2 = \frac{3}{4} \times 4 = 3$

∴ Required equation of ellipse is $\frac{x^2}{4} + \frac{y^2}{3} = 1$

$\Rightarrow 3x^2 + 4y^2 = 12$

95. Sum of focal distances of a point in an ellipse is always equal to length of major axis of that ellipse.

96. Equation of the curve is $\frac{x^2}{5^2} + \frac{y^2}{4^2} = 1$

Here, a = 5, b = 4

∴ $PF_1 + PF_2 = 2a = 2 \times 5 = 10$

97. The equation of the ellipse is

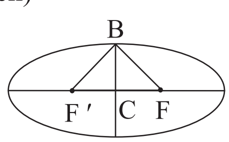
$16x^2 + 25y^2 = 400 \Rightarrow \frac{x^2}{25} + \frac{y^2}{16} = 1$

Here, $a^2 = 25$, $b^2 = 16$

$e = \sqrt{1 - \frac{b^2}{a^2}} = \sqrt{1 - \frac{16}{25}} \Rightarrow e = \frac{3}{5}$

Hence, the foci are $(\pm\, ae, 0) = (\pm\, 3, 0)$

98. Since, $\angle FBF' = \frac{\pi}{2}$ (Given)



∴ $\angle FBC = \angle F'BC = \frac{\pi}{4}$

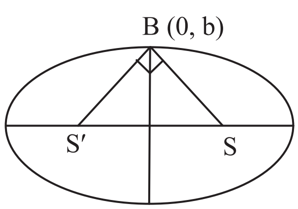
Now, CB = CF

$\Rightarrow b = ae \Rightarrow b^2 = a^2e^2$

$\Rightarrow a^2(1 - e^2) = a^2e^2 \Rightarrow 1 - e^2 = e^2$

$\Rightarrow 2e^2 = 1 \Rightarrow e = \frac{1}{\sqrt{2}}$

99.

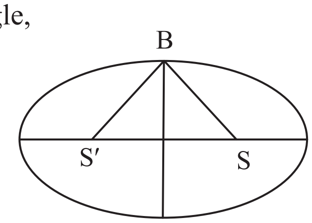


S = (ae, 0), S′ = (–ae, 0) and b = ae

Now, $a^2 e^2 = a^2 (1 - e^2)$

$\Rightarrow e = \frac{1}{\sqrt{2}}$

100. Since, ΔSBS′ is an isosceles right angled triangle,



∴ $\angle SBS' = \frac{\pi}{2}$, $\angle BSS' = \angle BS'S = \frac{\pi}{4}$

∴ $e = \frac{1}{\sqrt{2}}$

101. Distance between the foci = 2ae = 16 and

$e = \frac{1}{2}$

∴ Length of the major axis of the ellipse

$= 2a = \frac{2ae}{e} = \frac{16}{\frac{1}{2}} = 32$

102. According to the given condition,

$\sqrt{1 - \frac{25}{169}} = \sqrt{1 - \frac{b^2}{a^2}}$

$\Rightarrow \frac{144}{169} = 1 - \frac{b^2}{a^2}$

$\Rightarrow \frac{b^2}{a^2} = \frac{25}{169}$

$\Rightarrow \frac{b}{a} = \frac{5}{13}$ ....[∵ a > 0, b > 0]

$\Rightarrow \frac{a}{b} = \frac{13}{5}$

103. $5x^2 + 9y^2 = 45$

$\Rightarrow \frac{x^2}{9} + \frac{y^2}{5} = 1$

∴ Length of latus rectum $= \frac{2b^2}{a} = \frac{2 \times 5}{3} = \frac{10}{3}$

104. Given, ellipse is $\frac{x^2}{\left(\frac{1}{3}\right)^2} + \frac{y^2}{\left(\frac{1}{2}\right)^2} = 1$

Here, b > a

∴ Latus rectum $= \frac{2a^2}{b} = \frac{2 \times \frac{1}{9}}{\frac{1}{2}} = \frac{4}{9}$

105. Latus rectum = $\frac{1}{3}$ (major axis)

$\Rightarrow \frac{2b^2}{a} = \frac{2a}{3}$

$\Rightarrow a^2 = 3b^2$

$\Rightarrow a^2 = 3a^2(1 - e^2)$

$\Rightarrow e = \sqrt{\frac{2}{3}}$

106. Given, $\frac{2b^2}{a} = b$

$\Rightarrow \frac{b}{a} = \frac{1}{2}$

$\Rightarrow \frac{b^2}{a^2} = \frac{1}{4}$

Hence, $e = \sqrt{1 - \frac{b^2}{a^2}} = \frac{\sqrt{3}}{2}$

107. $x^2 = 9\cos^2\theta$

$y^2 = 16\sin^2\theta$

$\Rightarrow \frac{x^2}{9} + \frac{y}{16} = 1$

$\therefore$ $e = \frac{\sqrt{7}}{4}$

Distance between foci = 2be = $2\sqrt{7}$

108. Let (x, y) be any point on ellipse.
Then, by focus-directrix property of ellipse,

$\sqrt{(x+1)^2 + (y-1)^2} = \frac{1}{2}\left|\frac{x-y+3}{\sqrt{1+1}}\right|$

$\therefore$ $8(x^2 + 2x + 1 + y^2 - 2y + 1) = x^2 + y^2 + 9 - 2xy - 6y + 6x$

$\therefore$ $7x^2 + 2xy + 7y^2 + 10x - 10y + 7 = 0$

109. solving $x + y - 3 = 0$
$x - y + 1 = 0$, we get
$(x, y) = (1, 2)$

110. Here, $a^2 = 9$, $b^2 = 25$
Since, b > a

$\therefore$ $e = \sqrt{\frac{b^2 - a^2}{b^2}} = \sqrt{\frac{25-9}{25}} = \frac{4}{5}$

111. $\frac{(x-1)^2}{2} + \left(y + \frac{3}{4}\right)^2 = \frac{1}{16}$

$\Rightarrow \frac{(x-1)^2}{2\left(\frac{1}{16}\right)} + \frac{\left(y+\frac{3}{4}\right)^2}{\left(\frac{1}{16}\right)} = 1$

$\Rightarrow \frac{(x-1)^2}{\left(\frac{1}{8}\right)} + \frac{\left(y+\frac{3}{4}\right)^2}{\left(\frac{1}{16}\right)} = 1$

$\therefore$ $a^2 = \frac{1}{8}$, $b^2 = \frac{1}{16}$

$b^2 = a^2(1 - e^2)$

$\Rightarrow \frac{1}{16} = \frac{1}{8}(1 - e^2)$

$\Rightarrow e^2 = 1 - \frac{1}{2}$

$\Rightarrow e = \frac{1}{\sqrt{2}}$

112. $4x^2 + y^2 - 8x + 4y - 8 = 0$

$\Rightarrow 4(x^2 - 2x) + y^2 + 4y = 8$

$\Rightarrow 4(x^2 - 2x + 1) + y^2 + 4y + 4 = 16$

$\Rightarrow 4(x - 1)^2 + (y + 2)^2 = 16$

$\Rightarrow \frac{(x-1)^2}{4} + \frac{(y+2)^2}{16} = 1$

Comparing with $\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1$, we get

h = 1, k = –2

$\therefore$ centre of the ellipse = (1, –2)

113. Given equation of ellipse is

$25x^2 + 9y^2 - 150x - 90y + 225 = 0$

$\Rightarrow 25(x-3)^2 + 9(y-5)^2 = 225$

$\Rightarrow \frac{(x-3)^2}{9} + \frac{(y-5)^2}{25} = 1$

Since, b > a

$\therefore$ $e = \sqrt{1 - \frac{a^2}{b^2}} = \sqrt{1 - \frac{9}{25}} = \sqrt{\frac{16}{25}} = \frac{4}{5}$

114. $x^2 + 2y^2 - 2x + 3y + 2 = 0$

$\Rightarrow (x^2 - 2x + 1) + 2\left(y^2 + \frac{3}{2}y + \frac{9}{16}\right) = -2 + 1 + \frac{9}{8}$

$\Rightarrow (x - 1)^2 + 2\left(y + \frac{3}{4}\right)^2 = \frac{1}{8}$

$\Rightarrow \frac{(x-1)^2}{\frac{1}{8}} + \frac{\left(y+\frac{3}{4}\right)^2}{\frac{1}{16}} = 1,$

which is an ellipse with $a^2 = \frac{1}{8}$ and $b^2 = \frac{1}{16}$

Also, $b^2 = a^2(1-e^2)$

$\Rightarrow \frac{1}{16} = \frac{1}{8}(1-e^2)$

$\Rightarrow e^2 = 1 - \frac{1}{2}$

$\Rightarrow e = \frac{1}{\sqrt{2}}$

115. $25x^2 + 4y^2 + 100x - 4y + 100 = 0$

$\Rightarrow 25(x^2 + 4x) + 4(y^2 - y) = -100$

$\Rightarrow 25(x^2 + 4x + 4) + 4\left(y^2 - y + \frac{1}{4}\right) = -100 + 100 + 1$

$\Rightarrow 25(x+2)^2 + 4\left(y - \frac{1}{2}\right)^2 = 1$

$\Rightarrow \frac{(x+2)^2}{\frac{1}{25}} + \frac{\left(y-\frac{1}{2}\right)^2}{\frac{1}{4}} = 1$

Here $a^2 = \frac{1}{25}$, $b^2 = \frac{1}{4}$, $h = -2$, $k = \frac{1}{2}$

$\therefore$ $e = \frac{\sqrt{b^2 - a^2}}{b} = \frac{\sqrt{\frac{1}{4} - \frac{1}{25}}}{\frac{1}{2}} = \frac{\sqrt{21}}{5}$

$\therefore$ Foci $= (h, k \pm be)$

$= \left(-2, \frac{1}{2} \pm \frac{\sqrt{21}}{10}\right) = \left(-2, \frac{5 \pm \sqrt{21}}{10}\right)$

116. $5x^2 + y^2 + y = 8$

$\Rightarrow 5x^2 + y^2 + y + \frac{1}{4} = 8 + \frac{1}{4}$

$\Rightarrow 5x^2 + \left(y + \frac{1}{2}\right)^2 = \frac{33}{4}$

$\Rightarrow \frac{x^2}{\left(\frac{33}{20}\right)} + \frac{\left(y+\frac{1}{2}\right)^2}{\left(\frac{33}{4}\right)} = 1$

The equation represent an ellipse.

117. Here, 2a = 10m and 2ae = 8m

$\therefore$ $e = \frac{4}{5}$, a = 5m

Now, $b^2 = a^2(1 - e^2) = 9$

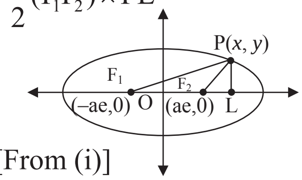
$\Rightarrow b = 3$

Thus, required area = $\pi ab = 15\pi$ sq. metre.

118. We have, $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$\therefore$ $y = \frac{b}{a}\sqrt{a^2 - x^2}$ ….(i)

Now, area of Δ $PF_1F_2 = \frac{1}{2}(F_1F_2) \times PL$



$= \frac{1}{2}(2ae) \times y$

$= ae.\frac{b}{a}\sqrt{a^2 - x^2}$ ….[From (i)]

$\therefore$ $A = eb\sqrt{a^2 - x^2}$, which is maximum when $x = 0$.

Thus, the maximum value of A is abe.

119. Vertices = (0, ± 15), foci = (0, ± 20)

$\therefore$ b = 15 and be = 20 $\Rightarrow e = \frac{4}{3}$

$a^2 = b^2(e^2 - 1)$

$= 15^2\left(\frac{16}{9} - 1\right)$

$= 175$

$\therefore$ The equation of hyperbola is

$\frac{-x^2}{175} + \frac{y^2}{225} = 1$

$\Rightarrow \frac{y^2}{225} - \frac{x^2}{175} = 1$

120. Given, ae = 2, e = 2

$\therefore$ a = 1

Now, $b^2 = a^2(e^2 - 1)$

$\Rightarrow b^2 = 1(4 - 1)$

$\Rightarrow b^2 = 3$

$\therefore$ the equation of hyperbola is

$\frac{x^2}{1} - \frac{y^2}{3} = 1$

$\Rightarrow 3x^2 - y^2 = 3$

121. Given: ae = 8, e = $\sqrt{2}$

$\therefore$ $a = 4\sqrt{2}$

Now, $b^2 = a^2(e^2 - 1)$

$\Rightarrow b^2 = 32(2 - 1)$

$\Rightarrow b^2 = 32$

$\therefore$ the equation of hyperbola is $\frac{x^2}{32} - \frac{y^2}{32} = 1$

$\therefore$ $x^2 - y^2 = 32$

122. Given, ae = 8 and $\frac{2b^2}{a} = 24$

$\Rightarrow b^2 = 12a$

Now, $b^2 = a^2 (e^2 - 1)$

$\Rightarrow 12a = a^2e^2 - a^2$

$\Rightarrow 12a = 64 - a^2$

$\Rightarrow a^2 + 12a - 64 = 0$

$\Rightarrow a = 4$ ....[$\because$ a > 0]

$\therefore$ $b^2 = 12(4) = 48$

$\therefore$ the equation of hyperbola is

$\frac{x^2}{16} - \frac{y^2}{48} = 1 \Rightarrow 3x^2 - y^2 = 48$

123. $16x^2 - 9y^2 - 64x + 18y - 90 = 0$

$\therefore$ $16(x^2 - 4x + 4) - 9(y^2 - 2y + 1) = 145$

$\therefore$ $\frac{(x-2)^2}{\frac{145}{16}} - \frac{(y-1)^2}{\frac{145}{9}} = 1,$

Comparing with $\frac{X^2}{a^2} - \frac{Y^2}{b^2} = 1$, we get

$X = x - 2$, $Y = y - 1$

$a^2 = \frac{145}{16}$, $b^2 = \frac{145}{9}$

$\therefore$ $e = \sqrt{1 + \frac{b^2}{a^2}} = \sqrt{1 + \frac{16}{9}} = \frac{\pm 5}{3}$

Focus of the hyperbola, $\frac{X^2}{a^2} - \frac{Y^2}{b^2} = 1$ is, ($X = \pm$ ae, Y = 0)

i.e. $x - 2 = \pm\left(\frac{\sqrt{145}}{4} \times \frac{5}{3}\right)$, $y - 1 = 0$

i.e. $x - 2 = \pm \frac{5\sqrt{145}}{12}$, $y = 1$

i.e. $x = \frac{24 \pm 5\sqrt{145}}{12}$, $y = 1$

$\therefore$ Focus = $\left(\frac{24 \pm 5\sqrt{145}}{12}, 1\right)$

124. $\frac{x^2}{36} - \frac{y^2}{k^2} = 1$ is a hyperbola $\Rightarrow k^2 > 0$

Now, $\frac{y^2}{k^2} = \frac{x^2}{36} - 1 = \frac{x^2 - 36}{36}$

$\Rightarrow k^2 = \frac{36y^2}{x^2 - 36} > 0 \Rightarrow x^2 - 36 > 0$

$\Rightarrow x^2 > 36$

This is true only for point (10, 4).

$\therefore$ (10, 4) lies on given hyperbola.

125. $\frac{x^2}{12 - k} + \frac{y^2}{8 - k} = 1$

$\Rightarrow \frac{x^2}{12 - k} - \frac{y^2}{k - 8} = 1$

$\therefore$ 12 > k and k > 8

$\Rightarrow 8 < k < 12$

$\therefore$ the given equation represents a hyperbola, if 8 < k < 12.

126. Consider,

$x^2 - y^2 + 3x - 2y - 43 = 0$

Comparing with

$ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$, we get

$a = 1, h = 0, b = -1, g = \frac{3}{2}, f = -1, c = -43$

$\therefore$ $\Delta = abc + 2fgh - af^2 - bg^2 - ch^2$

$\therefore$ $\Delta = 43 + 0 - 1 + \frac{9}{4} - 0 = \frac{177}{4}$

$\therefore$ $\Delta \neq 0$

Also, $ab - h^2 = -1$

$\therefore$ $ab - h^2 < 0$

$\therefore$ $x^2 - y^2 + 3x - 2y - 43 = 0$ is the equation of hyperbola.

127. The given equation can be written as

$\frac{x^2}{\frac{32}{3}} - \frac{y^2}{8} = 1$

$\Rightarrow \frac{x^2}{\left(\frac{4\sqrt{2}}{\sqrt{3}}\right)^2} - \frac{y^2}{(2\sqrt{2})^2} = 1$

$\Rightarrow a = \frac{4\sqrt{2}}{\sqrt{3}}$

$\therefore$ Length of transverse axis of a hyperbola

$= 2a = 2 \times \frac{4\sqrt{2}}{\sqrt{3}} = \frac{8\sqrt{2}}{\sqrt{3}}$

128. $\frac{x^2}{9} - \frac{y^2}{4} = 1$

$\Rightarrow a^2 = 9, b^2 = 4$

$e = \frac{\sqrt{a^2 + b^2}}{a} = \frac{\sqrt{9 + 4}}{3} = \frac{\sqrt{13}}{3}$

directrix of hyperbola is $x = \frac{a}{e}$

$\Rightarrow x = \frac{3}{\frac{\sqrt{13}}{3}} \Rightarrow x = \frac{9}{\sqrt{13}}$

129. $x^2 - 4y^2 = 1$

$\Rightarrow \frac{x^2}{(1)^2} - \frac{y^2}{\left(\frac{1}{2}\right)^2} = 1$

$\Rightarrow a^2 = 1,\ b^2 = \left(\frac{1}{2}\right)^2$

Also, $b^2 = a^2(e^2 - 1)$

$\Rightarrow \frac{1}{4} + 1 = e^2 \Rightarrow e = \frac{\sqrt{5}}{2}$

130. Here a = b, so it is a rectangular hyperbola.
Hence, eccentricity $e = \sqrt{2}$

131. Let the equation of hyperbola be $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

Since, hyperbola passes through the points (3, 0), $(3\sqrt{2}, 2)$

$\therefore \quad \frac{9}{a^2} - 0 = 1$ and $\frac{18}{a^2} - \frac{4}{b^2} = 1$

$\Rightarrow a^2 = 9$ and $\frac{4}{b^2} = \frac{18}{a^2} - 1$

$\Rightarrow a^2 = 9$ and $\frac{4}{b^2} = \frac{18}{9} - 1$

$\Rightarrow a^2 = 9$ and $b^2 = 4$

Now, $e = \sqrt{1 + \frac{b^2}{a^2}} = \sqrt{1 + \frac{4}{9}} = \frac{\sqrt{13}}{3}$

132. Given length of LR = 8

$\Rightarrow \frac{2b^2}{a} = 8$

Also, $2b = \frac{1}{2} 2ae$

$\Rightarrow 4b^2 = a^2e^2 \Rightarrow 4a^2(e^2 - 1) = a^2e^2$

$\Rightarrow 4e^2 - e^2 = 4 \Rightarrow e = \frac{2}{\sqrt{3}}$

133. Eccentricity of hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$e = \sqrt{1 + \frac{b^2}{a^2}}$

$\Rightarrow e^2 = \frac{a^2 + b^2}{a^2}$ ….(i)

Eccentricity of hyperbola $\frac{y^2}{b^2} - \frac{x^2}{a^2} = 1$ is

$e_1 = \sqrt{1 + \frac{a^2}{b^2}}$

$\Rightarrow e_1^2 = \frac{b^2 + a^2}{b^2}$ …. (ii)

From (i) and (ii), we get

$\frac{1}{e_1^2} + \frac{1}{e^2} = 1$

134. The hyperbola is $\frac{x^2}{16} - \frac{y^2}{9} = 1$

$\therefore$ Difference of focal distance = 2a = 8

135. Since, distance between directrices = $\frac{2a}{e}$ and eccentricity of rectangular hyperbola = $\sqrt{2}$.

$\therefore$ Distance between directrices = $\frac{2a}{\sqrt{2}}$

Given, $\frac{2a}{\sqrt{2}} = 10$

$\Rightarrow 2a = 10\sqrt{2}$

Now, distance between foci = 2ae

$= (10\sqrt{2})(\sqrt{2})$

$= 20$

136. Given, $x = a\left(t + \frac{1}{t}\right)$

$\Rightarrow \frac{x}{a} = t + \frac{1}{t}$ ....(i)

and $y = b\left(t - \frac{1}{t}\right)$

$\Rightarrow \frac{y}{b} = t - \frac{1}{t}$ ....(ii)

Squaring and subtracting equation (ii) from (i), we get

$\frac{x^2}{a^2} - \frac{y^2}{b^2} = t^2 + 2 + \frac{1}{t^2} - t^2 + 2 - \frac{1}{t^2}$

$\Rightarrow \frac{x^2}{a^2} - \frac{y^2}{b^2} = 4$

which represents a hyperbola.

137. $x^2 - 2x - 4y^2 + 16y - 40 = 0$

$\Rightarrow (x^2 - 2x) - 4(y^2 - 4y) - 40 = 0$

$\Rightarrow (x - 1)^2 - 1 - 4[(y - 2)^2 - 4] - 40 = 0$

$\Rightarrow (x - 1)^2 - 4(y - 2)^2 = 25$

$\Rightarrow \frac{(x-1)^2}{25} - \frac{(y-2)^2}{\frac{25}{4}} = 1$, which is a hyperbola.

138. Given equation of lines are

$\sqrt{3}x - y - 4\sqrt{3}k = 0$

$\Rightarrow \sqrt{3}x - y = 4\sqrt{3}k$ ….(i)

and $\sqrt{3}kx + ky - 4\sqrt{3} = 0$

$\Rightarrow k(\sqrt{3}x + y) = 4\sqrt{3}$

$\Rightarrow \sqrt{3}x + y = \frac{4\sqrt{3}}{k}$ ....(ii)

Multiplying equation (i) and (ii), we get

$(\sqrt{3}x - y)(\sqrt{3}x + y) = 4\sqrt{3}k \times \frac{4\sqrt{3}}{k}$

$\Rightarrow 3x^2 - y^2 = 48$

$\Rightarrow \frac{x^2}{(48/3)} - \frac{y^2}{48} = 1$, which is a hyperbola.

139. Given equation of hyperbola is

$x^2 - y^2 + 1 = 0$

$\Rightarrow x^2 - y^2 = -1$

$\Rightarrow \frac{x^2}{1} - \frac{y^2}{1} = -1$

$\therefore$ $a^2 = 1, b^2 = 1$

$e = \sqrt{\frac{a^2 + b^2}{b^2}} = \sqrt{\frac{1+1}{1}} = \sqrt{2}$

$\therefore$ foci $\equiv (0, \pm be) \equiv (0, \pm\sqrt{2})$, and

centre $\equiv (0, 0)$

Centre of circle $\equiv (0, 0)$, radius of circle $= \sqrt{2}$

$\therefore$ Equation of circle is $x^2 + y^2 = 2$.

140. Hyperbola is $\frac{x^2}{144} - \frac{y^2}{81} = \frac{1}{25}$

$a = \sqrt{\frac{144}{25}}$,

$b = \sqrt{\frac{81}{25}}$

$\therefore$ $e_1 = \sqrt{1 + \frac{81}{144}} = \sqrt{\frac{225}{144}} = \frac{15}{12} = \frac{5}{4}$

$\therefore$ foci $= (ae_1, 0) = \left(\frac{12}{5} \times \frac{5}{4}, 0\right) = (3, 0)$

$\therefore$ focus of ellipse = (4e, 0)

Since, focus of ellipse and hyperbola is same

$\therefore$ (4e, 0) = (3, 0)

$\Rightarrow e = \frac{3}{4}$

Hence, $b^2 = 16\left(1 - \frac{9}{16}\right) = 7$

141. Eccentricity of ellipse $x^2 + 9y^2 = 9$ i.e.

$\frac{x^2}{9} + \frac{y^2}{1} = 1$

$(e_1)^2 = 1 - \frac{1}{9} = \frac{8}{9}$

Now, eccentricity of hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is,

$(e_2)^2 = 1 + \frac{b^2}{a^2} = \frac{9}{8}$

$\therefore$ $\frac{b^2}{a^2} = \frac{9}{8} - 1$ $\therefore$ $\frac{a^2}{b^2} = \frac{8}{1}$

142. The equation of the ellipse is $\frac{x^2}{4} + \frac{y^2}{1} = 1$

Let e be its eccentricity.

Then, $e = \sqrt{1 - \frac{1}{4}} = \frac{\sqrt{3}}{2}$

The foci of the ellipse are $S\left(\sqrt{3}, 0\right)$ and $S'\left(-\sqrt{3}, 0\right)$.

Eccentricity of the hyperbola $= \frac{1}{e} = \frac{2}{\sqrt{3}}$

$\therefore$ $b^2 = a^2\left(\frac{4}{3} - 1\right) = \frac{a^2}{3}$

The hyperbola passes through $S\left(\sqrt{3}, 0\right)$.

$\therefore$ $\frac{3}{a^2} - 0 = 1 \Rightarrow a^2 = 3 \Rightarrow a = \sqrt{3}$

$\therefore$ the co-ordinates of the foci of hyperbola are $(\pm 2, 0)$.

143. $x - 3y = 1$ ….(i)

and $x^2 - 4y^2 = 1$ ….(ii)

On solving (i) and (ii), we get

$A(1,0)$ and $B\left(-\frac{13}{5}, -\frac{6}{5}\right)$

These are the points of intersection of the straight line and hyperbola.

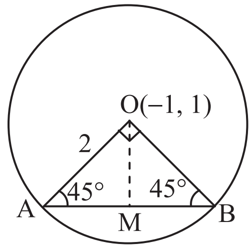
$\therefore$ Length of straight line intercepted by the hyperbola

$= \sqrt{\left(-\frac{13}{5} - 1\right)^2 + \left(-\frac{6}{5}\right)^2}$

$= \sqrt{\left(-\frac{18}{5}\right)^2 + \left(-\frac{6}{5}\right)^2} = \sqrt{\frac{324 + 36}{25}}$

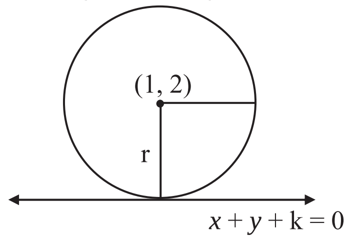
$= \sqrt{\frac{360}{25}} = \frac{6}{5}\sqrt{10}$ units

144. Given equation of circle
$x^2 + y^2 + 2x - 2y - 2 = 0$
$\Rightarrow (x + 1)^2 + (y - 1)^2 = 4$
$\therefore$ centre = (–1, 1), and radius = 2



$\sin 45° = \dfrac{OM}{OA}$
$\Rightarrow OM = \sqrt{2}$
$\therefore$ locus of the mid-points of the chord is
$(x + 1)^2 + (y - 1)^2 = \left(\sqrt{2}\right)^2$
$\Rightarrow x^2 + 2x + 1 + y^2 - 2y + 1 = 2$
$\Rightarrow x^2 + y^2 + 2x - 2y = 0$

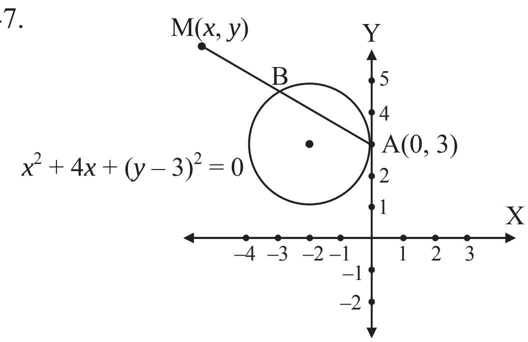
145.



Since, $x + y + k = 0$ touches the given circle.
$\therefore \left|\dfrac{1(1) + 1(2) + k}{\sqrt{1+1}}\right|$ = radius
$\Rightarrow \dfrac{3 + k}{\sqrt{2}} = \pm\sqrt{2} \Rightarrow k = -1$ or $k = -5$

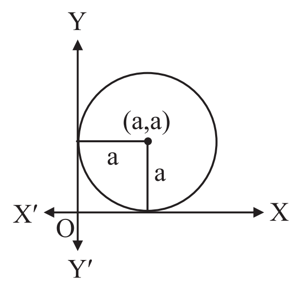
146. The diameter of the circle is perpendicular distance between the parallel lines (tangents)
Now, $3x - 4y + 4 = 0$ ….(i)
$6x - 8y - 7 = 0$
i.e., $3x - 4y - \dfrac{7}{2} = 0$ ….(ii)
Since, equation (i) and (ii) are parallel to each other.
$\therefore$ diameter $= \left|\dfrac{4 - \left(-\dfrac{7}{2}\right)}{\sqrt{(3)^2 + (-4)^2}}\right| = \dfrac{15}{2 \times 5} = \dfrac{3}{2}$
$\therefore$ radius $= \dfrac{3}{4}$

147.



Let M = (x, y)
Since, AM = 2AB
$\therefore \dfrac{AB}{AM} = \dfrac{1}{2}$
$\therefore$ B is the mid point of seg AM.
$\therefore B = \left(\dfrac{x}{2}, \dfrac{y+3}{2}\right)$
Since, B lies on circle $x^2 + 4x + (y - 3)^2 = 0$
$\therefore \left(\dfrac{x}{2}\right)^2 + 4\left(\dfrac{x}{2}\right) + \left(\dfrac{y+3}{2} - 3\right)^2 = 0$
i.e. $\dfrac{x^2}{4} + 2x + \dfrac{y - 6x + 9}{4} = 0$
i.e. $x^2 + y^2 + 8x - 6y + 9 = 0$
is the required locus of M.

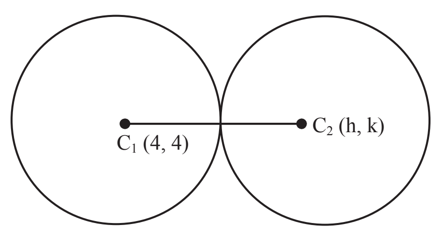
148. For given circle, $x^2 + y^2 - 2ax - 2ay + a^2 = 0$
Centre = (a, a)
Also, radius $= \sqrt{a^2 + a^2 - a^2} = a$



The above circle touches $x = 0$.

149. Given equation is $x^2 + y^2 - 6x + 2y = 0$.
Centre = (3, –1)
Since, diameter is passing through origin and (3, –1).
$\therefore$ option (A) is the correct answer.

150.



Given, $x^2 + y^2 - 8x - 8y - 4 = 0$
$\therefore (x^2 - 8x + 16) + (y^2 - 8y + 16) = 16 + 16 + 4$
$\Rightarrow (x - 4)^2 + (y - 4)^2 = 36$
Equation of circle touching X – axis
$(x - h)^2 + (y - k)^2 = k^2$
Since, both circle touches externally
$\therefore$ distance between their centre $= r_1 + r_2$
$\sqrt{(4 - h)^2 + (4 - k)^2} = 6 + k$

$\Rightarrow (4-h)^2 + (4-k)^2 = (6+k)^2$
$\Rightarrow (4-h)^2 = 36 + 12k + k^2 - 16 + 8k - k^2$
$\Rightarrow (4-h)^2 = 20k + 20$
This is equation of parabola
∴ answer is option (D)

151. Equations of tangents to the circle $x^2 + y^2 - 2x - 4y - 20 = 0$ with centre A(1, 2),
At, B(1, 7) is $y = 7$
At, C(4, –2) is $3x - 4y - 20 = 0$
These tangents intersect each other at D(16, 7).
∴ Area of quadrilateral BACD
= Area of ΔABD + Area of ΔACD
$= \frac{1}{2}(AB)(BD) + \frac{1}{2}(AC)(CD)$
...[∵ ∠ABD = ∠ACD = 90°]
$= \frac{1}{2} \times (5) \times (15) + \frac{1}{2} \times (5) \times (15)$
= 75 sq. units

152. $AB = \sqrt{(3+3)^2 + (3-5)^2}$
$= \sqrt{36+4} = \sqrt{40} = 2\sqrt{10}$
Centroid divides orthocentre and circumcentre in the ratio 2 : 1.

AB : BC = 2 : 1
$AC = \frac{3}{2}\ AB$
$= \frac{3}{2}\left(2\sqrt{10}\right) = 3\sqrt{10}$
radius $= \frac{1}{2}\ AC = \frac{1}{2}\left(3\sqrt{10}\right) = 3\sqrt{\frac{5}{2}}$

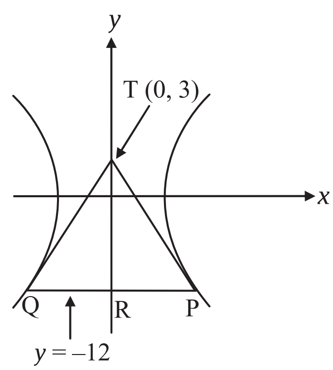
153. Given, $x + y = 0$ ….(i)
$x^2 + y^2 + 4y = 0$ ….(ii)
Solving (i) and (ii), we get
$x = 0, y = 0; x = 2, y = -2$
∴ parabola passes through (0, 0) and (2, –2). These points are satisfied by the parabola $y^2 = 2x$.

154. Given equation of ellipse is $\frac{x^2}{144} + \frac{y^2}{25} = 1$
$\Rightarrow$ a = 12, b = 5
Now, $e = \sqrt{1 - \frac{b^2}{a^2}} = \sqrt{1 - \frac{25}{144}} = \frac{\sqrt{119}}{12}$
∴ focus = (ae, 0) = $\left(\sqrt{119}, 0\right)$
∴ Radius $= \sqrt{\left(0-\sqrt{119}\right)^2 + \left(\sqrt{2}-0\right)^2} = 11$

155. $\frac{x^2}{16} + \frac{y^2}{12} = 1$
∴ centre of ellipse = (0, 0)
∴ centre of circle = (0, 0)
$y = 2x + \sqrt{76}$ …(i)
$2y + x = 8$ …(ii)
On solving (i) and (ii), we get
$x = \frac{8 - 2\sqrt{76}}{5},\ y = \frac{16 + \sqrt{76}}{5}$
Since (x, y) lies on the circle,
∴ radius $= \sqrt{(x-0)^2 + (y-0)^2}$
$= \sqrt{\left(\frac{8-2\sqrt{76}}{5}\right)^2 + \left(\frac{16+\sqrt{76}}{5}\right)^2}$
$= 2\sqrt{7}$
∴ Equation of circle is $x^2 + y^2 = \left(2\sqrt{7}\right)^2$
$\Rightarrow x^2 + y^2 = 28$

157. Midpoint of (4, 0) and (0, 4) is (2, 2).
Distance between (2, 2) and centre (0, 0)
$= \sqrt{2^2 + 2^2} = 2\sqrt{2}$

158. PQ is a chord of contact.
Equation of PQ is
$\frac{xx_1}{9} - \frac{yy_1}{36} = 1$
$\Rightarrow 0 - \frac{3y}{36} = 1 \Rightarrow y = -12$



Substituting $y = -12$ in $4x^2 - y^2 = 36$, we get $x = \pm 3\sqrt{5}$
$P\left(3\sqrt{5}, -12\right), Q\left(-3\sqrt{5}, -12\right)$, T (0, 3)
$PQ = 6\sqrt{5}$, TR = 15
Area of ΔPTQ $= \frac{1}{2} \times PQ \times TR$
$= \frac{1}{2} \times 6\sqrt{5} \times 15$
$= 45\sqrt{5}$ sq.units

Evaluation Test

1. Since the triangle is equilateral.

∴ centroid of the triangle is same as the circumcentre

and radius of the circumcircle $= \frac{2}{3}$ (median)

$= \frac{2}{3}(3a) = 2a$

Hence, the equation of the circumcircle whose centre is at (0, 0) and radius 2a is

$x^2 + y^2 = (2a)^2$

$\Rightarrow x^2 + y^2 = 4a^2$

2. Let the other end be $(t, 3-t)$.

∴ the equation of the circle in diameter form is

$(x-1)(x-t)+(y-1)(y-3+t)=0$

$\Rightarrow x^2 + y^2 - (1+t)x - (4-t)y + 3 = 0$

∴ the centre (h, k) is given by

$h = \frac{1+t}{2}, k = \frac{4-t}{2}$

$\Rightarrow 2h + 2k = 5$

Hence, the locus is $2x + 2y = 5$.

3. We have, $x^2 - 8x + 12 = 0$

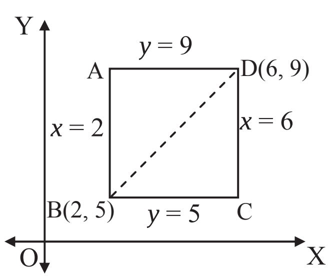
$\Rightarrow (x-6)(x-2) = 0$

$\Rightarrow x = 2, 6$

and $y^2 - 14y + 45 = 0$

$\Rightarrow (y-5)(y-9) = 0$

$\Rightarrow y = 5, 9$



Since, centre of circle is inscribed in square.

∴ BD is the diameter of circle

∴ centre = (h, k) = $\left(\frac{2+6}{2}, \frac{5+9}{2}\right)$ = (4, 7)

4. Let $A \equiv (x_1, y_1)$ and $B \equiv (x_2, y_2)$.

According to the given condition,

$x_1 + x_2 = -2a$, $x_1x_2 = -b^2$

$y_1 + y_2 = -2p$, $y_1y_2 = -q^2$

The equation of the circle with A (x_1, y_1) and B (x_2, y_2) as the end points of diameter is

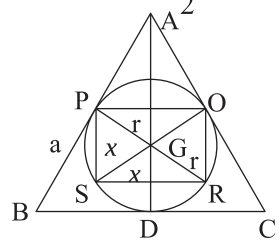
$(x - x_1)(x - x_2) + (y - y_1)(y - y_2) = 0$

$\Rightarrow x^2 + y^2 - x(x_1 + x_2) - y(y_1 + y_2) + x_1x_2 + y_1y_2 = 0$

$\Rightarrow x^2 + y^2 + 2ax + 2py - b^2 - q^2 = 0$

5. Let p be the altitude, then

$p = a\sin 60^\circ = \frac{a}{2}\sqrt{3}$.



Since, the triangle is equilateral, therefore centroid, orthocentre, circumcentre and incentre all coincide.

∴ radius of the inscribed circle $= \frac{p}{3} = \frac{a}{2\sqrt{3}} = r$

Let x be the side of the square inscribed, then angle in a semicircle being a right angle,

$x^2 + x^2 = (2r)^2 = 4r^2$

$\Rightarrow 2x^2 = \frac{4a^2}{12} = \frac{a^2}{3}$

∴ required area $= x^2 = \frac{a^2}{6}$

6. Given, parabola $y = x^2$ ....(i)

Straight line $y = 2x - 4$ ....(ii)

From (i) and (ii), $x^2 - 2x + 4 = 0$

Let $f(x) = x^2 - 2x + 4$

∴ $f'(x) = 2x - 2$

For least distance, $f'(x) = 0$

$\Rightarrow 2x - 2 = 0 \Rightarrow x = 1$

∴ $y = (1)^2 = 1$ ….[From (i)]

So the point least distance from the line is (1, 1).

7. For parabola, $y^2 = 8x$

$\Rightarrow 4a = 8 \Rightarrow a = 2$

vertex of $y^2 = 8x$ is $O \equiv (0, 0)$

Now, end points of latus rectum are

$L(a, 2a); L'(a, -2a) \Rightarrow L(2, 4); L'(2, -4)$

∴ the circle passes through the points (0,0), (2,4) and (2,–4).

All the three points are satisfied by the option (C).

∴ Option (C) is the correct answer.

8. Eccentricity of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is $e=\sqrt{\frac{a^2+b^2}{a^2}}$

Eccentricity of conjugate hyperbola is $e'=\sqrt{\frac{a^2+b^2}{b^2}}$

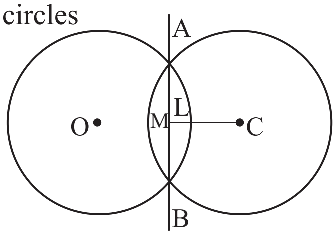
The given equation of hyperbola can be written as

$\frac{x^2}{1}-\frac{y^2}{\frac{1}{3}}=1$

Here, $a^2=1, b^2=\frac{1}{3}$

$\therefore$ $e'=\sqrt{\frac{1+\frac{1}{3}}{\frac{1}{3}}}=\sqrt{4}=2$

9. Let AB be the line of intersection of the two circles



$x^2+y^2=25$ ....(i)

$x^2+y^2-8x+7=0$ ....(ii)

Solving (i) and (ii), we get coordinates of A and B.

Subtracting (i) from (ii), we get

$-8x+32=0 \Rightarrow x=4$

From (i), we get $16+y^2=25$

$\Rightarrow y^2=9 \Rightarrow y=\pm3$

Thus coordinates of A and B are (4, 3) and (4, –3).

$\therefore$ equation of L is $\frac{y-3}{3+3}=\frac{x-4}{4-4} \Rightarrow x-4=0$

Also coordinates of centre C of second circle is (4, 0).

Hence, CM = Length of perpendicular from C to the line $L=\left|\frac{4-4}{\sqrt{1}}\right|=0$

10. Here $a^2 = 16$, $b^2 = 9$

But $b^2 = a^2(1 - e^2)$

$\therefore$ $9 = 16(1 - e^2)$

$\Rightarrow e^2 = 1 - \frac{9}{16}=\frac{7}{16} \Rightarrow e = \frac{\sqrt{7}}{4}$

Now, foci are (ae, 0), (–ae, 0)

i.e., $\left(\sqrt{7},0\right)$, $\left(-\sqrt{7},0\right)$

Centre of the circle is (0, 3)

$\therefore$ radius of the circle is

$=\sqrt{\left(\sqrt{7}-0\right)^2+\left(0-3\right)^2} = \sqrt{7+9} = 4$

11. The equation of the ellipse is $\frac{x^2}{4}+\frac{y^2}{1}=1$.

Let e be its eccentricity.

Then, $e = \sqrt{1-\frac{1}{4}}=\frac{\sqrt{3}}{2}$

The foci of the ellipse are $S\left(\sqrt{3},0\right)$ and $S'\left(-\sqrt{3},0\right)$.

Eccentricity of the hyperbola = $\frac{1}{e}=\frac{2}{\sqrt{3}}$

$\therefore$ $b^2 = a^2\left(\frac{4}{3}-1\right)=\frac{a^2}{3}$ ....(i)

The hyperbola passes through $S\left(\sqrt{3},0\right)$.

$\therefore$ $\frac{3}{a^2}-0 = 1 \Rightarrow a^2 = 3$

Putting $a^2 = 3$ in (i), we get

$b^2 = 1$

Hence, the equation of the hyperbola is $\frac{x^2}{3}-\frac{y^2}{1}=1$ i.e., $x^2 - 3y^2 = 3$.

12. Semi minor axis = b = 2

Semi major axis = a = 4

Equation of ellipse is $\frac{x^2}{a^2}+\frac{y^2}{b^2} = 1$

$\Rightarrow \frac{x^2}{16}+\frac{y^2}{4} = 1$

$\Rightarrow x^2 + 4y^2 = 16$

13. Given equation of circle is

$x^2 + y^2 - 4x - 8y - 5 = 0$

$\therefore$ Centre = (2, 4) and radius = $\sqrt{4+16+5} = 5$

the circle is intersecting the line $3x - 4y = m$ at two distinct points.

$\therefore$ length of perpendicular from centre on the line < radius

$\Rightarrow \left|\frac{6-16-m}{5}\right|<5$

$\Rightarrow |10 + m| < 25$

$\Rightarrow - 25 < m + 10 < 25 \Rightarrow - 35 < m < 15$

14. Let P = (1, 0) , Q(–1, 0) and A = (x, y)

Now, $\frac{AP}{AQ} = \frac{BP}{BQ} = \frac{CP}{CQ} = \frac{1}{3}$

$\Rightarrow \frac{AP}{AQ} = \frac{1}{3}$

$\Rightarrow 3AP = AQ \Rightarrow 9AP^2 = AQ^2$

$\Rightarrow 9(x-1)^2 + 9y^2 = (x+1)^2 + y^2$

$\Rightarrow 9x^2 - 18x + 9 + 9y^2 = x^2 + 2x + 1 + y^2$

$\Rightarrow 8x^2 - 20x + 8y^2 + 8 = 0$

$\Rightarrow x^2 + y^2 - \frac{5}{2}x + 1 = 0$ ....(i)

Since, points A, B and C lies on the circle

∴ Circumcentre of ABC = Centre of Circle (i)

$= \left(\frac{5}{4}, 0\right)$

15. 
Given equation of ellipse is

$x^2 + 4y^2 = 4 \Rightarrow \frac{x^2}{4} + \frac{y^2}{1} = 1 \Rightarrow a = 2, b = 1$

$\Rightarrow$ P(2, 1)

Let the required equation of ellipse is

$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

Since, the ellipse passes through (4, 0).

∴ a = 4

Also, it is passes through P(2, 1).

∴ $\frac{4}{16} + \frac{1}{b^2} = 1$

$\Rightarrow \frac{1}{b^2} = 1 - \frac{1}{4}$

$\Rightarrow b^2 = \frac{4}{3}$

∴ equation of ellipse becomes $\frac{x^2}{16} + \frac{3y^2}{4} = 1$

$\Rightarrow x^2 + 12y^2 = 16$

16. 
The lines $x - y - 2 = 0$ and $x - y + 2 = 0$ are parallel, and tangent to the circle.

Distance between them = diameter of the circle

$= \frac{2-(-2)}{\sqrt{1^2+1^2}} = \frac{4}{\sqrt{2}} = 2\sqrt{2}$

Let (h, k) be the centre of the circle.

Since, $x + y = 0$ is the diameter.

∴ h + k = 0

$\Rightarrow$ h = –k ....(i)

Now, perpendicular drawn from (h, k) to the $x - y - 2 = 0$ is equal to radius.

∴ $\left|\frac{h-k-2}{\sqrt{2}}\right| = \sqrt{2}$

∴ $\left|\frac{-k-k-2}{\sqrt{2}}\right| = \sqrt{2}$ ....[From (i)]

$\Rightarrow$ 2k + 2 = 2 k = 0

∴ h = 0 ....[From (i)]

∴ required equation of circle is

$(x-0)^2 + (y-0)^2 = \left(\sqrt{2}\right)^2$

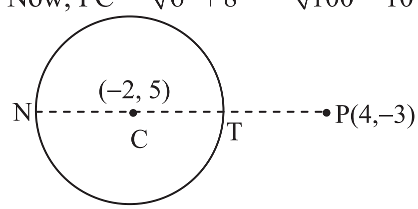
$\Rightarrow x^2 + y^2 = 2$

17. Centre of the given circle = C(–2, 5)

Radius of the circle CN = CT $= \sqrt{g^2 + f^2 - c}$

$= \sqrt{2^2 + 5^2 + 7} = \sqrt{36} = 6$

Now, PC = $\sqrt{6^2 + 8^2} = \sqrt{100} = 10$



We join the external point, (4, –3) to the centre of the circle (–2, 5). Then PT is the minimum distance, from external point P to the circle and PN is the maximum distance.

Minimum distance = PT = PC – CT = 10 – 6 = 4

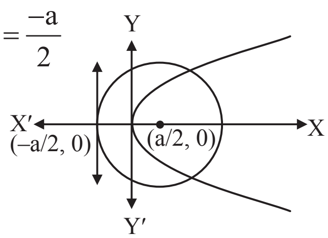
Maximum distance = PN = PC + CN = 10 + 6 = 16

So, sum of minimum and maximum distance = 16 + 4 = 20

18. General equation of circle
$f(x, y) = (x - h)^2 + (y - k)^2 - a^2 = 0$
$f(0, \lambda) = h^2 + (\lambda - k)^2 - a^2 = 0$
$\Rightarrow \lambda^2 - 2k\lambda + k^2 + h^2 - a^2 = 0$
Equation has equal roots (1, 1)
$\Rightarrow$ Sum of roots = $-\frac{b}{a} \Rightarrow 2 = 2k \Rightarrow k = 1$
Also, $f(\lambda, 0) = (\lambda - h)^2 + (0 - k)^2 - a^2 = 0$
$\lambda^2 - 2h\lambda + h^2 + k^2 - a^2 = 0$
Equation has roots $\lambda = \frac{1}{2}$ and 2
Sum of roots = $-\frac{b}{a} \Rightarrow \frac{5}{2} = 2h \Rightarrow h = \frac{5}{4}$
$\therefore$ Centre (h, k) = $\left(\frac{5}{4}, 1\right)$

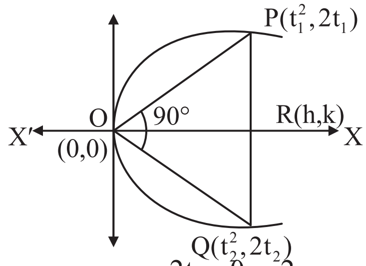
19. Here, $y = x^2 - 4x + 3$
$\Rightarrow y + 1 = x^2 - 4x + 4 \Rightarrow y + 1 = (x - 2)^2$
So, the vertex is (2, –1).
and for the circle, $x^2 + (y - 3)^2 = 9$
Centre = (0, 3)
Distance between vertex and centre
$= \sqrt{2^2 + (-4)^2} = 2\sqrt{5}$

20. Given parabola is $y^2 = 2ax$
$\therefore$ Focus (a/2, 0) and directrix is given by $x = -a/2$
Since, circle touches the directrix.
$\therefore$ Radius of circle = distance from the point (a/2, 0) to the line $x = \frac{-a}{2}$



$\therefore$ Radius $= \frac{\left|\frac{a}{2} + \frac{a}{2}\right|}{\sqrt{1}} = a$
$\therefore$ Equation of circle is
$\left(x - \frac{a}{2}\right)^2 + y^2 = a^2$ ....(i)
Also, $y^2 = 2ax$ ....(ii)
Solving (i) and (ii), we get
$x = \frac{a}{2}, -\frac{3a}{2}$
Putting these values in $y^2 = 2ax$ we get
$y = \pm a$ and $x = -3a/2$ gives imaginary values of y.
$\therefore$ Required points are $(a/2, \pm a)$.

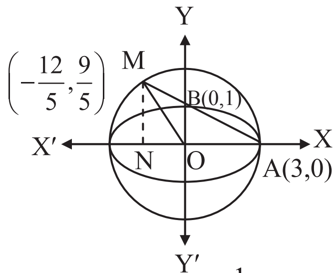
21. Let the coordinates of P and Q are $(t_1^2, 2t_1), (t_2^2, 2t_2)$ on parabola $y^2 = 4x$.



Slope of OP = $\frac{2t_1 - 0}{t_1^2 - 0} = \frac{2}{t_1}$
Slope of OQ = $\frac{2t_2 - 0}{t_2^2 - 0} = \frac{2}{t_2}$
Slope of OP × slope of OQ = –1
$\Rightarrow \frac{2}{t_1} \cdot \frac{2}{t_2} = -1 \Rightarrow t_1 t_2 = -4$ ….(i)
Let the coordinates of mid point of PQ are (h, k)
$\therefore$ $t_1^2 + t_2^2 = 2h$ ….(ii)
$t_1 + t_2 = k$ ….(iii)
Now, $(t_1 + t_2)^2 = t_1^2 + t_2^2 + 2t_1 t_2$
$\Rightarrow k^2 = 2h + 2(-4)$ ….[From (i), (ii) and (iii)]
$\Rightarrow y^2 = 2x - 8$, which is required locus.

22. According to the given condition,
$\sqrt{(x-2)^2 + y^2} + \sqrt{(x+2)^2 + y^2} = 8$ ….(i)
Squaring on both sides, we get
$(x - 2)^2 + y^2 = 64 + (x + 2)^2 + y^2 - 2 \times 8\sqrt{(x+2)^2 + y^2}$
$\Rightarrow -4x = 64 + 4x - 16\sqrt{(x+2)^2 + y^2}$
$\Rightarrow -x - 8 = -2\sqrt{(x+2)^2 + y^2}$
Put $y = 3$ in (i), we get
$-x - 8 = -2\sqrt{(x+2)^2 + 9}$
Squaring on both sides, we get
$x^2 + 64 + 16x = 4(x + 2)^2 + 36$
$3x^2 = 12$
$\Rightarrow x^2 = 4$
$\Rightarrow x = \pm 2$

23. Equation of auxiliary circle is $x^2 + y^2 = 9$ ….(i)
Equation of AB i.e., AM is $\frac{x}{3} + \frac{y}{1} = 1$ ….(ii)
Solving (i) and (ii), we get $M\left(-\frac{12}{5}, \frac{9}{5}\right)$



Now, area of $\Delta AOM = \frac{1}{2} \times OA \times MN$

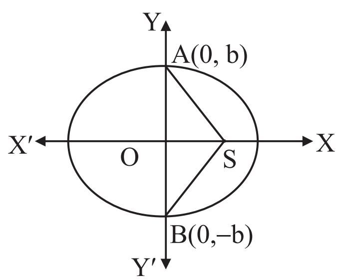
$$= \frac{1}{2} \times 3 \times \frac{9}{5} = \frac{27}{10} \text{ sq. unit.}$$

24. In the given figure, S is focus whose coordinates are (ae, 0).

$\because$ ΔABS is an equilateral triangle.

$\therefore$ Area of $\Delta ABS = \frac{1}{2} \times AB \times OS = \frac{\sqrt{3}}{4}(\text{side})^2$

$\Rightarrow \frac{1}{2} \times 2b \times ae = \frac{\sqrt{3}}{4}(2b)^2$



$\Rightarrow ae = \sqrt{3}\,b$ ….(i)

Also, $b^2 = a^2(1 - e^2)$

$\Rightarrow \left(\frac{ae}{\sqrt{3}}\right)^2 = a^2(1 - e^2)$ ....[From (i)]

$\Rightarrow e^2 = 3 - 3e^2$

$\Rightarrow e = \frac{\sqrt{3}}{2}$

25. The auxiliary circle of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is $x^2 + y^2 = a^2$

Area of this circle = πa^2

$\therefore$ $\pi a^2 = 2 \times \pi ab$

$\Rightarrow a = 2b$

Eccentricity of ellipse = $\sqrt{1 - \frac{b^2}{a^2}}$

$$= \sqrt{1 - \frac{b^2}{4b^2}} = \frac{\sqrt{3}}{2}$$

26. Locus of the point P, if A and B are fixed and PA + PB = constant, is an ellipse.

We have, PA + PB = 4, which is a constant.

$\therefore$ Locus of the point P is an ellipse.

27. Locus of the point P, if A and B are fixed and $\angle APB = \frac{\pi}{2}$, is a circle with diameter AB.

But, we have $PA^2 + PB^2$ = constant.

$\therefore$ Locus of the point P is a circle.

28. $y = 7x - 25$ ....(i)

and $x^2 + y^2 = 25$

$\therefore$ $x^2 + (7x - 25)^2 = 25$

$\Rightarrow x^2 + 49x^2 + 625 - 350x = 25$

$\Rightarrow 50x^2 - 350x + 600 = 0$

$\Rightarrow x^2 - 7x + 12 = 0 \Rightarrow x = 3, 4$

Substituting $x = 3,4$ in (i), we get

$y = 21 - 25 \Rightarrow y = -4$, $y = 28 - 25 \Rightarrow y = 3$

Let A ≡ (3, –4), B ≡ (4, 3)

Using distance formula, we get

$AB = \sqrt{(3-4)^2 + (-4-3)^2}$

$= \sqrt{1 + 49} = \sqrt{50} = 5\sqrt{2}$

46. $f(x) = x^2 + \frac{1}{x}$
$f\left(\frac{1}{x}\right) = \left(\frac{1}{x}\right)^2 + \frac{1}{\left(\frac{1}{x}\right)} = \frac{1}{x^2} + x$

$= 4(a +1) - (a + 1)^2 - [4(a - 1) - (a - 1)^2]$
$= 4(2 - a)$

52. $\frac{3x^2 + 7x - 1}{3} = x^2 + \frac{7}{3}x - \frac{1}{3}$ is a polynomial function.

55. As f (b) is not defined, f is not a function.

$\Rightarrow f^{-1}(y) = \frac{y+3}{2} \Rightarrow f^{-1}(x = \frac{x+3}{2}$

57. $g[f(x)] = 5[f(x)] - 6 = 5x^2 - 6$

58. Since $f(x) = 3x - 1$, $g(x) = x^2 + 1$
$\therefore$ $f[g(x)] = 3[g(x)] - 1 = 3[x^2 + 1] - 1 = 3x^2 + 2$

59. $f(f(x)) = f(x^2 + 1) = (x^2 + 1)^2 + 1 = x^4 + 2x^2 + 2$

Hence, $D_f = \left(\frac{7}{5}, \infty\right)$

67. $f(x) = \frac{(x-2)(x-1)}{(x-2)(x+3)}$
Hence, domain is $\{x : x \in R, x \ne 2, x \ne -3\}$.

68. For $x = -3, 3$, $|x^2 - 9| = 0$
Therefore, $\log|x^2 - 9|$ does not exist at $x = -3, 3$.
Hence, domain of function is $R - \{-3, 3\}$

69. $\log\left\{\frac{5x - x^2}{6}\right\} \ge 0 \Rightarrow \frac{5x - x^2}{6} \ge 1$
$\Rightarrow x^2 - 5x + 6 \le 0$ or $(x - 2)(x - 3) \le 0$.
Hence, $2 \le x \le 3$.

22. A = {4, 5}, B = {–6, –7}, C = {–7, 10}
(B ∩ C) = {–7} ⇒ A ∩ (B ∩ C) = ϕ

23. A = {x/6x^2 + x – 15 = 0}
∴ $6x^2 + x - 15 = 0$
$\Rightarrow (3x + 5)(2x - 3) = 0$
∴ $x = -\frac{5}{3}$ or $x = \frac{3}{2}$
$\Rightarrow A = \left\{-\frac{5}{3}, \frac{3}{2}\right\}$
Similarly, $B = \left\{1, \frac{3}{2}\right\}$ and $C = \left\{-1, \frac{3}{2}\right\}$
$A \cap B \cap C = \left\{\frac{3}{2}\right\}$

24. Let A ≡ set of persons who take tea and
B ≡ set of persons who take coffee
n(A ∪ B) = 50, n(A) = 35, n (B) = 25

Hence, n (A – B) = n (A) – n (A ∩ B)

25. P = Set of children who like pizza
B = Set of children who like burger
n(P) = 62, n(B) = 47, n(P ∩ B) = 36
(P ∩ B′) = Set of children who like pizza but not burger
∴ n(P ∩ B′) = n(P) – n(P ∩ B) = 62 – 36 = 26.

26. A = Set representing no. of consumers using Brand A, n(A) = 15
B = Set representing no. of consumers using Brand B, n(B) = 20
A ∩ B = Set representing no. of consumers using both the brands, n(A ∩ B) = 5
A ∪ B = Set representing no. of consumers using atleast one brand.
∴ n(A ∪ B) = n(A) + n(B) – n(A ∩ B) = 30

28. U = Universal set of all adults
M = Set of all males, F = Set of all females
V = Set of all vegetarians
Total number of adults = 20
Total number of males = 8
∴ Total number of females = 20 – 8 = 12
Total number of vegetarian = 9
Total number of male vegetarian = 5
∴ Total number of female vegetarian = 9 – 5 = 4
∴ Total number of female non-vegetarian
= 12 – 4 = 8

29. C = Set of students who play chess
T = Set of students who play table tennis
M = Set of students who play carrom
∴ n(X) = 120, n(C) = 46, n(T) = 30, n(M) = 40
n(C ∩ T) = 14, n(T ∩ M) = 10, n(C ∩ M) = 8,
n(C ∪ T ∪ M)′ = 30
∴ n(C ∪ T ∪ M) = n(X) – n(C ∪ T ∪ M)′ = 90

(C ∩ T ∩ M) = Set of students who play chess, table tennis and carrom.

∴ n(C ∪ T ∪ M)
$= n(C) + n(T) + n(M) - n(C \cap T) - n(T \cap M) - n(C \cap M) + n(C \cap T \cap M)$

∴ $A \cap B \neq \phi$

31. Let A denote the set of Americans, who like cheese and let B denote the set of Americans, who like apples.
Let Population of Americans be 100.
Then n(A) = 63, n(B) = 76
Now, $n(A \cup B) = n(A) + n(B) - n(A \cap B)$
$= 63 + 76 - n(A \cap B)$
∴ $n(A \cup B) + n(A \cap B) = 139$
$\Rightarrow n(A \cap B) = 139 - n(A \cup B)$
But, $n(A \cup B) \leq 100$
∴ $-n(A \cup B) \geq -100$
∴ $139 - n(A \cup B) \geq 139 - 100 = 39$
∴ $n(A \cap B) \geq 39$ i.e., $39 \leq n(A \cap B)$
Again, $A \cap B \subseteq A$, $A \cap B \subseteq B$
∴ $n(A \cap B) \leq n(A) = 63$ and
$n(A \cap B) \leq n(B) = 76$
∴ $n(A \cap B) \leq 63$
Then, $39 \leq n(A \cap B) \leq 63 \Rightarrow 39 \leq x \leq 63$

32. Since, $8^n - 7n - 1 = (7 + 1)^n - 7n - 1$

$({}^nC_0 = {}^nC_n, {}^nC_1 = {}^nC_{n-1}$ etc.)
$= 49[{}^nC_2 + {}^nC_3(7) + \ldots\ldots + {}^nC_n 7^{n-2}]$
∴ $8^n - 7n - 1$ is a multiple of 49 for $n \geq 2$
For n = 1, $8^n - 7n - 1 = 8 - 7 - 1 = 0$
For n = 2, $8^n - 7n - 1 = 64 - 14 - 1 = 49$
∴ $8^n - 7n - 1$ is a multiple of 49 for $n \in N$.
∴ X contains elements which are multiples of 49 and clearly Y contains all multiples of 49.
∴ $X \subseteq Y$

33. The given set is a cartesian product containing 6 elements. Only $A \times (B \cup C)$ contains 6 elements.

34. Here $1, 2, 3 \in A$ & $3, 5 \in B$
∴ $A \times B = \{1, 2, 3\} \times \{3, 5\}$
∴ The remaining elements are : (1, 5), (2, 3), (3, 5)

35. Clearly, A is the set of all first elements in ordered pairs in A × B and B is the set of all second elements in A × B.

36. $(1, 4), (2, 6), (3, 6) \in A \times B$
$\Rightarrow \{1, 2, 3\} \subset A$ and $\{4, 6\} \subset B$
∴ A has 3 elements and B has 2 elements.

37. Number of relations on the set A = Number of subsets of $(A \times A) = 2^{n^2}$, $[\because n(A \times A) = n^2]$.

38. $n(A \times A) = n(A).\, n(A) = 3^2 = 9$
So, the total number of subsets of A × A is 2^9 and a subset of A × A is a relation over the set A.

39. Since, $(-1, 0) \in A \times A$ and $(0, 1) \in A \times A$
∴ $(-1, 0) \in A \times A \Rightarrow -1, 0 \in A$
and $(0, 1) \in A \times A \Rightarrow 0, 1 \in A$
∴ $\{-1, 0, 1\} \in A$

41. $R_2 \subseteq A \times B$, so it is a relation from A to B.

42. Number of relations from A to B = $2^{o(A).o(B)}$

43. Since, $R = \{(x, y) | x, y \in Z, x^2 + y^2 \leq 4\}$
∴ R = {(–2, 0), (–1, 0), (–1, 1), (0 –1) (0, 1), (0, 2), (0, –2) (1, 0), (1, 1), (2, 0)}
Hence, Domain of R = {– 2, – 1, 0, 1, 2}.

46. Since R is an equivalence relation on set A, therefore $(a, a) \in R$ for all $a \in A$. Hence, R has at least n ordered pairs.

47. Let $(a, b) \in R$
Then, $(a, b) \in R \Rightarrow (b, a) \in R^{-1}$
$\Rightarrow (b, a) \in R$ ….$[\because R = R^{-1}]$
So, R is symmetric.

48. For any $a \in N$, we find that a|a, therefore R is reflexive but R is not symmetric, because aRb does not imply that bRa.

49. The relation is not symmetric, because $A \subseteq B$ does not imply that $B \subset A$. But it is anti-symmetric because $A \subset B$ and $B \subset A \Rightarrow A = B$

50. The given relation is not reflexive and transitive but it is symmetric, because $x^2 + y^2 = 1 \Rightarrow y^2 + x^2 = 1$.

51. R is a relation from {11, 12, 13} to {8, 10, 12} defined by $y = x - 3 \Rightarrow x - y = 3$
∴ R = {11, 8},{13, 10}.
Hence, R^{-1} = {(8, 11), (10, 13)}

52. We have, R = {(1, 3); (1, 5); (2, 3); (2, 5); (3, 5); (4, 5)}
R^{-1} = {(3, 1), (5, 1), (3, 2), (5, 2); (5, 3); (5, 4)}
Hence, RoR^{-1} = {(3, 3); (3, 5); (5, 3); (5, 5)}

53. $f(x) = f(x + 1)$

∴ $x^2 - 2x + 3 = (x + 1)^2 - 2(x + 1) + 3$

∴ $x^2 - 2x = x^2 + 2x + 1 - 2x - 2 \Rightarrow x = 1/2$

54. $f(x) = ax^2 + bx + 2$

∴ $f(1) = a(1)^2 + b(1) + 2 = a + b + 2$

But $f(1) = 3 \Rightarrow 3 = a + b + 2 \Rightarrow a + b = 1$ ….(i)

and $f(4) = a(4)^2 + b(4) + 2 = 16a + 4b + 2$

But $f(4) = 42 \Rightarrow 42 = 16a + 4b + 2$

∴ $40 = 16a + 4b \Rightarrow 4a + b = 10$ ….(ii)

By solving, (i) & (ii) a = 3 and b = – 2

55. $f(x) = x + \frac{1}{x} \Rightarrow f(x^3) = x^3 + \frac{1}{x^3}$

∴ $[f(x)]^3 = \left(x+\frac{1}{x}\right)^3 = \left(x^3+\frac{1}{x^3}\right) + 3\left(x+\frac{1}{x}\right)$

∴ $[f(x)]^3 = f(x^3) + 3f(x)$

∴ $[f(x)]^3 = f(x^3) + 3f\left(\frac{1}{x}\right) \Rightarrow \lambda = 3$

56. $a.f(x) + b.f\left(\frac{1}{x}\right) = \frac{1}{x} - 5$

On replacing x by $\frac{1}{x}$, $b.f(x) + a.f\left(\frac{1}{x}\right) = x - 5$

Solving two equations,

$f(x) = \frac{1}{a^2-b^2}\left(\frac{a}{x} - bx\right) - \frac{5}{a+b}$

∴ $f(2) = \frac{3(2b-3a)}{2(a^2-b^2)}$

58. As f (a) is not unique,

∴ f is not a function.

60. $[x] = I$ (Integers only).

61. Let $f(x) = x^2 + \sin^2 x$

Here, $f(-x) = f(x)$

∴ $f(x)$ is an even function.

62. If $f(x) = \sqrt{1+x+x^2} - \sqrt{1-x+x^2}$, then

$f(-x) = \sqrt{1-x+x^2} - \sqrt{1+x+x^2}$

∴ $f(-x) = -f(x)$

So, $f(x)$ is an odd function.

63. The general expression for the function satisfying $f(x + y) = f(x) f(y)$ for all $x, y \in R$ is $f(x) = [f(1)]^x = a^x$ for all $x, y \in R$. [$\because f(1) = a$]

64. $f^{-1}(y) = \{x \in R: y = f(x)\}$

$\Rightarrow f^{-1}(2) = \{x \in R: 2 = f(x)\}$

$= \{x \in R: x^2 - 3x + 4 = 2\}$

$= \{x \in R: x^2 - 3x + 2 = 0\} = \{1, 2\}$

65. $f(f(x)) = \frac{1}{1-f(x)} = \frac{1}{1-\frac{1}{1-x}} = \frac{x-1}{x}$

∴ $f[f(f(x))] = f\left(\frac{x-1}{x}\right) = \frac{x}{x-x+1} = x$

66. $f(x) = \frac{x+3}{4x-5}$

∴ $f(t) = \frac{t+3}{4t-5} = \frac{\left(\frac{3+5x}{4x-1}\right)+3}{4\left(\frac{3+5x}{4x-1}\right)-5} = x$

67. (gof) (1) = g (f (1)) = g (4) = 8,

(gof) (2) = g (f (2)) = g (5) = 7

and (gof) (3) = g (f (3)) = g (6) = 9

68. $f(x) = \frac{x-1}{x+1} \Rightarrow \frac{f(x)+1}{f(x)-1} = \frac{2x}{-2}$

$\Rightarrow x = \frac{1+f(x)}{1-f(x)}$

∴ $f(\alpha x) = \frac{\alpha x-1}{\alpha x+1} = \frac{(\alpha+1)f(x)+\alpha-1}{(\alpha-1)f(x)+\alpha+1}$

69. Given, $(gof)\left(-\frac{5}{3}\right) - (fog)\left(-\frac{5}{3}\right)$

$= g\left\{f\left(\frac{-5}{3}\right)\right\} - f\left\{g\left(\frac{-5}{3}\right)\right\}$

$= g(-2) - f\left(\frac{5}{3}\right) = 2 - 1 = 1$

70. $f(-1) = f(1) = 1$

∴ function is many-one function.

∴ f is neither one-one nor onto.

71. $f'(x) = \frac{1}{(1+x)^2} > 0 \ \forall x \in [0,\infty)$

and range $\in [0,1)$

$\Rightarrow$ function is one-one but not onto.

72. $f(x) = \frac{x-2}{x-3}, x \neq 3$

Let $y = f(x) \Rightarrow y = \frac{x-2}{x-3} \Rightarrow x = \frac{2-3y}{1-y}$

$\Rightarrow y \neq 1 \Rightarrow$ Range of $f(x)$ is $R - \{1\}$

So, f is onto

For one-one, let $f(x_1) = f(x_2)$

$\Rightarrow \frac{x_1-2}{x_1-3} = \frac{x_2-2}{x_2-3} \Rightarrow x_1 = x_2$

Hence, f is one-one.

73. Let $f(x_1) = f(x_2) \Rightarrow [x_1] = [x_2] \not\Rightarrow x_1 = x_2$
{For example, if $x_1 = 1.4$, $x_2 = 1.5$, then $[1.4] = [1.5] = 1$}
$\therefore$ f is not one-one.
Also, f is not onto as its range I (set of integers) is a proper subset of its co-domain R.

74. Let $x_1, x_2 \in R$, then $f(x_1) = \cos x_1$,
& $f(x_2) = \cos x_2$, Now $f(x_1) = f(x_2)$
$\Rightarrow \cos x_1 = \cos x_2 \Rightarrow x_1 = 2n\pi \pm x_2$
$\Rightarrow x_1 \neq x_2$,
$\therefore$ it is not one-one.
Again the value of f-image of x lies in between –1 to 1
$\Rightarrow f[R] = \{f(x) : -1 \le f(x) \le 1\}$
So other numbers of co-domain (besides –1 and 1) is not f-image. $f[R] \in R$, so it is also not onto. So this mapping is neither one-one nor onto.

75. $x^2 - 6x + 7 = (x - 3)^2 - 2$
Here, minimum value is – 2 and maximum ∞.
Hence, range of function is $[-2, \infty)$.

76. For domain, take $\frac{x}{1+x} \ge 0$
$\therefore$ $D_f = (-\infty, -1) \cup [0, \infty)$

77. $1 + x \ge 0$
$\Rightarrow x \ge -1;\ 1 - x \ge 0$
$\Rightarrow x \le 1, x \neq 0$
Hence, domain is $[-1, 1] - \{0\}$.

78. $y = \sin^{-1}\left[\log_3\left(\frac{x}{3}\right)\right]$
$\therefore$ $-1 \le \log_3\left(\frac{x}{3}\right) \le 1$ $\therefore$ $\frac{1}{3} \le \frac{x}{3} \le 3$
$\therefore$ $1 \le x \le 9$
$\therefore$ $x \in [1, 9]$

79. f(x) is defined, if
$x^2 - 5x + 6 \ge 0$ and $2x + 8 - x^2 \ge 0$
$\Rightarrow (x - 2)(x - 3) \ge 0$ and $(x - 4)(x + 2) \le 0$
$\therefore$ $x \in (-\infty, 2] \cup [3, \infty)$ and $x \in [-2, 4]$
$\therefore$ $x \in [-2, 2] \cup [3, 4]$

80. Domain of $f(x) = R - \{3\}$,
and for Range : $x \neq 3 \Rightarrow x < 3$ or $x > 3$
Now, $x < 3 \Rightarrow x - 3 < 0 \Rightarrow |x - 3| = -(x - 3)$
$\Rightarrow f(x) = \frac{-(x-3)}{x-3} = -1$
Similarly, for $x > 3$, $f(x) = 1$
$\therefore$ Range (f) = {1, –1}.

81. $\text{Dom(f)} = R - \left\{-\frac{2}{3}\right\}$
For Range(f), let $y = f(x) = \frac{1}{3x+2}$
$\therefore$ $3x + 2 = \frac{1}{y} \Rightarrow x = \frac{1}{3}\left(2 - \frac{1}{y}\right)$
x is real if $y \neq 0$. Hence, $R_f = R - \{0\}$

82. f(x) is defined for all $x \in R - \{0\}$.
So, dom(f) = R – {0}
Let $y = \frac{1+x^2}{x^2}$
$\Rightarrow x = \pm\sqrt{\frac{1}{y-1}}$
For x to be real, $y - 1 > 0 \Rightarrow y \in (1, \infty)$

83. f(x) is defined for all $x \in R$. So, dom(f) = R.
Let $y = f(x) \Rightarrow y = \frac{x}{1+x^2}$
$\therefore$ $x = \frac{1 \pm \sqrt{1 - 4y^2}}{2y}$
For x to be real, $1 - 4y^2 \ge 0$ and $y \neq 0$
$\Rightarrow -\frac{1}{2} \le y \le \frac{1}{2}$ and $y \neq 0$

84. f(x) is defined for $x^2 + x - 6 \neq 0$, i.e., $x \neq -3, 2$
$\therefore$ Dom(f) = R – {– 3, 2}
Let $y = \frac{x^2 - 3x + 2}{x^2 + x - 6} = \frac{x-1}{x+3}$
$\Rightarrow x = \frac{3y+1}{y-1}$
x is real for $y - 1 \neq 0$, i.e., $y \neq 1$
Hence, range(f) = R – {1}

85. Here, $f(x) = \sqrt{x^2 + x + 1}$
$\Rightarrow y^2 = x^2 + x + 1$
$\Rightarrow x^2 + x + (1 - y^2) = 0$
$\Rightarrow x = \frac{-1 \pm \sqrt{1 - 4(1 - y^2)}}{2}$
$\Rightarrow x = \frac{-1 \pm \sqrt{4y^2 - 3}}{2}$
For x real, $4y^2 - 3 \ge 0$
$\therefore$ $y \ge \pm\frac{\sqrt{3}}{2}$
$\therefore$ $R_f = \left[\frac{\sqrt{3}}{2}, \infty\right)$

and $2x = 6 \Rightarrow x = 3$
There is no value of x which satisfies both the above equations. Thus, $A = \phi$.

5. $|2x + 3| < 7 \Rightarrow -7 < 2x + 3 < 7$

$\Rightarrow \sqrt{x} = 0, 4$
$\Rightarrow x = 0, 16 \Rightarrow x = 16$
$\Rightarrow$ S contains exactly two elements.

7. The number of non- empty subsets $= 2^n - 1$
$= 2^4 - 1$ ....[$\because$ n = 4]
$= 15$.

8. Power set is the set of all subsets.
$n(A) = 5 \Rightarrow n(P(A)) = 2^5 = 32$

9. A = {4, 8, 12, 16, 20, 24, …..}
B = {6, 12, 18, 24, 30, …….}
$\therefore$ $A \subset B = \{12, 24, \ldots\} = \{x : x \text{ is a multiple of } 12\}$.

10. Given set is $\{(a, b) : 2a^2 + 3b^2 = 35, a, b \in Z\}$
We can see that, $2(\pm2)^2 + 3(\pm3)^2 = 35$
and $2(\pm4)^2 + 3(\pm1)^2 = 35$
$\therefore$ (2, 3), (2, –3), (–2, –3), (–2, 3), (4, 1), (4, –1), (–4, –1), (–4, 1) are 8 elements of the set.
$\therefore$ n = 8.

$(a_{10}, a_1), (a_{10}, a_2), (a_{10}, a_3), \ldots (a_{10}, a_{10})\}$
$\because$ $x \ne y$, removing groups with same elements i.e. $(a_1, a_1), (a_2, a_2) \ldots (a_{10}, a_{10})$, we get
$n(A) = 9 \times 10 = 90$

12. n (S) = 10
$\therefore$ Number of subsets of S which do not contain the element 6

$= 2^9 = 512$

13. Since $2^m - 2^n = 56 = 8 \times 7 = 2^3 \times 7$
$\Rightarrow 2^n(2^{m-n} - 1) = 2^3 \times 7$
$\therefore$ n = 3 and $2^{m-n} = 8 = 2^3$
$\Rightarrow m - n = 3 \Rightarrow m - 3 = 3 \Rightarrow m = 6$
$\therefore$ m = 6, n = 3

14. $O(S) = O\left(\bigcup_{i=1}^{30} A_i\right) = \frac{1}{10}(5 \times 30) = 15$
Since, element in the union S belongs to 10 of $A_i^{'}$s
Also, $O(S) = O\left(\bigcup_{j=1}^{n} B_j\right) = \frac{3n}{9} = \frac{n}{3}$
$\therefore$ $\frac{n}{3} = 15 \Rightarrow n = 45$

15. $A - (A - B) = A \cap (A \cap B^c)^c = A \cap (A^c \cup B)$
$= \phi \cup (A \cap B) = A \cap B$

16. $A = B \cap C, B = C \cap A$
$\Rightarrow$ A, B are equivalent sets.
….[$\because$ A and B are interchangeable in both equations]

18. $A \cap X = B \cap X = \phi$
$\therefore$ A and X, B and X are disjoint sets
Also, $A \cup X = B \cup X \Rightarrow A = B$

19. If $A \subseteq B$, then $A \cup B = B$
$\therefore$ $n(A \cup B) = n(B) = 6$

20. $n[(A \cap B)' \cap A]$
$= n[(A' \cup B') \cap A]$

$= n(A) - n(A \cap B) = 8 - 2 = 6$

21. $A = \{x \mid x \text{ is a root of } x^2 - 1 = 0\}$

$\Rightarrow x = 1$
$\Rightarrow A \cup B = A$

22. Since, $4^n - 3n - 1 = (3 + 1)^n - 3n - 1$

$= 3^n + {}^nC_1 \cdot 3^{n-1} + {}^nC_2 \cdot 3^{n-2} + \ldots + {}^nC_{n-1} \cdot 3 + {}^nC_n - 3n - 1$

$= {}^nC_2 3^2 + {}^nC_3 \cdot 3^3 + \ldots + {}^nC_n \cdot 3^3$ $\ldots\left[{}^nC_0 = {}^nC_n, {}^nC_1 = {}^nC_{n-1}, \text{etc.}\right]$

$= 9\left[{}^nC_2 = {}^nC_3(3) + \ldots + {}^nC_n \cdot 3^{n-1}\right]$

∴ $4^2 - 3n - 1$ is a multiple of 9 for $n \geq 2$.

for $n = 1$, $4^n - 3n - 1 = 4 - 3 - 1 = 0$,

for $n = 2$, $4^n - 3n - 1 = 16 - 6 - 1 = 9$,

∴ $4^n - 3n - 1$ is a multiple of 9 for all $n \in N$.

∴ X contains elements, which are multiples of 9, and clearly Y contains all multiples of 9.

∴ $X \subseteq Y$ i.e. $X \cap Y = X$

$= 20 - 17 = 3$

26. $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

$= 200 + 300 - 100$

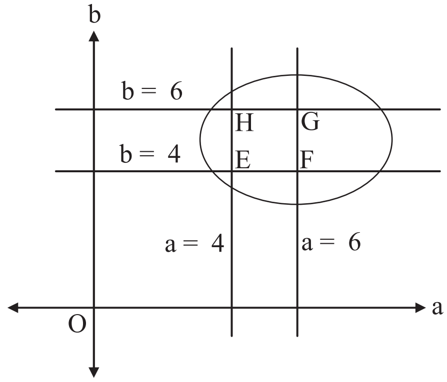
$\therefore$ $n(P \cap D) = 285 - 265 = 20$
$\therefore$ $n(P \cap D) - n(P \cap D \cap S) = 20 - 10 = 10$

41. $n(A) = 40\%$ of $10{,}000 = 4{,}000$
$n(B) = 20\%$ of $10{,}000 = 2{,}000$
$n(C) = 10\%$ of $10{,}000 = 1{,}000$
$n(A \cap B) = 5\%$ of $10{,}000 = 500$
$n(B \cap C) = 3\%$ of $10{,}000 = 300$
$n(C \cap A) = 4\%$ of $10{,}000 = 400$
$n(A \cap B \cap C) = 2\%$ of $10{,}000 = 200$
We want to find,
$n(A \cap B^c \cap C^c) = n[A \cap (B \cup C)^c]$
$= n(A) - n[A \cap (B \cup C)]$
$= n(A) - n[(A \cap B) \cup (A \cap C)]$
$= n(A) - [n(A \cap B) + n(A \cap C)$
$- n(A \cap B \cap C)]$
$= 4000 - [500 + 400 - 200]$
$= 4000 - 700 = 3300.$

42. Since, $y = e^x$ and $y = x$ do not meet for any $x \in R$
$\therefore$ $A \cap B = \phi$

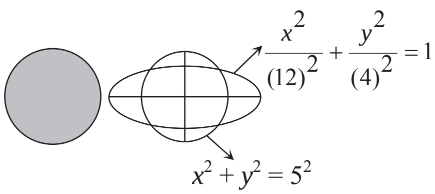
43. $|a - 5| < 1$ and $|b - 5| < 1$
$\Rightarrow 4 < a < 6$ and $4 < b < 6$
$4(a - 6)^2 + 9(b - 5)^2 \le 36$
$\Rightarrow \dfrac{(a-6)^2}{9} + \dfrac{(b-5)^2}{4} \le 1$



Set A represents square EFGH and Set B represents an ellipse.

$\Rightarrow A \subset B$

44. A = Set of all values $(x, y) : x^2 + y^2 = 25 = 5^2$



$B = \frac{x^2}{144} + \frac{y^2}{16} = 1$ i.e., $\frac{x^2}{(12)^2} + \frac{y^2}{(4)^2} = 1$

Clearly, $A \cap B$ consists of four points.

45. Let the original set contains (2n + 1) elements, then subsets of this set containing more than n elements, i.e., subsets containing (n + 1) elements, (n + 2) elements, ……. (2n + 1) elements.

$\therefore$ Required number of subsets

$= {}^{2n+1}C_{n+1} + {}^{2n+1}C_{n+2} + ... + {}^{2n+1}C_{2n} + {}^{2n+1}C_{2n+1}$

$= {}^{2n+1}C_{n} + {}^{2n+1}C_{n-1} + ... + {}^{2n+1}C_{1} + {}^{2n+1}C_{0}$

$= {}^{2n+1}C_{0} + {}^{2n+1}C_{1} + {}^{2n+1}C_{2} + ... + {}^{2n+1}C_{n-1} + {}^{2n+1}C_{n}$

$= \frac{1}{2}\left[(1+1)^{2n+1}\right] = \frac{1}{2}[2^{2n+1}] = 2^{2n}$.

46. Since, $4^n - 3n - 1 = (3 + 1)^n - 3n - 1$

$= 3^n + {}^nC_1 3^{n-1} + {}^nC_2 3^{n-2} + ….. + {}^nC_{n-1}3 + {}^nC_n - 3n - 1$

$= {}^nC_2 3^2 + {}^nC_3 .3^3 + …… + {}^nC_n 3^n$ ....$[{}^nC_0 = {}^nC_n, {}^nC_1 = {}^nC_{n-1}$ etc]

$= 9[{}^nC_2 + {}^nC_3(3) + …… + {}^nC_n 3^{n-1}]$

$\therefore$ $4^n - 3n - 1$ is a multiple of 9 for $n \geq 2$.

For n = 1, $4^n - 3n - 1 = 4 - 3 - 1 = 0$,

For n = 2, $4^n - 3n - 1 = 16 - 6 - 1 = 9$

$\therefore$ $4^n - 3n - 1$ is a multiple of 9 for all $n \in N$

$\therefore$ X contains elements, which are multiples of 9, and clearly Y contains all multiples of 9.

$\therefore$ $X \subseteq Y$ i.e., $X \cup Y = Y$.

47. $R = A \times B$.

48. $A - B = \{a\}, B \cap C = \{c, d\}$

$\therefore$ $(A - B) \times (B \cap C) = \{a\} \times \{c, d\}$
$= \{(a, c), (a, d)\}$

49. $R \times (P^c \cup Q^c)^c = R \times [(P^c)^c \cap (Q^c)^c]$

$= R \times (P \cap Q) = (R \times P) \cap (R \times Q)$

50. A = {2, 4, 6}; B = {2, 3, 5}

$\therefore$ $A \times B$ contains $3 \times 3 = 9$ elements.

Hence, number of relations from A to B = 2^9.

51. $n((A \times B) \cap (B \times A)) = n^2 = 99^2$.

52. n(A) = 4, n(B) = 2

$\therefore$ $n(A \times B) = 4 \times 2 = 8$

Required numbers = ${}^8C_3 + {}^8C_4 + …. + {}^8C_8$

$= 2^8 - ({}^8C_0 + {}^8C_1 + {}^8C_2)$

= 256 – 37

= 219

53. In option (D), ordered pair $(a, d) \notin A \times B$. Thus it is not a relation from A to B.

54. A relation is equivalence if it is reflexive, symmetric and transitive.

56. Total number of reflexive relations in a set with n elements = 2^n.

Therefore, total number of reflexive relation set with 4 elements = 2^4.

57. $x^2 - 4x^2 + 3x^2 = 0$

$\therefore$ $xRx \Rightarrow$ Reflexive

58. Given A = {2, 4, 6, 8};

R = {(2, 4)(4, 2) (4, 6) (6, 4)}

$(a, b) \in R \Rightarrow (b, a) \in R$ and also $R^{-1} = R$.

Hence, R is symmetric.

59. For any $a \in N$, we find a|a, therefore R is reflexive.

But, R is not symmetric, because aRb does not imply that bRa.

60. Here, (3, 3), (6, 6), (9, 9), (12, 12), [Reflexive]; (3, 6), (6, 12), (3, 12), [Transitive].

Hence, reflexive and transitive only.

61. since $(5, 5) \notin S$.

$\therefore$ The relation S is not reflexive

It is symmetric and transitive.

62.

Equivalence classes	Product
(1, 11)	1
(3, 13)	3
(5, 15)	5
(7, 17)	7
(9, 19)	9
(10, 20)	0
(12, 21) (2, 12) (2, 21)	2
(4, 14) (4, 22) (14, 22)	4
(16, 23) (6, 16) (6, 23)	6
(8, 18) (8, 24) (18, 24)	8

∴ There are 10 different equivalence classes.

63. Given A = {1, 2, 3, 4}
R = {(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)}
$(2, 3) \in$ R but $(3, 2) \notin$ R.
Hence, R is not symmetric.
R is not reflexive as $(1, 1) \notin$ R.
R is not a function as $(2, 4) \in$ R and $(2, 3) \in$ R.
R is not transitive as $(1, 3) \in$ R and $(3, 1) \in$ R but $(1, 1) \notin$ R.

64. For any $a \in R$, we have $a \geq a$. Therefore the relation R is reflexive, but it is not symmetric, as $(2, 1) \in$ R but $(1, 2) \notin$ R. The relation R is transitive also, because $(a, b) \in R$, $(b, c) \in R$ imply that $a \geq b$ and $b \geq c$ which is turn imply that $a \geq c$.

65. $|a - a| = 0 < 1$
∴ $a\,R\,a \ \forall\ a \in R$
∴ R is reflexive.
Again, $a\,R\,b \Rightarrow |a - b| \leq 1 \Rightarrow |b - a| \leq 1 \Rightarrow bRa$
∴ R is symmetric,
Again, $1R\frac{1}{2}$ and $\frac{1}{2}R1$ but $\frac{1}{2} \neq 1$
∴ R is not anti-symmetric.
Further, 1 R 2 and 2 R 3 but $1 \not R 3$,
$[\because |1 - 3| = 2 > 1]$
∴ R is not transitive.

66. $x\rho y$, $y\rho z \Rightarrow 2x + y = 41$ and $2y + z = 41$ which do not imply $2x + z = 41$

67. for option D, $x > |x|$ is not true hence not reflexive
Take $x = 2$, $y = -1$, clearly $x > |y|$ but $y > |x|$ does not hold, hence not symmetric
Now, Let $x > |y|$ and $y > |z| \Rightarrow x, y > 0$.
∴ Rewriting, $x > |y|$ and $y > |z| \Rightarrow x > |z|$
Hence transitive.

68. r = {(a, b)| $a, b \in R$ and $a - b + \sqrt{3}$ is an irrational no.}
Here, r is reflexive as $aRa = a - a + \sqrt{3} = \sqrt{3}$ which is an irrational no.
$\sqrt{3}\ r1 = \sqrt{3} - 1 + \sqrt{3} = 2\sqrt{3} - 1$, which is an irrational number.
But $1r\sqrt{3} = 1 - \sqrt{3} + \sqrt{3} = 1$ which is not an irrational number.
∴ $\sqrt{3}\ r\ 1 \not\Rightarrow \frac{1}{\sqrt{3}}$
∴ r is not symmetric.
Also, r is not transitive.
Since, $\sqrt{3}$ r 1 and 1 r $2\sqrt{3} \not\Rightarrow \sqrt{3}$ r $2\sqrt{3}$
∴ Option (B) is the correct answer.

69. On the set R;
$x\rho y \Leftrightarrow x - y = 0$ or $x - y \in Q'$
∵ $x - x = 0 \Rightarrow x\rho x$ (Reflexive)
if $x - y = 0 \Rightarrow y - x = 0$ or $x - y \in Q^c$
$\Rightarrow y - x \in Q'$ (Symmetric)
Take $x = 1 + \sqrt{2}$; $y = \sqrt{2} + \sqrt{3}$; $z = \sqrt{2} + 2$
$x - y = 1 - \sqrt{3} \in Q'$ and $y - z = \sqrt{3} - 2 \in Q'$
Here $x\rho y$ and $y\rho z$ but x is not related to z.
∴ Not transitive

70. Since, G. C. D. of a and a is 'a'
∴ if $a \neq 2$, then G. C. D. $\neq 2$
∴ R is not reflexive.
Let aRb
∴ G. C. D. of a, b = 2
i.e., (a, b) = 2
$\Rightarrow$ (b, a) = 2 $\Rightarrow$ G. C. D. of b, a = 2
∴ R is symmetric.
Again, let aRb and bRc
∴ G. C. D. of a, b = 2 and G. C. D. of b, c = 2 $\} \not\Rightarrow$ G. C. D of (a, c) = 2
∴ R is not transitive.

71. Here, R = {$(x, y) \in W \times W$: the words x and y have at least one letter in common}
R is reflexive as the words x and x have all letters in common.
Hence, R is reflexive.
Also, if $(x, y) \in R$ i.e., x and y have a common letter, then y and x also have a letter in common
∴ R is symmetric.

R is not transitive as $(x, y) \in$ R and $(y, \ ) \in$ R need not imply $(x, \ ) \in$ R
For example, let x = CANE, y = NEST and z = WITH
then $(x, y) \in$ R and $(y, z) \in$ R, but $(x, z) \notin$ R
∴ R is reflexive and symmetric but not transitive.

72. For reflexive, $\theta = \phi$, so $\sec^2\theta - \tan^2\theta = 1$,
∴ R is reflexive.
For symmetric, $\sec^2\theta - \tan^2\phi = 1$
so, $(1 + \tan^2\theta) - (\sec^2\phi - 1) \Rightarrow \sec^2\phi - \tan^2\theta = 1$
∴ R is symmetric
For transitive, Let $\sec^2\theta - \tan^2\phi = 1$ ....(i)
and $\sec^2\phi - \tan^2\gamma = 1$
∴ $1 + \tan^2\phi - \tan^2\gamma = 1$
$\Rightarrow \sec^2\theta - \tan^2\gamma = 1$ ....[From (i)]
∴ R is transitive.

73. $f(x) = \sqrt{x} \Rightarrow \dfrac{f(25)}{f(16)+f(1)} = \dfrac{\sqrt{25}}{\sqrt{16}+\sqrt{1}} = \dfrac{5}{5} = 1$

74. $f(x) = 2x, \quad x > 3$
$= x^2, \quad 1 < x \le 3$
$= 3x, \quad x \le 1$
∴ as, $x = -1$, $f(x) = f(-1) = 3(-1) = -3$
as, $x = 2$, $f(x) = f(2) = (2)^2 = 4$
as, $x = 4$, $f(x) = f(4) = 2(4) = 8$
∴ $f(-1) + f(2) + f(4) = 9$

75. Since, $f(x)\,f(y) = f(xy)$
∴ $f(1).f(2) = f(2)$
∴ $f(1).4 = 4$
∴ $f(1) = 1$ ...(i)
Also, $f(2).f\left(\dfrac{1}{2}\right) = f(1)$
∴ $4 \times f\left(\dfrac{1}{2}\right) = 1$ ...[From (i)]
∴ $f\left(\dfrac{1}{2}\right) = \dfrac{1}{4}$

76. Given, $f(x) = \cos(\log x) \Rightarrow f(y) = \cos(\log y)$
Then, $f(x).f(y) - \dfrac{1}{2}\left[f\left(\dfrac{x}{y}\right) + f(xy)\right]$
$= \cos(\log x)\cos(\log y) - \dfrac{1}{2}\left[\cos\left(\log\dfrac{x}{y}\right) + \cos(\log xy)\right]$
$= \cos(\log x)\cos(\log y) - \dfrac{1}{2}[2\cos(\log x)\cos(\log y)] = 0$

77. $f(x + 1) - f(x) = 8x + 3$
$\Rightarrow [b(x + 1)^2 + c(x + 1) + d] - (bx^2 + cx + d) = 8x + 3$
$\Rightarrow (2b)x + (b + c) = 8x + 3$
$\Rightarrow 2b = 8, b + c = 3$
$\Rightarrow b = 4, c = -1$

78. $f(x + y) + f(x - y$
$= \dfrac{1}{2}\left[a^{x+y} + a^{-x-y} + a^{x-y} + a^{-x+y}\right]$
$= \dfrac{1}{2}\left[a^{x}(a^{y} + a^{-y}) + a^{-x}(a^{y} + a^{-y})\right]$
$= \dfrac{1}{2}(a^{x} + a^{-x})\,(a^{y} + a^{-y}) = 2f(x)f(y)$

79. $f(x) = \log\left[\dfrac{1+x}{1-x}\right]$
∴ $f\left(\dfrac{2x}{1+x^2}\right) = \log\left[\dfrac{1+\dfrac{2x}{1+x^2}}{1-\dfrac{2x}{1+x^2}}\right] = \log\left[\dfrac{x^2+1+2x}{x^2+1-2x}\right]$
$= \log\left[\dfrac{1+x}{1-x}\right]^2 = 2\log\left[\dfrac{1+x}{1-x}\right] = 2f(x)$

80. $e^{f(x)} = \dfrac{10+x}{10-x}, x \in (-10, 10)$
$\Rightarrow f(x) = \log\left(\dfrac{10+x}{10-x}\right)$
$\Rightarrow f\left(\dfrac{200x}{100+x^2}\right) = \log\left[\dfrac{10+\dfrac{200x}{100+x^2}}{10-\dfrac{200x}{100+x^2}}\right]$
$= \log\left[\dfrac{10(10+x)}{10(10-x)}\right]^2$
$= 2\log\left(\dfrac{10+x}{10-x}\right) = 2f(x)$
∴ $f(x) = \dfrac{1}{2}f\left(\dfrac{200x}{100+x^2}\right) \Rightarrow k = \dfrac{1}{2} = 0.5$

81. $f(x) = \cos[\pi^2]x + \cos[-\pi^2]x$
$f(x = \cos(9x) + \cos(-10x)$
[∵ $\pi = 3.14$,
∴ [9.85] = 9 and [– 9.85] = – 10]
$= \cos(9x) + \cos(10x)$
$= 2\cos\left(\dfrac{19x}{2}\right)\cos\left(\dfrac{x}{2}\right)$

$\therefore \quad f\left(\frac{\pi}{2}\right) = 2\cos\left(\frac{19\pi}{4}\right)\cos\left(\frac{\pi}{4}\right);$

$\therefore \quad f\left(\frac{\pi}{2}\right) = 2\times\frac{-1}{\sqrt{2}}\times\frac{1}{\sqrt{2}} = -1$

83. $f(x) = f(-x) \Rightarrow f(0 + x) = f(0 - x)$ is symmetrical about $x = 0$.

$\therefore$ $f(2 + x) = f(2 - x)$ is symmetrical about $x = 2$.

84. $f = \{(1, 1), (2, 4), (0, -2), (-1, -5)\}$ be a linear function from Z to Z. The function satisfies the above points, if $f(x) = 3x - 2$

85. Here, $f(x) = \log\frac{1+x}{1-x}$

and $f(-x) = \log\left(\frac{1-x}{1+x}\right) = \log\left(\frac{1+x}{1-x}\right)^{-1}$

$= -\log\left(\frac{1+x}{1-x}\right) = -f(x) = f(-x)$

$\Rightarrow f(x)$ is an odd function.

86. Since, $f(x)$ is even.

$\therefore \quad f(-x) = f(x)$

$\therefore \quad \frac{a^{-x}-1}{(-x)^n\left(a^{-x}+1\right)} = \frac{a^x-1}{x^n\left(a^x+1\right)}$

$\Rightarrow \frac{1-a^x}{(-1)^n x^n\left(1+a^x\right)} = \frac{a^x-1}{x^n\left(a^x+1\right)}$

$\Rightarrow \frac{-1}{(-1)^n} = 1 \Rightarrow -1 = (-1)^n$

$\therefore \quad n = -\frac{1}{3}$ can satisfy the equation.

87. $f(-x) = \sec\left[\log\left(-x+\sqrt{1+(-x)^2}\right)\right]$

$= \sec\left[\log\left(-x+\sqrt{1+x^2}\right)\right]$

$= \sec\left[\log\left(\sqrt{1+x^2}-x\right)\right]$

$= \sec\left[\log\left(\frac{1+x^2-x^2}{\sqrt{1+x^2}+x}\right)\right]$

$= \sec\left[\log\left(\frac{1}{\sqrt{1+x^2}+x}\right)\right]$

$= \sec\left[-\log\left(\sqrt{1+x^2}+x\right)\right]$

$= \sec\left[\log\left(\sqrt{1+x^2}+x\right)\right]$

$\therefore \quad f(x)$ is an even function.

88. $f(x) = \sin\left(\log(x+\sqrt{1+x^2})\right)$

$\Rightarrow f(-x) = \sin[\log(-x+\sqrt{1+x^2})]$

$\Rightarrow f(-x) = \sin\log\left((\sqrt{1+x^2}-x)\frac{(\sqrt{1+x^2}+x)}{(\sqrt{1+x^2}+x)}\right)$

$\Rightarrow f(-x) = \sin\log\left[\frac{1}{(x+\sqrt{1+(x^2)})}\right]$

$\Rightarrow f(-x) = \sin\left[-\log(x+\sqrt{1+x^2})\right]$

$\Rightarrow f(-x) = -\sin\left[\log(x+\sqrt{1+x^2})\right]$

$\Rightarrow f(-x) = -f(x)$

$\therefore \quad f(x)$ is odd function.

89. $f(x) + 2f\left(\frac{1}{x}\right) = 3x \quad \ldots.\text{(i)}$

$\therefore \quad f\left(\frac{1}{x}\right) + 2f(x) = \frac{3}{x} \quad \ldots.\text{(ii)}$

From (i) and (ii), we get

$3f(x) = \frac{6}{x} - 3x$

$\Rightarrow f(x) = \frac{2}{x} - x \Rightarrow f(-x) = -\frac{2}{x} + x$

Since, $f(x) = f(-x)$

$\therefore \quad \frac{2}{x} - x = -\frac{2}{x} + x$

$\Rightarrow \frac{4}{x} = 2x \Rightarrow x^2 = 2 \Rightarrow x = \pm\sqrt{2}$

$\therefore$ option (B) is the correct answer.

90. Given expression $= \sum_{i=0}^{98}\left[\frac{2}{3}+\frac{i}{99}\right]$

$= \sum_{i=0}^{32}\left[\frac{2}{3}+\frac{i}{99}\right] + \sum_{i=33}^{98}\left[\frac{2}{3}+\frac{i}{99}\right]$

$= 0 + \sum_{i=33}^{98}\left[\frac{2}{3}+\frac{i}{99}\right]$

$\left[\because \frac{2}{3} \le \frac{2}{3}+\frac{i}{99} < 1\right.$ for $i = 0, 1, 2, \ldots, 32]$

$= 66$

[$\because$ each term in the summation is one or more but less than 2 when $i = 33, 34, 35, \ldots, 98$]

91. $f(x) = \frac{1}{2}(1 + \cos 2x) + \frac{1}{2}\left[1+\cos\left(\frac{2\pi}{3}+2x\right)\right]$

$$-\frac{2\cos x\cos\left(\frac{\pi}{3}+x\right)}{2}$$

$$= 1 + \frac{1}{2}\left[\cos 2x+\cos\left(\frac{2\pi}{3}+2x\right)\right.$$

$$\left.-\cos\left(2x+\frac{\pi}{3}\right)-\cos\left(\frac{\pi}{3}\right)\right]$$

$$= \frac{3}{4}+\frac{1}{2}\left[\cos 2x+\cos\left(2x+\frac{2\pi}{3}\right)\right.$$

$$\left.-\cos\left(2x+\frac{\pi}{3}\right)\right]$$

$$= \frac{3}{4}+\frac{1}{2}\left[\cos 2x-2\sin\left(2x+\frac{\pi}{2}\right)\sin\left(\frac{\pi}{6}\right)\right]$$

$$= \frac{3}{4}+\frac{1}{2}\left[\cos 2x-2\sin\left(\frac{\pi}{2}+2x\right).\frac{1}{2}\right]$$

$$= \frac{3}{4}+\frac{1}{2}\left[\cos 2x-\cos 2x\right]= \frac{3}{4}$$

92. $y = \frac{x+2}{x-1} \Rightarrow x = \frac{3}{y-1}+1 = \frac{y+2}{y-1} = f(y)$.

93. Function given by $f(x) = ax + b$

$f^{-1}(x) = \frac{x-b}{a}$

So, $g(y) = y - 3$

94. $f(x) = |x|$

$$f(x) = \begin{cases} x, & \text{if } x \geq 0 \\ -x, & \text{if } x < 0 \end{cases}$$

Therefore, the function $f^{-1}(x)$ does not exist.

95. Let $f(x) = y \Rightarrow x = f^{-1}(y)$

Now, $y = 3x - 5$

$\Rightarrow x = \frac{y+5}{3}$

$\Rightarrow f^{-1}(y) = x = \frac{y+5}{3}$

$\therefore$ $f^{-1}(x) = \frac{x+5}{3}$

Also f is one-one and onto, so f^{-1} exists and is given by $f^{-1}(x) = \frac{x+5}{3}$.

96. Let $f(x) = y \Rightarrow x = f^{-1}(y)$

Now, $y = 2x + 6$

$\Rightarrow 2x = y - 6$

$\Rightarrow x = \frac{y}{2}-3$

$\Rightarrow f^{-1}(y) = \frac{y}{2}-3$

$\Rightarrow f^{-1}(x) = \frac{x}{2}-3$

97. Let $f(x) = y \Rightarrow x = f^{-1}(y)$

Now, $y = x^3 + 5$

$\Rightarrow y - 5 = x^3$

$\Rightarrow x = (y-5)^{\frac{1}{3}}$

$\Rightarrow f^{-1}(y) = (y-5)^{\frac{1}{3}}$

$\Rightarrow f^{-1}(x) = (x-5)^{\frac{1}{3}}$

98. Let $f(x) = y \Rightarrow x = f^{-1}(y)$. Now,

$y = \frac{2x-1}{x+5}$, $(x \neq -5)$

$xy + 5y = 2x - 1 \Rightarrow 5y + 1 = 2x - xy$

$\Rightarrow x(2 - y) = 5y + 1 \Rightarrow x = \frac{5y+1}{2-y}$

$\Rightarrow f^{-1}(y) = \frac{5y+1}{2-y}$

$\therefore$ $f^{-1}(x) = \frac{5x+1}{2-x}$, $x \neq 2$

99. We have, $f(x) = \frac{5x}{4x+5}$, $x \in R - \left\{\frac{5}{4}\right\}$

Let $f(x) = y$

$\Rightarrow x = f^{-1}(y)$

$y = \frac{5x}{4x+5}$

$\Rightarrow 4xy + 5y = 5x$

$\Rightarrow 5y = 5x - 4xy = x(5 - 4y)$

$\Rightarrow x = \frac{5y}{5-4y}$

$g(y) = f^{-1}(y) = \frac{5y}{5-4y}$, $x \in R - \left\{\frac{5}{4}\right\}$

100. Given, $f(x) = 2^{x(x-1)}$

$\Rightarrow x(x-1) = \log_2 f(x)$

$\Rightarrow x^2 - x - \log_2 f(x) = 0$

$\Rightarrow x = \frac{1 \pm \sqrt{1+4\log_2 f(x)}}{2}$

Only $x = \frac{1+\sqrt{1+4\log_2 f(x)}}{2}$ lies in the domain

$\Rightarrow (y-2)\, e^{2x} + y - 2 = e^{2x} - 1$

$\Rightarrow e^{2x} = \frac{1-y}{y-3} = \frac{y-1}{3-y}$

$\Rightarrow 2x = \log_e \left(\frac{y-1}{3-y}\right)$

$\Rightarrow x = \frac{1}{2}\log_e \left(\frac{y-1}{3-y}\right)$

$\Rightarrow f^{-1}(y) = \frac{1}{2}\log_e\left(\frac{y-1}{3-y}\right)$

$\Rightarrow f^{-1}(x) = \log_e \left(\frac{x-1}{3-x}\right)^{\frac{1}{2}}$

102. Let $y = f(x) = \frac{10^x - 10^{-x}}{10^x + 10^{-x}}$

$\therefore \quad y = \frac{10^{2x}-1}{10^{2x}+1}$

$\Rightarrow 10^{2x} = \frac{1+y}{1-y}$

$\Rightarrow 2x = \log_{10}\frac{1+y}{1-y}$

$\Rightarrow f^{-1}(x) = \frac{1}{2}\log_{10}\frac{1+x}{1-x}$

103. Let $y = f(x) = \frac{16^x - 16^{-x}}{16^x + 16^{-x}}$

$\therefore \quad y = \frac{16^{2x}-1}{16^{2x}+1}$

$\Rightarrow 16^{2x} = \frac{1+y}{1-y}$

$\Rightarrow 2x = \log_{16}\frac{1+y}{1-y}$

$\Rightarrow x = \frac{1}{2}\log_{16}\frac{1+y}{1-y} \Rightarrow f^{-1}(y) = \frac{1}{2}\log_{16}\frac{1+y}{1-y}$

$\Rightarrow f^{-1}(x) = \frac{1}{2}\log_{16}\frac{1+x}{1-x}$

105. $f(2) = \frac{2}{2^2+1} = \frac{2}{5}$

$\therefore \quad f(f(2)) = f\left(\frac{2}{5}\right) = \frac{\frac{2}{5}}{\left(\frac{2}{5}\right)^2+1} = \frac{10}{29}$

106. Here, $f(2) = \frac{2+1}{2-1} = 3$

$\therefore \quad f(f(2)) = f(3) = \frac{3+1}{3-1} = \frac{4}{2} = 2$

$\therefore \quad f(f(f(2))) = f(2) = \frac{2+1}{2-1} = 3$

$= \left(25 - \frac{399}{16}\right)^{\frac{1}{4}} = \left(\frac{1}{16}\right)^{\frac{1}{4}} = \frac{1}{2}$

111. $f(x) = \dfrac{x-1}{x+1}$

$\Rightarrow \dfrac{f(x)+1}{f(x)-1} = \dfrac{2x}{-2}$

$\Rightarrow x = \dfrac{f(x)+1}{1-f(x)}$

$\therefore \quad f(2x) = \dfrac{2x-1}{2x+1} = \dfrac{2\left[\dfrac{f(x)+1}{1-f(x)}\right]-1}{2\left[\dfrac{f(x)+1}{1-f(x)}\right]+1} = \dfrac{3f(x)+1}{f(x)+3}$

112. $f(x) = \dfrac{\alpha x}{x+1}$;

$f(f(x)) = f\left(\dfrac{\alpha x}{x+1}\right) = \dfrac{\alpha\left(\dfrac{\alpha x}{x+1}\right)}{\dfrac{\alpha x}{x+1}+1}$

But $f(f(x)) = x$

$\therefore \quad \dfrac{\alpha^2 x}{\alpha x + x + 1} = x$

L.H.S, Put $\alpha = -1$,

$\therefore \quad \dfrac{(-1)^2 x}{(-1)x+x+1} = \dfrac{x}{-x+x+1} = x$;

$\therefore \quad \alpha = -1$

113. Given, $f(x) = ax + b$, $g(x) = cx + d$

and $f(g(x)) = g(f(x))$

$\Rightarrow f(cx + d) = g(ax + b)$

$\Rightarrow a(cx + d) + b = c(ax + b) + d$

$\Rightarrow ad + b = cb + d$

$\Rightarrow f(d) = g(b)$

114. $fog\,(x) = f\,[g(x)]$

$= f\left(x^{\frac{1}{3}}\right) = 8\left(x^{\frac{1}{3}}\right)^3$

$= 8x$

115. $(fog)\,(x) = f(g(x)) = f\left(\dfrac{x-1}{2}\right)$

$= 2\left(\dfrac{x-1}{2}\right) + 1 = x$

$\Rightarrow (fog)\,(x) = x \Rightarrow x = (fog)^{-1}(x)$

Hence, $(fog)^{-1}\left(\dfrac{1}{x}\right) = \dfrac{1}{x}$

$\therefore \quad 0 \le x - [x] < 1, \forall x \in R$

$\Rightarrow 1 \le 1 + x - [x] < 2, \forall x \in R$

$\Rightarrow 1 \le g(x) < 2, \forall x \in R$

Hence, $f(g(x)) = 1 \ \forall x \in R$

119. $g(f(x)) = g(|x|) = [|x|]$

and $f(g(x)) = f([x]) = |[x]|$

When $x \ge 0$, $[|x|] = [x] = |[x]|$

$\Rightarrow f(g(x)) = g(f(x))$

When $x < 0$, $[x] \le x < 0$

$\Rightarrow |[x]| \ge |x|$

$\Rightarrow |[x]| \ge |x| \ge [|x|]$ ....[$\because$ $[t] \le t$ for all t]

$\Rightarrow f(g(x)) \ge g(f(x))$

$\therefore \quad g(f(x)) \le f(g(x))$ for all $x \in R$

120. $(hofog)(x) = (hof)(g(x))$

$= (hof)\left(\sqrt{x^2+1}\right)$

$= h(x^2 + 1 - 1)$

$= h(x^2) = \begin{cases} 0 & , \text{if } x = 0 \\ x^2 & , \text{if } x \neq 0 \end{cases}$

121. Given,

$f(x) = \sin^2 x + \sin^2\left(x+\frac{\pi}{3}\right) + \cos\left(x+\frac{\pi}{3}\right)\cos x$

$= \frac{1}{2}\left\{1-\cos 2x + 1 - \cos\left(2x+\frac{2\pi}{3}\right) + \cos\left(2x+\frac{2\pi}{3}\right) + \cos\frac{\pi}{3}\right\}$

$= \frac{1}{2}\left[\frac{5}{2} - \left\{\cos 2x + \cos\left(2x+\frac{2\pi}{3}\right)\right\} + \cos\left(2x+\frac{\pi}{3}\right)\right]$

$\therefore$ $gof(x) = g[f(x)] = g\left(\frac{5}{4}\right)$

$= 1$ .... $\left[\because g\left(\frac{5}{4}\right) = 1\right]$

Hence, gof(x) is a constant function.

122. $(gof)(x) = \sin x^2 \Rightarrow (gogof)(x) = \sin(\sin x^2)$

$\Rightarrow (fogogof)(x) = (\sin(\sin x^2))^2 = \sin^2(\sin x^2)$

Now, $\sin^2(\sin x^2) = \sin(\sin x^2)$

$\Rightarrow \sin(\sin x^2) = 0, 1$

$\Rightarrow \sin x^2 = n\pi, (4n+1)\frac{\pi}{2}$ $n \in I$

$\Rightarrow \sin x^2 = 0 \Rightarrow x^2 = n\pi$

$\Rightarrow x = \pm\sqrt{n\pi}$ $n \in W$

123. $|x| = -x$, if $x < 0$

$= x$, if $x \geq 0$

Now, $(fog)(x) = f[g(x)]$

$= |g(x)| + g(x)$

$= ||x| - x| + |x| - x$

When, $x < 0$

$(fog)(x) = |-x - x| + (-x) - x$

$= -2x - 2x = -4x$

124. Let f(x) be periodic with period T.

Then, $f(x + T) = f(x)$ for all $x \in R$

$\Rightarrow x + T - [x + T] = x - [x]$. for all $x \in R$

$\Rightarrow x + T - x = [x + T] - [x]$

$\Rightarrow [x + T] - [x] = T$ for all $x \in R$

$\Rightarrow T = 1, 2, 3, 4, \ldots\ldots.$

The smallest value of T satisfying

$f(x + T) = f(x)$ for all $x \in R$ is 1.

Hence, $f(x) = x - [x]$ has period 1.

125. g(x) is neither injective nor surjective

$(gof)(x) = \left(e^x\right)^2 = e^{2x}$

This is an injective function.

126. At $x = 0$, f(x) is not defined.

128. $f(x) = f(y)$

$\Rightarrow x + 2 = y + 2 \Rightarrow x = y$

$\therefore$ Function f is one-one

129. Total number of distinct functions from $A \rightarrow A = n^n = 6^6$

Number of bijections = n! = 6!

$\therefore$ Number of functions which are not bijections $= 6^6 - 6!$

130. Number of bijective function from a set of 10 elements to itself is $^{10}P_{10}$.

So, required number = 10!

131. The total number of injective functions from a set A containing 3 elements to a set B containing 4 elements is equal to the total number of arrangements of 4 by taking 3 at a time i.e., $^4P_3 = 24$.

132. Number of injective mapping = $^5P_4 = 120$

133. $|x|$ is not one-one; x^2 is not one-one;

$x^2 + 1$ is not one-one. But $2x - 5$ is one-one because $f(x) = f(y) \Rightarrow 2x - 5 = 2y - 5 \Rightarrow x = y$

Now, $f(x) = 2x - 5$ is onto.

$\therefore$ $f(x) = 2x - 5$ is bijective.

134. Let $x_1, x_2 \in R$ such that $f(x_1) = f(x_2)$

$\Rightarrow x_1 = \pm x_2$

$\therefore$ $f(x_1) = f(x_2)$ does not impty that $x_1 = x_2$

$\therefore$ f is not one-one.

Consider an element 2 in the co-domain R.

There doesnot exist any x is domain R such that $f(x) = 2$.

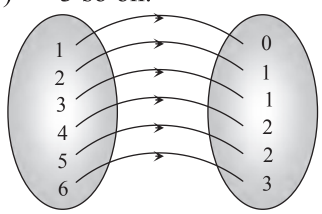
$\therefore$ f is not onto.

135. $f'(x) = 2 + \cos x > 0$. So, f(x) is strictly monotonic increasing so, f(x) is one-to-one and onto.

136. Let $x, y \in$ N such that $f(x) = f(y)$
Then, $f(x) = f(y) \Rightarrow x^2 + x + 1 = y^2 + y + 1$
$\Rightarrow (x - y)(x + y + 1) = 0$
$\Rightarrow x = y$ or $x = (-y - 1) \notin$ N
$\therefore$ f is one-one.
Again, since for each $y \in$ N, there exist $x \in$ N
$\therefore$ f is onto.

137. We have $f(x) = (x - 1)(x - 2)(x - 3)$ and $f(1) = f(2) = f(3) = 0 \Rightarrow f(x)$ is not one-one. For each $y \in$ R, there exists $x \in$ R such that $f(x) = y$. Therefore is onto. Hence, f : R $\to$ R is onto but not one-one.

138. f : N $\to$ I
$f(1) = 0, f(2) = -1, f(3) = 1, f(4) = -2, f(5) = 2$ and $f(6) = -3$ so on.



In this type of function every element of set A has unique image in set B and there is no element left in set B. Hence f is one-one and onto function.

139. f : N $\to$ N

$$f(n) = \begin{cases} \frac{n+1}{2} & \text{if n is odd} \\ \frac{n}{2} & \text{if n is even} \end{cases}$$

Now for n = 1, $f(1) = \frac{1+1}{2} = 1$

and if n = 2, $f(2) = \frac{2}{2} = 1$

$\therefore$ f (1) = f (2), But $1 \neq 2$.
$\therefore$ f (x) is not one-one.

$f(x) = \frac{n+1}{2}$ if n is odd

if $y = \frac{n+1}{2}$ then $n = 2y - 1, \forall y$

Also, $f(x) = \frac{n}{2}$ if n is even i.e., $y = \frac{n}{2}$

or $n = 2y \; \forall y$
$\therefore$ $f(x)$ is onto.

140. σ : N $\to$ Z
$\sigma(1) = 0, \sigma(2) = 1, \sigma(3) = -1, \sigma(4) = 2,$
$\sigma(5) = -2, \sigma(6) = 3, \sigma(7) = -3$
$\therefore$ σ is one-one and onto.

141. Function f : R $\to$ R is defined by $f(x) = e^x$. Let $x_1, x_2 \in$ R and $f(x_1) = f(x_2)$ or $e^{x_1} = e^{x_2}$ or $x_1 = x_2$. Therefore is one-one. Let $f(x) = e^x = y$. Taking log on both sides, we get $x = \log y$. We know that negative real numbers have no pre-image or the function is not onto and zero is not the image of any real number. Therefore function f is into.

142. Here, $(f - g)(x) = f(x) - g(x)$

$\therefore$ $(f - g)(x) = \begin{cases} x - 0 = x, & \text{if } x \text{ is rational} \\ 0 - x = -x, & \text{if } x \text{ is irrational} \end{cases}$

Let k = f – g
Let x, y be any two distinct real numbers.
Then, $x \neq y$
$\Rightarrow -x \neq -y$
Now, $x \neq y$
$\Rightarrow k(x) \neq k(y) \Rightarrow (f - g)(x) \neq (f - g)(y)$
$\Rightarrow$ f – g is one-one.
Let y be any real number
If y is a rational number, then
$k(y) = y$
$\Rightarrow (f - g)(y) = y$
If y is an irrational number , then
$k(-y) = y$
$\Rightarrow (f - g)(-y) = y$
Thus, every $y \in$ R (co-domain) has its pre-image in R (domain)
$\therefore$ f – g : R $\to$ R is onto.
Hence, f – g is one-one and onto.

143. Let $x, y \in$ R be such that
$f(x) = f(y)$
$\Rightarrow x^3 + 5x + 1 = y^3 + 5y + 1$
$\Rightarrow (x^3 - y^3) + 5(x - y) = 0$
$\Rightarrow (x - y)(x^2 + xy + y^2 + 5) = 0$

$$\Rightarrow (x - y)\left[\left(x + \frac{y}{2}\right)^2 + \frac{3y^2}{4} + 5\right] = 0$$

$$\Rightarrow x = y \text{ and } \left(x + \frac{y}{2}\right)^2 + \frac{3y^2}{4} + 5 \neq 0$$

$\therefore$ f : R $\to$ R is one-one
Let y be an arbitrary element in R (co-domain).
Then, $f(x) = y$ i.e., $x^3 + 5x + 1 = y$ has at least one real root, say β in R
$\therefore$ $\beta^3 + 5\beta + 1 = y$
$\Rightarrow f(\beta) = y$
Thus, for each $y \in$ R there exists $\beta \in$ R such that $f(\beta) = y$
$\therefore$ f : R $\to$ R is onto
Hence, f: R $\to$ R is one-one onto.

144. Since, f(x) and g(x) has same domain and co-domain A and B and $f(1) = (1)^2 - 1 = 0$

$g(1) = 2\left|1-\frac{1}{2}\right| - 1 = 2 \times \frac{1}{2} - 1 = 0$

$f(1) = 0 = g(1)$, $f(0) = 0 = g(0)$

$f(-1) = 2 = g(-1)$, $f(2) = 2 = g(2)$

$A = \{-1, 0, 1, 2\}$, $B = \{-4, -2, 0, 2\}$

∴ By definition, the two function are equal f = g

145. $-\sqrt{1+(-\sqrt{3})^2} \le (\sin x - \sqrt{3}\cos x) \le \sqrt{1+(-\sqrt{3})^2}$

∴ $-2 \le (\sin x - \sqrt{3}\cos x) \le 2$

∴ $-2 + 1 \le (\sin x - \sqrt{3}\cos x + 1) \le 2 + 1$

∴ $-1 \le (\sin x - \sqrt{3}\cos x + 1) \le 3$

i.e., range = [–1, 3]

∴ For f to be onto S = [–1, 3].

146. Given, $f(x) = \sin x$

∴ $f : R \to R$ is neither one-one nor onto as $R_f = [-1, 1]$.

$f : \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \to [-1, 1]$

is both one-one and onto.

$f : [0, \pi] \to [-1, 1]$

is neither one-one nor onto as

$R_f = [0, 1]$.

$f : \left[0, \frac{\pi}{2}\right] \to [-1, 1]$ is one-one but not onto as

$R_f = [0, 1]$.

147. Let $f(x) = \frac{x^2-1}{x^2+1} = \frac{x^2+1-2}{x^2+1} = 1-\frac{2}{x^2+1}$

∵ $x^2 + 1 > 1$;

∴ $\frac{2}{x^2+1} \le 2$

So $1-\frac{2}{x^2+1} \ge 1-2$;

∴ $-1 \le f(x) < 1$

Thus, f(x) has the minimum value equal to –1.

148. The quantity under root is positive, when

$-1-\sqrt{3} \le x \le -1+\sqrt{3}$.

149. The function $f(x) = \sqrt{\log(x^2-6x+6)}$ is defined, when $\log(x^2 - 6x + 6) \ge 0$

$\Rightarrow x^2 - 6x + x \ge 1 \Rightarrow (x - 5)(x - 1) \ge 0$

This inequality holds, if $x \le 1$ or $x \ge 5$. Hence, the domain of the function will be $(-\infty, 1] \cup [5, \infty)$.

150. Here, $x + 3 > 0$ and $x^2 + 3x + 2 \ne 0$

∴ $x > -3$ and $(x + 1)(x + 2) \ne 0$, i.e., $x \ne -1, -2$.

∴ Domain = $(-3, \infty) - \{-1, -2\}$.

151. $D_f = D_g \cap D_h$

where $g(x) = \frac{1}{\log_{10}(1-x)}$ and $h(x) = \sqrt{2+x}$

Now, $D_g = \{x \in R : 1 - x > 0, \log_{10}(1 - x) \ne 0\}$

$= \{x \in R : x < 1, 1 - x \ne 1\}$

$= \{x \in R : x < 1, x \ne 0\}$

and $D_h = \{x \in R : x + 2 \ge 0\}$

$= \{x \in R : x \ge -2\}$

∴ $D_f = [(-\infty, 1) - \{0\}] \cap [-2, \infty)$

$= [-2, 1) - \{0\}$

152. $f(x) = \log|\log x|$, f(x) is defined if $|\log x| > 0$ and $x > 0$ i.e., if $x > 0$ and $x \ne 1$

(∵ $|\log x| > 0$ if $x \ne 1$)

$\Rightarrow x \in (0, 1) \cup (1, \infty)$.

153. $\frac{1-|x|}{2-|x|} \ge 0$

$\Rightarrow \frac{|x|-1}{|x|-2} \ge 0$

$\Rightarrow |x| \le 1$ as $|x| > 2$

$\Rightarrow x \in (-\infty, -2) \cup (2, \infty) \cup [-1, 1]$

154. $f(x) = \sqrt{\log\frac{1}{|\sin x|}}$

$\Rightarrow \sin x \ne 0 \Rightarrow x \ne n\pi + (-1)^n 0$

$\Rightarrow x \ne n\pi$. Domain of $f(x) = R - \{n\pi, n \in I\}$.

155. f(x) is to be defined when $x^2 - 1 > 0$

$\Rightarrow x^2 > 1, \Rightarrow x < -1$ or $x > 1$ and $3 + x > 0$

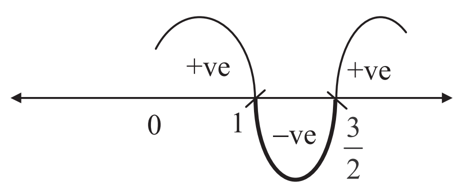
∴ $x > -3$ and $x \ne -2$

∴ $D_f = (-3, -2) \cup (-2, -1) \cup (1, \infty)$.

156. $f(x) = e^{\sqrt{5x-3-2x^2}}$

$\Rightarrow 5x - 3 - 2x^2 \ge 0$

$\Rightarrow (x - 1)\left(x-\frac{3}{2}\right) \le 0$



∴ $D_f = \left[1, \frac{3}{2}\right]$

157. To define f(x), $9 - x^2 > 0 \Rightarrow |x| < 3$
$\Rightarrow -3 < x < 3$, ...(i)
and $-1 \le (x - 3) \le 1$
$\Rightarrow 2 \le x \le 4$ .....(ii)
From (i) and (ii), $2 \le x < 3$ i.e., [2, 3).

158. $-1 \le 1 + 3x + 2x^2 \le 1$
Case I : $2x^2 + 3x + 1 \ge -1$; $2x^2 + 3x + 2 \ge 0$
$x = \dfrac{-3 \pm \sqrt{9-16}}{6} = \dfrac{-3 \pm i\sqrt{7}}{6}$ (imaginary).
Case II : $2x^2 + 3x + 1 \le 1$
$\Rightarrow 2x^2 + 3x \le 0 \Rightarrow 2x\left(x + \dfrac{3}{2}\right) \le 0$
$\Rightarrow \dfrac{-3}{2} \le x \le 0 \Rightarrow x \in \left[-\dfrac{3}{2}, 0\right]$
In case I, we get imaginary value hence, rejected
$\therefore$ Domain of function = $\left[\dfrac{-3}{2}, 0\right]$.

159. $f(x) = \sqrt{\cos^{-1}\left(\dfrac{1-|x|}{2}\right)}$
$\therefore -1 \le \dfrac{1-|x|}{2} \le 1$
$\Rightarrow -2 - 1 \le -|x| \le 2 - 1$
$\Rightarrow -3 \le |x| \le 1$
$\Rightarrow -1 \le |x| \le 3$
$\Rightarrow x \in [-3, 3]$

$\Rightarrow x^2 + 2\left(\dfrac{5}{2}\right)x + \left(\dfrac{5}{2}\right)^2 - \left(\dfrac{5}{2}\right)^2 + \dfrac{15}{2} \ge 0$
$\Rightarrow \left(x + \dfrac{5}{2}\right)^2 + \dfrac{5}{4} \ge 0$ and $x^2 + 5x + 6 \le 0$
$\Rightarrow (x + 3)(x + 2) \le 0 \Rightarrow x \in [-3, -2]$

161. $f(x) = \sqrt{9 - x^2}$
f(0) = 3, f(3) = 0
$\therefore 0 \le f(x) \le 3$
$\therefore x \in [0, 3]$

162. $f(x) = \dfrac{x+2}{|x+2|}$
$f(x) = \begin{cases} -1, & x < -2 \\ 1, & x > -2 \end{cases}$
$\therefore$ Range of f(x) is $\{-1, 1\}$.

$\Rightarrow x^2(1 - y) + 2(17 - y)x + (7y - 71) = 0$
For real value of x, $b^2 - 4ac \ge 0$
$\Rightarrow y^2 - 14y + 45 \ge 0 \Rightarrow y \ge 9, y \le 5$.

164. Dom (f) = R – {2}
For Range (f), let $y = f(x) = \dfrac{x^2 - 4}{x - 2}$
$\therefore y = \dfrac{(x-2)(x+2)}{(x-2)}$
$\therefore y = (x + 2)$
Since, Dom (f) = R – {2}
$\therefore x \ne 2$
$\therefore y \ne (2 + 2)$ i.e. $y \ne 4$
$\therefore$ Range (f) = R – {4}

165. Let $y = \dfrac{x^2 - x + 4}{x^2 + x + 4}$
$\Rightarrow (y - 1)x^2 + (y + 1)x + 4y - 4 = 0$
For real value of x, $b^2 - 4ac \ge 0$
$\Rightarrow (y + 1)^2 - 4(y - 1)(4y - 4) \ge 0$
$\Rightarrow -15y^2 + 34y - 15 \ge 0$
$\Rightarrow 15y^2 - 34y + 15 \ge 0$
$\Rightarrow \left(y - \dfrac{3}{5}\right)\left(y - \dfrac{5}{3}\right) \le 0$
$\Rightarrow \dfrac{3}{5} \le y \le \dfrac{5}{3}$

166. Since maximum and minimum values of cos – sin x are $\sqrt{2}$ and $-\sqrt{2}$ respectively, therefore range of f(x) is $[-\sqrt{2}, \sqrt{2}]$.

167. $\cos 2x + 7 = a(2 - \sin x) \Rightarrow a = \dfrac{\cos 2x + 7}{2 - \sin x}$
$\Rightarrow a = \dfrac{1 - 2\sin^2 x + 7}{2 - \sin x} = \dfrac{2(4 - \sin^2 x)}{2 - \sin x}$
$\Rightarrow a = 2(2 + \sin x)$
$\therefore a \in [2, 6]$ ….[$\because -1 \le \sin x \le 1$]

168. Let $y = \log_e(3x^2 + 4)$

$\Rightarrow 3x^2 + 4 = e^y \Rightarrow x^2 = \dfrac{e^y - 4}{3}$

Since, $x^2 \ge 0$

$\therefore \quad \dfrac{e^y - 4}{3} \ge 0 \Rightarrow e^y - 4 \ge 0 \Rightarrow y \ge \log_e 4$

$\Rightarrow e^{2y} = 4 - x^2 \Rightarrow x^2 = 4 - e^{2y} \Rightarrow x = \sqrt{4 - e^{2y}}$

$\therefore \quad 4 - e^{2y} \ge 0$

$\Rightarrow e^{2y} \le 4 \Rightarrow 2y \le \log_e 4$

$\Rightarrow y \le \dfrac{1}{2} \log_e 4 \Rightarrow y \le \log_e 2$

$\therefore \quad y \in (-\infty, \log_e 2]$

170. $f(\theta) = \begin{vmatrix} 1 & \tan\theta & 1 \\ -\tan\theta & 1 & \tan\theta \\ -1 & -\tan\theta & 1 \end{vmatrix}$

$\therefore \quad f(\theta) = 2\sec^2\theta \ge 2$

$\therefore \quad$ range of f is $[2, \infty)$.

171. $f(x) = \tan\sqrt{\dfrac{\pi^2}{9} - x^2}$

$\Rightarrow x^2 \le \dfrac{\pi^2}{9} \Rightarrow x \in \left[-\dfrac{\pi}{3}, \dfrac{\pi}{3}\right]$ = Domain of f(x)

When domain is in closed interval, we use differentiation method.

$f'(x) = \sec^2\sqrt{\dfrac{\pi^2}{9} - x^2} \cdot \dfrac{1}{2\sqrt{\dfrac{\pi^2}{9} - x^2}}(-2x)$

When $f'(x) = 0$, $x = 0$

Finding values of f(x) when $x = 0, -\dfrac{\pi}{3}, \dfrac{\pi}{3}$

[End points of domain]

$\therefore \quad f(0) = \tan\sqrt{\dfrac{\pi^2}{9}} = \sqrt{3}$ and $f\left(-\dfrac{\pi}{3}\right) = f\left(\dfrac{\pi}{3}\right) = 0$

$\therefore \quad$ Range of function = $\left[0, \sqrt{3}\right]$

Evaluation Test

1. Given, $g(x) = x^2 + x - 2$

and $\dfrac{1}{2}(gof)(x) = 2x^2 - 5x + 2$

$\Rightarrow g(f(x)) = 4x^2 - 10x + 4$

$\Rightarrow (f(x))^2 + f(x) - 2 = 4x^2 - 10x + 4$

$\Rightarrow (f(x))^2 + f(x) - (4x^2 - 10x + 6) = 0$

$\Rightarrow f(x) = \dfrac{-1 \pm \sqrt{1 + 16x^2 - 40x + 24}}{2}$

$= \dfrac{-1 \pm (4x - 5)}{2} = 2x - 3, -2x + 2$

2. $fog(x) = x^3 - \dfrac{1}{x^3}$

Since, $\left(x - \dfrac{1}{x}\right)^3 = x^3 - \dfrac{1}{x^3} - 3x.\dfrac{1}{x}\left(x - \dfrac{1}{x}\right)$

$\therefore \quad x^3 - \dfrac{1}{x^3} = \left(x - \dfrac{1}{x}\right)^3 + 3\left(x - \dfrac{1}{x}\right)$

Given, $f(g(x)) = x^3 - \dfrac{1}{x^3}$

$\therefore \quad f(g(x)) = \left(x - \dfrac{1}{x}\right)^3 + 3\left(x - \dfrac{1}{x}\right)$

$\therefore \quad f\left(x - \dfrac{1}{x}\right) = \left(x - \dfrac{1}{x}\right)^3 + 3\left(x - \dfrac{1}{x}\right)$

Put $x - \dfrac{1}{x} = t$

$\therefore \quad f(t) = t^3 + 3t \qquad \therefore \quad f(x) = x^3 + 3x$

$\therefore \quad f'(x) = 3x^2 + 3$

3. Given, $f(x + y) = f(x) + f(y) \ \forall \ x, y \in R$

$\Rightarrow f(2) = f(1+1) = f(1) + f(1) = 2f(1)$

$f(3) = f(2 + 1) = f(2) + f(1)$

$= 2f(1) + f(1) = 3f(1)$

Continuing in this way, we get

$f(r) = rf(1) \in N$

$\therefore \quad \sum_{r=1}^{n} f(r) = \sum_{r=1}^{n} rf(1) = f(1) \sum_{r=1}^{n} r$

$= 7(1 + 2 + 3 + ... + n)$

$= \dfrac{7n(n+1)}{2}$

4. Given, $f(x) = x^2 - 3$

$\therefore$ $f(-1) = (-1)^2 - 3 = -2$

$\Rightarrow (fof)(-1) = f(-2) = (-2)^2 - 3 = 1$

$\Rightarrow (fofof)(-1) = f(1) = 1^2 - 3 = -2$ ....(i)

Similarly, (fofof)(0) = 33 ....(ii)

and (fofof)(1) = –2 ....(iii)

From (i), (ii) and (iii), we get

(fofof)(–1) + (fofof)(0) + (fofof)(1)

$= -2 + 33 - 2 = 29 = f\left(4\sqrt{2}\right)$

5. $x = \left(\sqrt{3}+1\right)^5$

$= {}^5C_0\left(\sqrt{3}\right)^5 + {}^5C_1\left(\sqrt{3}\right)^4 + {}^5C_2\left(\sqrt{3}\right)^3 + {}^5C_3\left(\sqrt{3}\right)^2 + {}^5C_4\left(\sqrt{3}\right)^1 + {}^5C_5$

$= \left(\sqrt{3}\right)^5 + 5(9) + 10\left(3\sqrt{3}\right) + 30 + 5\sqrt{3} + 1$

$= 76 + 44\sqrt{3} = 152.20$

$\therefore$ $[x] = [152.20] = 152$

6. $f(x + y) = f(x) + f(y)$ .....(i)

Putting $x = y = 1$ in (i), we get

f(2) = 2f(1)

$\Rightarrow f(2) = 2(5)$ ....[$\because$ f(1) = 5(given)]

Putting $x = 2$ and $y = 1$ in (i), we get

f(3) = f(2) + f(1) = 3(5)

Similarly, f(4) = 4(5)

f(5) = 5(5)

...

...

...

f(100) = 100(5) = 500

7. For any $x \in (0, 2)$, $x \neq x + 1$

$\therefore$ $(x, x) \notin S$.

$\therefore$ S is not a reflexive relation.

So, S is not an equivalence relation.

$T = \{(x, y): x - y \text{ is an integer}\}$

For any $x \in R$,

$x - x = 0$, which is an integer.

$\Rightarrow (x, x) \in T$

$\therefore$ T is reflexive on R.

Let $(x, y) \in T$. Then,

$x - y$ is an integer

$\Rightarrow y - x$ is an integer

$\Rightarrow (y, x) \in T$

$\therefore$ T is symmetric on R.

Let $(x, y) \in T$ and $(y, z) \in T$.

Then, $x - y$ is an integer and $y - z$ is an integer

$\Rightarrow x - z$ is an integer

$\Rightarrow (x, z) \in T$

$\therefore$ T is transitive on R.

So, T is an equivalence relation on R.

8. Here, $(0, 3) \in R$, because $0 = 0 \times 3$

But, $(3, 0) \notin R$,

because $3 \neq$ (any rational number) $\times 0$

So, R is not a symmetric relation and hence it is not an equivalence relation.

$S = \left\{\left(\frac{m}{n}, \frac{p}{q}\right): \text{m, n, p and q are integers such that n, q} \neq 0 \text{ and } qm = pn\right\}$

Let m, n $\in$ Z such that n $\neq$ 0. Then,

$mn = nm \Rightarrow \frac{m}{n} = \frac{m}{n} \Rightarrow \left(\frac{m}{n}, \frac{m}{n}\right) \in S$

So, S is reflexive.

Let $\left(\frac{m}{n}, \frac{p}{q}\right) \in S$. Then,

$qm = pn \Rightarrow np = mq$

$\Rightarrow \left(\frac{p}{q}, \frac{m}{n}\right) \in S$

So, S is symmetric.

Let $\left(\frac{m}{n}, \frac{p}{q}\right) \in S$ and $\left(\frac{p}{q}, \frac{r}{s}\right) \in S$.

Then, qm = pn and sp = rq

$\Rightarrow$ (qm) (sp) = (pn) (rq)

$\Rightarrow sm = rn \Rightarrow \left(\frac{m}{n}, \frac{r}{s}\right) \in S$

So, S is transitive.

Hence, S is an equivalence relation.

9. $\theta \in P$

$\Rightarrow \sin\theta - \cos\theta = \sqrt{2}\cos\theta$

$\Rightarrow (\sin\theta - \cos\theta)^2 = 2\cos^2\theta$

$\Rightarrow \sin^2\theta + \cos^2\theta - 2\sin\theta\cos\theta = 2\cos^2\theta$

$\Rightarrow \cos^2\theta + 2\sin\theta\cos\theta + \sin^2\theta = 2\sin^2\theta$

$\Rightarrow (\cos\theta + \sin\theta)^2 = 2\sin^2\theta$

$\Rightarrow \cos\theta + \sin\theta = \sqrt{2}\sin\theta$

$\Rightarrow \theta \in Q$

$\therefore$ P = Q

Putting $x = 0$ and $y = 0$, we get
$f(0) = \{f(0)\}^2 - \{f(a)\}^2$
$\Rightarrow 1 = 1 - \{f(a)\}^2 \Rightarrow f(a) = 0$
Now, $f(2a-x) = f(a-(x-a))$
$= f(a)\,f(x-a) - f(a-a)\,f(a+x-a)$

Case I:
$\sin\theta \ge 0$ and $2\sin\theta - 1 \ge 0$
$\Rightarrow \sin\theta \ge 0$ and $\sin\theta \ge \frac{1}{2}$
$\Rightarrow \frac{\pi}{6} \le \theta \le \frac{5\pi}{6}$
$\therefore$ $A \cap B = \left\{\theta : \frac{\pi}{2} \le \theta \le \frac{5\pi}{6}\right\}$
....$\left[\because B = \left\{\theta : \frac{\pi}{2} \le \theta \le \frac{3\pi}{2}\right\}\right]$

$\Rightarrow \sin\theta \le 0$ and $\sin\theta \le \frac{1}{2}$
$\Rightarrow \pi \le \theta \le 2\pi$
$\therefore$ $A \cap B = \left\{\theta : \pi \le \theta \le \frac{3\pi}{2}\right\}$
....$\left[\because B = \left\{\theta : \frac{\pi}{2} \le \theta \le \frac{3\pi}{2}\right\}\right]$

Classical Thinking

1. $a = 21, d = 16 - 21 = -5$
$t_n = a + (n-1)d$
$\therefore$ $t_{15} = 21 + (15 - 1)(-5) = 21 - 70 = -49$

2. $a = \sqrt{3}$, $d = \sqrt{12} - \sqrt{3} = \sqrt{3}$
$\therefore$ $t_{10} = \sqrt{3} + 9\sqrt{3} = 10\sqrt{3} = \sqrt{300}$

3. Given series
$\left(3 - \frac{1}{n}\right) + \left(3 - \frac{2}{n}\right) + \left(3 - \frac{3}{n}\right) + ... \text{(A.P.)}$
Therefore, common difference
$d = \left(3 - \frac{2}{n}\right) - \left(3 - \frac{1}{n}\right) = -\frac{1}{n}$ and first term
$a = \left(3 - \frac{1}{n}\right)$
Now, p^{th} term of the series $= a + (p-1)d$
$= \left(3 - \frac{1}{n}\right) + (p-1)\left(-\frac{1}{n}\right)$
$= 3 - \frac{1}{n} + \frac{1}{n} - \frac{p}{n} = \left(3 - \frac{p}{n}\right)$

4. $d - c = e - d$
$\Rightarrow 2d = e + c$
$\Rightarrow 2d - 2c = e + c - 2c$
$\Rightarrow 2(d - c) = e - c$

5. a, b, c are in A.P., dividing by bc we get
$\frac{a}{bc}, \frac{1}{c}, \frac{1}{b}$ are in A.P.

6. $a = 3, d = 3$
Let there be n terms.
$\therefore$ $3 + (n-1)3 = 111$
$\Rightarrow n = 37$

7. $a = 72, d = -2$
Let n^{th} term be 40.
$\therefore$ $t_n = a + (n-1)d$
$\therefore$ $40 = 72 + (n-1)(-2)$
$\Rightarrow n = 17$

8. $d = -1 + 2i$, $t_4 = t_3 + d = 6 - 2i + (-1 + 2i) = 5$
which is purely real.

9. Given that, 9^{th} term $= a + (9-1)d = 0$
$\Rightarrow a + 8d = 0$
Now, ratio of 29^{th} and 19^{th} terms
$= \frac{a + 28d}{a + 18d} = \frac{(a + 8d) + 20d}{(a + 8d) + 10d} = \frac{20d}{10d} = \frac{2}{1}$

10. Let the first term and common difference of an A.P. be A and D respectively.
Now, p^{th} term $= A + (p-1)D = a$
q^{th} term $= A + (q-1)D = b$
and r^{th} term $= A + (r-1)D = c$
$\therefore$ $a(q - r) + b(r - p) + c(p - q)$
$= a\left\{\frac{b-c}{D}\right\} + b\left\{\frac{c-a}{D}\right\} + c\left\{\frac{a-b}{D}\right\}$

$\Rightarrow 406 = 2n^2 + n \Rightarrow 2n^2 + n - 406 = 0$
$\Rightarrow n = \frac{-1 \pm \sqrt{1 + 4.2.406}}{2.2} = \frac{-1 \pm \sqrt{3249}}{4}$

Let n be the number of terms in the A.P. on L.H.S. Then,

$x + 28 = (x + 1) + (n-1)\,3 \Rightarrow n = 10$

$\therefore$ $(x + 1) + (x + 4) + \ldots.. + (x + 28) = 155$

$\Rightarrow \frac{10}{2}[(x + 1) + (x + 28)] = 155$

$\Rightarrow x = 1$

21. $S_5 = \frac{1}{4}(S_{10} - S_5) \Rightarrow 5S_5 = S_{10}$

$\therefore$ $5 \times \frac{5}{2}(2 \times 2 + 4d) = \frac{10}{2}(2 \times 2 + 9d)$

$\Rightarrow d = -6$

then $A_1 - \frac{1}{3} = \frac{1}{24} - A_2$

$\Rightarrow A_1 + A_2 = \frac{3}{8}$ ......(i)

Now, A_1 is a arithmetic mean of $\frac{1}{3}$ and A_2.

$\therefore$ $2A_1 = \frac{1}{3} + A_2 \Rightarrow 2A_1 - A_2 = \frac{1}{3}$ ......(ii)

From (i) and (ii), we get $A_1 = \frac{17}{72}$ and $A_2 = \frac{5}{36}$

23. Let the two numbers be a and b and let $A_1, A_2, \ldots.., A_n$ be the n A.M.'s between them. Then a, $A_1, A_2, \ldots., A_n$, b are in A.P. and let d be the common difference.

Now, $T_{n+2} = b = a + (n + 2 - 1)d$

$\Rightarrow d = \frac{b-a}{n+1}$

Also, $A_1 + A_2 + \ldots..+ A_n = S_{n+1} - a$

$= \frac{1}{2}(n+1)\left[2a + (n+1-1)\frac{(b-a)}{(n+1)}\right] - a$

$= \frac{n}{2}[2a + (b-a)] = \frac{n}{2}(a+b) = n\left(\frac{a+b}{2}\right)$

$\therefore$ S = Na

24. Let the three numbers be a + d, a, a – d. therefore, a + d + a + a – d = 33

$\Rightarrow a = 11$

and $a(a + d)(a - d) = 792$

$\Rightarrow 11(121 - d^2) = 792 \Rightarrow d = 7$

The required numbers are 4, 11, 18.

Hence, the smallest number is 4.

25. $t_n = ar^{n-1} = 1.(2)^{n-1} = 2^{n-1}$

26. Given sequence is $\sqrt{2}, \sqrt{10}, \sqrt{50}$........

Common ratio $r = \sqrt{5}$, first term $a = \sqrt{2}$, then 7^{th} term

$t_7 = \sqrt{2}(\sqrt{5})^{7-1} = \sqrt{2}(\sqrt{5})^6 = \sqrt{2}(5)^3 = 125\sqrt{2}$

28. $t_n = ar^{n-1} = 1\left(\frac{1}{2}\right)^{n-1} = \left(\frac{1}{2}\right)^{n-1}$

29. $a = 3,\ r = \frac{\left(\frac{-3}{2}\right)}{3} = \frac{-1}{2}$

$\Rightarrow t_n = ar^{n-1} = 3\left(\frac{-1}{2}\right)^{n-1}$

30. Let r be common ratio of G.P.

$\Rightarrow t_3 = r^2,\ t_5 = r^4$

$\therefore$ $t_3 + t_5 = 90 \Rightarrow r^2 + r^4 = 90$

$\Rightarrow r^2 = 9$

$\Rightarrow r = \pm 3$

31. Accordingly, $ar^9 = 9$ and $ar^3 = 4$

$r^3 = \frac{3}{2}$ and $a = \frac{8}{3}$

$\therefore$ 7^{th} term i.e., $ar^6 = \frac{8}{3}\left(\frac{3}{2}\right)^2 = 6$

Trick : 7^{th} term is equidistant from 10^{th} and 4^{th} so it will be $\sqrt{9\times4} = 6$.

33. $t_3 = ar^{3-1} = ar^2 = 20$ and
$t_7 = ar^{7-1} = ar^6 = 320$
Solving, a = 5 and r = 2

34. a, 8, b are in G.P. and $a \neq b$

$\Rightarrow \frac{8}{a} = \frac{b}{8} \Rightarrow ab = 64$

and a, b, – 8 are in A.P.

$\Rightarrow b - a = -8 - b$

$\therefore$ $b = \left(\frac{a-8}{2}\right)$

Solving, a = 16 and b = 4

35. a = 5, r = 3

$S_n = \frac{a(r^n - 1)}{r-1} = \frac{5(3^n - 1)}{2}$

36. $a = 3$ and $r = \frac{12}{3} = 4 > 1$

$\therefore$ $S_n = a\left[\frac{r^n - 1}{r-1}\right] = 3\left[\frac{4^n - 1}{4-1}\right] = 4^n - 1$

38. a = 1, r = 3

$S_n = \frac{a(r^n - 1)}{r-1}$

$3280 = \frac{3^n - 1}{2}$

$6561 = 3^n$

$\Rightarrow 3^8 = 3^n \Rightarrow n = 8$

39. Let n be the number of terms needed.
For G.P. $2, 2^2, 2^3, \ldots$, a = 2, r = 2 and $S_n = 30$

$S_n = \frac{a(r^n - 1)}{r-1} \Rightarrow 30 = \frac{2(2^n - 1)}{2-1} \Rightarrow n = 4$

40. $S_8 = 82\ (S_4)$
Let the G.P. be $a + ar + ar^2 + \ldots$, then

$\frac{a(r^8 - 1)}{(r-1)} = 82\left\{\frac{a(r^4 - 1)}{r-1}\right\}$

$(r^4 - 1)(r^4 + 1) = 82(r^4 - 1)$

$\Rightarrow r^4 + 1 = 82$

$r^4 = 81$

$\Rightarrow r = 3$

41. $S_n = \frac{a(r^n - 1)}{r-1}$, r = 2

$\therefore$ $S_8 = \frac{a(2^8 - 1)}{2-1} \Rightarrow a(2^8 - 1) = 510 \Rightarrow a = 2$

$\therefore$ $t_3 = 2(2)^{3-1} = 2(2)^2 = 8$

42. $S_n = 2 + 22 + 222 + \ldots$ n terms

$= 2\,[1 + 11 + 111 + \ldots$ n terms]

$= \frac{2}{9}[(10 - 1) + (100 - 1) + (1000 - 1) + \ldots$ n terms]

$= \frac{2}{9}\left[10\left(\frac{10^n - 1}{10-1}\right) - n\right] = \frac{2}{9}\left[\frac{10}{9}(10^n - 1) - n\right]$

$= \frac{2}{81}[10(10^n - 1) - 9n]$

43. $S_n = 0.9 + 0.99 + 0.999 + \ldots$ n terms

$= 1 - 0.1 + 1 - 0.01 + 1 - 0.001 + \ldots$ n terms

$= 1 + 1 + 1 + \ldots$ n terms $- [0.1 + 0.01 + 0.001 + \ldots$ n terms]

$= n - 0.1\left[\frac{1-(0.1)^n}{1-0.1}\right]$

$= n - \frac{1}{9}[1 - (0.1)^n]$

$= \frac{9n - [1-(0.1)^n]}{9}$

44. $a = 2$, $S_\infty = 6$

Now, $S_\infty = \frac{a}{1-r}$

$\Rightarrow 6 = \frac{2}{1-r}$

$\Rightarrow 1 - r = \frac{1}{3}$

$\Rightarrow r = 1 - \frac{1}{3}$

$\Rightarrow r = \frac{2}{3}$

45. According to condition, $\frac{3/4}{1-r} = \frac{4}{3}$

$\Rightarrow r = \frac{7}{16}$

46. $\frac{g_1}{p} = \frac{q}{g_2} \Rightarrow g_1g_2 = pq$

47. Let 1,a, b, 64
$\Rightarrow a^2 = b$ and $b^2 = 64a$
$\Rightarrow a = 4$ and $b = 16$

48. Let the numbers be a, ar, ar^2
Sum = 70 $\Rightarrow a(1 + r + r^2) = 70$
It is given that 4a, 5ar, $4ar^2$ are in A.P.
$\therefore$ $2(5ar) = 4a + 4ar^2 \Rightarrow r = 2$ or $r = \frac{1}{2}$
Substituting values of r, a = 10 and a = 40
$\therefore$ The numbers are 10, 20, 40 or 40, 20, 10

49. Let numbers are $\frac{a}{r}$, a, ar
According to given conditions,
$\frac{a}{r} . a . ar = 216$
$\Rightarrow a = 6$
And, sum of product pairwise = 156
$\Rightarrow \frac{a}{r} . a + \frac{a}{r} . ar + a . ar = 156$
$\Rightarrow r = 3$
Hence, numbers are 2, 6, 18.
Trick : Since 2 × 6 × 18 = 216 (as given) and no other option gives the value.

50. Considering corresponding A.P.
a + 6d = 10 and a + 11d = 25 $\Rightarrow$ d = 3, a = – 8
$\Rightarrow t_{20} = a + 19d = -8 + 57 = 49$
Hence, 20^{th} term of the corresponding H.P. is $\frac{1}{49}$.

53. $\because$ H < G < A

54. (A.M.) (H.M.) = $(G.M)^2$
$\Rightarrow 9. 36 = (G.M)^2 \Rightarrow$ G.M. = 18

56. $G^2 = AH$
$\Rightarrow 144 = 25H$
$\Rightarrow H = 5.76$

58. Let $S = 1 + 3x + 5x^2 + 7x^3 + ...$
Then, $xS = 1x + 3x^2 + 5x^3 + ...$
$S - xS = 1 + 2x + 2x^2 + 2x^3 + ...$ to ∞
$\therefore$ $S(1 - x) = 1 + 2x + 2x^2 + 2x^3 + ...$ to ∞
$= 1 + \frac{2x}{1-x} = \frac{1-x+2x}{1-x}$
$\therefore$ $S = \frac{1+x}{(1-x)^2}$

59. Here a = 3, d = 2 and r = r
Now $S_\infty = \frac{a}{1-r} + \frac{dr}{(1-r)^2} \quad (|r| < 1)$
$\therefore$ $S_\infty = \frac{3}{1-r} + \frac{2r}{(1-r)^2}$ $\therefore$ $\frac{44}{9} = \frac{3-r}{(1-r)^2}$
$\therefore$ $44r^2 - 79r + 17 = 0$
$\therefore$ $r = \frac{1}{4}$ or $\frac{17}{11}$
But, $r \neq \frac{17}{11}$
$\therefore$ $r = \frac{1}{4}$

60. $\sum_{r=1}^{n}(2r+5) = 2\sum_{r=1}^{n} r + \sum_{r=1}^{n} 5 = \frac{2(n)(n+1)}{2} + 5n$
$= n(n + 6)$

61. $(2^2 - 1^2) + (4^2 - 3^2) + (6^2 - 5^2) + ...$
$= (2^2 + 4^2 + 6^2 + ...) - (1^2 + 3^2 + 5^2 + ...)$
$= \sum_{r=1}^{n}(2r)^2 - \sum_{r=1}^{n}(2r-1)^2 = \sum_{r=1}^{n} 4r - \sum_{r=1}^{n} 1$
$= 4\left[\frac{n(n+1)}{2}\right] - n = n(2n + 1)$

62. $\frac{n(n+1)(2n+1)}{6} = 1015$
$\therefore$ $n(n + 1)(2n + 1) = 6090$
$\Rightarrow n(n + 1)(2n + 1) = 14 \times 15 \times 29$
$\Rightarrow n = 14$

63. $(31)^2 + (32)^2 + (33)^2 + ... + (60)^2$
$= [(1)^2 + (2)^2 + (3)^2 + ... + (60)^2]$
$- [(1)^2 + (2)^2 + (3)^2 + ... + (30)^2]$
$= \sum_{r=1}^{60} r^2 - \sum_{r=1}^{30} r^2 = 64355$

64. The first factors of the terms of the given series is 1, 2, 3, 4, …., n and second factors of the terms of the given series is
2, 3, 4, …….(n + 1)
$\therefore$ n^{th} term of the given series
$= n(n + 1) = n^2 + n$
Hence, sum =
$\Sigma n^2 + \Sigma n = \frac{1}{6} n(n+1)(2n+1) + \frac{n}{2}(n+1)$
$= \frac{1}{6} n(n+1)(2n+1+3)$
$= \frac{1}{3} n(n+1)(n+2)$

65. $1^3 + 2^3 + 3^3 + \ldots.. + 25^3 = \sum_{r=1}^{25} r^3$

$= \frac{(25)^2(25+1)^2}{4}$

$= 105625$

66. $2(1)^2 + 3(2)^2 + 4(3)^2 + \ldots$ upto 10 terms

$= \sum_{r=1}^{10}(r+1)r^2 = \sum_{r=1}^{10} r^3 + \sum_{r=1}^{10} r^2 = 3410$

67. $y = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots$

$= \log_e(1 + x)$

$\therefore$ $1 + x = e^y \Rightarrow x = e^y - 1$

68. Sum of given series = $y + \frac{y^2}{2} + \frac{y^3}{3} + \ldots.,$

where $y = x^2$.

$\therefore$ Sum of given series $= -\log(1 - y)$

$= -\log_e(1 - x^2)$

69. $\log_e 3 - \frac{\log_e 3^2}{2^2} + \frac{\log_3 3^3}{3^2} - \frac{\log_e 3^4}{4^2} + \ldots$

$= \log_e 3\left\{1 - \frac{2}{2^2} + \frac{3}{3^2} - \frac{4}{4^2} + \ldots\right\}$

$= \log_e 3\left\{1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \ldots\right\}$

$= \log_e 3 \log_e(1 + 1) = \log_e 3 \log_e 2$

Critical Thinking

1. $\frac{1}{1+\sqrt{x}}, \frac{1}{1-x}, \frac{1}{1-\sqrt{x}}, \ldots.$

i.e., $\frac{1-\sqrt{x}}{1-x}, \frac{1}{1-x}, \frac{1+\sqrt{x}}{1-x}, \ldots.,$

which is an A.P. with d = $\frac{\sqrt{x}}{1-x}$

$\therefore$ The fourth term = $t_3 + d = \frac{1+\sqrt{x}}{1-x} + \frac{\sqrt{x}}{1-x}$

$= \frac{1+2\sqrt{x}}{1-x}$

2. Here, $T_n = 3n - 1$, putting n = 1, 2, 3, 4, 5 we get first five terms, 2, 5, 8, 11, 14

Hence, sum is 2 + 5 + 8 + 11 + 14 = 40.

3. Given series 3.8 + 6.11 + 9.14 + 12.17 + …..

First factors are 3, 6, 9, 12 whose n^{th} term is 3n and second factors are 8, 11, 14, 17

$t_n = [8 + (n - 1)3] = (3n + 5)$

Hence n^{th} term of given series = 3n(3n + 5).

4. Required number n is the number of terms in the series 105 + 112 + 119 + …. + 994

$\therefore$ 994 = n^{th} term of the above A.P.

$\Rightarrow 994 = 105 + (n - 1) \times 7$

$\Rightarrow n = \frac{994 - 98}{7}$

$\Rightarrow n = 128$

5. Given sequence is in A.P.

$\therefore$ $a = 8 - 6i$, $d = -1 + 2i$

$\therefore$ $t_n = a + (n - 1)d = (9 - n) + i(2n - 8)$

For purely imaginary term, $9 - n = 0$

$\Rightarrow n = 9$

6. First term = a, d = b – a and last term = c

If the no. of terms is n, then

$t_n = c = a + (n - 1)(b - a) \Rightarrow \frac{c-a}{b-a} = n - 1$

Solving, $n = \frac{b+c-2a}{b-a}$

7. d = b – a and if the number of terms is n, then

$2a = a + (n - 1)(b - a)$

$\Rightarrow \frac{a}{b-a} + 1 = n \Rightarrow n = \frac{b}{b-a}$

8. a, b, c are in A.P.

$\Rightarrow b - a = c - b \Rightarrow \frac{b-a}{c-b} = 1$

9. If D is the common difference of the A.P. a, b, c, d, e, then b = a + D, c = a + 2D, d = a + 3D, e = a + 4D

$\therefore$ $a - 4b + 6c - 4d + e$

$= a - 4(a + D) + 6(a + 2D) - 4(a + 3D) + a + 4D = 0$

10. Suppose that $\angle A = x°$, then $\angle B = x + 10°$, $\angle C = x + 20°$ and $\angle D = x + 30°$

So, we know that $\angle A + \angle B + \angle C + \angle D = 2\pi$

Putting these values, we get

$(x°) + (x° + 10°) + (x° + 20°) + (x° + 30°) = 360°$

$\Rightarrow x = 75°$

Hence, the angles of the quadrilateral are 75°, 85°, 95°, 105°.

11. As we know $T_n = S_n - S_{n-1}$

$= (2n^2 + 5n) - \{2(n - 1)^2 + 5(n - 1)\}$

$= 2n^2 + 5n - 2n^2 + 4n - 2 - 5n + 5$

$= 4n + 3$

12. $t_n = S_n - S_{n-1}$

$= \left\{nP + \frac{n(n-1)}{2}Q\right\} - \left\{(n-1)P + \frac{(n-1)(n-2)}{2}Q\right\}$

$= P + (n - 1)Q$

∴ Common difference $= t_n - t_{n-1}$

$= [P + (n - 1)Q] - [P + (n - 2)Q] = Q$

13. $d = \frac{1}{3} - \frac{1}{2} = \frac{-1}{6}$

∴ $S_9 = \frac{9}{2}\left\{2 \times \frac{1}{2} + (9-1)\left(\frac{-1}{6}\right)\right\} = -\frac{3}{2}$

14. Required sum = 10 + 13 + 16 + … + 97

$= \frac{n}{2}(10 + 97)$ …. (i)

Here, $97 = 10 + (n - 1)3 \Rightarrow n = 30$

∴ From (i), $S_n = \frac{30}{2}(10 + 97) = 1605$

15. The smallest 3 digit no. divisible by 7 is 105 and greatest is 994.

Given sequence is in A.P. with d = 7

∴ $994 = 105 + (n - 1)7 \Rightarrow n = 128$

∴ $S_n = \frac{n}{2}[2a + (n - 1)d]$

$= \frac{128}{2}[2(105) + (128 - 1)7] = 70336$

16. According to the given condition

$\frac{15}{2}[10 + 14 \times d] = 390 \Rightarrow d = 3$

Hence, middle term i.e., 8^{th} term is given by

5 + 7 × 3 = 26

17. $= a + (n - 1)d$ and

$S_n = \frac{n}{2}(a + \ )$

Eliminating a, we get

$S_n = \frac{n}{2}\{\ - (n - 1)d + \ \} = \frac{n}{2}\{2\ - (n - 1)d\}$

18. Suppose work is completed in n days

$\frac{n}{2}[2 \times 150 + (n - 1)(-4)] = n(152 - 2n)$

Had no worker dropped from work, total no. of workers who would have worked all the n days is 150 (n – 8)

∴ $n(152 - 2n) = 150(n - 8) \Rightarrow n = 25$

19. d = – 2, sum = – 5

∴ $-5 = \frac{5}{2}\{2a + 4(-2)\} \Rightarrow a = 3$

Hence, the actual sum (when d = 2) is

$\frac{5}{2}\{2 \times 3 + (5-1) \times 2\} = \frac{5}{2}(6 + 8) = 35$

21. Here $a = S_1 = 6$

$S_7 = 105 \Rightarrow \frac{7}{2}[2 \times 6 + (7 - 1)d] = 105 \Rightarrow d = 3$

∴ $\frac{S_n}{S_{n-3}} = \frac{\frac{n}{2}\{2 \times 6 + (n-1)3\}}{\frac{(n-3)}{2}\{2 \times 6 + (n-4)3\}} = \frac{n+3}{n-3}$

22. $S_{2n} = 3S_n$

∴ $\frac{2n}{2}[2a + (2n - 1)d] = \frac{3n}{2}[2a + (n - 1)d]$

$\Rightarrow 2a = (n + 1)d$

∴ $\frac{S_{3n}}{S_n} = \frac{\frac{3n}{2}[2a + (3n-1)d]}{\frac{n}{2}[2a + (n-1)d]} = 6$

23. Let S_n and S'_n be the sum of n terms of two A.P.'s and t_{11} and t'_{11} be the respective 11^{th} terms, then

$\frac{S_n}{S'_n} = \frac{\frac{n}{2}[2a + (n-1)d]}{\frac{n}{2}[2a' + (n-1)d']} = \frac{7n+1}{4n+27}$

$\Rightarrow \frac{a + \frac{(n-1)}{2}d}{a' + \frac{(n-1)}{2}d'} = \frac{7n+1}{4n+27}$

Now put n = 21,

we get $\frac{a + 10d}{a' + 10d'} = \frac{t_{11}}{t'_{11}} = \frac{148}{111} = \frac{4}{3}$

24. a, b, c, are in A.P $\Rightarrow 2b = a + c$

Also, $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are in A.P. $\Rightarrow \frac{2}{b} = \frac{1}{a} + \frac{1}{c}$

∴ $\frac{2}{\frac{a+c}{2}} = \frac{a+c}{ac} \Rightarrow a = c$ and $b = a$

25. (a + 2b – c) (2b + c – a) (c + a – b)

= (a + a + c – c)(a + c + c – a)(2b – b)

= 4abc

(∵ a, b, c are in A.P., ∴ 2b = a + c).

26. The sum of n arithmetic mean between a and b $= \frac{n}{2}(a+b)$

27. $\frac{a^{n+1}+b^{n+1}}{a^n+b^n} = \frac{a+b}{2}$
$\Rightarrow a^{n+1} - ab^n + b^{n+1} - ba^n = 0$
$\Rightarrow (a - b)(a^n - b^n) = 0$
If $a^n - b^n = 0$. Then $\left(\frac{a}{b}\right)^n = 1 = \left(\frac{a}{b}\right)^0$
Hence, n = 0

28. The resulting progression will have n + 2 terms with 2 as the first term and 38 as the last term.
Therefore, the sum of the progression
$= \frac{n+2}{2}(2+38)$
$= 20(n + 2)$
By hypothesis, $20(n + 2) = 200$
$\Rightarrow n = 8$

29. As, log 2, $\log(2^n - 1)$ and $\log(2^n + 3)$ are in A.P.
Therefore,
$2\log(2^n - 1) = \log 2 + \log(2^n + 3)$
$2^{2n} - 4.2^n - 5 = 0$
$\Rightarrow (2^n - 5)(2^n + 1) = 0$
As 2^n cannot be negative, hence $2^n - 5 = 0$
$\Rightarrow 2^n = 5$ or $n = \log_2 5$

30. The given numbers are in A.P.
∴ $2\log_9(3^{1-x} + 2) = \log_3(4.3^x - 1) + 1$
$\Rightarrow 2\log_{3^2}(3^{1-x} + 2) = \log_3(4.3^x - 1) + \log_3 3$
$\Rightarrow \frac{2}{2}\log_3(3^{1-x} + 2) = \log_3[3(4.3^x - 1)]$
$\Rightarrow 3^{1-x} + 2 = 3(4.3^x - 1)$
$\Rightarrow \frac{3}{y} + 2 = 12y - 3$, where $y = 3^x$
$\Rightarrow 12y^2 - 5y - 3 = 0$
∴ $y = \frac{-1}{3}$ or $\frac{3}{4} \Rightarrow 3^x = \frac{-1}{3}$ or $3^x = \frac{3}{4}$
∴ $x = \log_3\left(\frac{3}{4}\right) \Rightarrow x = 1 - \log_3 4$

31. Let the three numbers be a – d, a, a + d
We get a – d + a + a + d = 15
$\Rightarrow a = 5$
and $(a - d)^2 + a^2 + (a + d)^2 = 83$
$\Rightarrow a^2 + d^2 - 2ad + a^2 + a^2 + d^2 + 2ad = 83$
$\Rightarrow 2(a^2 + d^2) + a^2 = 83$
Putting a = 5
$\Rightarrow 2(25 + d^2) + 25 = 83$
$\Rightarrow 2d^2 = 8$
$\Rightarrow d = 2$
Thus, numbers are 3, 5, 7.
Trick :
Since 3 + 5 + 7 = 15 and $3^2 + 5^2 + 7^2 = 83$

32. $\left(1-\frac{1}{2}\right)+\left(1-\frac{1}{4}\right)+\left(1-\frac{1}{8}\right) + ...$
∴ $t_n = 1 - \left(n^{th} \text{ term of G.P. } \frac{1}{2}, \frac{1}{4}, \frac{1}{8}\right)$
$= 1 - \frac{1}{2}\left(\frac{1}{2}\right)^{n-1}$
$= 1 - \frac{1}{2^n}$

33. $t_3 = 4 \Rightarrow ar^2 = 4$
∴ $a \times ar \times ar^2 \times ar^3 \times ar^4 = (ar^2)^5 = 4^5$

34. $t_3 = ar^{3-1} = ar^2 = 36$ and $t_6 = ar^{6-1} = ar^5 = 972$
Solving, a = 4 and r = 3
∴ $t_8 = ar^7 = 4(3)^7 = 8748$

35. $t_n = ar^{n-1}$ and r = 2
∴ $t_n = a(2)^{n-1} \Rightarrow t_9 = a(2)^8$
∴ $a(2)^8 = 128 \Rightarrow a = \frac{128}{256} = \frac{1}{2}$

36. $ab^2 = a(ac)$ and $cb^2 = c(ac)$
∴ $ab^2 - cb^2 = a^2c - ac^2$
$\Rightarrow a(b^2 + c^2) = c(a^2 + b^2)$

37. $a + ar = -4$ and $ar^4 = 4ar^2 \Rightarrow r^2 = 4 \Rightarrow r = \pm 2$
Substituting $r = \pm 2$, we get $a = \frac{-4}{3}$ and $a = 4$
∴ Required G.P. is $\frac{-4}{3}, \frac{-8}{3}, \frac{-16}{3}, ...$
or 4, – 8, 16, – 32, ….

38. The common ratio of the G.P. is x^{n+4}
∴ 8^{th} term $= x^{52} = x^{-4}(x^{n+4})^7$
$\Rightarrow 7n = 28$
$\Rightarrow n = 4$

39. Let $AR^{p-1} = a$,
$AR^{q-1} = b$,
$AR^{r-1} = c$
So
$a^{q-r}b^{r-p}c^{p-q} = (AR^{p-1})^{q-r}(AR^{q-1})^{r-p}(AR^{r-1})^{p-q}$
$= A^{(q-r+r-p+p-q)}R^{(pq-pr-q+r+qr-pq-r+p+pr-rq-p+q)}$
$= A^0R^0 = 1$

40. $a = \frac{5}{2}, r = \frac{1}{2} < 1$

$\therefore \quad S_n = \frac{a\left(1-r^n\right)}{1-r} = 5\left[\frac{2^n - 1}{2^n}\right]$

41. Given series is a G.P. with $a = \sqrt{2}$ and $r = \sqrt{3}$

$\therefore \quad S_{10} = \frac{\sqrt{2}\left(\left(\sqrt{3}\right)^{10} - 1\right)}{\sqrt{3}-1} = \frac{\sqrt{2}(243-1)}{\sqrt{3}-1} \times \frac{\sqrt{3}+1}{\sqrt{3}+1}$

$= 121\sqrt{6} + 121\sqrt{2}$

$= 121\left(\sqrt{6}+\sqrt{2}\right)$

42. $\left(1-\frac{1}{2}\right) + \left(1-\frac{1}{4}\right) + \left(1-\frac{1}{8}\right) + \ldots.$

$\therefore \quad S_n = n - \left(\frac{1}{2}+\frac{1}{4}+\frac{1}{8}+\ldots.\text{upto n terms}\right)$

$= n - \frac{\frac{1}{2}\left(1-\left(\frac{1}{2}\right)^n\right)}{1-\frac{1}{2}} = n - \left(1-\frac{1}{2^n}\right)$

$= n - 1 + 2^{-n}$

43. $t_4 = 24$ and $t_9 = 768$

$\therefore \quad t_4 = ar^3 \Rightarrow ar^3 = 24$

and $t_9 = ar^8 \Rightarrow ar^8 = 768$

Solving, $a = 3$ and $r = 2 > 1$

$\therefore \quad S_{10} = \frac{a\left[r^{10}-1\right]}{r-1} = \frac{3\left[2^{10}-1\right]}{2-1} = 3(2^{10} - 1)$

44. $S_{10} = 244\ S_5$

$\Rightarrow (1 - r^{10}) = 244\ (1 - r^5)$

$\Rightarrow r^{10} - 244\ r^5 + 243 = 0$

$\Rightarrow r^5 = 243$ or $r^5 = 1$

$\Rightarrow r = 3$ or $r = 1$

45. $a_1 = 3$, $a_n = 96$

$\Rightarrow a_1r^{n-1} = 96$

$\Rightarrow r^{n-1} = 32$

$r^{n-1} = 2^5$

$2^{n-1} = 2^5$

$\Rightarrow n - 1 = 5$

$\Rightarrow n = 6$

46. $a = 7$ and $ar^{n-1} = 448$

Now, $S_n = \frac{a(r^n - 1)}{r-1} = 889$

$\Rightarrow \frac{(ar^{n-1}.r - a)}{r-1} = 889 \Rightarrow \frac{448r - 7}{r-1} = 889$

$\Rightarrow r = 2$

47. Given that $\frac{a(r^n - 1)}{r-1} = 255 \quad (\because\ r > 1)$ ....(i)

$ar^{n-1} = 128$ ....(ii)

and common ratio $r = 2$ ....(iii)

From (i), (ii) and (iii), we get

$a(2)^{n-1} = 128$ ....(iv)

and $\frac{a(2^n - 1)}{2-1} = 255$ ....(v)

Dividing (v) by (iv), we get

$\frac{2^n - 1}{2^{n-1}} = \frac{255}{128}$

$\Rightarrow 2 - 2^{-n+1} = \frac{255}{128}$

$\Rightarrow 2\left(1 - 2^{-n}\right) = \frac{255}{128}$

$\Rightarrow 2^{-n} = 2^{-8}$

$\Rightarrow n = 8$

Putting $n = 8$ in equation (iv),

we get $a.2^7 = 128 = 2^7$ or $a = 1$

48. $\frac{S_3}{S_6 - S_3} = \frac{125}{27} \Rightarrow \frac{S_3}{S_6} = \frac{125}{152}$

$\therefore \quad \frac{a(1-r^3)}{a(1-r^6)} = \frac{125}{152} \Rightarrow \frac{1}{1+r^3} = \frac{125}{152}$

$\Rightarrow r^3 = \frac{27}{125} \Rightarrow r = \frac{3}{5}$

49. $r = \frac{t_2}{t_1} = \frac{b}{a}$; last term = c

$\Rightarrow ar^{n-1} = c$

$\Rightarrow \frac{ar^n}{r} = c$

$\Rightarrow ar^n = cr$

$\therefore \quad S_n = \frac{a(1-r^n)}{1-r} = \frac{a - ar^n}{1-r} = \frac{a - cr}{1-r} = \frac{a - c\left(\frac{b}{a}\right)}{1-\frac{b}{a}}$

50. We have

$1 + a + a^2 + \ldots.. + a^x = (1 + a)(1 + a^2)(1 + a^4)$

$\Rightarrow \frac{(1-a^{x+1})}{(1-a)} = (1 + a)(1 + a^2) + (1 + a^4)$

$\Rightarrow (1 - a^{x+1}) = (1 - a)(1 + a)(1 + a^2)(1 + a^4)$

$\Rightarrow (1 - a^{x+1}) = (1 - a^8)$

$\Rightarrow x + 1 = 8$

$\Rightarrow x = 7$

51. $S_n = 4 + 44 + 444 + \ldots\ldots$ to n terms

$= \frac{4}{9}\left[(10-1)+(10^2-1)+(10^3-1)+\ldots\ldots+(10^n-1)\right]$

$= \frac{4}{9}\left\{(10+10^2+10^3+\ldots.+10^n)-(1+1+1+\ldots\ldots n \text{ times})\right\}$

$= \frac{4}{9}\left\{\frac{10(10^n-1)}{10-1}-n\right\} = \frac{4}{9}\left\{\frac{10}{9}(10^n-1)-n\right\}$

52. $1 + (1 + x) + (1 + x + x^2) + \ldots. + (1 + x + x^2 + \ldots. + x^{n-1})$

$= \frac{1-x}{1-x}+\frac{1-x^2}{1-x}+\frac{1-x^3}{1-x}+\ldots\ldots+\frac{1-x^n}{1-x}$

$= \frac{1}{1-x}[(1 + 1 + \ldots. \text{ n times}) - (x + x^2 + \ldots + x^n)]$

$= \frac{1}{1-x}\left[n-\frac{x(1-x^n)}{1-x}\right]$

$= \frac{n}{1-x}-\frac{x(1-x^n)}{(1-x)^2}$

53. Infinite series $9 - 3 + 1 - \frac{1}{3} + \ldots\ldots..\infty$ is a G.P. with $a = 9$, $r = \frac{-1}{3}$

$\therefore \quad S_\infty = \frac{a}{1-r} = \frac{9}{1+\left(\frac{1}{3}\right)} = \frac{9\times 3}{4} = \frac{27}{4}$

54. Let the G.P. be $a + ar + ar^2 + \ldots.$, $|r| < 1$,

then $ar = 2$ and $\frac{a}{1-r} = 8$

$\therefore \quad \frac{ar(1-r)}{a} = \frac{2}{8} \Rightarrow r = \frac{1}{2}$ and $a = 4$

55. $\frac{1}{7}+\frac{2}{7^2}+\frac{1}{7^3}+\frac{2}{7^4}+\ldots.$ upto ∞

$= \left(\frac{1}{7}+\frac{1}{7^3}+\frac{1}{7^5}+\ldots.\right)+2\left(\frac{1}{7^2}+\frac{1}{7^4}+\frac{1}{7^6}+\ldots.\right)$

$= \frac{\frac{1}{7}}{1-\frac{1}{7^2}}+\frac{2\left(\frac{1}{7^2}\right)}{1-\frac{1}{7^2}}$

$= \frac{3}{16}$

56. $2.3\overline{45} = 2.3 + 0.045 + 0.00045 + \ldots.$

$= \frac{23}{10}+\frac{45}{1000}+\frac{45}{100000}+\ldots.$

From 2nd term onwards, the terms are in G.P.

$\therefore \quad s_\infty = \frac{a}{1-r} = \frac{\frac{45}{1000}}{1-\frac{1}{100}} = \frac{1}{22}$

$\therefore \quad 2.3\overline{45} = \frac{23}{10}+\frac{1}{22} = \frac{129}{55}$

Alternate Method:

$2.3\overline{45} = 2 + \frac{345-3}{990} = 2 + \frac{342}{990} = \frac{129}{55}$

57. $4^{1/3}.\,4^{1/9}.4^{1/27}\ldots\ldots\infty$

$\therefore \quad S = 4^{1/3 + 1/9 + 1/27\ldots\ldots\infty}$

$\Rightarrow S = 4^{\left(\frac{1/3}{1-1/3}\right)} = 4^{\frac{1/3}{2/3}}$

$\Rightarrow S = 4^{1/2}$

$\Rightarrow S = 2$

58. $5 = \frac{x}{1-r} \Rightarrow 5 - 5r = x \Rightarrow r = 1 - \frac{x}{5}$

As $|r| < 1$ i.e., $\left|1-\frac{x}{5}\right| < 1$

$\therefore \quad -1 < 1 - \frac{x}{5} < 1$

$\therefore \quad -5 < 5 - x < 5$

$\therefore \quad -10 < -x < 0$

$\therefore \quad 10 > x > 0$

$\therefore \quad 0 < x < 10$

59. $A = 1 + r^z + r^{2z} + r^{3z} + \ldots.. \infty$

$A = 1 + [r^z + r^{2z} + r^{3z} + \ldots.. \infty]$

We know that sum of infinite G.P. is

$S_\infty = \frac{a}{1-r} \ (-1 < r < 1)$

Therefore, $A = 1 + \left[\frac{r^z}{1-r^z}\right]$

$\Rightarrow A = \frac{1-r^z+r^z}{1-r^z} \Rightarrow A = \frac{1}{1-r^z}$

$\Rightarrow 1 - r^z = \frac{1}{A} \Rightarrow r^z = \frac{A-1}{A}$

Hence, $r = \left[\frac{A-1}{A}\right]^{\frac{1}{z}}$

60. We have, $x = \sum_{n=0}^{\infty} a^n = \frac{1}{1-a} \Rightarrow a = \frac{x-1}{x}$

$y = \sum_{n=0}^{\infty} b^n = \frac{1}{1-b} \Rightarrow b = \frac{y-1}{y}$

$z = \sum_{n=0}^{\infty} a^n b^n = \frac{1}{1-ab} \Rightarrow ab = \frac{z-1}{z}$

$\therefore \quad \frac{x-1}{x} \cdot \frac{y-1}{y} = \frac{z-1}{z}$

$\Rightarrow xy + z = zx + yz$

61. a = 3, r = 3

G.M. $= (3.3^2.3^3 \ldots\ldots 3^n)^{1/n}$

$= (3^{1+2+3\ldots\ldots+n})^{1/n} = \left(3^{\frac{n(n+1)}{2}}\right)^{1/n} = 3^{\frac{(n+1)}{2}}$

62. As given, $G = \sqrt{xy}$

$\therefore \quad \frac{1}{G^2 - x^2} + \frac{1}{G^2 - y^2} = \frac{1}{xy - x^2} + \frac{1}{xy - y^2}$

$= \frac{1}{x-y}\left\{-\frac{1}{x} + \frac{1}{y}\right\} = \frac{1}{xy} = \frac{1}{G^2}$

63. a, g_1, g_2, b are in G.P. $\Rightarrow \frac{g_1}{a} = \frac{g_2}{g_1} = \frac{b}{g_2}$

$\therefore \quad \frac{g_1}{a} = \frac{g_2}{g_1}$ and $\frac{g_2}{g_1} = \frac{b}{g_2} \Rightarrow a = \frac{g_1^2}{g_2}$ and $b = \frac{g_2^2}{g_1}$

$\therefore \quad \frac{g_1^2}{g_2} + \frac{g_2^2}{g_1} = a + b$

64. G.M $= b = \sqrt{ac}$

$\frac{1}{b-a} + \frac{1}{b-c} = \frac{1}{\sqrt{ac} - a} + \frac{1}{\sqrt{ac} - c}$

$= \frac{1}{\sqrt{a}\left[\sqrt{c} - \sqrt{a}\right]} + \frac{1}{\sqrt{c}\left[\sqrt{a} - \sqrt{c}\right]}$

$= \frac{1}{\sqrt{a}\left[\sqrt{c} - \sqrt{a}\right]} - \frac{1}{\sqrt{c}\left[\sqrt{c} - \sqrt{a}\right]}$

$= \frac{1}{\sqrt{ac}} = \frac{1}{b}$

65. Let the 9 terms of a G.P. be

$\frac{a}{r^4}, \frac{a}{r^3}, \frac{a}{r^2}, \frac{a}{r}, a, ar, ar^2, ar^3, ar^4$

Given, fifth term a = 2

Hence, product of 9 terms is $a^9 = (2)^9 = 512$

66. Let the terms of given G.P. be $\frac{a}{r}$, a, ar

then product $= \frac{a}{r} \times a \times ar = 1000$

$\frac{a}{r}$, a + 6, ar + 7 are in A.P.

$\therefore \quad 2(a + 6) = \frac{a}{r} + ar + 7 \quad \therefore \quad 25 = \frac{10}{r} + 10r$

$\therefore \quad 2r^2 - 5r + 2 = 0$

$\therefore \quad (2r - 1)(r - 2) = 0$

$\therefore \quad r = 2, \frac{1}{2}$

Hence, the G.P is 5, 10, 20,…. or 20, 10, 5.…

67. Suppose that x to be added then numbers 13, 15, 19 so that new numbers $x + 13$, $15 + x$, $19 + x$ will be in H.P.

$\Rightarrow (15 + x) = \frac{2(x+13)(19+x)}{x+13+x+19}$

$\Rightarrow x^2 + 31x + 240 = x^2 + 32x + 247 \Rightarrow x = -7$

68. a, b, c are in H.P. $\Rightarrow \frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are in A.P.

$\therefore \quad \frac{1}{b} - \frac{1}{a} = \frac{1}{c} - \frac{1}{b} \Rightarrow \frac{a-b}{b-c} = \frac{a}{c}$

69. 7^{th} term of corresponding A.P. is $\frac{1}{8}$ and 8^{th} term will be $\frac{1}{7}$

$\Rightarrow a + 6d = \frac{1}{8}$ and $a + 7d = \frac{1}{7}$

Solving these, we get $d = \frac{1}{56}$ and $a = \frac{1}{56}$

Therefore, 15^{th} term of this A.P.

$= \frac{1}{56} + 14 \times \frac{1}{56} = \frac{15}{56}$

Hence, the required 15^{th} term of the H.P. is $\frac{56}{15}$.

70. Let a be the first term and d be the common difference of the corresponding A.P.

p^{th} term of A.P. $(T_p) = a + (p - 1)d$

$= \frac{1}{q}$ …..(i)

q^{th} term of A.P. $(T_q) = a + (q - 1)d$

$= \frac{1}{p}$ …..(ii)

From (i) – (ii), $(p-q)d = \frac{1}{q} - \frac{1}{p} = \frac{p-q}{pq}$

$\Rightarrow d = \frac{1}{pq}$

From (i),

$a + (p-1)\frac{1}{pq} = \frac{1}{q} \Rightarrow a = \frac{1}{pq}$

$\therefore$ $T_{pq} = a + (pq-1)d$

$= \frac{1}{pq} + (pq-1)\frac{1}{pq} = 1$

Therefore, pq^{th} term is 1.

71. H.M. $= \frac{2\left(\frac{a^2}{1-a^2b^2}\right)}{\frac{a}{1-ab}+\frac{a}{1+ab}} = \frac{2a^2}{2a} = a$

72. $c = \frac{2ab}{a+b} \Rightarrow \frac{c}{a} = \frac{2b}{a+b}$ and $\frac{c}{b} = \frac{2a}{a+b}$

$\therefore$ $\frac{c}{a} + \frac{c}{b} = \frac{2b}{a+b} + \frac{2a}{a+b} = 2$

73. $H = \frac{2ab}{a+b}$

$\Rightarrow H - a = \frac{2ab}{a+b} - a = \frac{ab-a^2}{a+b}$

and $H - b = \frac{2ab}{a+b} - b = \frac{ab-b^2}{a+b}$

$\therefore$ $\frac{1}{H-a} + \frac{1}{H-b} = \frac{a+b}{ab-a^2} + \frac{a+b}{ab-b^2}$

$= \frac{(a+b)}{(b-a)}\left[\frac{(b-a)}{ab}\right]$

$= \frac{1}{a} + \frac{1}{b}$

74. $H = \frac{2ab}{a+b} \Rightarrow \frac{H}{a} = \frac{2b}{a+b}$

$\therefore$ $\frac{H+a}{H-a} = \frac{3b+a}{b-a}$

Similarly, $\frac{H+b}{H-b} = \frac{3a+b}{a-b} = -\frac{3a+b}{b-a}$

$\therefore$ $\frac{H+a}{H-a} + \frac{H+b}{H-b} = \frac{2b-2a}{b-a} = 2$

75. a, b, c are in H.P.

$\therefore$ $b = \frac{2ac}{a+c}$

Also b, c, d are in H.P. $\Rightarrow c = \frac{2bd}{b+d}$

Multiplying we get, $bc = \frac{4abcd}{(a+c)(b+d)}$

$\therefore$ $ab + bc + cd + ad = 4ad$

$\Rightarrow ab + bc + cd = 3ad$

76. We know that A > G > H

Where A is arithmetic mean, G is geometric mean and H is harmonic mean, then A > G

$\Rightarrow \frac{a+b}{2} > \sqrt{ab}$ or $(a+b) > 2\sqrt{ab}$

77. Let the numbers be a and b, then

$4 = \frac{2ab}{a+b} \Rightarrow a + b = \frac{ab}{2}$

$A = \frac{a+b}{2}$ and $G = \sqrt{ab}$

Also, $2A + G^2 = 27$

$\therefore$ $a + b + ab = 27 \Rightarrow \frac{ab}{2} + ab = 27 \Rightarrow ab = 18$

and hence a + b = 9.

Only option A satisfies this condition.

78. As given, $2b = a + c \Rightarrow 3^{2b} = 3^{a+c}$

or $(3^b)^2 = 3^a.3^c$ i.e $3^a, 3^b, 3^c$ are in G.P.

79. $\frac{T_2}{T_1} = \frac{T_3}{T_2}$

$\Rightarrow 2^{(b-a)x} = 2^{(c-b)x}$

$\Rightarrow (b-a)x = (c-b)x$

$\Rightarrow (b-a) = (c-b) \forall x, x \neq 0$

$\therefore$ $2^{ax+1}, 2^{bx+1}, 2^{cx+1}$ is a G.P., $\forall x \neq 0$

80. a, b, c are in A.P. $\Rightarrow 2b = a + c$

Now,

$(10^{bx+10})^2 = (10^{ax+10}. 10^{cx+10})$

$\Rightarrow 10^{2(bx+10)} = 10^{ax+cx+20}$

$\Rightarrow 2(bx + 10) = ax + cx + 20, \forall x$

$\Rightarrow 2b = a + c$ i.e. a, b, c are in A.P.

Hence, these are in G.P. $\forall x$

Alternate Method :

As we know if a, b, c are in A.P., then x^{an+r}, x^{bn+r}, x^{cn+r} are in G.P. for every n and r.

81. $\because$ a, b, c are in G.P. $\Rightarrow b^2 = ac$ …..(i)
Let $a^x = b^y = c^z = k$
$\Rightarrow a = k^{1/x}, b = k^{1/y}, c = k^{1/z}$
Putting these values in (i),
$k^{2/y} = k^{1/x}.k^{1/z} = k^{\frac{1}{x}+\frac{1}{z}}$, $\frac{2}{y} = \frac{1}{x} + \frac{1}{z}$
$\therefore$ $\frac{1}{x}, \frac{1}{y}, \frac{1}{z}$ are in A.P. or x y, z are in H.P.

82. Here, $\frac{\log x}{\log a}, \frac{\log x}{\log b}, \frac{\log x}{\log c}$ are in H.P.
$\Rightarrow \frac{\log a}{\log x}, \frac{\log b}{\log x}, \frac{\log c}{\log x}$ are in A.P.
$\Rightarrow \log_x a, \log_x b, \log_x c$ are in A.P.
$\Rightarrow$ a, b, c are in G.P.

83. Clearly, $x = \frac{1}{1-a}, y = \frac{1}{1-b}, z = \frac{1}{1-c}$
Since a, b, c are in A.P.
$\Rightarrow$ 1 – a, 1 – b, 1 – c are also in A.P.
$\Rightarrow \frac{1}{1-a}, \frac{1}{1-b}, \frac{1}{1-c}$ are in H.P.
$\therefore$ x, y, z are in H.P.

84. Given that $\frac{a}{b} = \frac{9}{1}$ or a = 9b
Here, $H = \frac{2ab}{a+b}$ and $G = \sqrt{ab}$
$\Rightarrow H : G = \frac{2ab}{a+b} : \sqrt{ab} = \frac{2.9b^2}{10b} : 3b = \frac{3}{5}$
Hence, G : H = 5 : 3

85. Given that $\frac{\text{H.M.}}{\text{G.M.}} = \frac{12}{13}$
$\Rightarrow \frac{\frac{2ab}{a+b}}{\sqrt{ab}} = \frac{12}{13}$ or $\frac{a+b}{2\sqrt{ab}} = \frac{13}{12}$
$\Rightarrow \frac{(a+b)+2\sqrt{ab}}{(a+b)-2\sqrt{ab}} = \frac{13+12}{13-12} = \frac{25}{1}$
$\Rightarrow \frac{\sqrt{a}+\sqrt{b}}{\sqrt{a}-\sqrt{b}} = \frac{5}{1}$
$\Rightarrow \frac{(\sqrt{a}+\sqrt{b})+(\sqrt{a}-\sqrt{b})}{(\sqrt{a}+\sqrt{b})-(\sqrt{a}-\sqrt{b})} = \frac{5+1}{5-1}$
$\Rightarrow \frac{2\sqrt{a}}{2\sqrt{b}} = \frac{6}{4}$
$\Rightarrow \left(\frac{a}{b}\right)^{1/2} = \frac{6}{4} \Rightarrow$ a : b = 9 : 4

86. Let $S = 1 + 2.2 + 3.2^2 + 4.2^3 + …. + 100.2^{99}$
$2S = 1.2 + 2.2^2 + 3.2^3 + …. + 100.2^{100}$
$S - 2S = 1 + (1.2 + 1.2^2 + 1.2^3$
$+ ….$ upto 99 terms) $- 100\cdot2^{100}$
$\therefore$ $S = -1 - \frac{2(2^{99}-1)}{2-1} + 100.2^{100}$
$= -1 - 2^{100} + 2 + 100.2^{100}$
$= 1 + 99 \times 2^{100}$

87. Given series, let
$S_n = 1 + \frac{2}{5} + \frac{3}{5^2} + \frac{4}{5^3} + ... + \frac{n}{5^{n-1}}$

$= n\left(\dfrac{16n^2 - 7}{3}\right)$

94. $\sum n^2 = 330 + \sum n$

$\Rightarrow \dfrac{n(n+1)(2n+1)}{6} = 330 + \dfrac{n(n+1)}{2}$

$\Rightarrow \dfrac{n(n+1)}{2}\left[\dfrac{2n+1}{3} - 1\right] = 330$

110. sin A, cos A and tan A are in G.P.

$\therefore \quad \cos^2 A = \sin A \tan A = \frac{\sin^2 A}{\cos A}$

$\Rightarrow \cos^3 A = \sin^2 A$

$\Rightarrow \cos^3 A = 1-\cos^2 A$

$\Rightarrow \cos^3 A + \cos^2 A = 1$

111. $\cos^4\theta \sec^2\alpha, \frac{1}{2}$ and $\sin^4\theta \operatorname{cosec}^2\alpha$ are in A.P.

$\therefore \quad 1 = \cos^4\theta\sec^2\alpha + \sin^4\theta\operatorname{cosec}^2\alpha$

$\Rightarrow \cos^4\theta\sin^2\alpha + \sin^4\theta\cos^2\alpha = \sin^2\alpha\cos^2\alpha$

$\Rightarrow (1-\sin^2\theta)\cos^2\theta\sin^2\alpha + \sin^4\theta(1-\sin^2\alpha)$
$= \sin^2\alpha(1-\sin^2\alpha)$

$\Rightarrow \cos^2\theta\sin^2\alpha + \sin^4\theta - \sin^2\theta\sin^2\alpha(\cos^2\theta+\sin^2\theta)$
$= \sin^2\alpha - \sin^4\alpha$

$\Rightarrow \sin^4\theta + \sin^4\alpha - \sin^2\theta\sin^2\alpha - \sin^2\alpha(1-\cos^2\theta)$
$= 0$

$\Rightarrow \sin^4\theta + \sin^4\alpha - 2\sin^2\theta\sin^2\alpha = 0$

$\Rightarrow (\sin^2\theta - \sin^2\alpha)^2 = 0$

$\Rightarrow \sin^2\theta = \sin^2\alpha$ and $\cos^2\theta = \cos^2\alpha$

$\therefore \quad \cos^8\theta\sec^6\alpha + \sin^8\theta\operatorname{cosec}^6\alpha$
$= \cos^2\theta + \sin^2\theta = 1$

112. $(0.05)^{\log_{\sqrt{20}}(0.1+0.01+.....)} = \left(\frac{1}{20}\right)^{2\log_{20}\left(\frac{0.1}{1-0.1}\right)}$

$= 20^{-2\log_{20}(1/9)} = 20^{2\log_{20}9}$

$= 20^{\log_{20}9^2} = 9^2 = 81$

113. If $\log_{ax}x$, $\log_{bx}x$, $\log_{cx}x$ are in H.P

Then $\frac{1}{\log_{ax}x}, \frac{1}{\log_{bx}x}, \frac{1}{\log_{cx}x}$ are in A.P.

i.e., $\log_x ax$, $\log_x bx$ $\log_x cx$ are in A.P.

∴ $2\log_x bx = \log_x ax + \log_x cx$

∴ $\log_x b^2x^2 = \log_x ac.\, x^2$

∴ $b^2x^2 = ac.\, x^2$

∴ $b^2 = ac$

∴ a, b, c, are in G.P

114. A.M. ≥ G.M.

∴ $\frac{27^{\cos x} + 81^{\sin x}}{2} \geq \sqrt{27^{\cos x} \times 81^{\sin x}}$

$\Rightarrow 27^{\cos x} + 81^{\sin x} \geq 2\sqrt{3^{3\cos x + 4\sin x}}$

$\Rightarrow 27^{\cos x} + 81^{\sin x} \geq 2 \times \sqrt{3^{-5}}$

....[$\because -5 \leq 3\cos x + 4\sin x \leq 5$]

$\Rightarrow 27^{\cos x} + 81^{\sin x} \geq \frac{2}{9\sqrt{3}}$

Hence, the minimum value of $27^{\cos x} + 81^{\sin x}$ is $\frac{2}{9\sqrt{3}}$.

115. Since, $\tan\frac{2\pi}{18}$, x, $\tan\frac{7\pi}{18}$ are in A.P. and

$\tan\frac{2\pi}{18}$, y $\tan\frac{5\pi}{18}$ are in A.P.

∴ $2x = \tan\frac{2\pi}{18} + \tan\frac{7\pi}{18}$ and $2y = \tan\frac{2\pi}{18} + \tan\frac{5\pi}{18}$

$\Rightarrow 2x = \tan 20° + \tan 70°$ and

$2y = \tan 20° + \tan 50°$

$\Rightarrow 2x = \frac{\sin(20° + 70°)}{\cos 20° \cos 70°}$ and $2y = \frac{\sin(20° + 50°)}{\cos 20° \cos 50°}$

$\Rightarrow 2x = \frac{\sin 90°}{\sin 20° \cos 20°}$ and $2y = \frac{\sin 70°}{\cos 20° \cos 50°}$

$\Rightarrow x = \frac{1}{2\sin 20° \cos 20°}$ and $2y = \frac{1}{\cos 50°}$

$\Rightarrow x = \frac{1}{\sin 40°}$ and $2y = \frac{1}{\sin 40°}$

$\Rightarrow x = 2y \Rightarrow \frac{x}{y} = 2$

116. Given, $\cos(\theta - \alpha)$, $\cos\theta$ and $\cos(\theta + \alpha)$ are in H.P.

$\Rightarrow \frac{1}{\cos(\theta-\alpha)}, \frac{1}{\cos\theta}, \frac{1}{\cos(\theta+\alpha)}$ will be in A.P.

$\Rightarrow \frac{2}{\cos\theta} = \frac{1}{\cos(\theta-\alpha)} + \frac{1}{\cos(\theta+\alpha)}$

$= \frac{\cos(\alpha+\theta) + \cos(\theta-\alpha)}{\cos^2\theta - \sin^2\alpha}$

$\Rightarrow \frac{2}{\cos\theta} = \frac{2\cos\theta\cos\alpha}{\cos^2\theta - \sin^2\alpha}$

$\Rightarrow \cos^2\theta - \sin^2\alpha = \cos^2\theta\cos\alpha$

$\Rightarrow \cos^2\theta\,(1 - \cos\alpha) = \sin^2\alpha$

$\Rightarrow \cos^2\theta\left(2\sin^2\frac{\alpha}{2}\right) = 4\sin^2\frac{\alpha}{2}\cos^2\frac{\alpha}{2}$

$\Rightarrow \cos^2\theta\sec^2\frac{\alpha}{2} = 2$

$\Rightarrow \cos\theta\sec\frac{\alpha}{2} = \pm\sqrt{2}$

117. $\sin\theta = \sqrt{\sin\phi\cos\phi}$

$\Rightarrow \sin\phi\cos\phi = \sin^2\theta$

$\Rightarrow \sin 2\phi = 2\sin^2\theta$

$\Rightarrow 1 - 2\sin^2\theta = 1 - \sin 2\phi$

$\Rightarrow \cos 2\theta = 1 - \cos\left(\frac{\pi}{2} - 2\phi\right)$

$= 2\sin^2\left(\frac{\pi}{4} - \phi\right)$

118. $\cos 2B = \frac{\cos(A+C)}{\cos(A-C)} = \frac{\cos A\cos C - \sin A\sin C}{\cos A\cos C + \sin A\sin C}$

$\Rightarrow \frac{1-\tan^2 B}{1+\tan^2 B} = \frac{1-\tan A\tan C}{1+\tan A\tan C}$

$\Rightarrow 1 + \tan^2 B - \tan A\tan C - \tan A\tan C\tan^2 B$

$= 1 - \tan^2 B + \tan A\tan C - \tan A\tan C\tan^2 B$

$\Rightarrow 2\tan^2 B = 2\tan A\tan C$

$\Rightarrow \tan^2 B = \tan A\tan C$

∴ tan A, tan B, tan C are in G.P.

Competitive Thinking

1. The given sequence is an A.P.

a = 10, d = –3

$t_{30} = 10 + (30 - 1)(-3)$

$= -77$

2. Given series $27 + 9 + 5\frac{2}{5} + 3\frac{6}{7} + \ldots$

$= 27 + \frac{27}{3} + \frac{27}{5} + \frac{27}{7} + \ldots + \frac{27}{2n-1} + \ldots$

Hence, n^{th} term of given series $t_n = \frac{27}{2n-1}$

So, $t_9 = \frac{27}{2\times9-1} = \frac{27}{17} = 1\frac{10}{17}$

3. Since, a, 9, 3a – b and 3a + b are in A.P.

$\therefore$ $9 - a = (3a + b) - (3a - b)$

$\Rightarrow 9 - a = 2b \Rightarrow a + 2b = 9$ ....(i)

Also, $9 - a = (3a - b) - 9$

$\Rightarrow 4a - b = 18$ ....(ii)

Eliminating b from (i) and (ii), we get

$4a - 18 = (9 - a)/2$

$\Rightarrow 8a - 36 = 9 - a \Rightarrow 9a = 45 \Rightarrow a = 5$

So, first 2 terms of the A.P. are 5 and 9

So, a = 5, d = 4

$\therefore$ 2011^{th} term $= a + 2010d$

$= 5 + 2010 \times 4$

$= 8045$

4. According to the given condition,

$100 (a + 99d) = 50(a + 49d)$

$\Rightarrow 2a + 198d = a + 49d$

$\Rightarrow a + 149d = 0$

$\therefore$ $T_{150} = a + 149d = 0$

5. a + 1, 2a + 1, 4a – 1 are in AP.

$\therefore$ $2a + 1 - (a + 1) = 4a - 1 - (2a + 1)$

$\Rightarrow a = 2a - 2$

$\Rightarrow a = 2$

6. It is not possible to express a + b + 4c – 4d + e in terms of a.

7. Required ratio is $\frac{44}{99} = \frac{4}{9}$

8. Given series 63 + 65 + 67 + 69 + ... (i)

and 3 + 10 + 17 + 24 + ... (ii)

Now from (i), m^{th} term = (2m + 61) and m^{th} term of (ii) series = (7m – 4)

According to the given condition,

$7m - 4 = 2m + 61$

$\Rightarrow 5m = 65 \Rightarrow m = 13$

9. According to the given condition,

$p\{a+(p-1)d\} = q\{a+(q-1)d\}$

$\Rightarrow a(p - q) + (p^2 - q^2)d + (q - p)d = 0$

$\Rightarrow (p - q)\{a + (p + q - 1)d\} = 0$

$\Rightarrow a + (p + q - 1)d = 0$ ....[$\because$ p ≠ q]

$\Rightarrow t_{p+q} = 0$

10. Given that, $t_p = a + (p - 1)d = q$ .... (i)

and $t_q = a + (q - 1)d = p$ .... (ii)

From (i) and (ii), we get $d = -\frac{(p-q)}{(p-q)} = -1$

Putting the value of d in equation (i), we get

$a = p + q - 1$

$t_r = a + (r - 1)d = (p + q - 1) + (r - 1)(-1)$

$= p + q - r$

11. $t_m = a + (m - 1)d = \frac{1}{n}$ and

$t_n = a + (n - 1)d = \frac{1}{m}$

On solving, $a = \frac{1}{mn}$ and $d = \frac{1}{mn}$

$\therefore$ $t_{mn} = a + (mn - 1)d = \frac{1}{mn} + (mn - 1)\frac{1}{mn} = 1$

12. Let the first term be a and common difference be d.

The last 3 terms are T_{23}, T_{22} and T_{21}.

According to the given condition,

$T_{21} + T_{22} + T_{23} = 261$

$\Rightarrow (a + 20d) + (a + 21d) + (a + 22d) = 261$

$\Rightarrow 3a + 63d = 261$ ....(i)

Also, sum of 3 middle terms = 141

$\Rightarrow T_{11} + T_{12} + T_{13} = 141$

$\Rightarrow (a + 10d) + (a + 11d) + (a + 12d) = 141$

$\Rightarrow 3a + 33d = 141$ ....(ii)

Solving (i) and (ii), we get a = 3

13. $164 = (3m^2 + 5m) - \{3(m - 1)^2 + 5(m - 1)\}$

$= (3m^2 + 5m) - 3m^2 + 6m - 3 - 5m + 5$

$\Rightarrow 164 = 6m + 2 \Rightarrow m = 27$

14. a = 3, d = 2

$S_n = \frac{n}{2}[2a + (n - 1)d]$

$= \frac{n}{2}[6 + (n - 1)2]$

$= n(n + 2)$

15. Series 108 + 117 + ... + 999 is an A.P.

Before 108, there are 11 multiples of 9 (and 108 is 12^{th} multiple. 999 is 111^{th} multiple of 9).

$\Rightarrow$ From 108 to 999 there are 100 terms.

$\Rightarrow$ Required sum

$= \frac{100}{2}(108 + 999)$ ...$\left[\because S_n = \frac{n}{2}(a + \ )\right]$

$= 50 \times 1107 = 55350$

16. The series of all natural numbers is
3, 6, 9, 12, ... 99

Here n = $\frac{99}{3}$ = 33, a = 3, d = 3

= 99

∴ $S_{33} = \frac{33}{2}\{3 + 99\}$

$= \frac{33}{2} \times 102$

= 33 × 51 = 1683

17. Series, 2 + 5 + 8 + 11 + …..
a = 2,d = 3 and let number of terms be n,

then sum of A.P. = $\frac{n}{2}\{2a + (n - 1)d\}$

$\Rightarrow 60100 = \frac{n}{2}\{2 \times 2 + (n - 1)3\}$

⇒ 120200 = n(3n + 1)

$\Rightarrow 3n^2 + n - 120200 = 0$

⇒ (n – 200)(3n + 601) = 0

Hence, n = 200

18. 12, 19, …, 96 is the series of numbers which are of two digits and leave remainder 5 when divided by 7.
Here, a = 12, d = 7
Last term ( ) = 96

$S_{13} = \frac{13}{2}[12+96]$

$= \frac{13}{2} \times 108$

= 702

19. For given series,
a = 1
d = 2

∴ $a_n = a + (n - 1)d$

∴ 2001 = 1 + (n – 1)(2)

∴ n = 1001

∴ $S_{1001} = \frac{1001}{2}[2(1) + (1001 - 1) \times (2)]$

∴ $S_{1001} = (1001)^2$

20. k^{th} term = 5k + 1

∴ 1^{st} term = a = 6
2^{nd} term = 11
3^{rd} term = 16

∴ d = 5

∴ $S_{100} = \frac{100}{2}[2 \times 6 + (100 - 1) \times 5]$

∴ $S_{100} = 50\ (507)$

21. Here, a = ₹ 200, d = ₹ 40
Saving in first two months = ₹ 400
Remained saving = 200 + 240 + 280 + …. upto n terms

$\Rightarrow \frac{n}{2}[400 + (n - 1)40] = 11040 - 400$

$\Rightarrow 200n + 20n^2 - 20n = 10640$

$\Rightarrow 20n^2 + 180n - 10640 = 0$

$\Rightarrow n^2 + 9n - 532 = 0$

⇒ (n + 28) (n – 19) = 0

⇒ n = 19

∴ Number of months = 19 + 2 = 21

22. According to the given condition,
4500 = 150 × 10
+ {148 + 146 + … upto n terms}

$= 1500 + \frac{n}{2}\{296 + (n - 1)(-2)\}$

$\Rightarrow n^2 - 149n + 3000 = 0$

⇒(n –24)(n –125) = 0

⇒ n = 24 ….[∵ n ≠ 125]

So, total time taken = 10 + 24 = 34 min.

23. Let the number of sides of the polygon be n.
Then the sum of interior angles of the polygon

$= (2n - 4)\frac{\pi}{2} = (n - 2)\pi$

Since, the angles are in A.P.and a = 120°,d = 5 therefore,

$\frac{n}{2}[2 \times 120 + (n - 1)5] = (n - 2)180$

$\Rightarrow n^2 - 25n + 144 = 0$

⇒ (n – 9) (n – 16) = 0

⇒ n = 9, 16

But n = 16 gives,

$T_{16} = a + 15d$

= 120° + 15.5°

= 195° which is impossible, as interior angle cannot be greater than 180°. Hence, n = 9.

24. We have $\frac{S_{n_1}}{S_{n_2}} = \frac{2n+3}{6n+5}$

$\Rightarrow \frac{\frac{n}{2}[2a_1 + (n-1)d_1]}{\frac{n}{2}[2a_2 + (n-1)d_2]} = \frac{2n+3}{6n+5}$

$$\Rightarrow \frac{2\left[a_1 + \left(\frac{n-1}{2}\right)d_1\right]}{2\left[a_2 + \left(\frac{n-1}{2}\right)d_2\right]} = \frac{2n+3}{6n+5}$$

$$\Rightarrow \frac{a_1 + \left(\frac{n-1}{2}\right)d_1}{a_2 + \left(\frac{n-1}{2}\right)d_2} = \frac{2n+3}{6n+5}$$

Put n = 25 then $\frac{a_1 + 12d_1}{a_2 + 12d_2} = \frac{2(25)+3}{6(25)+5}$

$$\Rightarrow \frac{t_{13_1}}{t_{13_2}} = \frac{53}{155}$$

25. Let the first term be a and common difference be d.

Given, $\frac{a_1 + a_2 + ... + a_p}{a_1 + a_2 + ... + a_q} = \frac{p^2}{q^2}$

$$\Rightarrow \frac{pa + d[1+2+...+(p-1)]}{qa + d[1+2+...+(q-1)]} = \frac{p^2}{q^2}$$

$$\Rightarrow \frac{pa + \frac{p(p-1)}{2}d}{qa + \frac{q(q-1)}{2}d} = \frac{p^2}{q^2} \Rightarrow \frac{a + \left(\frac{p-1}{2}\right)d}{a + \left(\frac{q-1}{2}\right)d} = \frac{p}{q}$$

We have to find, $\frac{a_6}{a_{21}} = \frac{a+5d}{a+20d}$

Put $\frac{p-1}{2} = 5$ and $\frac{q-1}{2} = 20$

$\Rightarrow p = 11$ and $\Rightarrow q = 41$

∴ $\frac{a+5d}{a+20d} = \frac{11}{41}$

26. Acording to the given condition,

$\frac{n}{2}\{2a + (n-1)d\} = \frac{m}{2}\{2a + (m-1)d\}$

$\Rightarrow 2a(m-n) + d(m^2 - m - n^2 + n) = 0$

$\Rightarrow (m-n)\{2a + d(m+n-1)\} = 0$

$\Rightarrow 2a + (m+n-1)d = 0$ ....[∵ $m \neq n$]

∴ $S_{m+n} = \frac{m+n}{2}\{2a + (m+n-1)d\}$

$= \frac{m+n}{2}\{0\} = 0$

27. Given that $S_n = nA + n^2B$

Putting n = 1, 2, 3, …… we get

$S_1 = A + B$, $S_2 = 2A + 4B$, $S_3 = 3A + 9B$

....

....

Therefore,

$T_1 = S_1 = A + B$,

$T_2 = S_2 - S_1 = A + 3B$,

$T_3 = S_3 - S_2 = A + 5B$,

....

....

Hence, the sequence is

(A + B), (A + 3B), (A + 5B)…….

Here, a = A + B and common difference d = 2B

28. $S_1 = a_2 + a_4 + a_6 + a_8 + …. + a_{100}$

$S_2 = a_1 + a_3 + a_5 + a_7 + …. + a_{99}$

∴ $S_1 - S_2 = (a_2 - a_1) + (a_4 - a_3) + … + (a_{100} - a_{99})$

$= d + d + … + d = 50d \Rightarrow d = \frac{S_1 - S_2}{50}$

29. As given $a_2 - a_1 = a_3 - a_2 = … = a_n - a_{n-1} = d$

Where d is the common difference of the given A.P.

Also $a_n = a_1 + (n-1)d$

Then by rationalising each term,

$$\frac{1}{\sqrt{a_2}+\sqrt{a_1}} + \frac{1}{\sqrt{a_3}+\sqrt{a_2}} + ….. + \frac{1}{\sqrt{a_n}+\sqrt{a_{n-1}}}$$

$$= \frac{\sqrt{a_2}-\sqrt{a_1}}{a_2 - a_1} + \frac{\sqrt{a_3}-\sqrt{a_2}}{a_3 - a_2} + ….. + \frac{\sqrt{a_n}-\sqrt{a_{n-1}}}{a_n - a_{n-1}}$$

$$= \frac{1}{d}(\sqrt{a_2} - \sqrt{a_1} + \sqrt{a_3} - \sqrt{a_2} + ….. + \sqrt{a_n} - \sqrt{a_{n-1}})$$

$$= \frac{1}{d}(\sqrt{a_n} - \sqrt{a_1}) = \frac{1}{d}\left(\frac{a_n - a_1}{\sqrt{a_n}+\sqrt{a_1}}\right)$$

$$= \frac{1}{d}\left\{\frac{(n-1)d}{\sqrt{a_n}+\sqrt{a_1}}\right\} = \frac{n-1}{\sqrt{a_n}+\sqrt{a_1}}$$

30. $\frac{1}{S_1S_2} + \frac{1}{S_2S_3} + ... + \frac{1}{S_{100}S_{101}} = \frac{1}{6}$

$$\Rightarrow \frac{1}{d}\left[\frac{S_2 - S_1}{S_1S_2} + \frac{S_3 - S_2}{S_2S_3} + ... + \frac{S_{101} - S_{100}}{S_{100}S_{101}}\right] = \frac{1}{6}$$

….[∵ $S_2 - S_1 = S_3 - S_2 = … = d$]

$$\Rightarrow \frac{1}{d}\left[\frac{1}{S_1} - \frac{1}{S_2} + \frac{1}{S_2} - \frac{1}{S_3} + ... + \frac{1}{S_{100}} - \frac{1}{S_{101}}\right] = \frac{1}{6}$$

$\Rightarrow \frac{1}{d}\left[\frac{1}{S_1}-\frac{1}{S_{101}}\right]=\frac{1}{6} \Rightarrow \frac{1}{d}\left[\frac{1}{S_1}-\frac{1}{S_1+100d}\right]=\frac{1}{6}$

$\Rightarrow \frac{1}{d}\left[\frac{100d}{S_1.(S_1+100d)}\right]=\frac{1}{6}$

$\Rightarrow S_1.(S_1 + 100d) = 600$ ….(i)

Given, $S_1 + S_{101} = 50$

$\Rightarrow S_1 + (S_1 + 100d) = 50 \Rightarrow 2S_1 + 100d = 50$

$\Rightarrow S_1 + 50d = 25$

$\Rightarrow S_1 = 25 - 50d$ ….(ii)

Putting (ii) in (i), we get

$(25 - 50d).(25 + 50d) = 600$

$\Rightarrow 625 - 2500\, d^2 = 600$

$\Rightarrow d^2 = \frac{1}{100} \Rightarrow d = \pm\frac{1}{10}$

$\therefore$ $|S_1 - S_{101}| = |S_1 - (S_1 + 100d)|$

$= |-100d| = 100\,|d|$ ….[$\because |xy| = |x|.|y|$]

$\therefore$ $|S_1 - S_{101}| = 10$ ….[$\because d = \pm 1/10$]

31. $a_1, a_2, a_3, \ldots, a_{n+1}$ are in A.P. and common difference = d

Let $S = \frac{1}{a_1a_2}+\frac{1}{a_2a_3}+\ldots\ldots\ldots+\frac{1}{a_na_{n+1}}$

$\Rightarrow S = \frac{1}{d}\left\{\frac{d}{a_1a_2}+\frac{d}{a_2a_3}+\ldots\ldots+\frac{d}{a_n\,a_{n+1}}\right\}$

$\Rightarrow S = \frac{1}{d}\left\{\frac{a_2-a_1}{a_1a_2}+\frac{a_3-a_2}{a_2a_3}+\ldots\ldots+\frac{a_{n+1}-a_n}{a_n\,a_{n+1}}\right\}$

$\Rightarrow S = \frac{1}{d}\left\{\frac{1}{a_1}-\frac{1}{a_2}+\frac{1}{a_2}-\frac{1}{a_3}+\ldots\ldots.+\frac{1}{a_n}-\frac{1}{a_{n+1}}\right\}$

$\Rightarrow S = \frac{1}{d}\left\{\frac{1}{a_1}-\frac{1}{a_{n+1}}\right\}=\frac{1}{d}\left\{\frac{a_{n+1}-a_1}{a_1a_{n+1}}\right\}$

$\Rightarrow S = \frac{1}{d}\left(\frac{nd}{a_1a_{n+1}}\right)=\frac{n}{a_1a_{n+1}}$

Trick: Check for n = 2.

32. Since, $a_1 = 0$

$\therefore$ $a_2 = d, a_3 = 2d, \ldots$

$\therefore$ $\left(\frac{a_3}{a_2}+\frac{a_4}{a_3}+\ldots+\frac{a_n}{a_{n-1}}\right)-a_2\left(\frac{1}{a_2}+\frac{1}{a_3}+\ldots+\frac{1}{a_{n-2}}\right)$

$= \left(\frac{2d}{d}+\frac{3d}{2d}+\ldots+\frac{(n-1)d}{(n-2)d}\right)$

$-d\left(\frac{1}{d}+\frac{1}{2d}+\ldots+\frac{1}{(n-3)d}\right)$

$= \left(\frac{2}{1}+\frac{3}{2}+\ldots+\frac{n-1}{n-2}\right)-\left(1+\frac{1}{2}+\frac{1}{3}+\ldots+\frac{1}{n-3}\right)$

$= \left[(1+1)+\left(1+\frac{1}{2}\right)+\ldots+\left(\frac{n-1}{n-2}\right)\right]$

$-\left(1+\frac{1}{2}+\frac{1}{3}+\ldots+\frac{1}{n-3}\right)$

$= (n-3)+\frac{n-1}{n-2} = (n-3)+1+\frac{1}{n-2}$

$= (n-2)+\frac{1}{n-2}$

33. As given

$d = a_2 - a_1 = a_3 - a_2 = \ldots. = a_n - a_{n-1}$

$\therefore$ sin d {cosec a_1 cosec a_2 + ….. + cosec a_{n-1} cosec a_n}

$= \frac{\sin(a_2-a_1)}{\sin a_1.\sin a_2}+\ldots\ldots+\frac{\sin(a_n-a_{n-1})}{\sin a_{n-1}\sin a_n}$

$= (\cot a_1 - \cot a_2) + (\cot a_2 - \cot a_3) + \ldots. + (\cot a_{n-1} - \cot a_n)$

$= \cot a_1 - \cot a_n$

34. $\log_3 2$, $\log_3(2^x - 5)$ and $\log_3\left(2^x-\frac{7}{2}\right)$ are in A.P.

$\Rightarrow 2\log_3(2^x - 5) = \log_3\left[(2)\left(2^x-\frac{7}{2}\right)\right]$

$\Rightarrow (2^x - 5)^2 = 2^{x+1} - 7$

$\Rightarrow 2^{2x} - 12.2^x + 32 = 0$

$\Rightarrow x = 2,3$

But $x = 2$ does not hold, hence $x = 3$

35. $2\tan^{-1}y = \tan^{-1}x + \tan^{-1}z$

$\Rightarrow \tan^{-1}\left(\frac{2y}{1-y^2}\right)=\tan^{-1}\left(\frac{x+z}{1-xz}\right)$

$\Rightarrow \frac{2y}{1-y^2}=\frac{x+z}{1-xz}$

But $2y = x + z$ …[$\because x, y, z$ are in A.P.]

$\therefore$ $1 - y^2 = 1 - xz$

$\Rightarrow y^2 = xz$

$\because$ $x\ y\ z$ are both in G.P. and A.P.,

$\therefore$ $x = y = z$

36. Since, a,b,c are in A.P., we get

$b - c = -d$, ...(i)

$c - a = 2d$, ...(ii)

$a - b = -d$ ...(iii)

Also, since x, y, z are in G.P., we get

$y^2 = x.z$ ...(iv)

Now, $x^{b-c}.y^{c-a}.z^{a-b}$

$= x^{-d}.y^{2d}.z^{-d}$ ...[From (i), (ii), (iii)]

$= x^{-d}.(x.z)^d.z^{-d}$

$= 1$

37. If a, b, c are in A.P., then 2b = a + c

So, $\dfrac{(a-c)^2}{(b^2-ac)} = \dfrac{(a-c)^2}{\left\{\left(\dfrac{a+c}{2}\right)^2-ac\right\}}$

$= \dfrac{4(a-c)^2}{[a^2+c^2+2ac-4ac]}$

$= \dfrac{4(a-c)^2}{(a-c)^2} = 4$

Trick: Put a = 1, b = 2, c = 3, then the required value is $\dfrac{4}{1} = 4$.

38. Let a – d, a, a + d be the roots of the equation $x^3 - 12x^2 + 39x - 28 = 0$

Then, (a – d) + a + (a + d) = 12 and (a – d)a(a + d) = 28

$\Rightarrow 3a = 12$ and $a(a^2 - d^2) = 28$

$\Rightarrow a = 4$ and $a(a^2 - d^2) = 28$

$\Rightarrow 16 - d^2 = 7$

$\Rightarrow d = \pm 3$

39. Arithmetic mean of ${}^nC_0$, ${}^nC_1$, ${}^nC_2$, ..., ${}^nC_n$ i.e. (n + 1) terms

$= \dfrac{{}^nC_0 + {}^nC_1 + {}^nC_2 + \ldots {}^nC_n}{n+1}$

$= \dfrac{2^n}{n+1}$

40. For set a to 2b,

2b is the $(n+2)^{th}$ term

∴ 2b = a + (n + 1)d

$\Rightarrow d = \dfrac{2b-a}{n+1}$

∴ m^{th} mean $= a + md = a + m\left(\dfrac{2b-a}{n+1}\right)$ ...(i)

For set 2a to b,

b is the $(n+2)^{th}$ term

∴ b = 2a + (n + 1)d

$\Rightarrow d = \dfrac{b-2a}{n+1}$

∴ m^{th} mean $= 2a + md = 2a + m\left(\dfrac{b-2a}{n+1}\right)$ ...(ii)

∴ From (i) and (ii)

$a + m\left(\dfrac{2b-a}{n+1}\right) = 2a + m\left(\dfrac{b-2a}{n+1}\right)$

$\Rightarrow \dfrac{a}{b} = \dfrac{m}{n+1-m}$

41. The given sequence is a G.P.

$a = 3,\ r = \dfrac{1}{3}$

$t_6 = 3\left(\dfrac{1}{3}\right)^{6-1}$

$= 3\left(\dfrac{1}{3}\right)^5$

$= \dfrac{1}{81}$

42. $r = \dfrac{1}{3}\sqrt{\dfrac{20}{3}.\dfrac{9}{10}} = \dfrac{\sqrt{60}}{10} = \sqrt{\dfrac{6}{10}} = \sqrt{\dfrac{3}{5}}$

∴ $t_5 = ar^4 = \left(\dfrac{10}{9}\right)\left(\dfrac{3}{5}\right)^2 = \dfrac{10}{9}.\dfrac{9}{25} = \dfrac{2}{5}$

43. Given that x, $2x + 2$, $3x + 3$ are in G.P.

Therefore,

$(2x + 2)^2 = x(3x + 3)$

$\Rightarrow x^2 + 5x + 4 = 0$

$\Rightarrow (x + 4)(x + 1) = 0$

$\Rightarrow x = -1, -4$

Now, first term: $a = x$

and second term: $ar = 2(x + 1)$

$\Rightarrow r = \dfrac{2(x+1)}{x}$

then 4^{th} term $= ar^3 = x\left[\dfrac{2(x+1)}{x}\right]^3 = \dfrac{8}{x^2}(x+1)^3$

Putting, $x = -4$

We get, $t_4 = \dfrac{8}{16}(-3)^3 = -\dfrac{27}{2} = -13.5$

44. Let the first four terms be a, –ar, ar^2, $-ar^3$, where r > 0, a > 0

According to the given conditions,

a – ar = 12 and $ar^2 - ar^3 = 48$

By solving, we get r = 2 (r > 0)

So, a = –12

45. $t_5 = ar^4 = \dfrac{1}{3}$ …..(i)

and $t_9 = ar^8 = \dfrac{16}{243}$ …..(ii)

Solving (i) and (ii), we get $r = \dfrac{2}{3}$ and $a = \dfrac{27}{16}$

Now 4^{th} term $= ar^3 = \dfrac{3^3}{2^4}.\dfrac{2^3}{3^3} = \dfrac{1}{2}$

46. $t_n = t_{n+1} + t_{n+2}$
$\Rightarrow a r^{n-1} = a r^n + a r^{n+1}$
$\Rightarrow r^{n-1} = r^n (1 + r)$
$\Rightarrow r^2 + r = 1$
$\Rightarrow r^2 + r - 1 = 0$
$\therefore \quad r = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
$= \frac{-1 \pm \sqrt{1+4}}{2}$
$= \frac{-1 \pm \sqrt{5}}{2}$

47. Let first term and common ratio of G.P. are respectively a and r, then under condition,
$t_n = t_{n-1} + t_{n-2}$
$\Rightarrow ar^{n-1} = ar^{n-2} + ar^{n-3}$
$\Rightarrow ar^{n-1} = ar^{n-1} r^{-1} + ar^{n-1} r^{-2}$
$\Rightarrow 1 = \frac{1}{r} + \frac{1}{r^2}$
$\Rightarrow r^2 - r - 1 = 0$
$\Rightarrow r = \frac{1 \pm \sqrt{1+4}}{2} = \frac{1+\sqrt{5}}{2}$
Taking only (+) sign ($\because r > 1$)

48. Let the G.P. be a, ar, ar^2, ar^3, ar^4, …
$t_2 + t_5 = ar + ar^4 = 216$
$\frac{t_4}{t_6} = \frac{ar^3}{ar^5} = \frac{1}{4}$
$\Rightarrow r^2 = 4 \Rightarrow r = \pm 2$
For r = 2,
$a(2 + 2^4) = 216$
$\Rightarrow a(18) = 216$
$\Rightarrow a = \frac{216}{18} = 12$
For r = –2,
$a(-2 + 2^4) = 216$
$\Rightarrow a(14) = 216$
$\Rightarrow a = \frac{216}{14} = \frac{108}{7}$
$\therefore \quad a = 12$

49. Let first term of G.P.= A and
common ratio = r
We know that n^{th} term of G.P. = Ar^{n-1}
Now $t_4 = a = Ar^3$, $t_7 = b = Ar^6$ and $t_{10} = c = Ar^9$
Relation $b^2 = ac$ is true because
$b^2 = (Ar^6)^2 = A^2r^{12}$ and $ac = (Ar^3)(Ar^9) = A^2r^{12}$

Alternate method : As we know, if p, q, r in A.P., then p^{th}, q^{th}, r^{th} terms of a G.P. are always in G.P., therefore, a, b, c will be in G.P. i.e. $b^2 = ac$.

50. The given series is a G.P. with a = i, r = –i
$\therefore \quad S_{100} = \frac{i(1-i^{100})}{1+i}$
$= \frac{i(1-(i^2)^{50})}{1+i}$
$= \frac{i(1-1)}{1+i} = 0$

51. $\frac{ar^n - a}{r-1} = 364$
$\Rightarrow \frac{ar^{n-1}.r - a}{r-1} = 364$ …..(i)
$\Rightarrow \frac{3 \times 243 - a}{2} = 364$
$\Rightarrow a = 1$
Now, putting this in (i), n = 6

52. $\therefore$ n^{th} term of series = $ar^{n-1} = a(3)^{n-1}$
$= 486$ …..(i)
and sum of n terms of series.
$S_n = \frac{a(3^n - 1)}{3-1} = 728$ ($\because r > 1$) ......(ii)
From (i), $a\left(\frac{3^n}{3}\right) = 486$ or $a.3^n = 3 \times 486$
$= 1458$
From (ii), $a.3^n - a = 728 \times 2$
or $a.3^n - a = 1456$
$\therefore \quad 1458 - a = 1456$
$\Rightarrow a = 2$

53. $t_2 = ar = 24$
$t_5 = ar^4 = 3$
$\frac{t_5}{t_2} = \frac{1}{8} = r^3$
$\Rightarrow r = \frac{1}{2}$ & a = 48
$S_6 = \frac{a\left(1-r^6\right)}{1-r}$
$= \frac{48\left(1-\left(\frac{1}{2}\right)^6\right)}{1-\frac{1}{2}} = \frac{189}{2}$

54. $9 + 99 + 999 + \ldots\ldots 10$ terms

$= (10 - 1) + (100 - 1) + (1000 - 1) + \ldots 10$ terms

$= (10 + 10^2 + 10^3 + \ldots 10 \text{ terms}) - (10)$

$$= \frac{10\left(10^{10} - 1\right)}{10 - 1} - 1$$

$$= \frac{10\left(10^{10} - 1\right)}{9} - 10$$

$$= \frac{10\left(10^{10} - 1\right) - 90}{9}$$

$$= \frac{100}{9}\left(10^9 - 1\right)$$

55. Series $3 + 33 + 333 + \ldots\ldots + n$ terms

Given series can be written as,

$$= \frac{1}{3}[9 + 99 + 999 + \ldots + n \text{ terms}]$$

$$= \frac{1}{3}[(10 - 1) + (10^2 - 1) + (10^3 - 1) + \ldots + n \text{ terms}]$$

$$= \frac{1}{3}[10 + 10^2 + \ldots + 10^n] - \frac{1}{3}[1 + 1 + 1 + \ldots + n \text{ terms}]$$

$$= \frac{1}{3} \cdot \frac{10(10^n - 1)}{10 - 1} - \frac{1}{3}.n$$

$$= \frac{1}{3}\left[\frac{10^{n+1} - 10}{9} - n\right]$$

$$= \frac{1}{3}\left[\frac{10^{n+1} - 9n - 10}{9}\right]$$

$$= \frac{1}{27}[10^{n+1} - 9n - 10]$$

56. Let the G.P. be $a, ar, ar^2, ar^3, \ldots, ar^{48}, ar^{49}$

i.e., $a_1 = a$, $a_2 = ar$, $a_3 = ar^2$, …, $a_{49} = ar^{48}$ and $a_{50} = ar^{49}$

$$\therefore \quad \frac{a_1 - a_3 + a_5 - \ldots + a_{49}}{a_2 - a_4 + a_6 - \ldots + a_{50}}$$

$$= \frac{a - ar^2 + ar^4 - \ldots + ar^{48}}{ar - ar^3 + ar^5 - \ldots + ar^{49}}$$

$$= \frac{\dfrac{a\left(1 - (-r^2)^{25}\right)}{1 - (-r^2)}}{\dfrac{ar\left(1 - (-r^2)^{25}\right)}{1 - (-r^2)}} = \frac{1}{r} = \frac{a}{ar} = \frac{a_1}{a_2}$$

57. Since $n^m + 1$ divides $1 + n + n^2 + \ldots\ldots + n^{127}$

Therefore, $\dfrac{1 + n + n^2 + \ldots\ldots + n^{127}}{n^m + 1}$ is an integer

$\Rightarrow \dfrac{1 - n^{128}}{1 - n} \times \dfrac{1}{n^m + 1}$ is an integer

$\Rightarrow \dfrac{(1 - n^{64})(1 + n^{64})}{(1 - n)(n^m + 1)}$

is an integer, when largest $m = 64$.

58. $\dfrac{\sqrt{2} + 1}{\sqrt{2} - 1}, \dfrac{1}{\sqrt{2}(\sqrt{2} - 1)}, \dfrac{1}{2}, \ldots\ldots$

Common ratio of the series $= \dfrac{1}{\sqrt{2}(\sqrt{2} + 1)}$

$$\therefore \quad \text{sum} = \frac{a}{1 - r} = \left(\frac{\sqrt{2} + 1}{\sqrt{2} - 1}\right) \Big/ \left(1 - \frac{1}{\sqrt{2}(\sqrt{2} + 1)}\right)$$

$$= \frac{(\sqrt{2} + 1)}{(\sqrt{2} - 1)} \cdot \frac{\sqrt{2}(\sqrt{2} + 1)}{(1 + \sqrt{2})}$$

$$= \sqrt{2}(\sqrt{2} + 1)^2$$

59. Clearly it is a infinite G.P. whose common ratio is 0.24.

$$\therefore \quad S_\infty = \frac{a}{1 - r} = \frac{5.05}{1 - 0.24} = 6.64474$$

60. $(32)\,(32)^{1/6}(32)^{1/36} \ldots\infty = (32)^{1 + \frac{1}{6} + \frac{1}{36} + \ldots\infty}$

$= (32)^{\frac{1}{1 - (1/6)}} = (32)^{\frac{1}{5/6}} = (32)^{\frac{6}{5}}$

$= 2^6 = 64$

61. According to the given condition,

$$\frac{a}{1 - r} = \frac{4}{3}$$

$$\Rightarrow \frac{3}{4}\left(\frac{1}{1 - r}\right) = \frac{4}{3}$$

$$\Rightarrow r = 1 - \frac{9}{16} = \frac{7}{16}$$

62. According to the given condition,

$$4 = \frac{a}{1 - r}$$

$\Rightarrow 4 \Rightarrow a = 4 - 4r$

$\Rightarrow 4r = 4 - a$

Only option (D) satisfies this condition.

63. $3 + 3\alpha + 3\alpha^2 + 3\alpha^3 + \ldots\ldots \infty = \dfrac{45}{8}$

$$\Rightarrow 3\left[\frac{1}{1 - \alpha}\right] = \frac{45}{8} \Rightarrow 8 = 15(1 - \alpha) \Rightarrow \alpha = \frac{7}{15}$$

64. $y = x - x^2 + x^3 - x^4 + \ldots\ \infty$

Then $xy = x^2 - x^3 + x^4 - \ldots\infty$

Adding, $y + xy = x + 0 + 0 \ldots + 0$

$\Rightarrow x - xy = y$

$\Rightarrow x(1 - y) = y$

$\Rightarrow x = \dfrac{y}{1-y}$

Alternate method:

$y = \dfrac{x}{1-(-x)} \Rightarrow y = \dfrac{x}{1+x}$

$\Rightarrow y + yx = x \Rightarrow x = \dfrac{y}{1-y}$

65. Common ratio (r) $= \dfrac{2}{x}$

For sum to be finite $r < 1 \Rightarrow \dfrac{2}{x} < 1$

$\Rightarrow 2 < x$

$\Rightarrow x > 2$

66. We have $\dfrac{a}{1-r} = x$

and $\dfrac{a^2}{1-r^2} = \dfrac{a}{1-r}.\dfrac{a}{1+r} = y$

$\Rightarrow y = x.\dfrac{a}{1+r} = x\dfrac{x(1-r)}{1+r}$

$\Rightarrow \dfrac{y}{x^2} = \dfrac{1-r}{1+r} \Rightarrow \dfrac{x^2}{y} = \dfrac{1+r}{1-r}$

$\Rightarrow \dfrac{x^2}{y}(1 - r) = 1 + r$

$\Rightarrow r\left[1+\dfrac{x^2}{y}\right] = -1 + \dfrac{x^2}{y}$

$\Rightarrow r = \dfrac{x^2-y}{x^2+y}$

67. Let r be the common ratio of the G.P. Then

$S = \dfrac{a}{1-r} \Rightarrow r = 1 - \dfrac{a}{S}$

Now S_n = Sum of n terms

$= a\left(\dfrac{1-r^n}{1-r}\right)$

$= \dfrac{a}{1-r}(1 - r^n)$

$= S\left[1-\left(1-\dfrac{a}{S}\right)^n\right]$

68. Since the series are in G.P., therefore

$x = \dfrac{1}{1-a}$ and $y = \dfrac{1}{1-b}$

$\therefore$ $a = \dfrac{x-1}{x}$, $b = \dfrac{y-1}{y}$

$\therefore$ $1 + ab + a^2b^2 + \ldots\ \infty$

$= \dfrac{1}{1-ab} = \dfrac{1}{1-\dfrac{x-1}{x}.\dfrac{y-1}{y}} = \dfrac{xy}{x+y-1}$

69. $1-\cos\alpha = \dfrac{1}{2-\sqrt{2}} = 1+\dfrac{1}{\sqrt{2}}$ $\ldots\left[\because \dfrac{a}{1-r} = 2-\sqrt{2}\right]$

$\Rightarrow \cos\alpha = -\dfrac{1}{\sqrt{2}} = \cos\dfrac{3\pi}{4}$

$\Rightarrow \alpha = \dfrac{3\pi}{4}$

70. $1 + \sin x + \sin^2 x + \ldots$ upto $\infty = 4 + 2\sqrt{3}$

$\Rightarrow \dfrac{1}{1-\sin x} = 4+2\sqrt{3}$

$\Rightarrow 1-\sin x = \dfrac{1}{2(2+\sqrt{3})}$

$\Rightarrow \sin x = \dfrac{4+2\sqrt{3}-1}{2(2+\sqrt{3})}$

$\Rightarrow \sin x = \dfrac{\sqrt{3}}{2} \Rightarrow x = \dfrac{\pi}{3}, \dfrac{2\pi}{3}$

71. $0.2\dot{3}\dot{4} = \dfrac{234-2}{990} = \dfrac{232}{990}$

72. $0.4\dot{2}\dot{3} = \dfrac{423-4}{990} = \dfrac{419}{990}$

73. 0.14189189189....

$= 0.14 + 0.00189 + 0.00000189 + \ldots$

$= \dfrac{14}{100} + 189\left[\dfrac{1}{10^5} + \dfrac{1}{10^8} + \ldots\infty\right]$

$= \dfrac{7}{50} + 189\left[\dfrac{\dfrac{1}{10^5}}{1-\left(\dfrac{1}{10^3}\right)}\right]$

$= \dfrac{7}{50} + 189\left[\dfrac{1}{10^5}\times\dfrac{10^3}{999}\right]$

$= \dfrac{7}{50} + \dfrac{189}{999\times100} = \dfrac{7}{50} + \dfrac{7}{3700}$

$= \dfrac{7}{50} + \dfrac{7}{25\times148} = \dfrac{21}{148}$

Alternate Method:

$0.14\dot{1}8\dot{9}$

$= \frac{14189-14}{99900} = \frac{14175}{99900} = \frac{21}{148}$

74. Let α and β be the roots of equation $x^2 - 18x + 9 = 0$

∴ G.M. of α and β $= \sqrt{\alpha\beta} = \sqrt{9} = 3$ [∵ αβ = 9]

75. Let G_1, G_2, G_3, G_4, G_5 be the G.M.'s are inserted between 486 and $\frac{2}{3}$. So total terms are 7.

$t_n = ar^{n-1}$

$\Rightarrow \frac{2}{3} = 486(r)^6 \Rightarrow r = \frac{1}{3}$

Hence, 4th G.M. will be, $t_5 = ar^4$

$= 486\left(\frac{1}{3}\right)^4$

$= 6$

76. Let a – d, a, a + d be three numbers in A.P.

∴ a + d + a + a – d = 15

⇒ a = 5

a – d + 1, a + 4, a + d + 19 are in G.P.

⇒ 6 – d, 9, 24 + d are in G.P.

∴ 81 = (6 – d) (24 + d)

$\Rightarrow 81 = 144 + 6d - 24d - d^2$

$\Rightarrow d^2 + 18d - 63 = 0$

∴ d = 3, –21

∴ the numbers are 2, 5, 8 and 26, 5, –16

77. x, y, z are in G.P., then $y^2 = x.z$

Now $a^x = b^y = c^z = m$

$\Rightarrow x \log_e a = y \log_e b = z \log_e c = \log_e m$

$\Rightarrow x = \log_a m, y = \log_b m, z = \log_c m$

Again as x, y, z are in G.P., so $\frac{y}{x} = \frac{z}{y}$

$\Rightarrow \frac{\log_b m}{\log_a m} = \frac{\log_c m}{\log_b m}$

$\Rightarrow \log_b a = \log_c b$

78. Let $a^{1/x} = b^{1/y} = c^{1/z}$

$\Rightarrow a = k^x, b = k^y, c = k^z$

Now, a, b, c are in G.P.

$\Rightarrow b^2 = ac$

$\Rightarrow k^{2y} = k^x.k^z = k^{x+z}$

$\Rightarrow 2y = x + z$

$\Rightarrow x, y, z$ are in A.P.

79. Since, a, b, c are in G.P.

∴ $b^2 = ac$

$\Rightarrow \log_e b^2 = \log_e ac$

$\Rightarrow \log_e a - 2\log_e b + \log_e c = 0$

Given, $(\log_e a)x^2 - (2\log_e b)\, x + \log_e c = 0$

Since, 1 satisfies this equation.

Therefore, 1 is one root and other root say β.

∴ $1.\beta = \frac{\log_e c}{\log_e a}$

∴ $\beta = \log_a c$

80. $\frac{x^{n+1} + y^{n+1}}{x^n + y^n} = \sqrt{xy} \Rightarrow x^{n+1} + y^{n+1} = \sqrt{xy}\,(x^n + y^n)$

$\Rightarrow x^{n+\frac{1}{2}}\left(x^{\frac{1}{2}} - y^{\frac{1}{2}}\right) = y^{n+\frac{1}{2}}\left(x^{\frac{1}{2}} - y^{\frac{1}{2}}\right)$

$\Rightarrow \left(\frac{x}{y}\right)^{n+\frac{1}{2}} = 1 \Rightarrow n = -\frac{1}{2}$

81. a + d, a + 4d, a + 8d, are in G.P.

$\Rightarrow (a + 4d)^2 = (a + d)(a + 8d)$

$\Rightarrow 8d^2 = ad \Rightarrow \frac{a}{d} = 8$

∴ common ratio $= \frac{a+4d}{a+d}$

$= \frac{8+4}{8+1} = \frac{4}{3}$

82. Series, 2, $2\frac{1}{2}$, $3\frac{1}{3}$, …… are in H.P.

$\Rightarrow \frac{1}{2}, \frac{2}{5}, \frac{3}{10}$,….. will be in A.P.

Now, first term $a = \frac{1}{2}$ and

common difference $d = -\frac{1}{10}$

So, 5th term of the A.P.

$= \frac{1}{2} + (5-1)\left(-\frac{1}{10}\right) = \frac{1}{10}$

Hence, 5th term of the H.P. is 10.

83. Here, 5th term of the corresponding A.P. = a + 4d = 45 …..(i)

and 11th term of the corresponding A.P. = a + 10d = 69 …..(ii)

From (i) and (ii), we get a = 29, d = 4

Therefore, 16th term of the corresponding A.P.

= a + 15d = 29 + 15 × 4 = 89

Hence, 16th term of the H.P. is $\frac{1}{89}$.

84. Since $a_1, a_2, a_3, \ldots\ldots a_n$ are in H.P

Therefore $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \ldots.. \frac{1}{a_n}$ will be in A.P.

Which gives, $\frac{1}{a_2} - \frac{1}{a_1} = \frac{1}{a_3} - \frac{1}{a_2} = \ldots\ldots$

$$= \frac{1}{a_n} - \frac{1}{a_{n-1}} = d$$

$$\Rightarrow \frac{a_1 - a_2}{a_1 a_2} = \frac{a_2 - a_3}{a_2 a_3} = \ldots\ldots = \frac{a_{n-1} - a_n}{a_{n-1} a_n} = d$$

$\Rightarrow a_1 - a_2 = da_1a_2,\ a_2 - a_3 = da_2a_3$

and $a_{n-1} - a_n = da_{n-1}a_n$

Adding these, we get

$d(a_1a_2 + a_2a_3 + \ldots\ldots + a_{n-1}a_n)$

$= (a_1 + a_2 + \ldots.. + a_{n-1}) - (a_2 + a_3 + \ldots.. + a_n)$

$= a_1 - a_n$ …..(i)

Also n^{th} term of this A.P. is given by

$$\frac{1}{a_n} = \frac{1}{a_1} + (n-1)d \Rightarrow d = \frac{a_1 - a_n}{a_1 a_n (n-1)}$$

Substituting this value of d in (i)

$$(a_1 - a_n) = \frac{a_1 - a_n}{a_1 a_n (n-1)}(a_1a_2 + a_2a_3 + \ldots.. + a_{n-1}a_n)$$

$(a_1a_2 + a_2a_3 + \ldots\ldots + a_{n-1}a_n) = a_1a_n(n - 1)$

85. We know that, $x_n = \frac{(n+1)ab}{na+b}$

$\therefore$ Sixth H.M. i.e. $x_6 = \frac{7.3.\left(\frac{6}{13}\right)}{\left(6.3 + \frac{6}{13}\right)}$

$$= \frac{126}{240}$$

$$= \frac{63}{120}$$

86. Let roots be α, β then

$\alpha + \beta = -\frac{b}{a} = 10$

$\alpha\beta = \frac{c}{a} = 11$

H.M. $= \frac{2\alpha\beta}{\alpha+\beta} = \frac{11 \times 2}{10} = \frac{11}{5}$

87. a,b,c are in H.P. $\Rightarrow b = \frac{2ac}{a+c}$

By inspection, we get (A) False (B) False (C) False

88. Since, a, b, c are in H.P.

$\therefore \frac{2}{b} = \frac{1}{a} + \frac{1}{c} \Rightarrow b = \frac{2ac}{a+c}$

Consider option (B),

$$\frac{1}{ca} = \frac{2\left(\frac{1}{bc} \cdot \frac{1}{ab}\right)}{\frac{1}{bc} + \frac{1}{ab}} = \frac{\left(\frac{2}{ab^2c}\right)}{\frac{a+c}{abc}}$$

$$= \frac{2(abc)}{ab^2c(a+c)} = \frac{2}{b(a+c)}$$

$\Rightarrow ca = \frac{b(a+c)}{2}$

$\Rightarrow b = \frac{2ac}{a+c}$

$\therefore \frac{1}{bc}, \frac{1}{ca}, \frac{1}{ab}$ are in H.P.

89. As given $H = \frac{2pq}{p+q}$

$$\therefore \frac{H}{p} + \frac{H}{q} = \frac{2q}{p+q} + \frac{2p}{p+q} = \frac{2(p+q)}{p+q} = 2$$

90. Let, the distance of school from home = d and time taken are t_1 and t_2.

$\therefore t_1 = \frac{d}{x}$ and $t_2 = \frac{d}{y}$

Avg. velocity $= \frac{\text{Total distance}}{\text{Total time}}$

$= \frac{2d}{\left(\frac{d}{x} + \frac{d}{y}\right)} = \frac{2xy}{x+y}$, which is the H.M. of x and y.

91. If x, y, z are in H.P., then $y = \frac{2xz}{x+z}$

$\therefore \log_e(x + z) + \log_e(x - 2y + z)$

$= \log_e\{(x + z)(x - 2y + z)\}$

$= \log_e\left[(x+z)\left(x+z-\frac{4xz}{x+z}\right)\right]$

$= \log_e[(x + z)^2 - 4xz]$

$= \log_e(x - z)^2$

$= 2 \log_e(x - z)$

92. We have $\frac{a^{n+1} + b^{n+1}}{a^n + b^n} = \frac{2ab}{a+b}$

$\Rightarrow a^{n+2} + ab^{n+1} + ba^{n+1} + b^{n+2} = 2a^{n+1}b + 2b^{n+1}a$

$\Rightarrow a^{n+1}(a - b) = b^{n+1}(a - b)$

or $\left(\frac{a}{b}\right)^{n+1} = (1) = \left(\frac{a}{b}\right)^0$

Hence, n = –1

93. $f(x) = x + \frac{1}{2} = \frac{2x+1}{2}$

$f(2x) = \frac{4x+1}{2}$

$f(4x) = \frac{8x+1}{2}$

f(x), f($2x$), f($4x$) are in H.P.

$\therefore$ $f(2x) = \frac{2f(x)f(4x)}{f(x)+f(4x)}$

$\Rightarrow x = 0, \frac{1}{4}$

At $x = 0$, terms are equal, so only solution is $x = \frac{1}{4}$

94. Given $x_1.x_2.x_3 \ldots\ldots. x_n = 1$

$\because$ A.M. $\geq$ G.M.

$\therefore$ $\left(\frac{x_1+x_2+x_3+......+x_n}{n}\right) \geq (x_1.x_2.x_3\ldots\ldots x_n)^{\frac{1}{n}}$

$= (1)^{\frac{1}{n}}$

$= 1$

$\therefore$ $x_1 + x_2 + x_3 + \ldots.. + x_n \geq n$

$\therefore$ $x_1 + x_2 + x_3 + \ldots.. + x_n$ can never be less than n.

95. A.M. $\geq$ G.M.

$\Rightarrow \frac{a_1+a_2+...+a_{n-1}+2a_n}{n}$

$\geq (a_1.a_2,...a_{n-1}2a_n)^{\frac{1}{n}} \geq (2c)^{\frac{1}{n}}$

$\therefore$ Minimum value of

$a_1 + a_2 + \ldots.+ a_{n-1} + 2a_n = n(2c)^{\frac{1}{n}}$

96. Since, p, q, r are in G.P.

$\therefore$ $q^2 = pr$

Also, $\tan^{-1}$ p, $\tan^{-1}$ q, $\tan^{-1}$ r are in A.P.

$\Rightarrow \tan^{-1} p + \tan^{-1} r = 2 \tan^{-1} q$

$\Rightarrow p + r = 2q$

$\Rightarrow$ p, q, r are in A.P.

Here, p, q, r are both in A.P. and G.P., which is possible only, if p = q = r.

97. $\frac{x+y}{2} = 3$

$\Rightarrow x + y = 6$

$xy = 1^2 = 1$

$x^2 + y^2 = (x + y)^2 - 2xy$

$= 36 - 2$

$= 34$

98. Given that A.M. = 8 and G.M. = 5, if α, β are roots of quadratic equation, then quadratic equation is

$x^2 - x(\alpha + \beta) + \alpha\beta = 0$

A.M. $= \frac{\alpha+\beta}{2} = 8 \Rightarrow \alpha + \beta = 16$

and G.M. $= \sqrt{\alpha\beta} = 5 \Rightarrow \alpha\beta = 25$

So the required quadratic equation will be

$x^2 - 16x + 25 = 0$.

99. $\frac{x+y}{2} = 9$

$\Rightarrow x + y = 18$

$xy = 4^2 = 16$

x and y are the roots.

$\therefore$ The equation is

$x^2 - 18x + 16 = 0$

100. GM $= \sqrt{ab} = 2$

$\Rightarrow ab = 4$

HM $= \frac{2ab}{a+b} = \frac{-8}{5}$

$\Rightarrow \frac{8}{a+b} = \frac{-8}{5}$

$\Rightarrow a + b = -5$

$\Rightarrow 2a + 2b = -10$

$ab = 4 \Rightarrow (2a)(2b) = 16$

$\therefore$ The required quadratic equation is

$x^2 - (2a + 2b)x + (2a)(2b) = 0$

$\Rightarrow x^2 + 10x + 16 = 0$

101. Sum of the roots of $x^2 - 2ax + b^2 = 0$ is 2a,

Therefore, A = A.M. of the roots = a

Product of the roots of $x^2 - 2bx + a^2 = 0$ is a^2

Therefore, G.M. of the roots is G = a

Thus, A = G

102. We have, $\tan n\theta = \tan m\theta$

$\Rightarrow n\theta = N\pi + (m\theta)$

$\Rightarrow \theta = \frac{N\pi}{n-m}$, putting N = 1,2,3……, we get

$\frac{\pi}{n-m}, \frac{2\pi}{n-m}, \frac{3\pi}{n-m}$ ……. which are in A.P.

Since, common difference, $d = \frac{\pi}{n-m}$.

103. Let three numbers a, b and c in G.P., then $b^2 = ac$

$\Rightarrow 2 \log_e b = \log_e a + \log_e c$ or

$\log_e b = \frac{\log_e a + \log_e c}{2}$

Thus, their logarithms are in A.P.

104. $225 = 3^2 \times 5^2 = d(225) = 3 \times 3 = 9$
$1125 = 3^2 \times 5^3 = d(1125) = 3 \times 4 = 12$
$640 = 2^7 \times 5 = d(640) = 8 \times 2 = 16$
9, 12, 16 are in G.P

105. If $\frac{x+y}{2}, y, \frac{y+z}{2}$ are in H.P., then

$$y = \frac{2\left(\frac{x+y}{2}.\frac{y+z}{2}\right)}{\frac{x+y}{2}+\frac{y+z}{2}}$$

$$= \frac{\frac{2}{4}(x+y)(y+z)}{\frac{1}{2}(x+2y+z)}$$

$$y = \frac{xy+xz+y^2+yz}{x+2y+z}$$

$\Rightarrow xy + 2y^2 + yz = xy + xz + y^2 + yz$
$\Rightarrow y^2 = xz$
Thus, x, y, z will be in G.P.

106. $(y-x), 2(y-a), (y-z)$ are in H.P.

$\Rightarrow \frac{1}{y-x}, \frac{1}{2(y-a)}, \frac{1}{y-z}$ are in A.P.

$$\Rightarrow \frac{1}{2(y-a)} - \frac{1}{(y-x)} = \frac{1}{(y-z)} - \frac{1}{2(y-a)}$$

$$\Rightarrow \frac{y-x-2y+2a}{y-x} = \frac{2y-2a-y+z}{y-z}$$

$$\Rightarrow \frac{-x-y+2a}{(y-x)} = \frac{y+z-2a}{(y-z)}$$

$$\Rightarrow \frac{(x-a)+(y-a)}{(x-a)-(y-a)} = \frac{(y-a)+(z-a)}{(y-a)-(z-a)}$$

$$\Rightarrow \frac{(x-a)}{(y-a)} = \frac{(y-a)}{(z-a)}$$

$\Rightarrow (x-a), (y-a), (z-a)$ are in G. P.

107. x, l, z are in A.P., then $2 = x + z$ ......(i)
and $4 = xz$ ......(ii)
Divide (ii) by (i), we get

$\frac{x.z}{x+z} = \frac{4}{2}$ or $\frac{2xz}{x+z} = 4$

Hence, x, 4, z will be in H.P.

108. Given, a, b, c are in G.P.
$\Rightarrow \log_x a, \log_x b \log_x c$ are in A.P.

$\Rightarrow \frac{\log a}{\log x}, \frac{\log b}{\log x}, \frac{\log c}{\log x}$ are in A.P.

$\Rightarrow \frac{\log x}{\log a}, \frac{\log x}{\log b}, \frac{\log x}{\log c}$ are in H.P.

i.e., $\log_a x, \log_b x, \log_c x$ are in H.P.

109. x, y, z are in G.P.
Hence, $y^2 = xz$
$\therefore$ $2 \log y = \log x + \log z$
$\Rightarrow 2(\log y + 1) = (1 + \log x) + (1 + \log z)$
$\Rightarrow 1 + \log x, 1 + \log y, 1 + \log z$ are in A.P.

$\Rightarrow \frac{1}{1+\log x}, \frac{1}{1+\log y}, \frac{1}{1+\log z}$ are is H.P.

110. Since, b^2, a^2, c^2 are in A.P.
$\therefore$ $a^2 - b^2 = c^2 - a^2$
$\Rightarrow (a-b)(a+b) = (c-a)(c+a)$

$$\Rightarrow \frac{1}{b+c} - \frac{1}{a+b} = \frac{1}{c+a} - \frac{1}{b+c}$$

$\Rightarrow \frac{1}{a+b}, \frac{1}{b+c}, \frac{1}{c+a}$ are in A.P.

$\therefore$ $(a+b), (b+c), (c+a)$ are in H.P.

111. Given, a, b, c are in A.P.
$\Rightarrow 2b = a + c \Rightarrow b - c = a - b$
Also, a^2, b^2, c^2 are in H.P.

$$\frac{1}{b^2} - \frac{1}{a^2} = \frac{1}{c^2} - \frac{1}{b^2}$$

$$\Rightarrow \frac{a^2-b^2}{a^2b^2} = \frac{b^2-c^2}{b^2c^2}$$

$\Rightarrow (a-b)[c^2(a+b) - a^2(b+c)] = 0$
....[$\because$ $(b-c) = (a-b)$]
$\Rightarrow a = b$ or $c^2a + c^2b - a^2b - a^2c = 0$
$\Rightarrow c^2a + c^2b - a^2b - a^2c = 0$
$\Rightarrow ac(c-a) = b(a^2 - c^2)$
$\Rightarrow ac = -b(c+a)$
$\Rightarrow -ac = b.2b$

$$\Rightarrow b^2 = -\left(\frac{a}{2}\right)c$$

$\therefore$ $-\frac{a}{2}$, b, c are in G.P.

112. $x + y + z = 15$, if 9, x, y, z, a are in A.P.

Sum $= 9 + 15 + a = \frac{5}{2}(9+a)$

$\Rightarrow 24 + a = \frac{5}{2}(9+a)$

$\Rightarrow 48 + 2a = 45 + 5a$
$\Rightarrow 3a = 3$
$\Rightarrow a = 1$

and $\frac{1}{x}+\frac{1}{y}+\frac{1}{z}=\frac{5}{3}$, if 9, x, y, z, a are in H.P.

Sum $= \frac{1}{9}+\frac{5}{3}+\frac{1}{a}=\frac{5}{2}\left[\frac{1}{9}+\frac{1}{a}\right] \Rightarrow a = 1$

113. Given, a, b, c are in G.P.

$\therefore$ $b^2 = ac$

$x = \frac{a+b}{2}$, $y = \frac{b+c}{2}$

$\therefore$ $\frac{a}{x} + \frac{c}{y} = \frac{2a}{a+b} + \frac{2c}{b+c}$

$= \frac{2(ab+bc+2ca)}{ab+ac+b^2+bc}$

$= \frac{2(ab+bc+2ca)}{(ab+ac+ac+bc)}$

$= 2$ ....[$\because b^2 = ac$]

114. Given that a, A_1, A_2, b are in A.P.

Therefore, $A_1 = \frac{a+A_2}{2}$, $A_2 = \frac{A_1+b}{2}$

$\Rightarrow A_1 + A_2 = \frac{1}{2}(a + b + A_1 + A_2)$

$\Rightarrow \frac{1}{2}(A_1 + A_2) = \frac{1}{2}(a + b)$ or

$A_1 + A_2 = a + b$

and a, G_1, G_2, b are in G.P.

Therefore, $G_1^2 = aG_2, G_2^2 = bG_1$

$\Rightarrow G_1^2G_2^2 = abG_1G_2 \Rightarrow G_1G_2 = ab$

Hence, $\frac{A_1+A_2}{G_1G_2} = \frac{a+b}{ab}$

Trick : Let a = 1, b = 2,

then $A_1 + A_2 = 1 + 2 = 3$

and G_1. $G_2 = 2 \times 1 = 2$

$\therefore$ $\frac{A_1+A_2}{G_1G_2} = \frac{3}{2}$, which is given by (A).

115. Given numbers a and 2.

A.M. = $\frac{a+2}{2}$ and G.M. = $\sqrt{2a}$

According to the given condition,

A.M. − G.M. = 1

$\Rightarrow \frac{a+2}{2} - \sqrt{2a} = 1$

$\Rightarrow \frac{a}{2} + 1 - 1 = \sqrt{2a}$

$\Rightarrow a = 2\sqrt{2a} \Rightarrow a^2 = 8a$

$\Rightarrow a(a - 8) = 0$

$\Rightarrow a = 0$ or 8

Since, $a \neq 0$

$\therefore$ a = 8

116. Let the two numbers be x, y.

$\therefore$ $x - y = 48$ ....(i)

and $\frac{x+y}{2} - \sqrt{xy} = 18$

$\Rightarrow x + y - 2\sqrt{xy} = 36$

$\Rightarrow 48 + y + y - 2\sqrt{(48+y)y} = 36$ ....[From (i)]

$\Rightarrow 12 + 2y = 2\sqrt{y(48+y)}$

$\Rightarrow 6 + y = \sqrt{y(48+y)}$

$\Rightarrow 36 + y^2 + 12y = 48y + y^2$

$\Rightarrow 36y = 36 \Rightarrow y = 1$

$\therefore$ $x = 48 + 1 = 49$

117. Since, H_1, H_2 are two harmonic means between a and b.

$\therefore$ $\frac{1}{a}, \frac{1}{H_1}, \frac{1}{H_2}, \frac{1}{b}$ are in A.P.

We know that 2A = a + b and $G^2 = ab$

$\therefore$ $2 \times \frac{1}{H_1} = \frac{1}{a} + \frac{1}{H_2}$

Similarly, $2 \times \frac{1}{H_2} = \frac{1}{b} + \frac{1}{H_1}$

On adding and solving we get,

$2\left(\frac{1}{H_1} + \frac{1}{H_2}\right) - \left(\frac{1}{H_1} + \frac{1}{H_2}\right) = \frac{1}{a} + \frac{1}{b}$

$\frac{1}{H_1} + \frac{1}{H_2} = \frac{a+b}{ab} = \frac{2A}{G^2}$

118. Let a and b be two numbers.

Sum of n A.M.'s = n × single A.M.

$\Rightarrow A_1 + A_2 = 2 \times \left(\frac{a+b}{2}\right) = a + b$

Product of n G.M.'s = (Single G.M.)^n

$\Rightarrow G_1.G_2 = \left(\sqrt{ab}\right)^2 = ab$

$\Rightarrow \frac{1}{a}, \frac{1}{H_1}, \frac{1}{H_2}, \frac{1}{b}$ are in A.P.

$\Rightarrow \frac{1}{H_1} + \frac{1}{H_2} = \frac{1}{a} + \frac{1}{b} = \frac{a+b}{ab}$

$\Rightarrow \frac{H_1H_2}{H_1+H_2} = \frac{G_1G_2}{A_1+A_2}$

$\Rightarrow \frac{G_1G_2}{H_1H_2} \times \frac{H_1+H_2}{A_1+A_2} = 1$

119. Given, $\sqrt{ab} = 10$

$\Rightarrow ab = 100$ and $\frac{2ab}{a+b} = 8$

$\Rightarrow a + b = 25$

$\therefore$ a = 5, b = 20

120. Let the positive numbers be a_1 and a_2.

a_1, A, a_2, ……..are in A.P. then $A = \frac{a_1 + a_2}{2}$

Also, a_1, G, a_2, …….. are in G.P.

$\therefore$ $G = \sqrt{a_1 a_2}$

$\frac{1}{a_1}, \frac{1}{H}, \frac{1}{a_2}$, ……. are in H.P.

$\therefore$ $\frac{2}{H} = \frac{1}{a_1} + \frac{1}{a_2} \Rightarrow H = \frac{2a_1a_2}{a_1 + a_2} \Rightarrow H = \frac{G^2}{A}$

121. Given A.M. = 2(G.M.) or $\frac{1}{2}(a+b) = 2\sqrt{ab}$

or $\frac{a+b}{2\sqrt{ab}} = \frac{2}{1}$

$\Rightarrow \frac{a+b+2\sqrt{ab}}{a+b-2\sqrt{ab}} = \frac{2+1}{2-1} = \frac{3}{1}$

$\Rightarrow \frac{(\sqrt{a}+\sqrt{b})^2}{(\sqrt{a}-\sqrt{b})^2} = \frac{3}{1}$

$\Rightarrow \frac{\sqrt{a}+\sqrt{b}}{\sqrt{a}-\sqrt{b}} = \frac{\sqrt{3}}{1} \Rightarrow \frac{a}{b} = \left(\frac{\sqrt{3}+1}{\sqrt{3}-1}\right)^2$

$\Rightarrow \frac{a}{b} = \frac{2+\sqrt{3}}{2-\sqrt{3}}$ or $a : b = (2+\sqrt{3}) : (2-\sqrt{3})$.

122. We have H.M. $= \frac{2ab}{a+b}$ and G.M. $= \sqrt{ab}$

So $\frac{\text{H.M.}}{\text{G.M.}} = \frac{4}{5} \Rightarrow \frac{2ab/(a+b)}{\sqrt{ab}} = \frac{4}{5}$

$\Rightarrow \frac{2\sqrt{ab}}{(a+b)} = \frac{4}{5} \Rightarrow \frac{a+b}{2\sqrt{ab}} = \frac{5}{4}$

$\Rightarrow \frac{a+b+2\sqrt{ab}}{a+b-2\sqrt{ab}} = \frac{5+4}{5-4}$

$\Rightarrow \frac{(\sqrt{a}+\sqrt{b})^2}{(\sqrt{a}-\sqrt{b})^2} = \frac{9}{1} \Rightarrow \frac{\sqrt{a}+\sqrt{b}}{\sqrt{a}-\sqrt{b}} = \frac{3}{1}$

$\Rightarrow \frac{(\sqrt{a}+\sqrt{b})+(\sqrt{a}-\sqrt{b})}{(\sqrt{a}+\sqrt{b})-(\sqrt{a}-\sqrt{b})} = \frac{3+1}{3-1}$

$\Rightarrow \frac{2\sqrt{a}}{2\sqrt{b}} = \frac{4}{2} \Rightarrow \left(\frac{a}{b}\right) = 2^2 = 4$

$\Rightarrow$ a : b = 4 : 1 or b : a = 1 : 4

123. According to the given condition,

$\frac{\frac{x+y}{2}}{\sqrt{xy}} = \frac{p}{q}$

$\Rightarrow \frac{x+y}{2\left(\sqrt{xy}\right)} = \frac{p}{q}$ ....(i)

$\Rightarrow \frac{x^2+y^2+2xy}{4xy} = \frac{p^2}{q^2}$

$\Rightarrow \frac{x^2+y^2+2xy-4xy}{4xy} = \frac{p^2-q^2}{q^2}$

$\Rightarrow \frac{(x-y)^2}{4xy} = \frac{p^2-q^2}{q^2}$

$\Rightarrow \frac{x-y}{2\sqrt{xy}} = \frac{\sqrt{p^2-q^2}}{q}$ ....(ii)

Dividing (ii) by (i), we get

$\frac{x+y}{x-y} = \frac{p}{\sqrt{p^2-q^2}} \Rightarrow \frac{x}{y} = \frac{p+\sqrt{p^2-q^2}}{p-\sqrt{p^2-q^2}}$

150. $1 + 3 + 7 + ….. + t_n$

$= 2 - 1 + 2^2 - 1 + 2^3 - 1 + ……. + 2^n - 1$

$= (2 + 2^2 + …… + 2^n) - n = 2^{n+1} - 2 - n$

151. Let n^{th} term of series is t_n, then

$S_n = 12 + 16 + 24 + 40 + …. + t_n$

Again $S_n = 12 + 16 + 24 + …… + t_n$

On subtraction

$0 = (12 + 4 + 8 + 16 + …. + \text{upto n terms}) - t_n$

$\Rightarrow t_n = 12 + [4 + 8 + 16 + ….. + \text{upto } (n - 1) \text{ terms}]$

$= 12 + \frac{4(2^{n-1} - 1)}{2 - 1} = 2^{n+1} + 8$

On putting n = 1, 2, 3 …..

$t_1 = 2^2 + 8$, $t_2 = 2^3 + 8$, $t_3 = 2^4 + 8$ …. etc.

$S_n = t_1 + t_2 + t_3 + …. + t_n$

$= (2^2 + 2^3 + 2^4 + ….. \text{upto n terms}) + (8 + 8 + 8 + …. \text{upto n terms})$

152. $(1 + 2) + (1 + 2 + 2^2) + ...$ upto n terms

$\therefore$ $T_n = 1 + 2 + 2^2 + ... + 2^n$

$\therefore$ $T_n = \frac{1(2^{n+1}-1)}{2-1} = 2^{n+1} - 1$

$\therefore$ $S_n = \sum T_n = \sum(2^{n+1}-1)$

$\therefore$ $S_n = \sum 2^{n+1} - \sum 1$

$= \frac{1}{2}\left[\log\frac{3}{2} + \log\frac{4}{3}\right]$

$= \frac{1}{2}\log\left(\frac{3}{2}\times\frac{4}{3}\right)$

$= \frac{1}{2}\log 2$

154. Let, $S = 2 + 7 + 14 + 23 + 34 + ... + t_n +$ .....(i)

and $S = 2 + 7 + 14 + ... + t_{n-1} + t_n +$ ....(ii)

From (i) and (ii), we get

$0 = 2 + [5 + 7 + 9 + 11 ..... + t_n - t_{n-1}] - t_n$

$\Rightarrow t_n = 2 + \left[\frac{n-1}{2}\{2\times5+(n-2)2\}\right]$

$\Rightarrow t_n = 2 + (n-1)(n+3)$

Now,

put n = 99

$\Rightarrow t_{99} = 2 + 98 \times 102 = 9998$

$= \frac{40\times41\times81}{6} + 4\left(\frac{20\times21\times41}{6}\right)$

$= 22140 + 4(2870)$

$= 33620$

$B - 2A = 33620 - 2(4410) = 24800$

$\Rightarrow 100\lambda = 24800 \Rightarrow \lambda = 248$

156. Since, $\sin\theta$, $\cos\theta$ and $\tan\theta$ are in G.P.

$\therefore$ $\frac{\cos\theta}{\sin\theta} = \frac{\tan\theta}{\cos\theta} = \frac{\sin\theta}{\cos^2\theta}$

$\Rightarrow \cos^3\theta = \sin^2\theta$ ....(i)

$\therefore$ $\cot^6\theta - \cot^2\theta = \frac{\cos^6\theta}{\sin^6\theta} - \frac{\cos^2\theta}{\sin^2\theta}$

$= 1 + \tan^2\theta = 1 + \frac{3}{2} = \frac{5}{2}$ ....$\left[\because \tan\theta = \sqrt{\frac{3}{2}}\right]$

158. $\cos(\theta - \alpha)$, $\cos\theta$, $\cos(\theta + \alpha)$ are in HP

$\therefore \quad \frac{1}{\cos(\theta-\alpha)}, \frac{1}{\cos\theta}, \frac{1}{\cos(\theta+\alpha)}$ are in AP

$\therefore \quad \frac{1}{\cos(\theta-\alpha)} + \frac{1}{\cos(\theta+\alpha)} = \frac{2}{\cos\theta}$

$\Rightarrow \frac{\cos(\theta+\alpha)+\cos(\theta-\alpha)}{\cos(\theta+\alpha)\cos(\theta-\alpha)} = \frac{2}{\cos\theta}$

$\Rightarrow 2\cos\theta\cos\alpha.\cos\theta = 2\cos(\theta+\alpha)\cos(\theta-\alpha)$

$\Rightarrow \cos^2\theta\cos\alpha = \cos^2\theta - \sin^2\alpha$

$\Rightarrow \cos^2\theta(\cos\alpha - 1) = -(1-\cos^2\alpha)$

$\Rightarrow \cos^2\theta - 1 + \cos\alpha$

$\therefore \quad \sum_{k=1}^{n} f(a+k) = f(a)[f(1) + f(2) + f(3) + \ldots f(n)]$ ...(i)

$\because \quad f(1) = 2$

$\therefore \quad f(2) = f(1+1) = f(1).f(1) = 4$

$\therefore \quad f(3) = f(2+1) = f(2).f(1) = 8$

and so on.

$\therefore$ substituting above values in (i), we get

$\sum_{k=1}^{n} f(a+k) = f(a)[2 + 4 + 8 + \ldots f(n)]$

$= f(a).2(2^n - 1)$

$\therefore \quad f(a).2(2^n - 1) = 16.(2^n - 1)$

$\therefore \quad f(a) = 8$

Since, $f(3) = 8$

$\therefore \quad a = 3$

Evaluation Test

1. $a_1, a_2, a_3, \ldots, a_n$ are in A.P. with common difference = 5

i.e., $a_2 - a_1 = a_3 - a_2 = a_4 - a_3 = \ldots = a_n - a_{n-1} = 5$

$\therefore \quad \tan^{-1}\left(\frac{5}{1+a_1a_2}\right) + \tan^{-1}\left(\frac{5}{1+a_2a_3}\right) + \ldots + \tan^{-1}\left(\frac{5}{1+a_{n-1}a_n}\right)$

$= \tan^{-1}\left(\frac{a_2-a_1}{1+a_1a_2}\right) + \tan^{-1}\left(\frac{a_3-a_2}{1+a_2a_3}\right) + \ldots + \tan^{-1}\left(\frac{a_n-a_{n-1}}{1+a_{n-1}a_n}\right)$

$= \tan^{-1}(a_2) - \tan^{-1}(a_1) + \tan^{-1}(a_3) - \tan^{-1}(a_2) + \ldots + \tan^{-1}(a_n) - \tan^{-1}(a_{n-1})$

$= \tan^{-1}(a_n) - \tan^{-1}(a_1) = \tan^{-1}\left(\frac{a_n-a_1}{1+a_1a_n}\right)$

$= \tan^{-1}\left(\frac{(n-1)5}{1+a_1a_n}\right)$ ....[$\because a_n = a_1 + (n-1)5$]

$= \tan^{-1}\left(\frac{5n-5}{1+a_1a_n}\right)$

2. Since, $a_1, a_2, a_3, \ldots$ are in H.P.

$\therefore \quad \frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \ldots$ are in A.P.

$\therefore \quad \frac{1}{25} = \frac{1}{5} + 19d$

$\Rightarrow d = \frac{1}{19}\left(\frac{-4}{25}\right) = -\frac{4}{19\times25}$

Since, $a_n < 0$

$\therefore \quad \frac{1}{5} - \frac{4}{19\times25}\times(n-1) < 0$

$\Rightarrow \frac{19\times5}{4} < n - 1$

$\Rightarrow n > 24.75$

3. p, q, r are positive and are in A.P.

$\therefore \quad q = \frac{p+r}{2}$ ....(i)

Since, the roots of $px^2 + qx + r = 0$ are real

$\therefore \quad q^2 \geq 4pr \Rightarrow \left[\frac{p+r}{2}\right]^2 \geq 4pr$ ....[From (i)]

$\Rightarrow p^2 + r^2 - 14pr \geq 0$

$\Rightarrow \left(\frac{r}{p}\right)^2 - 14\left(\frac{r}{p}\right) + 1 \geq 0$

....[$\because$ p > 0 and p ≠ 0]

$\Rightarrow \left(\frac{r}{p} - 7\right)^2 - 48 \geq 0$

$\Rightarrow \left(\frac{r}{p} - 7\right)^2 - (4\sqrt{3})^2 \geq 0$

$\Rightarrow \left|\frac{r}{p} - 7\right| \geq 4\sqrt{3}$

4. Let A be the first term and R be the common ratio of the G.P. Then,
$a = AR^{p-1}$
$\Rightarrow \log a = \log A + (p-1)\log R$ ....(i)
$b = AR^{q-1}$
$\Rightarrow \log b = \log A + (q-1)\log R$ ....(ii)
$c = AR^{r-1}$
$\Rightarrow \log c = \log A + (r-1)\log R$ ....(iii)
Multiplying (i), (ii) and (iii) by (q – r), (r – p) and (p – q) respectively and adding, we get
$(q-r)\log a + (r-p)\log b + (p-q)\log c = 0$
Expanding along first row, we get
$\Delta = (q-r)\log a + (r-p)\log b + (p-q)\log c$
$\Rightarrow \Delta = 0$

5. Let x_1, x_2, x_3 be a, ar, ar^2 and y_1, y_2, y_3 be b, br, br^2.
$\therefore$ A, B, C are (a,b), (ar, br), (ar^2, br^2) resp.
Now Slope of AB = $\frac{b}{a}$ = slope of BC.
Hence, the points are collinear.
i.e., lie on a straight line

Alternate method:

Given $x_2 = rx_1, x_3 = r^2x_1, y_2 = ry_1, y_3 = r^2y_1$

Area of $\Delta = \frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$

$= \frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ rx_1 & ry_1 & 1 \\ r^2x_1 & r^2y_1 & 1 \end{vmatrix}$

$= \frac{1}{2}x_1y_1\begin{vmatrix} 1 & 1 & 1 \\ r & r & 1 \\ r^2 & r^2 & 1 \end{vmatrix} = 0$

i.e , lie on a straight line.

6. We have,
Length of a side of S_n
= Length of a diagonal of S_{n+1}
$\Rightarrow$ Length of a side of S_n
= $\sqrt{2}$ (Length of a side of S_{n+1})

$\Rightarrow \frac{\text{Length of a side of } S_{n+1}}{\text{Length of a side of } S_n} = \frac{1}{\sqrt{2}}$ for all n ≥ 1

$\therefore$ sides of $S_1, S_2, ..., S_n$ form a G.P. with common ratio $\frac{1}{\sqrt{2}}$ and first term 10.

$\therefore$ length of the side of $S_n = 10\left(\frac{1}{\sqrt{2}}\right)^{n-1}$

$= \frac{10}{2^{\frac{n-1}{2}}}$

Now, area of $S_n = (\text{side})^2 = \left(\frac{10}{2^{\frac{n-1}{2}}}\right)^2$

$= \frac{100}{2^{n-1}}$

But, area of $S_n < 1$

$\Rightarrow \frac{100}{2^{n-1}} < 1$

$\Rightarrow 2^{n-1} > 100$

The above inequality is satisfied if n – 1 ≥ 7 i.e., n ≥ 8

7. We have, $T_p = a + (p-1)d = \frac{1}{q}$ ....(i)

and $T_q = a + (q-1)d = \frac{1}{p}$ ....(ii)

From (i) and (ii), we get $a = \frac{1}{pq}$ and $d = \frac{1}{pq}$

$\therefore$ sum of $(pq)^{th}$ terms $= \frac{pq}{2}\left[\frac{2}{pq} + (pq-1)\frac{1}{pq}\right]$

$= \frac{pq}{2}.\frac{2}{pq}\left[1 + \frac{1}{2}(pq-1)\right]$

$= \frac{2 + pq - 1}{2} = \frac{pq+1}{2}$

8. $\begin{vmatrix} x+1 & x+2 & x+a \\ x+2 & x+3 & x+b \\ x+3 & x+4 & x+c \end{vmatrix}$

Applying $C_1 \to C_1 - C_2$,

$= \begin{vmatrix} -1 & x+2 & x+a \\ -1 & x+3 & x+b \\ -1 & x+4 & x+c \end{vmatrix}$

$= (-1) \begin{vmatrix} 1 & x+2 & x+a \\ 1 & x+3 & x+b \\ 1 & x+4 & x+c \end{vmatrix}$

Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$,

$= (-1) \begin{vmatrix} 1 & x+2 & x+a \\ 0 & 1 & b-a \\ 0 & 2 & c-a \end{vmatrix}$

$= (-1)(c + a - 2b) = 0$

….[∵ a, b, c are in A.P. ⇒ 2b = a + c]

9. Let $S = 1 + \frac{1.3}{6} + \frac{1.3.5}{6.8} + ...\infty$

∴ $\frac{S}{4} = \frac{1}{4} + \frac{1.3}{4.6} + \frac{1.3.5}{4.6.8} + ...\infty$

Multiplying on both sides by $\frac{1}{2}$, we get

$\frac{S}{8} = \frac{1}{2.4} + \frac{1.3}{2.4.6} + \frac{1.3.5}{2.4.6.8} + ... \infty$

∴ $\frac{1}{2} - \frac{S}{8} = \frac{1}{2} - \left[\frac{1}{2.4} + \frac{1.3}{2.4.6} + \frac{1.3.5}{2.4.6.8} + ...\infty\right]$

$\Rightarrow \frac{1}{2} - \frac{S}{8} = \frac{1}{2} - \frac{1}{2}.\frac{1}{4} - \frac{1}{2}.\frac{1.3}{4.6} - \frac{1}{2}.\frac{1.3.5}{4.6.8} - ....\infty$

$\Rightarrow \frac{1}{2} - \frac{S}{8} = 1 - \frac{1}{2} + \frac{\frac{1}{2}\left(\frac{1}{2}-1\right)}{1.2} - \frac{\frac{1}{2}\left(\frac{1}{2}-1\right)\left(\frac{1}{2}-2\right)}{1.2.3} + \frac{\frac{1}{2}\left(\frac{1}{2}-1\right)\left(\frac{1}{2}-2\right)\left(\frac{1}{2}-3\right)}{1.2.3.4} - ....\infty$

$\Rightarrow \frac{1}{2} - \frac{S}{8} = (1-1)^{\frac{1}{2}} = 0$

∴ $\frac{S}{8} = \frac{1}{2} \Rightarrow S = 4$

10. Let the first installment be a and common difference of A.P. be d.

Given, 3600 = sum of 40 terms

$= \frac{40}{2}[2a + (40 - 1)d]$

∴ 3600 = 20(2a + 39d)

∴ 180 = 2a + 39d ….(i)

After 30 installments one third of the debt is unpaid

∴ $\frac{3600}{3} = 1200$ is unpaid and 2400 is paid.

Now, $2400 = \frac{30}{2}[2a + (30 - 1)d]$

∴ 160 = 2a + 29d ….(ii)

Subtracting (ii) from (i), we get 20 = 10d

∴ d = 2

From (i), 180 = 2a + 39(2)

∴ 2a = 180 – 78 = 102

∴ a = 51

∴ value of the 8th installment

= a + (8 – 1) d = 51 + 7(2) = ₹ 65

$P(E_2) = \frac{1}{3}$, So $P(\overline{E_2}) = 1 - \frac{1}{3} = \frac{2}{3}$
Clearly, E_1 and E_2 are independent events.
∴ $P(\overline{E_1} \cap \overline{E_2}) = P(\overline{E_1}) \times P(\overline{E_2})$

and $P(E/B) = \frac{4}{6} = \frac{2}{3}$
∴ $P(E) = P(A)\, P(E/A) + P(B)\, P(E/B)$
$= \frac{1}{2} . \frac{2}{5} + \frac{1}{2} . \frac{2}{3} = \frac{8}{15}$

$\Rightarrow P(B) = \frac{4}{6} = \frac{2}{3}$
∴ $A \cap B = \{4\}$
$\Rightarrow P(A \cap B) = \frac{1}{6}$

$\Rightarrow P(A) = P(A)^2$
$\Rightarrow P(A) = 0, 1$

39. We have $P(A + B) = P(A) + P(B) - P(AB)$
$\Rightarrow \frac{5}{6} = \frac{1}{2} + P(B) - \frac{1}{3} \Rightarrow P(B) = \frac{4}{6} = \frac{2}{3}$
Thus, $P(A).P(B) = \frac{1}{2} \times \frac{2}{3} = \frac{1}{3} = P(AB)$

$\therefore$ P(53 fri) = $\frac{2}{7}$; P(53 Sat) = $\frac{2}{7}$

There is one combination in common i.e., (Fri-Sat)

$\therefore$ P(53 Fri and 53 Sat) = $\frac{1}{7}$

$= 1 - P(A \cap B) = 1 - \frac{1}{4} = \frac{3}{4}$

50. $P(A' \cap B') = \frac{1}{3}$

$\Rightarrow P[(A \cup B)'] = \frac{1}{3}$

$\therefore$ $1 - P(A \cup B) = \frac{1}{3}$

$\Rightarrow P(A \cup B) = 1 - \frac{1}{3} = \frac{2}{3}$

$\therefore$ $P(M) = \frac{30}{80}, P(E) = \frac{20}{80}, P(M \cap E) = \frac{10}{80}$

$\therefore$ $P(M \cup E) = P(M) + P(E) - P(M \cap E)$

$= \frac{30}{80} + \frac{20}{80} - \frac{10}{80} = \frac{1}{2}$

$= P\left(E_1'\right)P\left(E_2'\right)$

$= (1 - p_1)(1 - p_2)$

55. $P(M) = \frac{1}{4} \Rightarrow P(M') = \frac{3}{4}$

and $P(W) = \frac{1}{3} \Rightarrow P(W') = \frac{2}{3}$

Both events are independent so that probability that no one will be alive is

$P(W' \cap M') = P(W')\ P(M') = \frac{3}{4} \times \frac{2}{3} = \frac{1}{2}$

56. Here, P(A) = p

$\Rightarrow P(\overline{A}) = 1 - p$

and $P(B) = q \Rightarrow P(\overline{B}) = 1 - q$

Probability that one person is alive is the sum of two cases A dies B lives and A lives B dies

$= p(1 - q) + q(1 - p) = p + q - 2pq$

57. Here, P(A) = 0.6 ; P(B) = 0.9

∴ Required pobability

$= P(A)\cdot P(\overline{B}) + P(B)\cdot P(\overline{A}) = (0.6)\ (0.1) + (0.9)\ (0.4)$

$= 0.06 + 0.36 = 42$

58. Since, E and F are independent

∴ $P(E \cap F) = P(E)\ P(F)$

$\Rightarrow P(E)\ P(F) = \frac{1}{12}$

Now, E and F are independent

∴ E′ and F′ are also independent

∴ $P(E' \cap F') = P(E') \cdot P(F') = \frac{1}{2}$

∴ $[1 - P(E)] \cdot [1 - P(F)] = \frac{1}{2}$

∴ $1 - P(E) - P(F) + P(E)\cdot P(F) = \frac{1}{2}$

∴ $1 - P(E) - P(F) + \frac{1}{12} = \frac{1}{2}$

$\Rightarrow P(E) + P(F) = \frac{7}{12}$

Solving, $P(E) = \frac{1}{4}$, $P(F) = \frac{1}{3}$

Hence, $P\left(\frac{B}{A}\right) = \frac{P(B \cap A)}{P(A)} = \frac{P(A)}{P(A)} = 1$

61. $P\left(\frac{\overline{B}}{\overline{A}}\right) = \frac{1 - P(A \cup B)}{P(\overline{A})} = \frac{1 - \frac{23}{60}}{1 - \frac{1}{3}} = \frac{37}{60} \times \frac{3}{2} = \frac{37}{40}$

62. A: Brown hair

$\Rightarrow P(A) = \frac{40}{100}$

B: Brown eyes

$\Rightarrow P(B) = \frac{25}{100}$

∴ $P(A \cap B) = \frac{15}{100}$

∴ $P(B/A) = \frac{P(A \cap B)}{P(A)} = \frac{\frac{15}{100}}{\frac{40}{100}} = \frac{3}{8}$

63. $P(A \cap B) = P(A) \cdot P(B/A) = \frac{1}{4} \times \frac{1}{2} = \frac{1}{8}$

Since, $P(A \cap B) = P(B)\ P(A/B)$

∴ $\frac{1}{8} = P(B) \times \frac{1}{4}$

$\Rightarrow P(B) = \frac{1}{2}$

∴ $P(A)\cdot P(B) = \frac{1}{4} \times \frac{1}{2} = \frac{1}{8} = P(A \cap B)$

∴ A and B are independent

64. It is based on Baye's theorem.

Probability of picked bag A, i.e., $P(A) = \frac{1}{2}$

Probability of picked bag B, i.e., $P(B) = \frac{1}{2}$

Probability of green ball picked from bag A

$= P(A).P\left(\frac{G}{A}\right) = \frac{1}{2} \times \frac{4}{7} = \frac{2}{7}$

Probability of green ball picked from bag B

$= P(B).P\left(\frac{G}{B}\right) = \frac{1}{2} \times \frac{3}{7} = \frac{3}{14}$

∴ Total probability of green ball $= \frac{2}{7} + \frac{3}{14} = \frac{1}{2}$

∴ Probability of fact that green ball is drawn from bag B

$$= \frac{P(B)P\left(\frac{G}{B}\right)}{P(A)P\left(\frac{G}{A}\right) + P(B)P\left(\frac{G}{B}\right)} = \frac{\frac{1}{2} \times \frac{3}{7}}{\frac{1}{2} \times \frac{4}{7} + \frac{1}{2} \times \frac{3}{7}} = \frac{3}{7}$$

65. Consider the following events :
A → Ball drawn is black;
E_1 → Bag I is chosen;
E_2 → Bag II is chosen and
E_3 → Bag III is chosen.

Then $P(E_1) = (E_2) = P(E_3) = \frac{1}{3}$, $P\left(\frac{A}{E_1}\right) = \frac{3}{5}$

$P\left(\frac{A}{E_2}\right) = \frac{1}{5}$, $P\left(\frac{A}{E_3}\right) = \frac{7}{10}$

∴ Required probability = $P\left(\frac{E_3}{A}\right)$

$$= \frac{P(E_3)P\left(\frac{A}{E_3}\right)}{P(E_1)P\left(\frac{A}{E_1}\right)+P(E_2)P\left(\frac{A}{E_2}\right)+P(E_3)P\left(\frac{A}{E_3}\right)}$$

$$= \frac{7}{15}$$

66. Let E denote the event that a six occurs and A is the event that the man reports that it is a '6', we have

$P(E) = \frac{1}{6}$, $P(E') = \frac{5}{6}$, $P(A/E) = \frac{3}{4}$ and

$P(A/E') = \frac{1}{4}$

∴ From Baye's theorem,

$$P(E/A) = \frac{P(E).P\left(\frac{A}{E}\right)}{P(E).P\left(\frac{A}{E}\right)+P(E').P\left(\frac{A}{E'}\right)}$$

$$= \frac{\frac{1}{6}\times\frac{3}{4}}{\frac{1}{6}\times\frac{3}{4}+\frac{5}{6}\times\frac{1}{4}} = \frac{3}{8}$$

Then $P(A_1) = \frac{9}{10}$, $P(A_2) = 1 - \frac{9}{10} = \frac{1}{10}$,

$P\left(\frac{E}{A_1}\right) = 1$ and $P\left(\frac{E}{A_2}\right) = \frac{1}{4}$

∴ Required probability is

$$P\left(\frac{A_2}{E}\right) = \frac{P(A_2)P\left(\frac{E}{A_2}\right)}{P(A_1)P\left(\frac{E}{A_1}\right)+P(A_2)P\left(\frac{E}{A_2}\right)} = \frac{1}{37}$$

$P(A_2 \cap E) = \frac{1}{6}$; as there are 6 pairs of consecutive letters of which one is ON.

∴ The required probability is

$$P\left(\frac{A_1}{E}\right) = \frac{P(A_1 \cap E)}{P(A_1 \cap E)+P(A_2 \cap E)} = \frac{\frac{2}{5}}{\frac{2}{5}+\frac{1}{6}}$$

Similarly, for B $= \frac{3}{3+7} = \frac{3}{10}$ and for C $= \frac{6}{6+11} = \frac{6}{17}$

∴ Probability of all the ships for arriving safely $= \frac{2}{7}\times\frac{3}{10}\times\frac{6}{17} = \frac{18}{595}$.

76. Let A and B be two given events. The odds against A are 5:2, therefore P(A) $= \frac{2}{7}$.

$= 1-\left(1-\frac{2}{7}\right)\left(1-\frac{6}{11}\right) = \frac{52}{77}$

44. $0.8 = 0.3 + x - 0.3x \Rightarrow x = \frac{5}{7}$.

45. Since events are mutually exclusive, therefore $P(A \cap B) = 0$ i.e., $P(A \cup B) = P(A) + P(B)$

$= 1 - [P(A) + P(B) - P(A \cap B)]$
$= 1 - (0.6 + 0.4 - 0.2)$
$= 0.2$
$= \frac{1}{5}$

$P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$= \frac{{}^7C_2}{{}^{10}C_3} + \frac{{}^6C_2}{{}^{10}C_3} - \frac{{}^3C_1}{{}^{10}C_3}$

$= \frac{33}{120}$

$= \frac{2}{5}$

54. Given, $P(A \cup B) = 0.6$ and $P(A \cap B) = 0.2$

We know that, if A and B are any two events, then $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\Rightarrow 0.6 = 1 - P(\overline{A}) + 1 - P(\overline{B}) - 0.2$

$\Rightarrow P(\overline{A}) + P(\overline{B}) = 2 - 0.8 = 1.2$

55. Given $P(A \cup B) = \frac{3}{5}$ and $P(A \cap B) = \frac{1}{5}$

We know $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\therefore \quad \frac{3}{5} = 1 - P(\overline{A}) + 1 - P(\overline{B}) - \frac{1}{5}$

$\therefore \quad 2 - \frac{4}{5} = P(\overline{A}) + P(\overline{B})$

$\Rightarrow P(\overline{A}) + P(\overline{B}) = \frac{6}{5}$.

56. $P(A \cap B') = P(A) - P(A \cap B)$

$= \frac{4}{5} - \frac{1}{2} = \frac{3}{10}$

57. $P(A \cap B') = P(A) - P(A \cap B)$

$= 0.7 - 0.3 = 0.4 = \frac{2}{5}$

58. $P(\overline{A} \cap B) = P(B) - P(A \cap B) = y - z$.

59. $P(\overline{A} \cap \overline{B}) = P(A \cup B)'$

$= 1 - P(A \cup B)$

$= 1 - P(A) - P(B) + P(A \cap B)$

$= 1 - 0.25 - 0.50 + 0.14 = 0.39$

60. $P(A' \cap B') = 1 - P(A \cup B)$

$\Rightarrow P(A \cup B) = \frac{2}{3}$

Now $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\Rightarrow \frac{2}{3} = x + x - \frac{1}{3} \Rightarrow x = \frac{1}{2}$

61. Since A and B are mutually exclusive,

$P(A \cup B) = P(A) + P(B)$

63. When two dice are thrown simultaneously,

n (S) = 36

A: Event that both the numbers on top are prime number

$\therefore$ A = {(2, 2), (2, 3), (2, 5), (3, 2), (3, 3), (3, 5), (5, 2), (5, 3), (5, 5)}

$\therefore$ n (A) = 9

$\therefore$ $P(A) = \frac{9}{36} = \frac{1}{4}$

When two coins are tossed simultaneously,

n (S) = 4

B : Event that we get one head and one tail

$\therefore$ n (B) = 2

$\therefore$ $P(B) = \frac{2}{4} = \frac{1}{2}$

Since both the events are independent of each other,

$\therefore$ Required probabiity = P (A) . P (B) = $\frac{1}{8}$

64. $P(\overline{A} \cap \overline{B}) = P(\overline{A \cup B}) = 1 - P(A \cup B)$

$= 0.2.$

65. Consider option (B)

$P(A' \cap B') = [1 - P(A)]\,[1 - P(B)]$

66. P(neither A nor B) $= P\left(\overline{A} \cap \overline{B}\right)$

$= P(\overline{A}).P(\overline{B}) = 0.6 \times 0.5$

$= 0.3$

67. $P\left(A' \cap B'\right) = 1 - P\left(A \cup B\right)$

$= 1 - \left[P(A) + P(B) - P\left(A \cap B\right)\right]$

$= 1 - 1 = 0$

68. Here, $P(X) = 0.3$; $P(Y) = 0.2$

Now $P(X \cup Y) = P(X) + P(Y) - P(X \cap Y)$

Since, these are independent events

$\therefore$ $P(X \cap Y) = P(X).P(Y)$

Thus, required probability

$\therefore$ Required probability $= P(A' \cap B')$

$= P(A')\,P(B')$

$= \frac{3}{4} \times \frac{2}{3} = \frac{1}{2}$

70. $P(A) = \frac{3}{8}$ and $P(B) = \frac{1}{2}$

$\therefore$ $P(A)\,P(B) = \frac{3}{8} \cdot \frac{1}{2} = \frac{3}{16}$

and $P(A \cap B) = \frac{2}{8} = \frac{1}{4} \neq P(A).P(B)$

$\therefore$ A and B are dependent.

71. Since, A and B are independent events

$\therefore$ $P(A \cap B) = P(A).P(B)$

$= [1 - P(\overline{A})]\,[1 - P(\overline{B})]$

$= [1 - 2/3]\,[1 - 2/7]$

$= \frac{1}{3} \cdot \frac{5}{7} = \frac{5}{21}$

72. $P\left(A \cup \overline{B}\right) = 0.8$ and $P(B) = \frac{2}{7} \Rightarrow P\left(\overline{B}\right) = \frac{5}{7}$

$\Rightarrow P(A) + P\left(\overline{B}\right) - P\left(A \cap \overline{B}\right) = 0.8$

$\Rightarrow P(A) + \frac{5}{7} - \frac{5}{7} P(A) = 0.8$

$\Rightarrow \frac{2}{7} P(A) = \frac{3}{35} \Rightarrow P(A) = 0.3$

73. Since $\overline{E_1} \cap \overline{E_2} = \overline{E_1 \cup E_2}$

and $(E_1 \cup E_2) \cap (\overline{E_1 \cup E_2}) = \phi$

$\therefore$ $P\{(E_1 \cup E_2) \cap (\overline{E_1} \cap \overline{E_2})\} = P(\phi) = 0 < \frac{1}{4}$

74. $P\left(\overline{A \cup B}\right) = \frac{1}{6}$

$\Rightarrow 1 - P(A \cup B) = \frac{1}{6}$

$\Rightarrow P(A \cup B) = \frac{5}{6}$

$\Rightarrow P(A) + P(B) - P(A \cap B) = \frac{5}{6}$

$\Rightarrow \frac{3}{4} + P(B) - \frac{1}{4} = \frac{5}{6} \Rightarrow P(B) = \frac{1}{3}$

Clearly, $P(A \cap B) = \frac{1}{4} = \frac{3}{4} \times \frac{1}{3} = P(A)\,P(B)$

So, A and B are independent.

Also, $P(A) \neq P(B)$. So, A and B are not equally likely.

75. $P(A \cap B) = \frac{1}{6}$ and $P\left(\overline{A} \cap \overline{B}\right) = \frac{1}{3}$

$\Rightarrow P(A)\,P(B) = \frac{1}{6}$ and $P(\overline{A})P(\overline{B}) = \frac{1}{3}$

$\Rightarrow xy = \frac{1}{6}$ and $(1 - x)(1 - y) = \frac{1}{3}$,

where $P(A) = x$, $P(B) = y$

$\Rightarrow xy = \frac{1}{6}$ and $1 - x - y + \frac{1}{6} = \frac{1}{3}$

$\Rightarrow xy = \frac{1}{6}$ and $x + y = \frac{5}{6}$

$\Rightarrow x = \frac{1}{2}$ and $y = \frac{1}{3}$ or $x = \frac{1}{3}$ and $y = \frac{1}{2}$

76. Let $A_i(i = 1, 2)$ denote the event that i^{th} plane hits the target.
Clearly, A_1 and A_2 are independent events.

$= \frac{2}{100} \times 2500 + \frac{3}{100} \times 3500 + \frac{5}{100} \times 4000$
$= 355$
Number of defective items from machine C
$= \frac{5}{100} \times 4000 = 200$

$= P(A \cap B) + P(A \cap C) – P[(A \cap B) \cap (A \cap C)]$
$= P(A \cap B) + P(A \cap C) – P(A \cap B \cap C)$

79. $P(B \cap C) = P(B) - \left[P\left(A \cap B \cap \overline{C}\right) + P\left(\overline{A} \cap B \cap \overline{C}\right)\right]$
$= \frac{3}{4} - \frac{2}{3} = \frac{1}{12}$

A – student is successful
$A – (A_1 \cap A_2 \cap A'_3) \cup (A_1 \cap A'_2 \cap A_3) \cup (A_1 \cap A_2 \cap A_3)$
$\therefore$ $P(A) = P(A_1) . P(A_2) . P(A'_3) + P(A_1) . P(A'_2) . P(A_3) + P(A_1) . P(A_2) . P(A_3)$
$\therefore$ $\frac{1}{2} = p . q. \frac{1}{2} + p . (1 – q) . \frac{1}{2} + p . q . \frac{1}{2}$
$\therefore$ $p + pq = 1 \quad \Rightarrow p (1 + q) = 1$

81. Probability of first card to be a king $= \frac{4}{52}$
and probability of also second to be a king
$= \frac{3}{51}$
Hence, required probability $= \frac{4}{52} \times \frac{3}{51} = \frac{1}{221}$.

ii. First is black and second is white
Probability $= \frac{3}{7} \times \frac{4}{6} = \frac{2}{7}$
Hence, required probability $= \frac{2}{7} + \frac{2}{7} = \frac{4}{7}$.

84. The sample space is [LWW, WLW]
$\therefore$ P(LWW) + P(WLW)
= Probability that in 5 match series, it is India's second win
= P(L)P(W)P(W) + P(W)P(L)P(W)
$= \frac{1}{8} + \frac{1}{8} = \frac{2}{8} = \frac{1}{4}$

85. Here, $P(A) = \frac{3}{4}$, $P(B) = \frac{4}{5}$
$\therefore$ $P(\overline{A}) = \frac{1}{4}$ and $P(\overline{B}) = \frac{1}{5}$
$\therefore$ Required probability
$= P(A).P(\overline{B}) + P(\overline{A}).P(B) = \frac{7}{20}$.

86. $P(A) = \frac{4}{5}$, $P(A') = \frac{1}{5}$
$P(B) = \frac{3}{5}$, $P(B') = \frac{2}{5}$
$\therefore$ P(both are false) = P(A′) . P(B′)
$= \frac{1}{5} . \frac{2}{5}$
$= \frac{2}{25}$
$\therefore$ P (atleast one of them is true)
= 1 – P (both are false)
$= 1 - \frac{2}{25} = \frac{23}{25}$

87. Consider the following events:
A = 'X' speaks truth, B = 'Y' speaks truth.
Then, $P(A) = \frac{60}{100} = \frac{3}{5}$ and $P(B) = \frac{50}{100} = \frac{1}{2}$

Required probability $= P\left((A\cap\overline{B})\cup(\overline{A}\cap B)\right)$

$= P(A\cap\overline{B}) + P(\overline{A}\cap B)$

$= \frac{3}{5}\times\frac{1}{2} + \frac{2}{5}\times\frac{1}{2} = \frac{1}{2}$

88. Consider the following events:
X = 'A' speaks truth, Y = 'B' speaks truth

Then, $P(X) = \frac{70}{100} = \frac{7}{10}$ and $P(Y) = \frac{80}{100} = \frac{4}{5}$

Required probability $= P[(X\cap\overline{Y})\cup(\overline{X}\cap Y)]$

$= \frac{7}{10}\times\frac{1}{5}+\frac{3}{10}\times\frac{4}{5}$

$= \frac{19}{50} = 0.38$

89. Consider the following events:
A = family who owns a car,
B = family who owns a house
Required probability = $P(A \cup B) - P(A \cap B)$

$= \frac{60+30-20}{100} - \frac{20}{100} = \frac{70-20}{100} = 0.5$

90. The probability of husband is not selected

$= 1 - \frac{1}{7} = \frac{6}{7}$

The probability that wife is not selected

$= 1 - \frac{1}{5} = \frac{4}{5}$

The probability that only husband selected

$= \frac{1}{7} \times \frac{4}{5} = \frac{4}{35}$

The probability that only wife selected

$= \frac{1}{5} \times \frac{6}{7} = \frac{6}{35}$

Hence, required probability $= \frac{6}{35} + \frac{4}{35} = \frac{10}{35}$

$= \frac{2}{7}$

91. The probability of students not solving the problem are $1-\frac{1}{3}=\frac{2}{3}$, $1-\frac{1}{4}=\frac{3}{4}$ and $1-\frac{1}{5}=\frac{4}{5}$

Therefore, the probability that the problem is not solved by any one of them $=\frac{2}{3}\times\frac{3}{4}\times\frac{4}{5}=\frac{2}{5}$

Hence, the probability that problem is solved $=1-\frac{2}{5}=\frac{3}{5}$.

92. i. This question can also be solved by one student

ii. This question can be solved by two students simultaneously

ii. This question can be solved by three students all together.

We have, $P(A)=\frac{1}{2}$, $P(B)=\frac{1}{4}$, $P(C)=\frac{1}{6}$

$\therefore$ $P(A \cup B \cup C) = P(A) + P(B) + P(C)$
$-[P(A).P(B) + P(B).P(C) + P(C).P(A)] +$
$[P(A).P(B).P(C)]$

$= \frac{1}{2}+\frac{1}{4}+\frac{1}{6}-\left[\frac{1}{2}\times\frac{1}{4}+\frac{1}{4}\times\frac{1}{6}+\frac{1}{6}\times\frac{1}{2}\right]$

$+\left[\frac{1}{2}\times\frac{1}{4}\times\frac{1}{6}\right]$

$= \frac{33}{48}$

93. $P\left(\frac{B}{A}\right) = \frac{P(A\cap B)}{P(A)} = \frac{\left(\frac{1}{10}\right)}{\left(\frac{1}{4}\right)} = \frac{2}{5}$.

94. For S and T as independent events,

P(S/T) = P(S). Thus, P(S/T) = 0.3.

95. $P(A/B) = \frac{P(A\cap B)}{P(B)} = \frac{\frac{7}{10}}{\frac{17}{20}} = \frac{7}{10}\times\frac{20}{17} = \frac{14}{17}$

96. $P(A \cap B) = P(A)\ P(B/A)$

$\therefore$ $P(A \cap B) = \frac{1}{4}\times\frac{2}{3} = \frac{1}{6}$

Now, $P(A/B) = \frac{P(A\cap B)}{P(B)}$

$\Rightarrow \frac{1}{2} = \frac{1}{6} \times \frac{1}{P(B)}$

$\Rightarrow P(B) = \frac{1}{3}$

97. $P(B / (A \cup B^c)] = \dfrac{P(B \cap (A \cup B^c))}{P(A \cup B^c)}$

$= \dfrac{P(A \cap B)}{P(A) + P(B^c) - P(A \cap B^c)}$

$= \dfrac{P(A) - P(A \cap B^c)}{P(A) + P(B^c) - P(A \cap B^c)}$

$= \dfrac{0.7 - 0.5}{0.8} = \dfrac{1}{4}$

98. S = {HHH, HHT, HTH, THH, HTT, THT, TTH, TTT}

∴ $n(E) = 4$, $n(F) = 4$ and $n(E \cap F) = 3$

∴ $P\left(\dfrac{E}{F}\right) = \dfrac{P(E \cap F)}{P(F)} = \dfrac{\frac{3}{8}}{\frac{4}{8}} = \dfrac{3}{4}$

99. Event that at least one of them is a boy → A,
Event that other is girl → B,
So, required probability

$P(B/A) = \dfrac{P(B \cap A)}{P(A)}$

Now, total cases are 3 (BG, BB, GG)

∴ $\dfrac{P(B \cap A)}{P(A)} = \dfrac{\frac{1}{3}}{\frac{2}{3}} = \dfrac{1}{2}$

….[∵ $B \cap A = \{BG\}$ and $A = \{BG, BB\}$]

100. Consider the following events:
A = Sum of the digits on the selected tickets is 8.
B = Product of the digits on the selected ticket is zero.
There are 14 tickets having product of digits appearing on them as zero. The numbers on such tickets are 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 20, 30, 40.

∴ $P(B) = \dfrac{14}{50}$ and $P(A \cap B) = \dfrac{1}{50}$

∴ Required probability = $P(A/B) = \dfrac{P(A \cap B)}{P(B)}$

$= \dfrac{1}{14}$

101. M: student studying maths
S: student studying science

∴ $P(M \cap S) = 40\% = 0.4$
$P(M) = 60\% = 0.6$
Probability of student studying science given the student is already studying maths
$= P(S/M) = P(M \cap S) / P(M)$

$= \dfrac{0.4}{0.6} = \dfrac{2}{3}$

102. $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\Rightarrow P(A \cap B) = P(A) + P(B) - P(A \cap B)$

{∵ $P(A \cap B) = P(A \cup B)$}

$\Rightarrow 2\,P(A \cap B) = P(A) + P(B)$

$\Rightarrow 2\,P(A).\dfrac{P(A \cap B)}{P(A)} = P(A) + P(B)$

$\Rightarrow 2\,P(A).P\left(\dfrac{B}{A}\right) = P(A) + P(B)$

103. We know that $P(A / B) = \dfrac{P(A \cap B)}{P(B)}$

Also we know that $P(A \cup B) \le 1$

$\Rightarrow P(A) + P(B) - P(A \cap B) \le 1$

$\Rightarrow P(A \cap B) \ge P(A) + P(B) - 1$

$\Rightarrow \dfrac{P(A \cap B)}{P(B)} \ge \dfrac{P(A) + P(B) - 1}{P(B)}$

$\Rightarrow P(A / B) \ge \dfrac{P(A) + P(B) - 1}{P(B)}$

104. $P(E \cap F) = P(E).P(F)$

Now, $P(E \cap F^c) = P(E) - P(E \cap F)$
$= P(E)[1 - P(F)]$
$= P(E).P(F^c)$

and $P(E^c \cap F^c) = 1 - P(E \cup F)$
$= 1 - [P(E) + P(F) - P(E \cap F)$
$= [1 - P(E)][1 - P(F)] = P(E^c)P(F^c)$

Also $P\left(\dfrac{E}{F}\right) = P(E)$ and $P\left(\dfrac{E^c}{F^c}\right) = P(E^c)$

$\Rightarrow P\left(\dfrac{E}{F}\right) + P\left(\dfrac{E^c}{F^c}\right) = 1.$

105. $P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} \Rightarrow \frac{1}{2} = \frac{P(A \cap B)}{1/4}$

$\Rightarrow P(A \cap B) = \frac{1}{8}$

Hence, events A and B are not mutually exclusive.

∴ Statement II is incorrect.

Now, $P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} \Rightarrow P(B) = \frac{1}{2}$

$\ldots\left[\because\ P(A \cap B) = \frac{1}{8} = P(A).P(B)\right]$

∴ events A and B are independent events.

∴ $P\left(\frac{A^c}{B^c}\right) = \frac{P(A^c \cap B^c)}{P(B^c)} = \frac{P(A^c)P(B^c)}{P(B^c)}$

$= \frac{3}{4}.\frac{1}{2}.\frac{2}{1} = \frac{3}{4}$

Hence, statement I is correct.

Again $P\left(\frac{A}{B}\right) + P\left(\frac{A}{B^c}\right) = \frac{1}{4} + \frac{P(A \cap B^c)}{P(B^c)}$

$= \frac{1}{4} + \frac{P(A) - P(A \cap B)}{P(B^c)}$

$= \frac{1}{4} + \frac{\frac{1}{4} - \frac{1}{8}}{\frac{1}{2}}$

$= \frac{1}{4} + \frac{1}{4} = \frac{1}{2}$

Hence, statement III is incorrect.

106. Consider the following events:
S = person is smoker,
NS = person is non smoker,
D = death due to lung cancer

$P(D) = P(S) \cdot P\left(\frac{D}{S}\right) + P(NS) \cdot P\left(\frac{D}{NS}\right)$

$\Rightarrow 0.006 = \frac{20}{100} \times P\left(\frac{D}{S}\right) + \frac{80}{100} \times \frac{1}{10} \times P\left(\frac{D}{S}\right)$

$\Rightarrow P\left(\frac{D}{S}\right) = \frac{1000 \times 0.006}{280} = \frac{6}{280} = \frac{3}{140}$

107. Let E denote the event that a five occurs and A be the event that the man reports it as '6'.

Then, $P(E) = \frac{1}{6}$, $P(E') = \frac{5}{6}$

$P(A/E) = \frac{2}{3}$, $P(A/E') = \frac{1}{3}$

From Baye's theorem,

$P(E/A) = \frac{P(E) \cdot P(A/E)}{P(E) \cdot P(A/E) + P(E') \cdot P(A/E')}$

$= \frac{\frac{1}{6} \times \frac{2}{3}}{\frac{1}{6} \times \frac{2}{3} + \frac{5}{6} \times \frac{1}{3}}$

$= \frac{2}{7}$

108. Let E_1 be the event that the ball is drawn from bag A, E_2 the event that it is drawn from bag B and E that the ball is red. We have to find $P(E_2/E)$.

Since both the bags are equally likely to be selected, we have $P(E_1) = P(E_2) = \frac{1}{2}$

Also $P(E/E_1) = \frac{3}{5}$, $P(E/E_2) = \frac{5}{9}$

Hence by Baye's theorem, we have

$P(E_2/E) = \frac{P(E_2)P(E/E_2)}{P(E_1)P(E/E_1) + P(E_2)P(E/E_2)}$

$= \frac{\frac{1}{2}.\frac{5}{9}}{\frac{1}{2}.\frac{3}{5} + \frac{1}{2}.\frac{5}{9}} = \frac{25}{52}$

109. Let A be the event of selecting bag X, B be the event of selecting bag Y and E be the event of drawing a white ball, the P(A) = 1/2, P(B) = 1/2, P(E/A) = 2/5, P(E/B) = 4/6 = 2/3

∴ P(E) = P(A) P(E/A) + P(B)P(E/B)

$= \frac{1}{2} \cdot \frac{2}{5} + \frac{1}{2} \cdot \frac{2}{3} = \frac{8}{15}$

110. K = He knows the answers, NK = He randomly ticks the answers, C = He is correct

$$P\left(\frac{K}{C}\right) = \frac{P(K).P\left(\frac{C}{K}\right)}{P(K).P\left(\frac{C}{K}\right) + P(NK).P\left(\frac{C}{NK}\right)}$$

$$= \frac{p \times 1}{p \times 1 + (1-p) \times \frac{1}{5}} = \frac{5p}{4p+1}$$

111. Consider the following events:

$E_1 \rightarrow$ He knows the answer, $E_2 \rightarrow$ He guesses the answer

$A \rightarrow$ He gets the correct answer.

We have,

$P(E_1) = \frac{90}{100} = \frac{9}{10}$, $P(E_2) = \frac{1}{10}$,

$P(A/E_1) = 1$, $P(A/E_2) = \frac{1}{4}$

∴ Required probability = $P(E_2/A)$

$$= \frac{P(E_2)P(A/E_2)}{P(E_1)P(A/E_1) + P(E_2)P(A/E_2)}$$

$$= \frac{\frac{1}{10} \times \frac{1}{4}}{\frac{9}{10} \times 1 + \frac{1}{10} \times \frac{1}{4}} = \frac{1}{37}$$

112. Required probability

$$= \frac{\frac{1}{7} \times \frac{7}{9}}{\frac{1}{7} \times \frac{7}{9} + \frac{3}{7} \times \frac{8}{9} + \frac{2}{7} \times \frac{5}{9} + \frac{1}{7} \times \frac{8}{9}} = \frac{1}{7}$$

113. Required probability $= \frac{(21)!2!}{(22)!} = \frac{1}{11} = \frac{1}{1+10}$

∴ Odds against = 10 : 1.

114. Required probability $= \frac{0.1}{0.1 + 0.32}$

$$= \frac{0.1}{0.42} = \frac{5}{21}$$

115. Probability [Person A will die in 30 years]

∴ $P(A) = \frac{8}{13} \Rightarrow P(\overline{A}) = \frac{5}{13}$

Similarly, $P(B) = \frac{4}{7} \Rightarrow P(\overline{B}) = \frac{3}{7}$

There are two ways in which one person is alive after 30 years. $\overline{A}B$ and $A\overline{B}$ are independent events.

So, required probability

$= P(\overline{A}).P(B) + P(A).P(\overline{B})$

$$= \frac{5}{13} \times \frac{4}{7} + \frac{8}{13} \times \frac{3}{7} = \frac{44}{91}$$

116. The probability of solving the question by these three students are $\frac{1}{3}, \frac{2}{7}$ and $\frac{3}{8}$ respectively.

∴ $P(A) = \frac{1}{3}$; $P(B) = \frac{2}{7}$; $P(C) = \frac{3}{8}$

Then, probability of question solved by only one student = $P(A\overline{B}\overline{C}$ or $\overline{A}B\overline{C}$ or $\overline{A}\overline{B}C)$

$$= P(A)\,P\left(\overline{B}\right)P\left(\overline{C}\right) + P\left(\overline{A}\right)P(B)\,P\left(\overline{C}\right) + P\left(\overline{A}\right)\,P\left(\overline{B}\right)P(C)$$

$$= \frac{1}{3}.\frac{5}{7}.\frac{5}{8} + \frac{2}{3}.\frac{2}{7}.\frac{5}{8} + \frac{2}{3}.\frac{5}{7}.\frac{3}{8}$$

$$= \frac{25+20+30}{168} = \frac{25}{56}$$

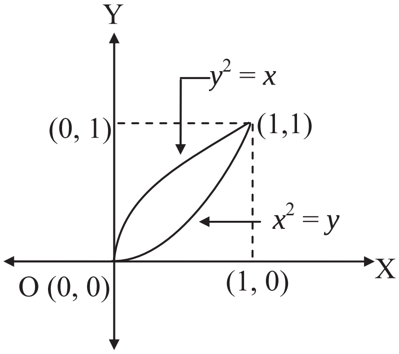
117. The quadratic equation $ax^2 + bx + c = 0$ has real roots when, $\Delta = b^2 - 4ac \geq 0$

Since a, b, c are chosen from the numbers 2, 3, 5.

6 different equations having distinct coefficients can be formed. Of these, only two equations having b = 5 will have real roots.

∴ Required probability $= \frac{2}{6} = \frac{1}{3}$

118.



A is an event of (x, y)which satisfies $y^2 \le x$

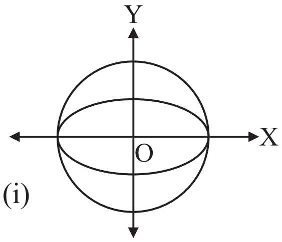
$\therefore$ $P(A) = \int_0^1 y\, dx = \int_0^1 \sqrt{x}\, dx = \frac{2}{3}$

B is an event of (x, y) which satisfies $x^2 \le y$

$P(B) = \int_0^1 y\, dx = \int_0^1 x^2\, dx = \frac{1}{3}$

$\therefore$ $P(A \cap B) = \frac{2}{3} - \frac{1}{3} = \frac{1}{3}$

119. Let, $\frac{x}{a^2} + \frac{y^2}{b^2} = 1$ be the given ellipse with eccentricity, $e = \frac{2\sqrt{2}}{3}$



$\therefore$ $e^2 = 1 - \frac{b^2}{a^2}$

$\therefore$ $b^2 = a^2 (1 - e^2)$ …(i)

Area of ellipse = πab

$= \pi a . \sqrt{a^2\left(1 - e^2\right)}$ …[From (i)]

$= \pi a^2 \sqrt{1 - e^2}$

$= \pi a^2 \sqrt{1 - \frac{8}{9}} = \frac{\pi a^2}{3}$

Also, radius of the circle = a

$\therefore$ Area of circle = πa^2

$\therefore$ Probability that point inside the circle lies outside the ellipse $= 1 - \frac{\frac{\pi a^2}{3}}{\pi a^2} = 1 - \frac{1}{3} = \frac{2}{3}$

Evaluation Test

1. Out of 30 numbers from 1 to 30, three numbers can be chosen in ${}^{30}C_3$ ways.

So, total number of elementary events = ${}^{30}C_3$.

Three consecutive numbers can be chosen in one of the following ways:

(1, 2, 3), (2, 3, 4),….,(28, 29, 30).

$\therefore$ Number of elementary events in which three numbers are consecutive is 28.

$\therefore$ Probability that the numbers are consecutive

$= \frac{28}{{}^{30}C_3} = \frac{1}{145}$

$\therefore$ required probability $= 1 - \frac{1}{145} = \frac{144}{145}$

2. We have,

$P(E) + P(F) - 2P(E \cap F) = \frac{11}{25}$ and

$P(\overline{E} \cap \overline{F}) = \frac{2}{25}$

$\Rightarrow P(E) + P(F) - 2P(E)P(F) = \frac{11}{25}$ and

$P(\overline{E})P(\overline{F}) = \frac{2}{25}$

$\Rightarrow x + y - 2xy = \frac{11}{25}$ and $1 - x - y + xy = \frac{2}{25}$,

Where, $P(E) = x$ and $P(F) = y$

$\Rightarrow x + y + 2 - 2x - 2y = \frac{11}{25} + 2 \times \frac{2}{25}$

....[On eliminating xy]

$\Rightarrow x + y = \frac{7}{5} \Rightarrow y = \frac{7}{5} - x$

Substituting $y = \frac{7}{5} - x$ in $1 - x - y + xy = \frac{2}{25}$, we get

$1 - \frac{7}{5} + x\left(\frac{7}{5} - x\right) = \frac{2}{25}$

$\Rightarrow 25x^2 - 35x + 12 = 0$

$\Rightarrow x = \frac{3}{5}, \frac{4}{5}$

When $x = \frac{3}{5}, y = \frac{4}{5}$ and $y = \frac{3}{5}$ for $x = \frac{4}{5}$

Hence, $P(E) = \frac{3}{5}$, $P(F) = \frac{4}{5}$ or $P(E) = \frac{4}{5}$, $P(F) = \frac{3}{5}$

3. Let A denote the event that each American man is seated adjacent to his wife and B denote the event that Indian man is seated adjacent to his wife. Then,

required probability = P(B/A)

$$= \frac{\text{Number of ways in which Indian man sits adjacent to his wife when each man is sited adjacents to his wife}}{\text{Number of ways in which each American man is seated adjacent to his wife}}$$

$$= \frac{(2!)^5 \times (5-1)!}{(2!)^4\,(6-1)!} = \frac{2}{5}$$

4. We have 13 denominations Ace, 2, 3, 4, …., 10, J, Q, K. For selecting exactly one pair, we select first any 3 denominations, 2 cards from 1 and one each from the other two

Thus, favourable ways = $^{13}C_3 . 3 . {}^4C_2 . {}^4C_1 . {}^4C_1$

Total ways = $^{52}C_4$

∴ required probability = $\frac{13.12.11.3.6.4.4.24}{6.52.51.50.49}$

$= \frac{6336}{20825} = 0.3042 = 0.3$

5. Let event A that minimum of the chosen number is 3 and B be the event that maximum of the chosen number is

∴ P(A) = P (choosing 3 and two other numbers from 4 to 10)

$$= \frac{^7C_2}{^{10}C_3} = \frac{7\times6\times3}{10\times9\times8} = \frac{7}{40}$$

P(B) = P(choosing 7 and choosing two other numbers from 1 to 6)

$$= \frac{^6C_2}{^{10}C_3} = \frac{6\times5\times3}{10\times9\times7} = \frac{1}{8}$$

$P(A \cap B)$ = P (choosing 3 and 7 and one other from 4 to 6)

$$= \frac{3}{^{10}C_3} = \frac{3\times3\times2}{10\times9\times8} = \frac{1}{40}$$

∴ $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$$= \frac{7}{40} + \frac{1}{8} - \frac{1}{40} = \frac{11}{40}$$

6. In the 22nd century there are 25 leap years viz. 2100, 2104, …., 2196 and 75 non-leap years.

Consider the following events:

E_1 = Selecting a leap year from 22nd century

E_2 = Selecting a non-leap year from 22nd century

A = There are 53 Sundays in a year of 22nd century

We have,

$P(E_1) = \frac{25}{100}$, $P(E_2) = \frac{75}{100}$

$P(A/E_1) = \frac{2}{7}$ and $P(A/E_2) = \frac{1}{7}$

∴ Required probability = P(A)

$= P\left((A \cap E_1) \cup (A \cap E_2)\right)$

$= P(A \cap E_1) + P(A \cap E_2)$

$= P(E_1)\, P(A/E_1) + P(E_2)\, P(A/E_2)$

$= \frac{25}{100} \times \frac{2}{7} + \frac{75}{100} \times \frac{1}{7}$

$= \frac{5}{28}$

7. We know that the probability of occurrence of an event is always less than or equal to 1 and it is given that $P(A \cup B \cup C) \geq 0.75$

∴ $0.75 \leq P(A \cup B \cup C) \leq 1$

$\Rightarrow 0.75 \leq P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(A \cap C) + P(A \cap B \cap C) \leq 1$

$\Rightarrow 0.75 \leq 0.3 + 0.4 + 0.8 - 0.08 - P(B \cap C) - 0.28 + 0.09 \leq 1$

$\Rightarrow 0.75 \leq 1.23 - P(B \cap C) \leq 1$

$\Rightarrow -0.48 \leq -P(B \cap C) \leq -0.23$

$\Rightarrow 0.23 \leq P(B \cap C) \leq 0.48$

8. From the tree diagram,

$P(B_G)$

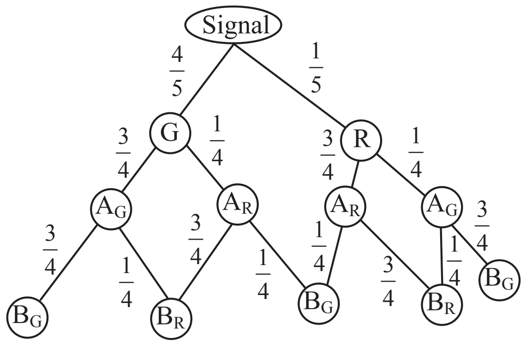
$= \frac{4}{5}\times\frac{3}{4}\times\frac{3}{4}+\frac{4}{5}\times\frac{1}{4}\times\frac{1}{4}+\frac{1}{5}\times\frac{3}{4}\times\frac{1}{4}+\frac{1}{5}\times\frac{1}{4}\times\frac{3}{4}$

$= \frac{23}{40}$

$$P\left(\frac{B_G}{G}\right) = \frac{3}{4}\times\frac{3}{4}+\frac{1}{4}\times\frac{1}{4} = \frac{5}{8}$$

$\therefore$ $P(B_G \cap G) = P(G)\, P\left(\frac{B_G}{G}\right)$

$$\Rightarrow P(B_G \cap G) = \frac{4}{5}\times\frac{5}{8} = \frac{1}{2}$$



$\therefore$ Required probability $= P\left(\frac{G}{B_G}\right) = \frac{P(B_G \cap G)}{P(B_G)}$

$$= \frac{\frac{1}{2}}{\frac{23}{40}} = \frac{20}{23}$$

$= A - 4I$

$= \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} - \begin{bmatrix} 4 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 4 \end{bmatrix}$

$R_1 - 2R_3 \Rightarrow \begin{bmatrix} 1 & -4 & 0 \\ -3 & 3 & 0 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -5 \\ -3 \\ 2 \end{bmatrix}$

$\Rightarrow x - 4y = -5$, and ….(i)

$-3x + 3y = -3$ ….(ii)

Solving (i) and (ii), we get $x = 3$

35. $\begin{bmatrix} a & 1 & 1 \\ 1 & a & 1 \\ 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$

Applying $R_1 \to R_1 - R_3$,

$\begin{bmatrix} a-1 & 0 & 0 \\ 1 & a & 1 \\ 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$

$\therefore \quad (a - 1)x + 0 + 0 = 0$

$\Rightarrow a - 1 = 0$

$\Rightarrow a = 1$

36. $|A| = -\frac{1}{2} \neq 0$

$\text{adj } A = \begin{bmatrix} \frac{i}{2} & 0 \\ 0 & i \end{bmatrix}$

$\therefore \quad A^{-1} = \frac{1}{\frac{-1}{2}} \begin{bmatrix} \frac{i}{2} & 0 \\ 0 & i \end{bmatrix} = \begin{bmatrix} -i & 0 \\ 0 & -2i \end{bmatrix}$

11. By sine rule,

$\frac{\sin A}{a} = \frac{\sin B}{b}$

$\Rightarrow \frac{2/3}{2} = \frac{\sin B}{3}$

$\Rightarrow \sin B = 1 = \sin 90^\circ \Rightarrow B = 90^\circ$

12. $\frac{\sin B}{\sin(A+B)} = \frac{\sin B}{\sin C} = \frac{b}{c}$

....[$\because A + B + C = \pi, A + B = \pi - C$]

13. $2s = a + b + c = 16 + 24 + 20 = 60 \Rightarrow s = 30$

$\therefore$ $\cos\frac{B}{2} = \sqrt{\frac{s(s-b)}{ac}} = \sqrt{\frac{30\times 6}{320}} = \frac{3}{4}$

14. Let a = 4 cm, b = 5 cm, c = 6 cm

16. $s - a = 3 \Rightarrow b + c - a = 6$ ....(i)

$s - c = 2 \Rightarrow a + b - c = 4$ ....(ii)

Adding (i) and (ii), we get b = 5

Since, $\angle B = 90^\circ$

∴ $b^2 = a^2 + c^2 \Rightarrow a^2 + c^2 = 25$ ….(iii)

Solving, we get a = 3, c = 4

17. We know that,

$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = k$

$\Rightarrow \frac{b}{\frac{1}{2}} = \frac{c}{\frac{1}{\sqrt{2}}} \Rightarrow c - \sqrt{2}\, b = 0$ ….(i)

By projection rule,

a = b cos C + c cos B

$\Rightarrow \sqrt{3} + 1 = \frac{b}{\sqrt{2}} + \frac{\sqrt{3}}{2}c$

$\Rightarrow 2(\sqrt{3}+1) = \sqrt{2}\,b + \sqrt{3}\,c$ ….(ii)

From (i) and (ii), we get

$2(\sqrt{3}+1) = (\sqrt{3}+1)c \Rightarrow c = 2$

18. $s = \frac{a+b+c}{2} = \frac{12}{2} = 6$

$\sin\frac{B}{2} = \sqrt{\frac{(s-c)(s-a)}{ca}} = \sqrt{\frac{2\times3}{12}} = \sqrt{\frac{1}{2}}$

$\cos\frac{B}{2} = \sqrt{\frac{s(s-b)}{ca}} = \sqrt{\frac{6\times1}{12}} = \sqrt{\frac{1}{2}}$

∴ $\sin\frac{B}{2} + \cos\frac{B}{2} = \frac{2}{\sqrt{2}} = \sqrt{2}$

19. $\frac{\sin\frac{A}{2}\sin\frac{C}{2}}{\sin\frac{B}{2}} = \sqrt{\frac{ac(s-b)(s-c)(s-b)(s-a)}{(s-a)(s-c)bc\times ab}}$

$= \frac{s-b}{b}$

But a, b and c are in A. P. $\Rightarrow 2b = a + c$

$\Rightarrow 2b + b = a + b + c$

$\Rightarrow 3b = 2s \Rightarrow s = \frac{3b}{2}$

∴ $\frac{s-b}{b} = \frac{\frac{3b}{2}-b}{b} = \frac{1}{2}$

20. By Napier’s analogy, we have

$\tan\frac{B-C}{2} = \frac{b-c}{b+c}\cot\frac{A}{2} \Rightarrow x = \frac{b-c}{b+c}$

21. $\tan\frac{A-B}{2} = \frac{a-b}{a+b}\cot\frac{C}{2}$

$\Rightarrow \theta = 150°$ and $330°$

2. $\cos\theta = 1 - 2x^2$

$\therefore$ $\cos\theta = 1 - 2\cos^2 40°$ ....[$\because \cos 40° = x$]

$= -(2\cos^2 40° - 1)$

$= -\cos(2 \times 40°) = -\cos 80°$

$\therefore$ $\cos\theta = \cos(180° + 80°) = \cos 260°$

and $\cos\theta = \cos(180° - 80°) = \cos 100°$

$\therefore$ $\theta = 100°$ and $260°$

3. $\tan\theta = \sqrt{3} = \tan\frac{\pi}{3} \Rightarrow \theta = n\pi + \frac{\pi}{3}$

For $-\pi < \theta < 0$,

Put $n = -1$, we get $\theta = -\pi + \frac{\pi}{3} = \frac{-2\pi}{3} = \frac{-4\pi}{6}$

4. $\cot\theta + \tan\theta = 2\operatorname{cosec}\theta \Rightarrow \frac{1}{\sin\theta\cos\theta} = \frac{2}{\sin\theta}$

$\Rightarrow \cos\theta = \frac{1}{2} = \cos\left(\frac{\pi}{3}\right) \Rightarrow \theta = 2n\pi \pm \frac{\pi}{3}$

5. $\tan\theta + \tan\left(\frac{\pi}{2} - \theta\right) = 2$

$\Rightarrow \tan\theta + \frac{1}{\tan\theta} = 2 \Rightarrow \tan^2\theta - 2\tan\theta + 1 = 0$

$\Rightarrow \tan\theta = 1 = \tan\frac{\pi}{4} \Rightarrow \theta = n\pi + \frac{\pi}{4}$

6. $\sin\theta = -\frac{1}{2} = -\sin\left(\frac{\pi}{6}\right) = \sin\left(\pi + \frac{\pi}{6}\right)$

$\tan\theta = \frac{1}{\sqrt{3}} = \tan\left(\frac{\pi}{6}\right) = \tan\left(\pi + \frac{\pi}{6}\right)$

$\Rightarrow \theta = \left(\pi + \frac{\pi}{6}\right)$

Hence, general value of θ is $2n\pi + \frac{7\pi}{6}$.

7. $\cos x - \sin x = \frac{1}{\sqrt{2}}$

Dividing both sides by $\sqrt{2}$, we get

$\frac{1}{\sqrt{2}}\cos x - \frac{1}{\sqrt{2}}\sin x = \frac{1}{2}$

$\Rightarrow \cos\left(\frac{\pi}{4} + x\right) = \cos\frac{\pi}{3} \Rightarrow \frac{\pi}{4} + x = 2n\pi \pm \frac{\pi}{3}$

$\Rightarrow x = 2n\pi + \frac{\pi}{3} - \frac{\pi}{4} = 2n\pi + \frac{\pi}{12}$

or $x = 2n\pi - \frac{\pi}{3} - \frac{\pi}{4} = 2n\pi - \frac{7\pi}{12}$

8. $1 + \cot\theta = \operatorname{cosec}\theta$

$\Rightarrow \frac{1}{\sin\theta} = 1 + \frac{\cos\theta}{\sin\theta} \Rightarrow \sin\theta + \cos\theta = 1$

Dividing both sides by $\sqrt{2}$, we get

$\sin\theta\sin\frac{\pi}{4} + \cos\theta\cos\frac{\pi}{4} = \cos\frac{\pi}{4}$

$\Rightarrow \cos\left(\theta - \frac{\pi}{4}\right) = \cos\frac{\pi}{4} \Rightarrow \theta - \frac{\pi}{4} = 2n\pi \pm \frac{\pi}{4}$

$\Rightarrow \theta = 2n\pi$ or $\theta = 2n\pi + \frac{\pi}{2}$

9. $\sin x - \cos x = \sqrt{2}$

$\Rightarrow \sin x\frac{1}{\sqrt{2}} - \cos x\frac{1}{\sqrt{2}} = 1$

$\Rightarrow \cos\left(x + \frac{\pi}{4}\right) = -1 = \cos\pi$

$\Rightarrow x + \frac{\pi}{4} = 2n\pi \pm \pi$

$\Rightarrow x = 2n\pi + \frac{3\pi}{4}$ or $2n\pi - \frac{5\pi}{4}$

10. $\cot\theta + \cot\left(\frac{\pi}{4} + \theta\right) = 2$

$\therefore$ $\frac{\cos\theta}{\sin\theta} + \frac{\cos\left(\frac{\pi}{4} + \theta\right)}{\sin\left(\frac{\pi}{4} + \theta\right)} = 2$

$\therefore$ $\sin\left(\frac{\pi}{4} + 2\theta\right) = 2\sin\theta\sin\left(\frac{\pi}{4} + \theta\right)$

$= \cos\left(\theta - \frac{\pi}{4} - \theta\right) - \cos\left(\theta + \frac{\pi}{4} + \theta\right)$

$\therefore \quad \sin\left(\frac{\pi}{4}+2\theta\right) = \cos\left(\frac{-\pi}{4}\right) - \cos\left(2\theta+\frac{\pi}{4}\right)$

$\Rightarrow \sin\left(\frac{\pi}{4}+2\theta\right)+\cos\left(\frac{\pi}{4}+2\theta\right)=\frac{1}{\sqrt{2}}$

$\Rightarrow \left(\frac{1}{\sqrt{2}}\cos 2\theta+\frac{1}{\sqrt{2}}\sin 2\theta\right)$

$+\left(\frac{1}{\sqrt{2}}\cos 2\theta-\frac{1}{\sqrt{2}}\sin 2\theta\right)=\frac{1}{\sqrt{2}}$

$\Rightarrow \frac{2}{\sqrt{2}}\cos 2\theta = \frac{1}{\sqrt{2}} \Rightarrow \cos 2\theta = \frac{1}{2} = \cos\left(\frac{\pi}{3}\right)$

$\Rightarrow 2\theta = 2n\pi \pm \frac{\pi}{3} \Rightarrow \theta = n\pi \pm \frac{\pi}{6}$

11. $\sin^2 x - 2\cos x + \frac{1}{4} = 0$

$\Rightarrow 1 - \cos^2 x - 2\cos x + \frac{1}{4} = 0$

Putting $\cos x = t$, we get

$1 - t^2 - 2t + \frac{1}{4} = 0 \Rightarrow 4t^2 + 8t - 5 = 0$

$\therefore \quad t = \frac{1}{2}$ or $t = -\frac{5}{2}$

Since, $\cos x \neq \frac{-5}{2}$

$\therefore \quad \cos x = \frac{1}{2} = \cos\frac{\pi}{3} \Rightarrow x = 2n\pi \pm \frac{\pi}{3}$

12. We have, $\sec\theta + \tan\theta = \sqrt{3}$ ....(i)

$\Rightarrow \sec\theta - \tan\theta = \frac{1}{\sqrt{3}}$ ....(ii)

....[$\because \sec^2\theta - \tan^2\theta = 1$]

By solving (i) and (ii), we get

$\tan\theta = \frac{1}{2}\left(\sqrt{3}-\frac{1}{\sqrt{3}}\right) = \frac{1}{\sqrt{3}}$

$\therefore \quad \tan\theta = \tan\left(\frac{\pi}{6}\right)$

$\Rightarrow \theta = n\pi + \frac{\pi}{6}$

$\therefore \quad \theta = \frac{\pi}{6}$ and $\frac{7\pi}{6}$ in $[0, 2\pi]$

Hence, there are two solutions.

13. $r\sin\theta = 3$,

$r = 4(1 + \sin\theta)$

Eliminating r, we get

$\frac{3}{\sin\theta} = 4 + 4\sin\theta$

$\therefore \quad \sin\theta = \frac{1}{2}, -\frac{3}{2}$

$\therefore \quad \sin\theta = \frac{1}{2}$ ....$\left[\because \sin\theta \neq \frac{-3}{2}\right]$

$\Rightarrow \theta = \frac{\pi}{6}, \pi - \frac{\pi}{6} = \frac{5\pi}{6}$ in $[0, 2\pi]$

14. $2\sin^2\theta - 3\sin\theta - 2 = 0$

$\therefore \quad \sin\theta = \frac{3 \pm \sqrt{9+16}}{4} = \frac{3 \pm 5}{4} = 2, -\frac{1}{2}$

$\therefore \quad \sin\theta = -\frac{1}{2}$ ....[$\because |\sin\theta| \leq 1$]

$\therefore \quad \sin\theta = \sin\left(\frac{-\pi}{6}\right)$

$\therefore \quad \theta = n\pi + (-1)^n\left(\frac{-\pi}{6}\right) = n\pi + (-1)^{n+1}\left(\frac{\pi}{6}\right)$

15. $2\cos^2 x + 3\sin x - 3 = 0$

$\Rightarrow 2 - 2\sin^2 x + 3\sin x - 3 = 0$

$\Rightarrow (2\sin x - 1)(\sin x - 1) = 0$

$\Rightarrow \sin x = \frac{1}{2}$ or $\sin x = 1$

$\Rightarrow x = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{\pi}{2}$ i.e., 30°, 150°, 90°.

16. $4\sin^2\theta + 2(\sqrt{3}+1)\cos\theta = 4 + \sqrt{3}$

$\Rightarrow 4 - 4\cos^2\theta + 2(\sqrt{3}+1)\cos\theta = 4 + \sqrt{3}$

$\Rightarrow 4\cos^2\theta - 2(\sqrt{3}+1)\cos\theta + \sqrt{3} = 0$

$\Rightarrow \cos\theta = \frac{2(\sqrt{3}+1) \pm \sqrt{4(\sqrt{3}+1)^2 - 16\sqrt{3}}}{8}$

$\Rightarrow \cos\theta = \frac{\sqrt{3}}{2}$ or $\frac{1}{2}$

$\Rightarrow \theta = 2n\pi \pm \frac{\pi}{6}$ or $2n\pi \pm \frac{\pi}{3}$

17. $\sin(A + B) = 1$ and $\cos(A - B) = \frac{\sqrt{3}}{2}$

$\Rightarrow A + B = \frac{\pi}{2}$ and $A - B = \frac{\pi}{6}$

$\Rightarrow A = \frac{\pi}{3}, B = \frac{\pi}{6}$

18. $\cos 7\theta = \cos \theta - \sin 4\theta$

$\Rightarrow \sin 4\theta = \cos\theta - \cos 7\theta$

$\Rightarrow \sin 4\theta = 2 \sin (4\theta) \sin (3\theta)$

$\Rightarrow \sin 4\theta = 0 \Rightarrow 4\theta = n\pi$ or

$\sin 3\theta = \frac{1}{2} = \sin\left(\frac{\pi}{6}\right)$

$\Rightarrow 3\theta = n\pi + (-1)^n \frac{\pi}{6}$

$\therefore \quad \theta = \frac{n\pi}{4}, \frac{n\pi}{3} + (-1)^n \frac{\pi}{18}$

19. $\frac{1-\tan^2\theta}{\sec^2\theta} = \frac{1}{2} \Rightarrow \cos^2\theta - \sin^2\theta = \frac{1}{2}$

$\Rightarrow \cos 2\theta = \frac{1}{2} = \cos\left(\frac{\pi}{3}\right)$

$\Rightarrow 2\theta = 2n\pi \pm \frac{\pi}{3} \Rightarrow \theta = n\pi \pm \frac{\pi}{6}$

20. $\sqrt{3}\tan 2\theta + \sqrt{3}\tan 3\theta + \tan 2\theta \tan 3\theta = 1$

$\Rightarrow \frac{\tan 2\theta + \tan 3\theta}{1 - \tan 2\theta \tan 3\theta} = \frac{1}{\sqrt{3}} \Rightarrow \tan 5\theta = \tan\frac{\pi}{6}$

$\Rightarrow 5\theta = n\pi + \frac{\pi}{6} \Rightarrow \theta = \left(n + \frac{1}{6}\right)\frac{\pi}{5}$

21. $\tan\theta + \tan 2\theta = \tan 3\theta (\tan\theta.\tan 2\theta - 1)$

$\Rightarrow \frac{\tan\theta + \tan 2\theta}{1 - \tan\theta\tan 2\theta} = -\tan 3\theta$

$\Rightarrow 2\tan 3\theta = 0 \Rightarrow 3\theta = n\pi$

$\Rightarrow \theta = \frac{n\pi}{3}$

22. $2\tan^2\theta = \sec^2\theta \Rightarrow 2\tan^2\theta = \tan^2\theta + 1$

$\Rightarrow \tan^2\theta = 1 = \tan^2\left(\frac{\pi}{4}\right) \Rightarrow \theta = n\pi \pm \frac{\pi}{4}$

23. $\tan\theta \tan 2\theta = 1$

$\therefore \quad \tan\theta \frac{2\tan\theta}{1-\tan^2\theta} = 1$

$\therefore \quad 2\tan^2\theta = 1 - \tan^2\theta$

$\therefore \quad 3\tan^2\theta = 1$

$\therefore \quad \tan^2\theta = \frac{1}{3} = \tan^2\left(\frac{\pi}{6}\right)$

$\therefore \quad \theta = n\pi \pm \frac{\pi}{6}$

24. $\sin 3\alpha = 4\sin\alpha \sin(x+\alpha)\sin(x-\alpha)$

$\therefore \quad \sin 3\alpha = 4\sin\alpha(\sin^2 x\cos^2\alpha - \cos^2 x\sin^2\alpha)$

$\therefore \quad 3\sin\alpha - 4\sin^3\alpha = 4\sin\alpha(\sin^2 x - \sin^2\alpha)$

$\therefore \quad \sin^2 x = \left(\frac{3}{4}\right) \Rightarrow \sin^2 x = \sin^2\frac{\pi}{3}$

$\therefore \quad x = n\pi \pm \frac{\pi}{3}$

25. $(\cos\theta + \cos 7\theta) + (\cos 3\theta + \cos 5\theta) = 0$

$\Rightarrow 2\cos 4\theta\cos 3\theta + 2\cos 4\theta\cos\theta = 0$

$\Rightarrow 2\cos 4\theta(\cos 3\theta + \cos\theta) = 0$

$\Rightarrow 4\cos 4\theta\cos 2\theta\cos\theta = 0$

$\Rightarrow 4\frac{\sin 2^3\theta}{2^3\sin\theta} = 0$

$\ldots\left[\because \cos A\cos 2A\cos 2^2A\cos 2^3A\ldots\cos 2^{n-1}A = \frac{\sin 2^n A}{2^n\sin A}\right]$

$\Rightarrow \sin 8\theta = 0$

$\Rightarrow 8\theta = n\pi$

$\Rightarrow \theta = \frac{n\pi}{8}$

26. Given, $\frac{\cos A}{a} = \frac{\cos B}{b} = \frac{\cos C}{c}$ ….(i)

By sine rule,

$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$ ….(ii)

From (i) and (ii), we get

$\therefore \quad \frac{\cos A}{\cos B} = \frac{\sin A}{\sin B}$

$\therefore \quad \sin(A - B) = 0 \Rightarrow A = B$

Similarly, we get,

$B = C$

$\therefore \quad A = B = C$

Thus, Δ ABC is an equilateral triangle.

27. We know that,

$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = k$

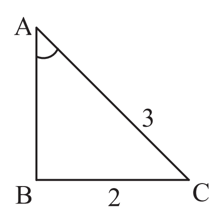
$\Rightarrow \frac{2}{\frac{2}{3}} = \frac{3}{\sin B} = \frac{c}{\sin C} = k$

$\Rightarrow k = 3$

$\therefore \quad \frac{3}{\sin B} = 3$

$\Rightarrow \sin B = 1$

$\Rightarrow B = 90°$



Hence, the triangle is a right angled triangle.

From the figure,

$\cos C = \frac{BC}{AC} = \frac{2}{3}$

28. Since the angles are in A.P., therefore B = 60°
By sine rule,
$\frac{b}{c} = \frac{\sin B}{\sin C} \Rightarrow \frac{\sqrt{3}}{\sqrt{2}} = \frac{\sqrt{3}}{2\sin C} \Rightarrow C = 45°$
∴ A = 180° – 60° – 45° = 75°

29. B = 60°, C = 75°
⇒A = 180° – 60° – 75° = 45°
By sine rule,
$\frac{b}{\sin B} = \frac{a}{\sin A} \Rightarrow \frac{b}{\sin 60^{o}} = \frac{2}{\sin 45^{o}} \Rightarrow b = \sqrt{6}$

30. Let the angles of the triangle be $2x$, $3x$ and $7x$.
∴ $2x + 3x + 7x = 180^{o} \Rightarrow 12x = 180^{o} \Rightarrow x = 15^{o}$
∴ the angles are 30^{o}, 45^{o} and 105^{o}
∴ a: b: c = sin 30° : sin45° : sin 105°
$= \frac{1}{2} : \frac{1}{\sqrt{2}} : \frac{\sqrt{3}+1}{2\sqrt{2}}$
$= \sqrt{2} : 2 : (\sqrt{3} + 1)$

31. $\frac{b-c}{a} = \frac{\sin B - \sin C}{\sin A}$
$= \frac{2\sin\frac{B-C}{2}\cos\frac{B+C}{2}}{2\sin\frac{A}{2}\cos\frac{A}{2}}$
$= \frac{\sin\left(\frac{B-C}{2}\right)\cos\left(\frac{B+C}{2}\right)}{\cos\left(\frac{B+C}{2}\right)\cos\frac{A}{2}}$
$= \frac{\sin\frac{B-C}{2}}{\cos\frac{A}{2}}$
$\Rightarrow (b - c)\cos\frac{A}{2} = a\sin\frac{B-C}{2}$

32. $\frac{1+\cos C\cos(A-B)}{1+\cos(A-C)\cos B} = \frac{1-\cos(A+B)\cos(A-B)}{1-\cos(A-C)\cos(A+C)}$
$= \frac{1-\frac{1}{2}(\cos 2A+\cos 2B)}{1-\frac{1}{2}(\cos 2A+\cos 2C)}$
$= \frac{1-\frac{1}{2}(1-2\sin^2 A+1-2\sin^2 B)}{1-\frac{1}{2}(1-2\sin^2 A+1-2\sin^2 C)}$
$= \frac{\sin^2 A+\sin^2 B}{\sin^2 A+\sin^2 C} = \frac{a^2+b^2}{a^2+c^2}$

33. $\frac{\cos\frac{B-C}{2}}{\sin\frac{A}{2}} = \frac{\sin\frac{B+C}{2}\cos\frac{B-C}{2}}{\sin\frac{B+C}{2}\sin\frac{A}{2}}$
$= \frac{2\sin\frac{B+C}{2}\cos\frac{B-C}{2}}{2\sin\left(\frac{\pi}{2}-\frac{A}{2}\right)\sin\frac{A}{2}}$
$= \frac{\sin B+\sin C}{\sin A} = \frac{b+c}{a}$

34. $\cos\theta = \frac{36+100-(14)^2}{2.6.10}$
⇒ θ = 120° ⇒ Obtuse angled triangle

35. Since A, B and C are in A.P., therefore
$B = 60° \ldots\left[\begin{array}{l}\because A+B+C=180^{o}\\ \Rightarrow A+C=2B \Rightarrow B=60^{o}\end{array}\right]$
Since sides a, b and c are in G.P., therefore
$b^2 = ac$
$\cos B = \frac{a^2+c^2-b^2}{2ac}$
$\Rightarrow \frac{1}{2} = \frac{a^2+c^2-b^2}{2b^2}$, ...[∵ $b^2 = ac$]
$\Rightarrow b^2 = a^2 + c^2 - b^2$
$\Rightarrow a^2 + c^2 = 2b^2$
$\Rightarrow a^2, b^2, c^2$ are in A.P.

36. A, B, C are in A. P. then angle B = 60°,
$\ldots\left[\begin{array}{l}\because A+B+C=180^{o}\\ \Rightarrow A+C=2B \Rightarrow B=60^{o}\end{array}\right]$
∴ $\cos B = \frac{a^2+c^2-b^2}{2ac}$,
$\Rightarrow \frac{1}{2} = \frac{a^2+c^2-b^2}{2ac} \Rightarrow a^2 + c^2 - b^2 = ac$
$\Rightarrow b^2 = a^2 + c^2 - ac$

37. $\frac{\cos A}{a} + \frac{\cos B}{b} + \frac{\cos C}{c}$
$= \frac{b^2+c^2-a^2+a^2+c^2-b^2+a^2+b^2-c^2}{2abc}$
$= \frac{a^2+b^2+c^2}{2abc}$

38. We have, a : b : c = 1 : $\sqrt{3}$: 2
i.e. a = λ, b = $\sqrt{3}$ λ, c = 2 λ
$\cos A = \frac{3\lambda^2+4\lambda^2-\lambda^2}{2(\sqrt{3}\lambda)(2\lambda)} = \frac{6\lambda^2}{4\sqrt{3}\lambda^2} = \frac{\sqrt{3}}{2}$
⇒ A = 30°

Similarly, $\cos B = \frac{1}{2} \Rightarrow B = 60°$,

$\cos C = 0 \Rightarrow C = 90°$.

Hence, A : B : C = 1 : 2 : 3

39. $(a^2 + b^2 - 2ab)\cos^2\frac{C}{2} + (a^2 + b^2 + 2ab)\sin^2\frac{C}{2}$

$= (a^2 + b^2)\left(\cos^2\frac{C}{2} + \sin^2\frac{C}{2}\right) - 2ab\left(\cos^2\frac{C}{2} - \sin^2\frac{C}{2}\right)$

$= a^2 + b^2 - 2ab\cos C$

$= a^2 + b^2 - (a^2 + b^2 - c^2) = c^2$

40. $\cos A = \frac{\sin B}{2\sin C} \Rightarrow \frac{b^2+c^2-a^2}{2bc} = \frac{b}{2c}$

$\Rightarrow b^2 + c^2 - a^2 - b^2 = 0 \Rightarrow c^2 = a^2$

$\Rightarrow c = a \Rightarrow$ Triangle is isosceles

41. $a = \sin\theta$, $b = \cos\theta$ and $c = \sqrt{1+\sin\theta\cos\theta}$

Since $\sqrt{1+\sin\theta\cos\theta}$ is greater than $\sin\theta$ and $\cos\theta$.

$\therefore$ C is the greatest angle,

$\therefore$ $\cos C = \frac{a^2+b^2-c^2}{2ab}$

$= \frac{\sin^2\theta + \cos^2\theta - (1+\sin\theta\cos\theta)}{2\sin\theta\cos\theta}$

$= -\frac{1}{2} = \cos 120°$

$\therefore$ $C = 120°$

42. $1 - \tan\frac{A}{2}\tan\frac{B}{2} = \frac{\cos\frac{A}{2}\cos\frac{B}{2} - \sin\frac{A}{2}\sin\frac{B}{2}}{\cos\frac{A}{2}\cos\frac{B}{2}}$

$= \frac{\cos\left(\frac{A}{2}+\frac{B}{2}\right)}{\cos\frac{A}{2}\cos\frac{B}{2}}$

$= \frac{\sin\frac{C}{2}}{\cos\frac{A}{2}\cos\frac{B}{2}}$

$= \left[\frac{(s-a)(s-b)bc.ac}{ab.s(s-a)s(s-b)}\right]^{1/2}$

$= \frac{c}{s} = \frac{2c}{a+b+c}$

43. $\frac{s(s-a)}{bc} - \frac{(s-b)(s-c)}{bc}$

$= \cos^2\frac{A}{2} - \sin^2\frac{A}{2} = \cos\frac{2A}{2} = \cos A$

44. $a\cos^2\frac{C}{2} + c\cos^2\frac{A}{2} = \frac{3b}{2}$

$\therefore$ $a\frac{s(s-c)}{ab} + c\frac{s(s-a)}{bc} = \frac{3b}{2}$

$\therefore$ $2s(s - c + s - a) = 3b^2$

$\therefore$ $2s(b) = 3b^2 \Rightarrow 2s = 3b \Rightarrow a + b + c = 3b$

$\therefore$ $a + c = 2b \Rightarrow$ a, b, c are in A.P.

45. $\tan\frac{C}{2} = \sqrt{\frac{(s-a)(s-b)}{s(s-c)}} = 1$

$\Rightarrow \tan\frac{C}{2} = \tan 45^\circ \Rightarrow \frac{C}{2} = 45^\circ$

$\Rightarrow C = 90°$

46. $\frac{\tan\frac{A}{2} - \tan\frac{B}{2}}{\tan\frac{A}{2} + \tan\frac{B}{2}} = \frac{\sqrt{\frac{(s-b)(s-c)}{s(s-a)}} - \sqrt{\frac{(s-a)(s-c)}{s(s-b)}}}{\sqrt{\frac{(s-b)(s-c)}{s(s-a)}} + \sqrt{\frac{(s-a)(s-c)}{s(s-b)}}}$

$= \frac{(s-b)\sqrt{s(s-c)} - (s-a)\sqrt{s(s-c)}}{(s-b)\sqrt{s(s-c)} + (s-a)\sqrt{s(s-c)}}$

$= \frac{\sqrt{s(s-c)}\,(s-b-s+a)}{\sqrt{s(s-c)}\,(s-b+s-a)} = \frac{a-b}{c}$

47. $\frac{1}{\sin^2\frac{A}{2}}, \frac{1}{\sin^2\frac{B}{2}}, \frac{1}{\sin^2\frac{C}{2}}$ are in A. P.

$\Rightarrow \frac{1}{\sin^2\frac{C}{2}} - \frac{1}{\sin^2\frac{B}{2}} = \frac{1}{\sin^2\frac{B}{2}} - \frac{1}{\sin^2\frac{A}{2}}$

$\Rightarrow \frac{ab}{(s-a)(s-b)} - \frac{ac}{(s-a)(s-c)} = \frac{ac}{(s-a)(s-c)} - \frac{bc}{(s-b)(s-c)}$

$\Rightarrow \left(\frac{a}{s-a}\right)\left(\frac{b(s-c)-c(s-b)}{(s-b)(s-c)}\right) = \left(\frac{c}{s-c}\right)\left(\frac{a(s-b)-b(s-a)}{(s-a)(s-b)}\right)$

$\Rightarrow abs - abc - acs + abc = acs - abc - bcs + abc$

$\Rightarrow ab - ac = ac - bc \Rightarrow ab + bc = 2ac$

$\Rightarrow \frac{1}{c} + \frac{1}{a} = \frac{2}{b} \Rightarrow$ a,b,c are in H. P.

48. Let $t = \tan\left(\frac{A-B}{2}\right)$

$\cos(A-B) = \frac{1-t^2}{1+t^2} \Rightarrow \frac{4}{5} = \frac{1-t^2}{1+t^2} \Rightarrow t = \frac{1}{3}$

So, $\tan\left(\frac{A-B}{2}\right) = \frac{1}{3}$

Then, $\tan\left(\frac{A-B}{2}\right) = \frac{a-b}{a+b}\cot\frac{C}{2}$

$\Rightarrow \frac{1}{3} = \frac{6-3}{6+3}\cot\frac{C}{2} \Rightarrow C = 90°$

$\therefore$ $\Delta = \frac{1}{2}(6)(3)\sin 90° = 9$ square units.

49. Let the common multiple be x.

$\therefore$ the sides are $(2x)$, $\left(\sqrt{6}\,x\right)$, $\left(\sqrt{3}+1\right)x$

$\because$ $\left(\sqrt{3}+1\right)x$ is the largest side.

If θ is the angle opposite to side $\left(\sqrt{3}+1\right)x$, then

$$\cos\theta = \frac{(2x)^2 + \left(\sqrt{6}x\right)^2 - \left[\left(\sqrt{3}+1\right)x\right]^2}{2\times(2x)\times(\sqrt{6}\,x)}$$

$$= \frac{3-\sqrt{3}}{2\sqrt{6}}$$

$\therefore$ $\cos\theta = \frac{\sqrt{3}-1}{2\sqrt{2}} \Rightarrow \theta = 75°$

50. We have,

$$\tan\left(\frac{A-B}{2}\right) = \sqrt{\frac{1-\cos(A-B)}{1+\cos(A-B)}} = \sqrt{\frac{1-\left(\frac{31}{32}\right)}{1+\left(\frac{31}{32}\right)}}$$

$\Rightarrow \frac{a-b}{a+b}\cot\frac{C}{2} = \frac{1}{\sqrt{63}}$

$\Rightarrow \frac{1}{9}\cot\frac{C}{2} = \frac{1}{\sqrt{63}}$

$\Rightarrow 2 - 2\cos^2\theta = 4 + 3\cos\theta$

$\Rightarrow 2\cos^2\theta + 3\cos\theta + 2 = 0$

$\Rightarrow \cos\theta = \frac{-3 \pm \sqrt{9 - 16}}{4}$,

which are imaginary, hence no solution.

14. $\cos 2x + k\sin x = 2k - 7$

$\Rightarrow 1 - 2\sin^2 x + k\sin x - 2k + 7 = 0$

$\Rightarrow 2\sin^2 x - k\sin x + 2k - 8 = 0$

$\Rightarrow \sin x = \frac{k \pm \sqrt{k^2 - 8(2k - 8)}}{4}$

$\Rightarrow \sin x = \frac{k \pm (k - 8)}{4} = \frac{k - 4}{2}, 2$

Since, $\sin x \neq 2$

and $-1 < \sin x < 1$

$\therefore$ $-1 < \frac{k - 4}{2} < 1 \Rightarrow -2 < k - 4 < 2$

$\Rightarrow 2 < k < 6$

$\therefore$ $\tan\alpha + \tan 4\alpha = 1 - \tan\alpha.\tan 4\alpha$

$\therefore$ $\dfrac{\tan\alpha + \tan 4\alpha}{1 - \tan\alpha.\tan 4\alpha} = 1$

$\therefore$ $\tan(\alpha + 4\alpha) = 1$

$\therefore$ $\tan 5\alpha = 1$

$81^{\sin^2\frac{\pi}{6}} + 81^{\cos^2\frac{\pi}{6}} = 30$

$\Rightarrow (81)^{\frac{1}{4}} + (81)^{\frac{3}{4}} = 30 \Rightarrow 30 = 30$

$\therefore$ option (A) is the correct answer.

19. $4\sin^4 x + \cos^4 x = 1$

$\Rightarrow 4\sin^4 x = 1 - \cos^4 x$

$\Rightarrow 4\sin^4 x - (\sin^2 x)(1 + 1 - \sin^2 x) = 0$

$\Rightarrow \sin^2 x[4\sin^2 x - 2 + \sin^2 x] = 0$

$\Rightarrow \sin^2 x(5\sin^2 x - 2) = 0$

$\Rightarrow \sin x = 0$ or $\sin x = \pm\sqrt{\dfrac{2}{5}}$

$\Rightarrow 2\sin^2\dfrac{\theta}{2} - 2\sin^2\dfrac{\theta}{2}\cos\dfrac{\theta}{2} = 0$

$\Rightarrow 2\sin^2\dfrac{\theta}{2}\left(1 - \cos\dfrac{\theta}{2}\right) = 0$

$\Rightarrow 2\sin^2\dfrac{\theta}{2}\left(2\sin^2\dfrac{\theta}{4}\right) = 0$

The given equation reduces to

$2\sqrt{2}\cos(\theta - \alpha) = 2$

$\Rightarrow \cos\left(\theta - \dfrac{\pi}{12}\right) = \cos\dfrac{\pi}{4}$

$\Rightarrow \theta - \dfrac{\pi}{12} = 2n\pi \pm \dfrac{\pi}{4} \Rightarrow \theta = 2n\pi \pm \dfrac{\pi}{4} + \dfrac{\pi}{12}$

53. $\sec\theta - \operatorname{cosec}\theta = \dfrac{4}{3}$

$\Rightarrow 3(\sin\theta - \cos\theta) = 4\sin\theta\cos\theta$

$\Rightarrow 3(\sin\theta - \cos\theta) = 2\sin 2\theta$

Squaring on both sides, we get $9(1 - s) = 4s^2$, where $s = \sin 2\theta$

$\Rightarrow 4s^2 + 9s - 9 = 0$

$\Rightarrow (s + 3)(4s - 3) = 0 \Rightarrow s = \frac{3}{4}$ ....[$\because \sin 2\theta \neq -3$]

$\Rightarrow \sin 2\theta = \frac{3}{4} = \sin \alpha$

$\Rightarrow 2\theta = n\pi + (-1)^n \alpha$

$\Rightarrow \theta = \frac{1}{2}\left[n\pi + (-1)^n \sin^{-1}\left(\frac{3}{4}\right)\right]$

54. Using $\sec 2\theta = \frac{1}{\cos 2\theta} = \frac{1+\tan^2\theta}{1-\tan^2\theta}$, we can write the given equation as

$\tan^2\theta + \frac{1+\tan^2\theta}{1-\tan^2\theta} = 1$

$\Rightarrow \tan^2\theta(1 - \tan^2\theta) + 1 + \tan^2\theta = 1 - \tan^2\theta$

$\Rightarrow 3\tan^2\theta - \tan^4\theta = 0$

$\Rightarrow \tan^2\theta(3 - \tan^2\theta) = 0$

$\Rightarrow \tan\theta = 0$ or $\tan^2\theta = 3$

$\Rightarrow \tan\theta = 0$ or $\tan^2\theta = \tan^2\frac{\pi}{3}$

$\Rightarrow \theta = m\pi$ or $\theta = n\pi \pm \frac{\pi}{3}$,

where m and n are integers.

55. $2\sqrt{3}\cos\theta = \tan\theta$

$\Rightarrow 2\sqrt{3}\cos^2\theta = \sin\theta$

$\Rightarrow 2\sqrt{3}\sin^2\theta + \sin\theta - 2\sqrt{3} = 0$

$\Rightarrow \sin\theta = \frac{-1 \pm 7}{4\sqrt{3}} \Rightarrow \sin\theta = \frac{-8}{4\sqrt{3}}$,

which is not possible

and $\sin\theta = \frac{6}{4\sqrt{3}} = \frac{\sqrt{3}}{2} = \sin\frac{\pi}{3}$

$\Rightarrow \theta = n\pi + (-1)^n \frac{\pi}{3}$

56. $3\sin^2 x - 7\sin x + 2 = 0$

$\Rightarrow 3\sin^2 x - 6\sin x - \sin x + 2 = 0$

$\Rightarrow 3\sin x(\sin x - 2) - (\sin x - 2) = 0$

$\Rightarrow (3\sin x - 1)(\sin x - 2) = 0$

$\Rightarrow \sin x = \frac{1}{3}$ or 2

$\Rightarrow \sin x = \frac{1}{3}$ ....[$\because \sin x \neq 2$]

Let $\sin^{-1}\frac{1}{3} = \alpha$, $0 < \alpha < \frac{\pi}{2}$ are the solutions in $[0, 5\pi]$. Then, $\alpha, \pi - \alpha, 2\pi + \alpha, 3\pi - \alpha, 4\pi + \alpha, 5\pi - \alpha$ are the solutions in $[0, 5\pi]$.

$\therefore$ number of solutions = 6

57. $\sin 2x + \cos 2x = 0$

$\Rightarrow (\sin 2x + \cos 2x)^2 = 0$

$\Rightarrow \sin^2 2x + \cos^2 2x + 2\sin 2x\cos 2x = 0$

$\Rightarrow 1 + \sin 4x = 0 \Rightarrow \sin 4x = -1$

$\therefore$ $4x = n\pi + (-1)^n\left(\frac{-\pi}{2}\right)$

$\therefore$ $4x = n\pi + (-1)^{n+1}\frac{\pi}{2}$

$\therefore$ $x = \frac{n\pi}{4} + (-1)^{n+1}\frac{\pi}{8}$

$\therefore$ For $\pi < x < 2\pi$, the values of x are $\frac{11\pi}{8}, \frac{15\pi}{8}$.

58. $2\sin^2\theta = 3\cos\theta$

$\Rightarrow 2 - 2\cos^2\theta = 3\cos\theta$

$\Rightarrow 2\cos^2\theta + 3\cos\theta - 2 = 0$

$\Rightarrow \cos\theta = \frac{-3 \pm \sqrt{9+16}}{4} = \frac{-3 \pm 5}{4}$

Neglecting (–) sign, we get

$\cos\theta = \frac{1}{2} = \cos\left(\frac{\pi}{3}\right) \Rightarrow \theta = 2n\pi \pm \frac{\pi}{3}$

The values of θ between 0 and 2π are $\frac{\pi}{3}, \frac{5\pi}{3}$.

59. $5\cos 2\theta + 2\cos^2\frac{\theta}{2} + 1 = 0$

$\Rightarrow 10\cos^2\theta + \cos\theta - 3 = 0$

$\Rightarrow (5\cos\theta + 3)(2\cos\theta - 1) = 0$

62. $\cos^2 x - 2\cos x = 4\sin x - \sin 2x$
$\Rightarrow \cos^2 x - 2\cos x = 4\sin x - 2\sin x\cos x$

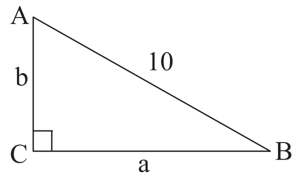
$\Rightarrow$ ΔABC is equilateral.

$\therefore$ $\Delta = \dfrac{\sqrt{3}}{4}a^2 = \dfrac{\sqrt{3}}{4}(2)^2 = \sqrt{3}$

77. $\sin^2 A + \sin^2 B = \sin^2 C$

$\Rightarrow \sin C = 1 \Rightarrow C = \frac{\pi}{2}$



$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$

$A(\Delta ABC) = \frac{1}{2}ab = \frac{1}{2}(10 \sin A)(10 \sin B)$

81. $\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$

According to the given condition,

In ΔABC, $a = 2b$ and

$A - B = 60° \Rightarrow A = 60° + B$

$\Rightarrow \frac{\sin(60° + B)}{2b} = \frac{\sin B}{b}$

$\Rightarrow \frac{\sin B}{\sin(B + 60°)} = \frac{1}{2}$

$\Rightarrow 2\sin B = \sin B \cos 60° + \cos B \sin 60°$

$\Rightarrow \frac{3}{2}\sin B = \frac{\sqrt{3}}{2}\cos B$

$\therefore$ $\tan B = \frac{1}{\sqrt{3}} \Rightarrow B = 30°$

$\therefore$ $A = 30° + 60° = 90°$

$\therefore$ ΔABC is right angled.

82. $\frac{\cos 2A}{a^2} - \frac{\cos 2B}{b^2}$

85. $\cos B = \frac{c^2 + a^2 - b^2}{2ac} \Rightarrow \cos B = \frac{1}{2} \Rightarrow B = \frac{\pi}{3}$

86. $(a + b + c)(a - b + c) = 3ac$

$\Rightarrow a^2 + 2ac + c^2 - b^2 = 3ac$

$\Rightarrow a^2 + c^2 - b^2 = ac$

87. $\cos A = \frac{8^2 + 10^2 - 6^2}{2.8.10} = \frac{128}{160} = \frac{4}{5}$

$\therefore$ $\sin A = \frac{3}{5}$

$\therefore$ $\sin 2A = 2 \sin A. \cos A = 2.\frac{3}{5}.\frac{4}{5} = \frac{24}{25}$

88. $\cos C = \frac{81 + 64 - x^2}{2.9.8} \Rightarrow \frac{2}{3} = \frac{145 - x^2}{144}$

$\Rightarrow x^2 = 49 \Rightarrow x = 7$

89. $\cos A = \frac{b^2 + c^2 - a^2}{2bc} = \frac{9 + 16 - 4}{2 \times 3 \times 4} = \frac{7}{8}$

$\Rightarrow A = \cos^{-1}\left(\frac{7}{8}\right)$

90. Let a = 3, b = 5, c = 7

$\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{9 + 25 - 49}{2 \times 3 \times 5} = \frac{-15}{30} = -\frac{1}{2}$

$\therefore$ $\angle C = \frac{2\pi}{3}$

91. Since, $c = \sqrt{13}$ is the smallest side.

$\therefore$ C is the smallest angle.

$\therefore$ $\cos C = \frac{b^2 + a^2 - c^2}{2ab} = \frac{48 + 49 - 13}{2 \times 7 \times 4\sqrt{3}}$

$\Rightarrow \cos C = \frac{3}{2\sqrt{3}} = \frac{\sqrt{3}}{2}$

$\Rightarrow C = 30°$

92. $\frac{\sin(A - B)}{\sin(A + B)} = \frac{\sin A \cos B - \sin B \cos A}{\sin C}$

$= \frac{a}{c} \cos B - \frac{b}{c} \cos A$

But $\cos B = \frac{a^2 + c^2 - b^2}{2ac}$, $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$

$\therefore$ $\frac{\sin(A - B)}{\sin(A + B)} = \frac{1}{2c^2}(a^2 + c^2 - b^2 - b^2 - c^2 + a^2)$

$= \frac{a^2 - b^2}{c^2}$

93. $\frac{1}{a + c} + \frac{1}{b + c} = \frac{3}{a + b + c}$

$\Rightarrow \frac{a + b + 2c}{(a + c)(b + c)} = \frac{3}{a + b + c}$

$\Rightarrow (a + b + 2c)(a + b + c) = 3(a + c)(b + c)$

$\Rightarrow a^2 + b^2 - c^2 = ab$

$\therefore$ $\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{ab}{2ab} = \frac{1}{2} = \cos 60^o$

$\Rightarrow C = 60^o$

94. $\angle C = 60°$, $\frac{1}{a + c} + \frac{1}{b + c} = \frac{3}{a + b + c}$

$\therefore$ $\frac{3}{a + b + c} - \frac{1}{a + c} = \frac{1}{b + c}$

95. $A + C = 2B \Rightarrow B = 60°$

$\cos B = \frac{a^2 + c^2 - b^2}{2ac}$

$\Rightarrow \cos 60^o = \frac{a^2 + c^2 - b^2}{2ac}$

$\Rightarrow b^2 = a^2 + c^2 - ac$

$\therefore$ $\frac{a + c}{\sqrt{a^2 - ac + c^2}} = \frac{a + c}{b} = \frac{\sin A + \sin C}{\sin B}$

97. Let $\frac{b + c}{11} = \frac{c + a}{12} = \frac{a + b}{13} = k$

$\therefore$ b + c = 11k ....(i)

c + a = 12k ....(ii)

and a + b = 13k ....(iii)

From (i) + (ii) + (iii), 2(a + b + c) = 36k

$\therefore$ a + b + c = 18 k ....(iv)

Now, (iv) – (i) gives, a = 7k

(iv) – (ii) gives, b = 6k

(iv) – (iii) gives, c = 5k

Now,

$\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{(7k)^2 + (6k)^2 - (5k)^2}{2 \times (7k) \times (6k)}$

$= \frac{49k^2 + 36k^2 - 25k^2}{84k^2} = \frac{60k^2}{84k^2} = \frac{5}{7}$

99. $a^2 \cos^2A - b^2 - c^2 = 0$

$\Rightarrow \cos^2A = \dfrac{b^2+c^2}{a^2}$

Since, $\cos^2A \le 1$ i.e., $\cos^2A < 1$

$\therefore \quad \dfrac{b^2+c^2}{a^2} < 1 \Rightarrow b^2 + c^2 - a^2 < 0$

$\therefore \quad \dfrac{b^2+c^2-a^2}{2bc} < 0 \quad ....[\because 2bc > 0]$

$\therefore \quad \cos A < 0 \Rightarrow A \in \left(\dfrac{\pi}{2}, \pi\right)$

100. Let $a = \alpha - \beta$, $b = \alpha + \beta$, $c = \sqrt{3\alpha^2+\beta^2}$

Since $\sqrt{3\alpha^2+\beta^2}$ is the largest side, the largest angle is C.

$\therefore \quad \cos C = \dfrac{a^2+b^2-c^2}{2ab}$

$\Rightarrow \cos C = \dfrac{\alpha^2+\beta^2-2\alpha\beta+\alpha^2+\beta^2+2\alpha\beta-3\alpha^2-\beta^2}{2(\alpha^2-\beta^2)}$

$\Rightarrow \cos C = -\dfrac{(\alpha^2-\beta^2)}{2(\alpha^2-\beta^2)} = \cos\left(\dfrac{2\pi}{3}\right)$

$\Rightarrow C = \dfrac{2\pi}{3}$

101. $\cos A = \dfrac{b^2+c^2-a^2}{2bc}$

$\Rightarrow \cos 60^\circ = \dfrac{1}{2} = \dfrac{9+c^2-16}{2\times3\times c}$

$\Rightarrow 3c = c^2 - 7$

$\Rightarrow c^2 - 3c - 7 = 0$

102. We have, $b = \sqrt{3}$, $c = 1$, $\angle A = 30^\circ$

$\cos A = \dfrac{b^2+c^2-a^2}{2bc}$

$\Rightarrow \dfrac{\sqrt{3}}{2} = \dfrac{(\sqrt{3})^2+1^2-a^2}{2.\sqrt{3}.1}$

$\Rightarrow a = 1$, $b = \sqrt{3}$, $c = 1$

$\therefore$ b is the largest side. Therefore, the largest angle B is given by

$\cos B = \dfrac{a^2+c^2-b^2}{2ac} = \dfrac{1+1-3}{2.1.1} = -\dfrac{1}{2} = \cos 120^\circ$

$\Rightarrow B = 120^\circ$

103. $a^4 + b^4 + c^4 = 2c^2(a^2+b^2)$

$\Rightarrow a^4 + b^4 + c^4 - 2a^2c^2 - 2b^2c^2 + 2a^2b^2 = 2a^2b^2$

$\Rightarrow (a^2+b^2-c^2)^2 = 2a^2b^2$

$\Rightarrow a^2 + b^2 - c^2 = \pm\sqrt{2}ab$

$\Rightarrow \dfrac{a^2+b^2-c^2}{2ab} = \pm\dfrac{\sqrt{2}ab}{2ab} = \pm\dfrac{1}{\sqrt{2}}$

$\Rightarrow \cos C = \cos 45^\circ$ or $\cos 135^\circ$

$\Rightarrow C = 45^\circ$ or 135°

104. We have, $b + c = 2a$ ....(i)

$\cos 60^\circ = \dfrac{b^2+c^2-a^2}{2bc} = \dfrac{(b+c)^2-2bc-a^2}{2bc}$

$\Rightarrow \dfrac{1}{2} = \dfrac{4a^2-2bc-a^2}{2bc} \Rightarrow \dfrac{1}{2} = \dfrac{3a^2}{2bc} - 1$

$\Rightarrow \dfrac{3}{2} = \dfrac{3a^2}{2bc}$

$\Rightarrow bc = a^2$ ....(ii)

From (i) and (ii), we get

$b + c = 2\sqrt{b}\sqrt{c}$

$\Rightarrow \left(\sqrt{b}-\sqrt{c}\right)^2 = 0 \Rightarrow b = c$

From (i), $a = b = c$

$\therefore$ Δ ABC is equilateral.

105. $\dfrac{\sin A}{\sin C} = \dfrac{\sin A\cos B - \cos A\sin B}{\sin B\cos C - \cos B\sin C}$

$\Rightarrow \dfrac{a}{c} = \dfrac{a\cos B - b\cos A}{b\cos C - c\cos B}$

$\Rightarrow ab\cos C - ac\cos B = ac\cos B - bc\cos A$

$\Rightarrow ab\cos C + bc\cos A = 2ac\cos B$

$\Rightarrow \dfrac{a^2+b^2-c^2}{2} + \dfrac{b^2+c^2-a^2}{2} = \dfrac{c^2+a^2-b^2}{1}$

$\Rightarrow b^2 = c^2 + a^2 - b^2 \Rightarrow b^2 = \dfrac{c^2+a^2}{2}$

$\Rightarrow a^2, b^2, c^2$ are in A.P.

106. $\dfrac{2\cos A}{a} + \dfrac{\cos B}{b} + \dfrac{2\cos C}{c} = \dfrac{a}{bc} + \dfrac{b}{ca}$

$\Rightarrow \dfrac{2(b^2+c^2-a^2)}{2abc} + \dfrac{a^2+c^2-b^2}{2abc} + \dfrac{2(a^2+b^2-c^2)}{2abc} = \dfrac{a}{bc} + \dfrac{b}{ca}$

$\Rightarrow \dfrac{3b^2+c^2+a^2}{2abc} = \dfrac{a}{bc} + \dfrac{b}{ca}$

$\Rightarrow \dfrac{3b}{2ac} + \dfrac{c}{2ab} + \dfrac{a}{2bc} = \dfrac{a}{bc} + \dfrac{b}{ca}$

$\Rightarrow b^2 + c^2 = a^2$

Hence, $\angle A = 90^\circ$

107. $4 \sin A = 4 \sin B = 3 \sin C$

$\therefore$ $4a = 4b = 3c$ or $a = b$

$\Rightarrow \quad 4x^2 - 2AB^2 = -2x^2$

109. $\dfrac{\sqrt{3}}{2} < \dfrac{b}{a} < 1$

$\Rightarrow b < a$

$\Rightarrow c < b < a$

$\Rightarrow B = 60°$ ....[$\because$ Angles are in A.P.]

Consider $\dfrac{\sqrt{3}}{2} < \dfrac{b}{a} < 1$

$\Rightarrow \dfrac{\sqrt{3}}{2} < \dfrac{b}{a}$

$\Rightarrow \sqrt{3}\,a < 2b$

$\Rightarrow 3a^2 < 4b^2$

$\Rightarrow 4b^2 - 3a^2 > 0$

Now, $b^2 = a^2 + c^2 - 2ac \cos 60°$

$\Rightarrow c^2 - ac + (a^2 - b^2) = 0$

$\therefore$ $c = \dfrac{a \pm \sqrt{4b^2-3a^2}}{2}$

Hence, the given expression is equal to 2, which is given by option (D).

Put $\sin^{-1} x = \alpha$, $\sin^{-1} y = \beta$, $\sin^{-1} z = \gamma$

$\therefore$ $\alpha + \beta + \gamma = \frac{\pi}{2}$

$\Rightarrow \alpha + \beta = \frac{\pi}{2} - \gamma \Rightarrow \cos (\alpha + \beta) = \cos\left(\frac{\pi}{2} - \gamma\right)$

$\Rightarrow \cos \alpha \cos \beta - \sin \alpha \sin \beta = \sin \gamma$ ….(i)

and, we have

$\sin \alpha = x \Rightarrow \cos \alpha = \sqrt{1-x^2}$

Similarly, $\cos\beta = \sqrt{1-y^2}$

$\therefore$ From (i), we get

$\sqrt{1-x^2} \cdot \sqrt{1-y^2} = xy + z$

Squaring on both sides, we get

$x^2 + y^2 + z^2 + 2xyz = 1$

$\sin^{-1} b = B$,

$\sin^{-1} c = C$

Here, $\cos^{-1} x = \cos^{-1} y = \cos^{-1} z = \pi$

$\Rightarrow x = y = z = \cos \pi = -1$

$\therefore$ $xy + yz + zx = (-1)(-1) + (-1)(-1) + (-1)(-1)$

and $\cos \gamma = \sqrt{1-q}$

$\therefore$ $\sin \alpha = \sqrt{1-p}$, $\sin \beta = \sqrt{p}$ and $\sin \gamma = \sqrt{q}$

The given equation can be written as

$\alpha + \beta + \gamma = \frac{3\pi}{4} \Rightarrow \alpha + \beta = \frac{3\pi}{4} - \gamma$

$\Rightarrow \cos (\alpha + \beta) = \cos\left(\frac{3\pi}{4} - \gamma\right)$

$= \cos\left\{\pi - \left(\frac{\pi}{4} + \gamma\right)\right\} = -\cos\left(\frac{\pi}{4} + \gamma\right)$

$\Rightarrow \sqrt{p}\sqrt{1-p} - \sqrt{1-p}\sqrt{p}$

$= -\left(\frac{1}{\sqrt{2}}\sqrt{1-q} - \frac{1}{\sqrt{2}}.\sqrt{q}\right)$

$\Rightarrow 0 = \sqrt{1-q} - \sqrt{q} \Rightarrow 1 - q = q \Rightarrow q = \frac{1}{2}$

$\sin^{-1}\sqrt{x^2+x+1}$ is defined when

$x(x + 1) + 1 \le 1$ or $x(x + 1) \le 0$ ….(ii)

From (i) and (ii),

$\sin^{-1}\left(\dfrac{2\tan\theta}{1+\tan^2\theta}\right) + \sin^{-1}\left(\dfrac{2\tan\phi}{1+\tan^2\phi}\right) = 2\tan^{-1} x$

$\Rightarrow \sin^{-1}[\sin(2\theta)] + \sin^{-1}[\sin(2\phi)] = 2\tan^{-1} x$

$\Rightarrow 2(\theta+\phi) = 2\tan^{-1} x$

$\Rightarrow x = \tan(\theta+\phi)$

$\Rightarrow x = \dfrac{\tan\theta + \tan\phi}{1-\tan\theta\tan\phi}$

Resubstituting the values of a and b, we get

$\Rightarrow \tan\theta = \sqrt{\sec^2\theta - 1} = \sqrt{\dfrac{1}{x^2} - 1} = \dfrac{1}{x}\sqrt{1-x^2}$

Now,

$\sin[\cot^{-1}(\tan\theta)] = \sin\left[\cot^{-1}\left(\dfrac{1}{x}\sqrt{1-x^2}\right)\right]$

Again, putting $x = \sin\theta$

$\therefore \quad \sin\cot^{-1}\left(\dfrac{1}{x}\sqrt{1-x^2}\right) = \sin\cot^{-1}\left(\dfrac{\sqrt{1-\sin^2\theta}}{\sin\theta}\right)$

Let length of altitude = p

Since, A + B + C = π

∴ $A + \frac{\pi}{8} + \frac{5\pi}{8} = \pi$

Area of $\Delta = \frac{1}{2}ap = \frac{1}{2}bc\sin A$

∴ $ap = bc\sin\frac{\pi}{4}$

∴ $ap = bc \times \frac{1}{\sqrt{2}}$

∴ $p = \frac{bc}{\sqrt{2}a}$ ....(i)

By sine rule,

$$\frac{a}{\sin\frac{\pi}{4}} = \frac{b}{\sin\frac{\pi}{8}} = \frac{c}{\sin\frac{5\pi}{8}}$$

$$= \frac{a}{\sqrt{2}}\left[\cos\left(\frac{5\pi}{8} - \frac{\pi}{8}\right) - \cos\left(\frac{5\pi}{8} + \frac{\pi}{8}\right)\right]$$

$$= \frac{a}{\sqrt{2}}\left[\cos\frac{\pi}{2} - \cos\frac{3\pi}{4}\right]$$

$$= \frac{a}{\sqrt{2}}\left[0 - \left(-\frac{1}{\sqrt{2}}\right)\right]$$

∴ $P = \frac{a}{2}$

19. $\tan\frac{A}{2}$ and $\tan\frac{B}{2}$ are the roots of the quadratic equation $6x^2 - 5x + 1 = 0$

∴ $\tan\frac{A}{2} + \tan\frac{B}{2} = \frac{5}{6}$, $\tan\frac{A}{2}.\tan\frac{B}{2} = \frac{1}{6}$

∴ $\tan\left(\frac{A}{2} + \frac{B}{2}\right) = \frac{\tan\frac{A}{2} + \tan\frac{B}{2}}{1 - \tan\frac{A}{2}\tan\frac{B}{2}} = \frac{\frac{5}{6}}{1 - \frac{1}{6}} = \frac{\frac{5}{6}}{\frac{5}{6}} = 1$

∴ $\tan\left(\frac{A+B}{2}\right) = 1$

∴ $\frac{A+B}{2} = \frac{\pi}{4}$

∴ $A + B = \frac{\pi}{2}$ ∴ $\angle C = \frac{\pi}{2}$

∴ ΔABC is a right angled triangle.

20. $r = \frac{\Delta}{s} = \frac{\frac{1}{2}ac\sin B}{\frac{1}{2}(a+b+c)} = \frac{ac}{a+b+c}$

....[∵ sin B = sin 90° = 1]

∴ $r = \frac{ac}{a+c+b} \times \frac{a+c-b}{a+c-b}$

$= \frac{ac(a+c-b)}{(a+c)^2 - b^2} = \frac{ac(a+c-b)}{a^2 + c^2 + 2ac - b^2}$

$= \frac{a+c-b}{2}$ ....[∵ $a^2 + c^2 = b^2$]

∴ Diameter = a + c − b

21. ∠A = 55°, ∠B = 15°, ∠C = 110°

∴ $\frac{a}{\sin 55^\circ} = \frac{b}{\sin 15^\circ} = \frac{c}{\sin 110^\circ} = k$

∴ a = k sin 55°, b = k sin 15°, c = k sin 110°

∴ $c^2 - a^2 = k^2\sin^2 110^\circ - k^2\sin^2 55^\circ$

$= k^2(\sin 110^\circ + \sin 55^\circ)(\sin 110^\circ - \sin 55^\circ)$

$= k^2\left(2\sin\frac{165^\circ}{2}\cos\frac{55^\circ}{2}\right)\left(2\sin\frac{55^\circ}{2}\cos\frac{165^\circ}{2}\right)$

$= k^2\sin 165^\circ\sin 55^\circ$

$= k^2\sin 15^\circ\sin 55^\circ$

$= (k\sin 55^\circ)(k\sin 15^\circ)$

$= ab$

22. A, B, C are in A.P.

$\therefore$ A + C = 2B

Also, A + B + C = 180°

$\therefore$ $\angle B = 60°$

$\frac{\sin A}{a}=\frac{\sin B}{b}=\frac{\sin C}{c}=k$

$\therefore$ sin A = ak, sin B = bk, sin C = ck

$\therefore$ $\frac{a}{c}\sin 2C + \frac{c}{a}\sin 2A$

$= \frac{a}{c}(2\sin C\cos C) + \frac{c}{a}(2\sin A\cos A)$

$= \frac{a}{c}(2ck\cos C) + \frac{c}{a}(2ak\cos A)$

$= 2ka\cos C + 2kc\cos A$

$= 2k(a\cos C + c\cos A)$

$= 2kb$ ….[$\because$ b = a cos C + c cos A]

$= 2\sin B$

$= 2\times\frac{\sqrt{3}}{2}$ ….[$\because \angle B = 60°$]

$= \sqrt{3}$

23. $2\cot^{-1}3 = 2\tan^{-1}\left(\frac{1}{3}\right) = \tan^{-1}\frac{1}{3} + \tan^{-1}\frac{1}{3}$

$= \tan^{-1}\left(\frac{\frac{1}{3}+\frac{1}{3}}{1-\frac{1}{3}\cdot\frac{1}{3}}\right)$

$= \tan^{-1}\left(\frac{3+3}{9-1}\right)$

$= \tan^{-1}\left(\frac{6}{8}\right)$

$= \tan^{-1}\frac{3}{4}$

$\therefore$ $\cot\left(\frac{\pi}{4}-2\cot^{-1}3\right) = \frac{1}{\tan\left(\frac{\pi}{4}-\tan^{-1}\frac{3}{4}\right)}$

$= \frac{1+\tan\frac{\pi}{4}\tan\left(\tan^{-1}\frac{3}{4}\right)}{\tan\frac{\pi}{4}-\tan\left(\tan^{-1}\frac{3}{4}\right)}$

$= \frac{1+1\cdot\frac{3}{4}}{1-\frac{3}{4}} = \frac{4+3}{4-3} = 7$

24. Let $\frac{1}{2}\cos^{-1}\left(\frac{a}{b}\right) = \theta$

$\therefore$ $\cos^{-1}\left(\frac{a}{b}\right) = 2\theta$

$\therefore$ $\cos 2\theta = \frac{a}{b}$

$\therefore$ $\tan\left[\frac{\pi}{4}+\frac{1}{2}\cos^{-1}\left(\frac{a}{b}\right)\right] + \tan\left[\frac{\pi}{4}-\frac{1}{2}\cos^{-1}\left(\frac{a}{b}\right)\right]$

$= \tan\left(\frac{\pi}{4}+\theta\right) + \tan\left(\frac{\pi}{4}-\theta\right)$

$= \frac{1+\tan\theta}{1-\tan\theta} + \frac{1-\tan\theta}{1+\tan\theta}$

$= \frac{(1+\tan\theta)^2+(1-\tan\theta)^2}{1-\tan^2\theta}$

$= \frac{2(1+\tan^2\theta)}{1-\tan^2\theta}$

$= \frac{2}{\frac{1-\tan^2\theta}{1+\tan^2\theta}} = \frac{2}{\cos 2\theta} = \frac{2}{\frac{a}{b}} = \frac{2b}{a}$

25. $\cos^{-1}\alpha - \cos^{-1}\beta = \cos^{-1}\left[\alpha\beta + \sqrt{1-\alpha^2}\sqrt{1-\beta^2}\right]$

Given, $\cos^{-1}x - \cos^{-1}\frac{y}{2} = \alpha$

$\therefore$ $\cos^{-1}\left[\frac{xy}{2}+\sqrt{(1-x^2)\left(1-\frac{y^2}{4}\right)}\right] = \alpha$

$\therefore$ $\cos\alpha = \frac{xy}{2}+\sqrt{(1-x^2)\left(1-\frac{y^2}{4}\right)}$

$\therefore$ $\sqrt{(1-x^2)\left(1-\frac{y^2}{4}\right)} = \cos\alpha - \frac{xy}{2}$

$\therefore$ $2\sqrt{(1-x^2)\left(1-\frac{y^2}{4}\right)} = 2\cos\alpha - xy$

Squaring on both sides, we get

$4(1-x^2)\left(1-\frac{y^2}{4}\right) = 4\cos^2\alpha - 4xy\cos\alpha + x^2y^2$

$\therefore$ $4 - y^2 - 4x^2 + x^2y^2 = 4\cos^2\alpha - 4xy\cos\alpha + x^2y^2$

$\therefore$ $4x^2 + y^2 - 4xy\cos\alpha = 4 - 4\cos^2\alpha$

$\therefore$ $4x^2 + y^2 - 4xy\cos\alpha = 4\sin^2\alpha$

26. $\sin^{-1} x + \sin^{-1} 2x = \frac{\pi}{3}$

$\therefore$ $\sin^{-1} 2x = \frac{\pi}{3} - \sin^{-1} x$

$\therefore$ $2x = \sin\left(\frac{\pi}{3} - \sin^{-1} x\right)$

$= \sin\frac{\pi}{3} \cos(\sin^{-1} x) - \cos\frac{\pi}{3} \sin(\sin^{-1} x)$

$\Rightarrow 2x = \frac{\sqrt{3}}{2} \cos(\sin^{-1} x) - \frac{1}{2}\cdot x$ .... (i)

Let $\sin^{-1} x = \theta$

$\therefore$ $\sin\theta = x$

$\cos\theta = \sqrt{1-x^2}$

$\therefore$ $\cos(\sin^{-1} x) = \sqrt{1-x^2}$ ....(ii)

From (i) and (ii), we get

$2x = \frac{\sqrt{3}}{2}\cdot\sqrt{1-x^2} - \frac{1}{2}x$

$\therefore$ $4x = \sqrt{3}\sqrt{1-x^2} - x$

$\therefore$ $5x = \sqrt{3}\sqrt{1-x^2}$

$\therefore$ $25x^2 = 3 - 3x^2$ (squaring both sides)

$\therefore$ $28x^2 = 3$

$\therefore$ $x^2 = \frac{3}{28}$

$\therefore$ $x = \sqrt{\frac{3}{28}} = \sqrt{\frac{1}{4}\cdot\frac{3}{7}} = \frac{1}{2}\sqrt{\frac{3}{7}}$

(From the given relation it can be seen that x is positive)

27. L.H.S. $= \sin^{-1}\left(\sin\frac{33\pi}{7}\right) + \cos^{-1}\left(\cos\frac{46\pi}{7}\right)$

$= \frac{2\pi}{7} + \pi - \frac{3\pi}{7} + \frac{3\pi}{8} + \frac{5\pi}{8}$

....[$\because \cos^{-1}(-x) = \pi - \cos^{-1} x$]

$= \pi - \frac{\pi}{7} + \pi = 2\pi - \frac{\pi}{7} = \frac{13\pi}{7}$

$\therefore$ $\frac{13\pi}{7} = \frac{a\pi}{b}$

$\therefore$ a = 13, b = 7

$\therefore$ a + b = 13 + 7 = 20

$\therefore$ $2\sqrt{2} - 1 = 2 \times 1.414 - 1 = 2.828 - 1 = 1.828$

$\therefore$ $2\sqrt{2} - 1 > \sqrt{3}$ ....[$\because \sqrt{3} = 1.732$]

$\therefore$ $\tan^{-1}(2\sqrt{2} - 1) > \tan^{-1}\left(\sqrt{3}\right)$

....[$\because \tan^{-1} x$ is an increasing function]

$\therefore$ $2\tan^{-1}(2\sqrt{2} - 1) > 2 \times \frac{\pi}{3}$

$\therefore$ $A > \frac{2\pi}{3}$ ....(i)

$\sin 3\theta = 3\sin\theta - 4\sin^3\theta$

$\therefore$ $3\theta = \sin^{-1}(3\sin\theta - 4\sin^3\theta)$

Put $\sin\theta = \frac{1}{3}$

$\therefore$ $\theta = \sin^{-1}\left(\frac{1}{3}\right)$

$\therefore$ $3\sin^{-1}\left(\frac{1}{3}\right) = \sin^{-1}\left[3\cdot\frac{1}{3} - 4\left(\frac{1}{3}\right)^3\right]$

$= \sin^{-1}\left(1 - \frac{4}{27}\right)$

$= \sin^{-1}\left(\frac{23}{27}\right) = \sin^{-1}(0.852)$

$\frac{\sqrt{3}}{2} = \frac{1.732}{2} = 0.866$, $0.852 < 0.866$

$\therefore$ $\sin^{-1}(0.852) < \sin^{-1}(0.866)$

….[$\because$ $\sin^{-1} x$ is also an increasing function]

$\therefore$ $3\sin^{-1}\left(\frac{1}{3}\right) < \sin^{-1}\left(\frac{\sqrt{3}}{2}\right)$

$\therefore$ $3\sin^{-1}\left(\frac{1}{3}\right) < \frac{\pi}{3}$ ....(ii)

$\sin^{-1}\left(\frac{3}{5}\right) = \sin^{-1}(0.6) < \sin^{-1}\left(\frac{\sqrt{3}}{2}\right)$

$\therefore$ $\sin^{-1}\left(\frac{3}{5}\right) < \frac{\pi}{3}$ ….(iii)

From (ii) and (iii), we get

$B = 3\sin^{-1}\left(\frac{1}{3}\right) + \sin^{-1}\left(\frac{3}{5}\right) < \frac{\pi}{3} + \frac{\pi}{3} = \frac{2\pi}{3}$

$\therefore$ $B < \frac{2\pi}{3}$ ….(iv)

From (i) and (iv), A > B

30. $\cot^{-1} x + \cot^{-1} y + \cot^{-1} z = \frac{\pi}{2}$

$\therefore$ $\frac{\pi}{2} - \tan^{-1} x + \frac{\pi}{2} - \tan^{-1} y + \frac{\pi}{2} - \tan^{-1} z = \frac{\pi}{2}$

$\therefore$ $\tan^{-1} x + \tan^{-1} y + \tan^{-1} z = \pi$

$\therefore$ $\tan(\tan^{-1} x + \tan^{-1} y + \tan^{-1} z) = \tan\pi = 0$

Let $A = \tan^{-1} x$, $B = \tan^{-1} y$, $C = \tan^{-1} z$

$\therefore$ $\tan(A + B + C) = \frac{\tan(A+B) + \tan C}{1 - \tan(A+B)\tan C}$

$= \frac{\frac{\tan A + \tan B}{1 - \tan A\tan B} + \tan C}{1 - \frac{\tan A + \tan B}{1 - \tan A\tan B}\cdot\tan C}$

$= \frac{\tan A + \tan B + \tan C - \tan A\tan B\tan C}{1 - \tan A\tan B - \tan B\tan C - \tan C\tan A}$

$\therefore$ $\tan(A + B + C) = 0$

$\Rightarrow \tan A + \tan B + \tan C = \tan A\tan B\tan C$

$\therefore$ $\tan(\tan^{-1} x) + \tan(\tan^{-1} y) + \tan(\tan^{-1} z)$

04 Pair of Straight Lines

Hints

Classical Thinking

1. Joint equation of pair of lines having slopes m_1 and m_2 and passing through the origin is
$y^2 - (m_1 + m_2)xy + m_1m_2 x^2 = 0$
$\Rightarrow 3x^2 - 4xy + y^2 = 0$
Alternate method:
Equations of the lines are $y = x$ and $y = 3x$ respectively.
i.e. $y - x = 0$ and $y - 3x = 0$
$\therefore$ the combined equation of the pair of lines is
$(y - x)(y - 3x) = 0$
$\therefore$ $y^2 - 3xy - xy + 3x^2 = 0 \Rightarrow 3x^2 - 4xy + y^2 = 0$

2. The required equation is
$y^2 - \left(\frac{8}{3}\right)xy - x^2 = 0$
$\Rightarrow 3x^2 + 8xy - 3y^2 = 0$

3. The required equation is
$y^2 - \frac{3}{2}xy - x^2 = 0$
$\Rightarrow 2x^2 + 3xy - 2y^2 = 0$

4. $x^2 + xy - 12y^2 = 0$
$\Rightarrow x^2 + 4xy - 3xy - 12y^2 = 0$
$\Rightarrow x(x + 4y) - 3y(x + 4y) = 0$
$\Rightarrow (x - 3y)(x + 4y) = 0$
$\Rightarrow x - 3y = 0$ and $x + 4y = 0$

5. It is a homogeneous equation of degree 2 in x and y.
$\therefore$ Correct option is (C).

6. $3x^2 - 10xy - 8y^2 = 0$
$\Rightarrow 3x^2 - 12xy + 2xy - 8y^2 = 0$
$\Rightarrow 3x(x - 4y) + 2y(x - 4y) = 0$
$\Rightarrow (3x + 2y)(x - 4y) = 0$
$\Rightarrow 3x + 2y = 0$ and $x - 4y = 0$

7. $6x^2 - 5xy + y^2 = 0$
$\Rightarrow 6x^2 - 3xy - 2xy + y^2 = 0$
$\Rightarrow 3x(2x - y) - y(2x - y) = 0$
$\Rightarrow (2x - y)(3x - y) = 0$
$\Rightarrow 3x - y = 0$ and $2x - y = 0$

8. Equation of straight lines parallel to $ax^2 + 2hxy + by^2 = 0$ and passing through point (x_1, y_1) is found by shifting the origin to (x_1, y_1)
$\therefore$ The required equation is
$a(x - x_1)^2 + 2h(x - x_1)(y - y_1) + b(y - y_1)^2 = 0$

9. $L_1 = x^2 - y^2 = 0$ represents pair of straight lines passing through the origin
To find equation of pair of straight lines parallel to L_1 and passing through (3, 4), shift the origin to (3, 4)
$\therefore$ $(x - 3)^2 + (y - 4)^2 = 0$
$\Rightarrow x^2 + y^2 - 6x - 8y + 25 = 0$

10. L_1: $ax^2 + 2hxy + by^2 = 0$
Equation of any line passing through origin and perpendicular to L_1 is given by
$bx^2 - 2hxy + ay^2 = 0$
….(interchanging coefficients of x^2 and y^2 and change of sign for xy term)
$\therefore$ The required equation is $ay^2 - 2hxy + bx^2 = 0$

11. The required equation is
$-3x^2 + 7xy + 5y^2 = 0$
i.e. $3x^2 - 7xy - 5y^2 = 0$

12. Comparing given equation with $ax^2 + 2hxy + by^2 = 0$, we get
$h = \frac{-1}{2}$ and $b = -6$
$\therefore$ Sum of slopes $= m_1 + m_2 = \frac{-2h}{b}$
$= \frac{-2\left(\frac{-1}{2}\right)}{-6} = \frac{-1}{6}$

13. Given equation of pair of lines is
$ax^2 + 10xy + y^2 = 0$
$\therefore$ A = a, H = 5, B = 1
Let the slopes of the lines given by be m_1 and m_2
$m_1 + m_2 = \frac{-2H}{B}$ and $m_1m_2 = \frac{A}{B}$
Given that $m_2 = 4m_1$
$\therefore$ $m_1 + 4m_1 = \frac{-2H}{B} = -10 \Rightarrow m_1 = -2$
and $m_1 \times 4m_1 = \frac{A}{B} = a \Rightarrow 4m_1^2 = a \Rightarrow a = 16$

14. Given equation of pair of lines is
$ax^2 + 4xy + y^2 = 0$
$\therefore$ A = a, H = 2, B = 1
$m_1 + m_2 = -4$ and $m_1m_2 = a$
Given that $m_1 = 3m_2$
$\therefore$ $3m_2 + m_2 = -4 \Rightarrow m_2 = -1$
Hence, $m_1 = -3$
$\therefore$ $a = (-1)(-3) = 3$

15. Given equation of pair of lines is
$ax^2 + (3a + 1)xy + 3y^2 = 0$
$\therefore$ $A = a,\ H = \dfrac{3a+1}{2},\ B = 3$
Given that $m_1 = \dfrac{1}{m_2} \Rightarrow m_1m_2 = 1$
Now, $m_1m_2 = \dfrac{a}{3} \Rightarrow \dfrac{a}{3} = 1 \Rightarrow a = 3$
Also, $m_1 + m_2 = -\left(\dfrac{3a+1}{3}\right) = \dfrac{-10}{3}$
$\Rightarrow m_1 + \dfrac{1}{m_1} = \dfrac{-10}{3} \Rightarrow 3m_1^2 + 10m_1 + 3 = 0$
$\therefore$ $m_1 = \dfrac{-1}{3}$ or -3.

16. Given equation of pair of lines is
$6x^2 + 41xy - 7y^2 = 0$
$\therefore$ $a = 6,\ h = \dfrac{41}{2},\ b = -7$
α and β are angles made by the two lines with X-axis
$\therefore$ their slopes m_1 and m_2 respectively are
$m_1 = \tan\alpha$ and $m_2 = \tan\beta$
$\tan\alpha.\tan\beta = m_1m_2 = -\dfrac{6}{7}$

17. Given equation of pair of lines is
$6x^2 - xy - y^2 = 0$
$\therefore$ $a = 6,\ h = -\dfrac{1}{2},\ b = -1$
If θ is the acute angle between the pair of lines
$\therefore$ $\tan\theta = \left|\dfrac{2\sqrt{h^2 - ab}}{a+b}\right|$
$\Rightarrow \tan\theta = \left|\dfrac{2\sqrt{\frac{1}{4}+6}}{5}\right| = 1$
$\Rightarrow \theta = \tan^{-1}(1) = 45^\circ$

18. Given equation of pair of lines is
$\sqrt{3}xy - y^2 = 0$
$\therefore$ $a = 0,\ h = \dfrac{\sqrt{3}}{2},\ b = -1$
$\therefore$ $\tan\theta = \left|\dfrac{2\sqrt{\frac{3}{4}-0}}{0-1}\right| = \left|\dfrac{2\times\frac{\sqrt{3}}{2}}{-1}\right| = \sqrt{3}$
$\Rightarrow \theta = \tan^{-1}(\sqrt{3}) = 60^\circ$

19. Given equation of pair of lines is
$11y^2 - 4xy + 4x^2 = 0$

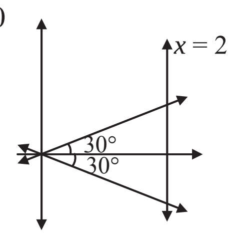
Critical Thinking

1. The lines passing through origin and parallel to the given lines are $y = m_1x$ and $y = m_2x$,
$\therefore$ the combined equation is
$(y - m_1x)(y - m_2x) = 0$
$\Rightarrow m_1m_2x^2 - (m_1 + m_2)xy + y^2 = 0$

2. Given line $2x - y = 0 \Rightarrow$ Slope $= 2$
Let the slope of required line be m
$\therefore$ $\tan 30° = \left|\frac{m-2}{1+2m}\right|$
$\Rightarrow \frac{1}{\sqrt{3}} = \left|\frac{m-2}{1+2m}\right|$
$\Rightarrow m^2 + 16m - 11 = 0$ ....(i)
Since, the line passes through origin, its equation is
$y = mx \Rightarrow m = \frac{y}{x}$
Substituting of m in equation (i), we get
$\left(\frac{y}{x}\right)^2 + 16\left(\frac{y}{x}\right) - 11 = 0$
$\Rightarrow 11x^2 - 16xy - y^2 = 0$

3. From the diagram, the required lines are
$y = \frac{x}{\sqrt{3}}$ i.e., $\sqrt{3}\,y - x = 0$
and
$y = \frac{-x}{\sqrt{3}}$ i.e., $\sqrt{3}\,y + x = 0$



$\therefore$ Combined equation is
$(\sqrt{3}\,y - x)(\sqrt{3}\,y + x) = 0$
i.e., $3y^2 - x^2 = 0$

4. Let $y = mx$ be the equation of line.
Slope of the given line $y = -x - \sqrt{3}$ is -1
Since, the pair of straight lines and the given line form an equilateral traingle, angle between them is 60°.

$\therefore$ $\tan\frac{\pi}{3} = \left|\frac{m+1}{1-m}\right| \Rightarrow \sqrt{3} = \left|\frac{m+1}{1-m}\right|$

$\Rightarrow 3(1-m)^2 = (1+m)^2$

$\Rightarrow 3(1+m^2-2m) = (1+m^2+2m)$

$\therefore$ $m^2 - 4m + 1 = 0$ ....(i)

The equation of line passing through origin is,

$y = mx \Rightarrow m = \frac{y}{x}$

Substituting the value of m in (i), we get

$\left(\frac{y}{x}\right)^2 - 4\left(\frac{y}{x}\right) + 1 = 0 \Rightarrow x^2 - 4xy + y^2 = 0$

5. $ax^2 + (a+b)xy + by^2 + x + y = 0$
$\Rightarrow ax^2 + bxy + x + axy + by^2 + y = 0$
$\Rightarrow x(ax + by + 1) + y(ax + by + 1) = 0$
$\Rightarrow (x + y)(ax + by + 1) = 0$

6. $pq(x^2 - y^2) + (p^2 - q^2)xy = 0$
$\Rightarrow pqx^2 - pqy^2 + p^2xy - q^2xy = 0$
$\Rightarrow px(py + qx) - qy(py + qx) = 0$
$\Rightarrow (px - qy)(py + qx) = 0$
$\Rightarrow px - qy = 0$ and $py + qx = 0$

$\therefore$ Required equation of the line is $px - qy = 0$

7. $x^2 + 6xy = 0 \Rightarrow x(x + 6y) = 0$
$\Rightarrow x = 0$ and $x + 6y = 0$ are two straight lines.
$x = 0$ represents Y-axis.

8. $y^2 - x^2 + 2x - 1 = 0$
$\Rightarrow y^2 - (x^2 - 2x + 1) = 0$
$\Rightarrow (y - 0)^2 - (x - 1)^2 = 0$
This is equation of pair of straight lines passing through (1, 0).

9. The given equation represents a pair of straight lines passing through (5, 6).

10. The lines passes through (–2, 2)
Only (–2,2) satisfies the given equation.

11. Given equation of pair of lines is
$ax^2 + xy - by^2 = 0$
Comparing the equations, with
$Ax^2 + 2Hxy + By^2 = 0$

$\therefore$ $A = a$, $H = \frac{1}{2}$ and $B = -a$

$\therefore$ the equation represents a pair of straight lines for all real values of ‘a’.

12. The combined equation of pair of straight lines passsing through origin and perpendicular to $3x^2 + xy - 2y^2 = 0$ is given by
$-2x^2 - xy + 3y^2 = 0$
i.e. $2x^2 + xy - 3y^2 = 0$
Since the required lines pass through (2, –3)

$\therefore$ By shifting the origin to (2, –3), we get
$2(x-2)^2 + (x-2)(y+3) - 3(y+3)^2 = 0$
$\Rightarrow 2x^2 + xy - 3y^2 - 5x - 20y - 25 = 0$

13. Separate equation of lines represented by
$3x^2 - 8xy + 5y^2 = 0$ are
$x - y = 0$ and
$3x - 5y = 0$
Line perpendicular to $x - y = 0$ i.e. $y = x$ and passing through (1, 2) is
$(y - 2) = -1(x - 1)$
i.e. $x + y - 3 = 0$ ....(i)
Line perpendicular to $3x - 5y = 0$
i.e. $y = \frac{3}{5}x$ and passing through (1, 2) is

$(y - 2) = \frac{-5}{3}(x-1)$

i.e. $5x + 3y - 11 = 0$ ....(ii)

$\therefore$ combined equation is
$(x + y - 3)(5x + 3y - 11) = 0$

14. Slope of the line $4x + 3y = 0$ is $m = -\frac{4}{3}$

$kx^2 - 5xy - 6y^2 = 0$
$\Rightarrow -6m^2 - 5m + k = 0$

$\Rightarrow -6\left(-\frac{4}{3}\right)^2 - 5\left(-\frac{4}{3}\right) + k = 0$

$\Rightarrow k - \frac{32}{3} + \frac{20}{3} = 0$

$\Rightarrow k = \frac{12}{3} \Rightarrow k = 4$

15. Let $y = mx$ be a line common to the given pair of lines,
It satisfies the given equations

$\therefore$ $am^2 + 2m + 1 = 0$ and ....(i)
$m^2 + 2m + a = 0$ ....(ii)
On solving (i) and (ii), we get

$\frac{m^2}{2(1-a)} = \frac{m}{a^2-1} = \frac{1}{2(1-a)}$

$\therefore$ $m^2 = 1$ and $m = -\left(\frac{a+1}{2}\right)$

$\therefore$ $(a+1)^2 = 4 \Rightarrow a = 1$ or -3

But for a = 1 the two pair have both the lines common.
So a = –3 and the slope m of the line common to both the pairs is 1.
Now $x^2 + 2xy + ay^2 = x^2 + 2xy - 3y^2$
$= (x \quad y)(x + 3y)$
and $ax^2 + 2xy + y^2 = -3x^2 + 2xy + y^2$
$= -(x - y)(3x + y)$
Thus, required equation is $(x + 3y)(3x + y) = 0$
i.e., $3x^2 + 10xy + 3y^2 = 0$

16. The equation of given lines are
$ax^2 + 2hxy + by^2 = 0$ ….(i)
$a'x^2 + 2h'xy + b'y^2 = 0$ ….(ii)
Let the line common to both be $y = mx$.
It will satisfy both the above equations.
Hence, $a + 2mh + bm^2 = 0$ ….(iii)
and $a' + 2mh' + b'm^2 = 0$ ….(iv)
Now eliminating 'm' from the equations (iii) and (iv), we get
$$\frac{m^2}{2ha' - 2h'a} = \frac{-m}{ba' - b'a} = \frac{1}{2bh' - 2b'h}$$
$$\Rightarrow m^2 = \frac{ha' - h'a}{bh' - b'h} \quad ....(v)$$
$$\text{and } m^2 = \frac{(ab' - ba')^2}{4(bh' - b'h)^2} \quad ....(vi)$$
From (v) and (vi), we get the required condition.

17. Given equation of pair of lines
$x^2 - 2xy \tan A - y^2 = 0$
∴ a = 1, h = – tan A, b = –1

$\Rightarrow \tan A = -2$
$\Rightarrow \angle A = \tan^{-1}(-2)$

18. Given equation of pair of lines is
$ax^2 + 2hxy + by^2 = 0$
Given that $m_1 = 5m_2$
∴ $m_1 + m_2 = 5m_2 + m_2 = \dfrac{-2h}{b}$
$$\Rightarrow m_2 = \frac{-h}{3b} \Rightarrow m_2^2 = \frac{h^2}{9b^2} \quad ....(i)$$
$$m_1m_2 = (5m_2)m_2 = \frac{a}{b}$$
∴ $m_2^2 = \dfrac{a}{5b}$ ....(ii)
∴ From (i) and (ii), we get
$5h^2 = 9ab$

19. Let the gradient of one line be m.
∴ the gradient of second line is 2m
We know,
$$m + 2m = \frac{-2h}{b}$$
∴ $3m = \dfrac{-2h}{b} \Rightarrow m = \dfrac{-2h}{3b}$ ….(i)
Also, $m \times 2m = \dfrac{a}{b} \Rightarrow 2m^2 = \dfrac{a}{b}$ ….(ii)
∴ from (i) and (ii), we get
$$2\left(\frac{-2h}{3b}\right)^2 = \frac{a}{b} \Rightarrow \frac{8h^2}{9b^2} = \frac{a}{b} \Rightarrow ab = \frac{8h^2}{9}$$

20. Given equation of pair of lines is
$ax^2 + 2hxy + by^2 = 0$
given that $m_2 = \lambda m_1$
Now, $m_1 + m_2 = m_1 + \lambda m_1 = \dfrac{-2h}{b}$
$$\Rightarrow m_1 = \frac{-2h}{b(1+\lambda)} \quad ....(i)$$
$$m_1.m_2 = m_1.\lambda m_1 = \frac{a}{b} \Rightarrow m_1 = \sqrt{\frac{a}{b\lambda}} \quad ….(ii)$$
∴ from (i) and (ii), we get
$$\sqrt{\frac{a}{b\lambda}} = \frac{-2h}{b(1+\lambda)}$$
Squaring both sides, we get
$4\lambda h^2 = ab(1 + \lambda)^2$

21. Given equation of pair of lines is
$ax^2 + 2hxy + by^2 = 0$
Given that, $m_1 = m_2^2$
$$m_1 m_2 = m_2^2 m_2 = \frac{a}{b}$$
∴ $m_2 = \left(\dfrac{a}{b}\right)^{\frac{1}{3}}$
Also, $m_1 + m_2 = m_2^2 + m_2 = \dfrac{-2h}{b}$
∴ $$\left\{\left(\frac{a}{b}\right)^{\frac{1}{3}}\right\}^2 + \left(\frac{a}{b}\right)^{\frac{1}{3}} = \frac{-2h}{b}$$
Cubing both sides, we get
$$\left(\frac{a}{b}\right)^2 + \frac{a}{b} + 3\left(\frac{a}{b}\right)^{\frac{2}{3}}.\left(\frac{a}{b}\right)^{\frac{1}{3}}.\left\{\left(\frac{a}{b}\right)^{\frac{2}{3}} + \left(\frac{a}{b}\right)^{\frac{1}{3}}\right\} = \frac{-8h^3}{b^3}$$

$\therefore \quad \left(\frac{a}{b}\right)^2 + \frac{a}{b} - \frac{6ah}{b^2} = \frac{-8h^3}{b^3}$

$\ldots.\left\{\because \left(\frac{a}{b}\right)^{\frac{1}{3}} + \left(\frac{a}{b}\right)^{\frac{2}{3}} = \frac{-2h}{b}\right\}$

$\therefore \quad ab(a + b) - 6abh + 8h^3 = 0$

22. Given equation of pair of lines is
$2x^2 - 5xy + 3y^2 = 0$

$\therefore \quad a = 2, h = \frac{-5}{2}, b = 3$

$\therefore \quad m_1 + m_2 = \frac{5}{6}$ and $m_1.m_2 = \frac{2}{3}$ ....(i)

Slopes of lines $= \frac{1}{m_1}$ and $\frac{1}{m_2}$

$\therefore$ Required equation of pair of lines is

$y^2 - \left(\frac{1}{m_1} + \frac{1}{m_2}\right)xy + \frac{1}{m_1m_2}x^2 = 0$

$\Rightarrow y^2 - \left(\frac{m_1 + m_2}{m_1m_2}\right)xy + \frac{1}{m_1m_2}x^2 = 0$

$\Rightarrow y^2 - \left(\frac{\frac{5}{6}}{\frac{2}{3}}\right)xy + \frac{1}{\left(\frac{2}{3}\right)}x^2 = 0$

$\Rightarrow 2y^2 - 5xy + 3x^2 = 0$

23. Let the angle made by one of the lines with X-axis = θ

$\therefore$ The angle made by other line with Y-axis = θ

$\therefore \quad m_1 = \tan\theta$,
$m_2 = \tan(90° - \theta) = \cot\theta$

$\therefore \quad m_1m_2 = \frac{a}{b} = 1$

$\Rightarrow \frac{a}{b} = 1 \Rightarrow a = b$

24. Given equation of pair of lines is
$x^2(\sec^2\theta - \sin^2\theta) - 2xy\tan\theta + y^2\sin^2\theta = 0$

$\therefore \quad a = \sec^2\theta - \sin^2\theta,\ h = -\tan\theta,\ b = \sin^2\theta$

Now, $m_1 + m_2 = \frac{2\tan\theta}{\sin^2\theta}$,

$m_1m_2 = \frac{\sec^2\theta - \sin^2\theta}{\sin^2\theta}$

$\therefore \quad m_1 - m_2 = \sqrt{(m_1 + m_2)^2 - 4m_1m_2}$

$= \sqrt{\left(\frac{2\tan\theta}{\sin^2\theta}\right)^2 - 4\left(\frac{\sec^2\theta - \sin^2\theta}{\sin^2\theta}\right)}$

$= \sqrt{\frac{4\tan^2\theta}{\sin^4\theta} - 4(\sec^2\theta\,\text{cosec}^2\theta - 1)}$

$= \sqrt{4\sec^2\theta\,\text{cosec}^2\theta - 4\sec^2\theta\,\text{cosec}^2\theta + 4}$

$= 2$

25. Given equation of pair of lines
$(\tan^2\alpha + \cos^2\alpha)x^2 - 2xy\tan\alpha + \sin^2\alpha\, y^2 = 0$
$a = \tan^2\alpha + \cos^2\alpha,\ h = -\tan\alpha,\ b = \sin^2\alpha$
If θ_1 and θ_2 are the angles made by lines with X-axis, then $\tan\theta_1 = m_1$ and $\tan\theta_2 = m_2$

Now, $m_1 + m_2 = \frac{2\tan\alpha}{\sin^2\alpha} = 2\sec\alpha\,\text{cosec}\,\alpha$

$m_1m_2 = \frac{\tan^2\alpha + \cos^2\alpha}{\sin^2\alpha} = \sec^2\alpha + \cot^2\alpha$

$\therefore \quad m_1 - m_2 = \sqrt{4\sec^2 a\,\text{cosec}^2 a - 4(\sec^2 a + \cot^2 a)}$

$= \sqrt{4\sec^2 a\,(\text{cosec}^2 a - 1) - 4\cot^2 a}$

$= \sqrt{4\cot^2 a\,(\sec^2 a - 1)}$

$= \sqrt{4\cot^2\alpha\tan^2\alpha}$

$= 2$

26. The equation of one of the lines passing through origin is $y = mx$.
The line makes an angle α with the line $y = x$

$\therefore \quad \tan\alpha = \pm\left\{\frac{m_1 - m_2}{1 + m_1m_2}\right\} = \pm\frac{(m-1)}{1+m}$

$\Rightarrow (1 + m)^2\tan^2\alpha = (m - 1)^2$

$\Rightarrow m^2 - 2m\left\{\frac{1+\tan^2\alpha}{1-\tan^2\alpha}\right\} + 1 = 0$

$\Rightarrow m^2 - 2m\sec 2\alpha + 1 = 0$

$\ldots.\left\{\because \frac{1+\tan^2\alpha}{1-\tan^2\alpha} = \sec 2\alpha\right\}$

But $m = \frac{y}{x}$

On eliminating m we get
$y^2 - 2xy\sec 2\alpha + x^2 = 0$.

27. Let the equation of one of the line which bisects the angle between the co-ordinate axes be $y = x$

$\therefore \quad m_1 = \tan 45^\circ = 1$

Let m_2 be the slope of the other line.

Now, $m_1m_2 = \frac{a}{b}$

Since $m_1 = 1$, we get $m_2 = \frac{a}{b}$;

Also, $m_1 + m_2 = \frac{-2h}{b}$

$\Rightarrow 1 + \frac{a}{b} = \frac{-2h}{b}$

$\Rightarrow a + b = -2h$

28. Let the equation of one of the lines be $y = x$

$\therefore$ $m_1 = \tan 45° = 1$

Now, $m_1m_2 = \frac{a}{c}$

Since $m_1 = 1$, we get $m_2 = \frac{a}{c}$

Also, $m_1 + m_2 = \frac{-b}{c}$

$\therefore$ $1 + \frac{a}{c} = \frac{-b}{c}$

$\Rightarrow \frac{a+b+c}{c} = 0$

$\Rightarrow a + b + c = 0$

29. Let the equation of one of the angle bisector of co-ordinate axes be $x + y = 0 \Rightarrow m_1 = -1$

Now, $m_1m_2 = \frac{a}{b}$

$\Rightarrow m_2 = -\frac{a}{b}$

Also, $m_1 + m_2 = \frac{-2h}{b}$

$\Rightarrow -1 - \frac{a}{b} = \frac{-2h}{b} \Rightarrow (a + b)^2 = 4h^2$

30. The line makes angles α and β with X-axis

$\Rightarrow \cot \alpha = \frac{1}{m_1}$ and $\cot \beta = \frac{1}{m_2}$

Given equation of pair of lines is

$2x^2 - 3xy + y^2 = 0$

$\therefore$ $a = 2, h = \frac{-3}{2}, b = 1$

Now, $m_1 + m_2 = 3$ and $m_1m_2 = 2$

$\therefore$ $\cot^2 \alpha + \cot^2 \beta = \frac{1}{m_1^2} + \frac{1}{m_2^2} = \frac{m_1^2 + m_2^2}{(m_1m_2)^2}$

$= \frac{(m_1 + m_2)^2 - 2m_1m_2}{(m_1m_2)^2}$

$= \frac{(3)^2 - 2(2)}{(2)^2} = \frac{5}{4}$

31. Given equation of pair of lines is

$ax^2 - bxy - y^2 = 0$

$\therefore$ $A = a, H = \frac{-b}{2}, B = -1$

Since lines make angles α and β with X-axis,

$\therefore$ $m_1 = \tan\alpha$ and $m_2 = \tan\beta$

Now, $m_1 + m_2 = \frac{b}{-1} \Rightarrow \tan \alpha + \tan \beta = -b$

and $m_1m_2 = \frac{a}{-1} \Rightarrow \tan \alpha \tan \beta = -a$

We know, $\tan (\alpha + \beta) = \frac{\tan\alpha + \tan\beta}{1 - \tan\alpha\tan\beta}$

$= \frac{-b}{1-(-a)} = \frac{-b}{1+a}$

32. Given equation of pair of lines is

$ax^2 + 2hxy + by^2 = 0$

$\tan \theta = \left(\frac{2\sqrt{H^2 - AB}}{A + B}\right)$

$= \left(\frac{\sqrt{4h^2 - 4ab}}{a+b}\right)$

$= \left(\frac{\sqrt{3a^2 + 3b^2 + 10ab - 4ab}}{a+b}\right)$

....$[\because 3a^2 + 3b^2 + 10ab = 4h^2]$

$\therefore$ $\tan \theta = \left(\frac{\sqrt{3(a+b)^2}}{a+b}\right)$

$\Rightarrow \theta = \tan^{-1}\left(\sqrt{3}\right)$

$= 60°$

33. Given equation of pair of lines is

$x^2 - 2pxy + y^2 = 0$

$\therefore$ $a = 1, h = -p, b = 1$

$\therefore$ $\tan \theta = \left|\frac{2\sqrt{h^2 - ab}}{a+b}\right|$

$\Rightarrow \tan \theta = \frac{\pm 2\sqrt{p^2 - 1}}{1+1} = \pm\sqrt{p^2 - 1}$

$\Rightarrow \tan^2\theta = p^2 - 1$

$\Rightarrow \sec^2\theta - 1 = p^2 - 1$

$\Rightarrow \theta = \sec^{-1} p$

34. Given equation of pair of lines is
$(x^2 + y^2) \sin\theta + 2xy = 0$

$\therefore$ $a = b = \sin\theta$, $h = 1$

$\therefore$ $\tan\theta = \left(\dfrac{2\sqrt{1-\sin^2\theta}}{2\sin\theta}\right)$

$\Rightarrow \theta = \tan^{-1}\left(\dfrac{\cos\theta}{\sin\theta}\right) = \tan^{-1}(\cot\theta)$

$\Rightarrow \theta = \tan^{-1}\left\{\tan\left(\dfrac{\pi}{2}-\theta\right)\right\} = \dfrac{\pi}{2} - \theta$

$\therefore$ $\tan 45° = \left|\dfrac{2\sqrt{\frac{1}{4} - ab}}{a+b}\right|$

$\Rightarrow (a + b)^2 = (1 - 4ab)$

$\Rightarrow a^2 + b^2 + 6ab - 1 = 0$

The above equation is satisfied by
$a = 1$ and $b = -6$

$\therefore$ $a = -\tan^2 A$, $h = \dfrac{k}{2}$, $b = 1$

$\therefore$ $\tan 2A = \left|\dfrac{2\sqrt{h^2 - ab}}{a+b}\right|$

$\tan 2A = \dfrac{2\sqrt{\frac{k^2}{4} + \tan^2 A}}{1 - \tan^2 A}$

$\Rightarrow \dfrac{2\tan A}{1-\tan^2 A} = \dfrac{2\sqrt{\frac{k^2}{4} + \tan^2 A}}{1-\tan^2 A}$

$\Rightarrow \dfrac{k^2}{4} + \tan^2 A = \tan^2 A \Rightarrow k = 0$

37. Here, $a_1 = a$, $h_1 = h$, $b_1 = b$,

$a_2 = 2$, $h_2 = \dfrac{-5}{2}$, $b_2 = 3$

Given that $\theta_1 = \theta_2$

$\Rightarrow \tan\theta_1 = \tan\theta_2$

$\Rightarrow \left|\dfrac{2\sqrt{h^2 - ab}}{a+b}\right| = \left|\dfrac{2\sqrt{\frac{25}{4} - 6}}{5}\right|$

$\Rightarrow \left|\dfrac{2\sqrt{h^2 - ab}}{a+b}\right| = \left|\dfrac{1}{5}\right|$

Squaring both sides, we get

$4 \times 25(h^2 - ab) = (a + b)^2$

$100(h^2 - ab) = (a + b)^2$

Comparing with given condition,

$a_1 = 3$, $h_1 = \dfrac{-7}{2}$, $b_1 = 4$

$a_2 = 6$, $h_2 = \dfrac{-5}{2}$, $b_2 = 1$

If θ_1 and θ_2 are acute angles between the two pairs of lines, then

$\tan\theta_1 = \left(\dfrac{2\sqrt{\frac{49}{4} - 12}}{3+4}\right) = \dfrac{1}{7}$

$\Rightarrow \theta_1 = \tan^{-1}\left(\dfrac{1}{7}\right)$

$\tan\theta_2 = \left(\dfrac{2\sqrt{\frac{25}{4} - 6}}{6+1}\right) = \left(\dfrac{1}{7}\right)$

Since the lines are perpendicular

$\therefore$ $A + B = 0$

$\Rightarrow 3a + (a^2 - 2) = 0$

$\Rightarrow a^2 + 3a - 2 = 0$

[Since the points (x_1, y_1) and (x_2, y_2) lie on the lines AB and AC respectively]
On solving, we get the co-ordinates of B and C.

$\therefore$ $B \equiv \left(\frac{18}{5}, \frac{3}{5}\right)$ and $C \equiv \left(\frac{-3}{5}, \frac{-3}{5}\right)$

Hence, the equation of third side i.e., BC is

$$\frac{y - \frac{3}{5}}{x - \frac{18}{5}} = \frac{\frac{-3}{5} - \frac{3}{5}}{\frac{-3}{5} - \frac{18}{5}}$$

$\Rightarrow 2x - 7y - 3 = 0.$

58. The given pair of lines can be separated as:
$L_1 = (\ \ + \sqrt{3}\,m)x + (m - \sqrt{3}\ \ )y = 0$
$L_2 = (\ \ - \sqrt{3}\,m)x + (m + \sqrt{3}\ \ )y = 0$
and $L_3 = \ \ x + my + n = 0$

$\therefore$ The slopes S_1, S_2 and S_3 of the three lines respectively are,

$$S_1 = \frac{-(\ \ + \sqrt{3}m)}{(m - \sqrt{3}\ \ )},\ S_2 = \frac{-(\ \ - \sqrt{3}m)}{(m + \sqrt{3}\ \ )},\ S_3 = \frac{-\ \ }{m}$$

Angle between L_1 and L_3 is

$$\theta_{13} = \tan^{-1}\left|\frac{S_1 - S_3}{1 + S_1S_3}\right|$$

$$= \tan^{-1}\left|\frac{-\left(\frac{\ \ + \sqrt{3}m}{m - \sqrt{3}\ \ }\right) + \frac{\ \ }{m}}{1 + \left(\frac{\ \ + \sqrt{3}m}{m - \sqrt{3}\ \ }\right)\left(\frac{\ \ }{m}\right)}\right|$$

$$= \tan^{-1}\left|\frac{-\sqrt{3}m^2 - \sqrt{3}\ \ ^2}{\ \ ^2 + m^2}\right| = \tan^{-1}\left(\sqrt{3}\right) = 60^\circ$$

Angle between L_2 and L_3 is

$$\theta_{23} = \tan^{-1}\left|\frac{S_2 - S_3}{1 + S_2S_3}\right| = \tan^{-1}\left|\frac{-\left(\frac{\ \ - \sqrt{3}m}{m + \sqrt{3}\ \ }\right) + \frac{\ \ }{m}}{1 + \left(\frac{\ \ - \sqrt{3}m}{m + \sqrt{3}\ \ }\right)\left(\frac{\ \ }{m}\right)}\right|$$

$$= \tan^{-1}\left|\frac{\sqrt{3}m^2 + \sqrt{3}\ \ ^2}{m^2 + \ \ ^2}\right| = \tan^{-1}(\sqrt{3}) = 60^\circ$$

$\therefore$ Angle between the lines L_1 and $L_2 = 60^\circ$
Hence, the triangle is equilateral.

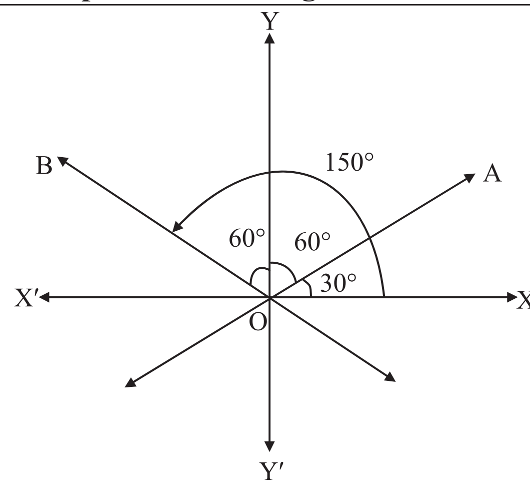
2.



Let OA and OB be the required lines.

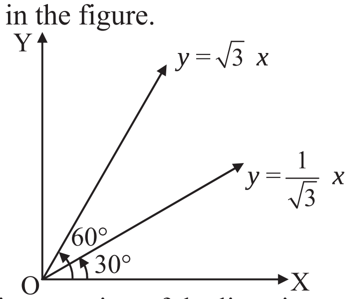
$\therefore$ angles made by OA and OB with X-axis are 30° and 150° respectively.

$\therefore$ their equations are $y = \frac{1}{\sqrt{3}}x$ and $y = -\frac{1}{\sqrt{3}}x$

i.e., $x - \sqrt{3}y = 0$ and $x + \sqrt{3}y = 0$

$\therefore$ The joint equations of the lines is
$\left(x - \sqrt{3}y\right)\left(x + \sqrt{3}y\right) = 0 \Rightarrow x^2 - 3y^2 = 0$

3. The lines trisecting the first quadrant are as shown in the figure.



$\therefore$ The joint equation of the lines is

$$\left(y - \frac{1}{\sqrt{3}}x\right)\left(y - \sqrt{3}x\right) = 0$$

$$\Rightarrow \left(\sqrt{3}y - x\right)\left(y - \sqrt{3}x\right) = 0$$

$$\Rightarrow \sqrt{3}x^2 - 4xy + \sqrt{3}y^2 = 0$$

4. 
The equations of bisectors are,

$y - 3 = (1)(x - 5)$ and $y - 3 = (-1)(x - 5)$

$\Rightarrow x - y - 2 = 0$ and $x + y - 8 = 0$

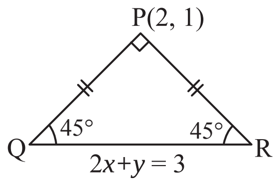
∴ The joint equation of the bisectors is

$(x - y - 2)(x + y - 8) = 0$

$\Rightarrow x^2 - y^2 - 10x + 6y + 16 = 0$

5. Slope of QR = –2.

Slope of PQ = m_1



∴ $\tan 45° = \left|\frac{m_1 + 2}{1 + m_1(-2)}\right|$

$\Rightarrow 1 = \left|\frac{m_1 + 2}{1 - 2m_1}\right|$

$\Rightarrow m_1 = -\frac{1}{3}$

∴ Equation of PQ passing through point P (2, 1) and having slope m_1 is

$y - 1 = -\frac{1}{3}(x - 2)$

$\Rightarrow 3(y - 1) + (x - 2) = 0$ ….(i)

Slope of PR = $m_2 = 3$ …. [∵ PQ ⊥ PR]

∴ equation of PR is

$y - 1 = 3(x - 2)$

$\Rightarrow (y - 1) - 3(x - 2) = 0$ ….(ii)

∴ The joint equation of the lines is

$[3(y - 1) + (x - 2)][(y - 1) - 3(x - 2)] = 0$

$\Rightarrow 3(y - 1)^2 - 8(y - 1)(x - 2) - 3(x - 2)^2 = 0$

$\Rightarrow 3(x^2 - 4x + 4) + 8(xy - x - 2y + 2) - 3(y^2 - 2y + 1) = 0$

$\Rightarrow 3x^2 - 3y^2 + 8xy - 20x - 10y + 25 = 0$

6. $x^2 - 7xy + 12y^2 = 0$

$\Rightarrow (x - 3y)(x - 4y) = 0$

Hence, the lines are intersecting and non-perpendicular.

7. $\sqrt{(x-2)^2 + y^2} + \sqrt{(x+2)^2 + y^2} = 4$

i.e. $\sqrt{(x-2)^2 + y^2} = 4 - \sqrt{(x+2)^2 + y^2}$

Squaring both sides, we get

$(x - 2)^2 + y^2 = 16 - 8\sqrt{(x+2)^2 + y^2} + (x + 2)^2 + y^2$

$\Rightarrow x^2 - 4x + 4 + y^2 = 16 + x^2 + 4x + 4 + y^2 - 8\sqrt{(x+2)^2 + y^2}$

$\Rightarrow x + 2 = \sqrt{(x+2)^2 + y^2}$

Again squaring both sides, we get

$(x + 2)^2 = (x + 2)^2 + y^2$

$\Rightarrow y^2 = 0$

This is an equation of pair of two coincident straight lines.

8. The required lines are parallel to $x^2 - 4xy + 3y^2 = 0$, which pass through (3, –2).

∴ the combined equation of lines is

$(x - 3)^2 - 4(x - 3)(y + 2) + 3(y + 2)^2 = 0$

$\Rightarrow x^2 - 6x + 9 - 4(xy + 2x - 3y - 6) + 3(y^2 + 4y + 4) = 0$

$\Rightarrow x^2 - 6x + 9 - 4xy - 8x + 12y + 24 + 3y^2 + 12y + 12 = 0$

$\Rightarrow x^2 - 4xy + 3y^2 - 14x + 24y + 45 = 0$

9. The required equation is $-2x^2 - 3xy + 5y^2 = 0$

i.e., $2x^2 + 3xy - 5y^2 = 0$

10. Given equation of pair of lines is

$4xy + 2x + 6y + 3 = 0$

$\Rightarrow 2x(2y + 1) + 3(2y + 1) = 0$

$\Rightarrow (2y + 1)(2x + 3) = 0$

∴ Separate equations of lines are $2x + 3 = 0$ and $2y + 1 = 0$

i.e. $x = \frac{-3}{2}$ and $y = \frac{-1}{2}$

The equation of line passing through (2, 1) and perpendicular to $x = \frac{-3}{2}$ is $y = 1$ i.e. $y - 1 = 0$

The equation of line passing through (2, 1) and perpendicular to $y = \frac{-1}{2}$ is $x = 2$ i.e. $x - 2 = 0$

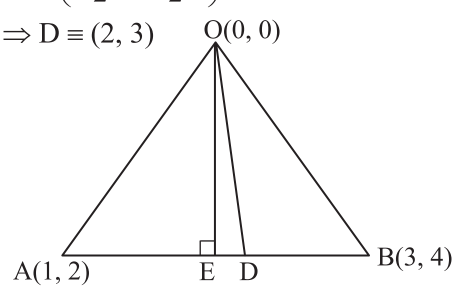
∴ Combined equation of pair of lines is $(x - 2)(y - 1) = 0$

$\Rightarrow xy - x - 2y + 2 = 0$

11. OD is the median

∴ $D \equiv \left(\frac{1+3}{2}, \frac{2+4}{2}\right)$

$\Rightarrow D \equiv (2, 3)$



Equation of OD is $y = mx$

$\Rightarrow y = \frac{3}{2}x \Rightarrow 3x - 2y = 0$

Slope of line AB = $\frac{2}{2} = 1$

Given, OE ⊥ AB

∴ Slope of OE = –1

Equation of OE is $y = mx$

$\Rightarrow y = -x \Rightarrow x + y = 0$

∴ Joint equation of median and altitude is

$(3x - 2y)(x + y) = 0$

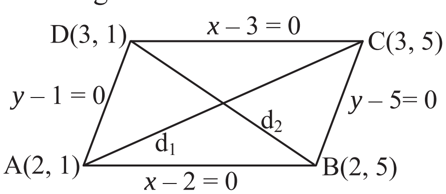
$\Rightarrow 3x^2 + xy - 2y^2 = 0$

12. We have, $x^2 - 5x + 6 = 0$ and $y^2 - 6y + 5 = 0$

$\Rightarrow (x - 3)(x - 2) = 0$ and $(y - 1)(y - 5) = 0$

∴ One pair of opposite sides of parallelogram is $x - 3 = 0$ and $x - 2 = 0$ and the other pair is $y - 1 = 0$ and $y - 5 = 0$

∴ The vertices of the parallelogram are as shown in the figure below.



∴ equation of diagonal d_1 is

$y - 1 = \frac{5-1}{3-2}(x-2)$

$\Rightarrow y - 1 = 4(x - 2) \Rightarrow y = 4x - 7$

and equation of diagonal d_2 is

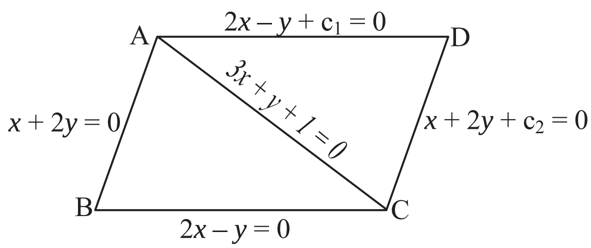
$y - 1 = \frac{5-1}{2-3}(x-3)$

$\Rightarrow y - 1 = -4(x - 3) \Rightarrow 4x + y = 13$

∴ the equations are $4x + y = 13$ and $y = 4x - 7$.

13. $2x^2 + 3xy - 2y^2 = 0$

$\Rightarrow x + 2y = 0$ and $2x - y = 0$



From the figure,

$A\left(\frac{-2}{5}, \frac{1}{5}\right)$, B(0, 0), $C\left(\frac{-1}{5}, \frac{-2}{5}\right)$

Now, equation of side AD is

$2x - y + c_1 = 0$

Substituting $x = \frac{-2}{5}$, $y = \frac{1}{5}$ in above equation, we get

$c_1 = 1$

∴ equation of AD becomes $2x - y + 1 = 0$

Similarly equation of side DC is $x + 2y + c_2 = 0$

i.e., $x + 2y + 1 = 0$

∴ $D\left(\frac{-3}{5}, \frac{-1}{5}\right)$

Now, equation of diagonal BD is

$y - 0 = \frac{0 + \frac{1}{5}}{0 + \frac{3}{5}}(x - 0)$

$\Rightarrow \frac{3}{5}y = \frac{1}{5}x$

$\Rightarrow x - 3y = 0$

14. Substituting the value of y in the equation $ax^2 + 2hxy + by^2 = 0$.

$\Rightarrow ax^2 + 2hx(mx) + b(mx)^2 = 0$

$\Rightarrow a + 2hm + bm^2 = 0$

15. One of the lines is $3x + 4y = 0$

i.e., $\frac{y}{x} = -\frac{3}{4}$

$\Rightarrow 4c\left(\frac{y}{x}\right)^2 - \left(\frac{y}{x}\right) + 6 = 0$ ....(i)

Substituting value of $\frac{y}{x}$ in equation (i), we get

$4c\left(\frac{-3}{4}\right)^2 - \left(-\frac{3}{4}\right) + 6 = 0$

$\Rightarrow 4c \times \frac{9}{16} + \frac{3}{4} + 6 = 0$

$\Rightarrow \frac{9c}{4} + \frac{3 + 24}{4} = 0 \Rightarrow 9c + 27 = 0$

$\Rightarrow c = -3$

16. Given equation of pair of lines is

$kx^2 - 5xy - 3y^2 = 0$

$\Rightarrow k - 5\frac{y}{x} - 3\left(\frac{y}{x}\right)^2 = 0$

$\Rightarrow k - 5m - 3m^2 = 0$ ....(i)

Now, slope of line $x - 2y + 3 = 0$ is $m_1 = \frac{1}{2}$.

∴ slope of the line perpendicular to $x - 2y + 3 = 0$ is $m = -2$.

Substituting value of m in equation (i), we get

$k - 5(-2) - 3(-2)^2 = 0$

$\Rightarrow k = -10 + 12 \Rightarrow k = 2$

17. $6x^2 + xy - y^2 = 0$

let $a = \frac{1}{2}$
$\therefore$ equation $3x^2 - axy - y^2 = 0$ becomes
$3x^2 - \frac{1}{2}xy - y^2 = 0$

$\Rightarrow 2m_2 + m_2 = 6 \Rightarrow m_2 = 2 \Rightarrow m_1 = 4$
Now, $m_1m_2 = \frac{a}{1} = a$

$\therefore$ $a = k, b = 1, h = \frac{5}{2}$
$\therefore$ $m_1 + m_2 = \frac{-2h}{b} = -5$
$m_1m_2 = \frac{a}{b} = k$
Given that, $m_1 - m_2 = 1$
Now, $(m_1 - m_2)^2 = (m_1 + m_2)^2 - 4m_1m_2$
$\Rightarrow 1^2 = (-5)^2 - 4k \Rightarrow 4k = 24$
$\Rightarrow k = 6$

26. If the gradients of two lines are in ratio 1 : n.
then $\frac{h^2}{ab} = \frac{(n+1)^2}{4n} = \frac{(3+1)^2}{4.3} = \frac{4}{3}$
Alternate Method:
Gradients $\frac{m_1}{m_2} = 1 : 3$
$\Rightarrow m_1 = m, m_2 = 3m$

$m_1 + m_2 = -\frac{2h}{b} \Rightarrow m + 3m = -\frac{2h}{b}$

$\Rightarrow m = \frac{-h}{2b}$

$m_1.m_2 = \frac{a}{b} \Rightarrow m.3m = \frac{a}{b}$

$\Rightarrow 3m^2 = \frac{a}{b} \Rightarrow 3.\frac{h^2}{4b^2} = \frac{a}{b} \Rightarrow \frac{h^2}{ab} = \frac{4}{3}$

27. $m_1 : m_2 = 1 : 2$

$\therefore \frac{h^2}{ab} = \frac{(2+1)^2}{4(2)} = \frac{9}{8}$

$\Rightarrow \frac{ab}{h^2} = \frac{8}{9}$

28. Given equation of pair of lines is
$x^2 + 4xy + y^2 = 0$

$\therefore$ a = 1, h = 2, b = 1

$\therefore \tan\theta = \left|\frac{2\sqrt{h^2 - ab}}{a+b}\right| = \left|\frac{2\sqrt{(2)^2 - (1)(1)}}{1+1}\right| = \sqrt{3}$

$\Rightarrow \theta = \tan^{-1}\left(\sqrt{3}\right) = 60°$

29. Given equation of pair of lines is
$(x^2 + y^2)\sqrt{3} = 4xy$

$\therefore a = \sqrt{3}, h = -2, b = \sqrt{3}$

$\therefore \tan\theta = \left|\frac{2\sqrt{4-3}}{2\sqrt{3}}\right| = \frac{1}{\sqrt{3}}$

$\Rightarrow \theta = \tan^{-1}\left(\frac{1}{\sqrt{3}}\right) = \frac{\pi}{6}$

30. Given equation of pair of lines is
$x^2 + 4y^2 - 7xy = 0$

$\therefore a = 1, h = -\frac{7}{2}, b = 4$

$\therefore \tan\theta = \left|\frac{2\sqrt{\left(\frac{-7}{2}\right)^2 - (1)(4)}}{1+(4)}\right|$

$= \left|\frac{2\sqrt{\frac{49}{4} - 4}}{5}\right| = \frac{\sqrt{33}}{5}$

$\Rightarrow \theta = \tan^{-1}\left(\frac{\sqrt{33}}{5}\right)$

31. Given equation of pair of lines is
$4x^2 - 24xy + 11y^2 = 0$

$\therefore$ a = 4, h = – 12, b = 11

$\therefore \tan\theta = \pm 2\frac{\sqrt{h^2 - ab}}{a+b} = \pm 2\frac{\sqrt{144-44}}{15} = \pm\frac{4}{3}$

Let ϕ be the angle between the lines.

$\therefore \tan\phi = \left|\frac{2\sqrt{\sec^2\theta - 1}}{2}\right|$

$\Rightarrow \tan\phi = \tan\theta \Rightarrow \phi = \theta$

33. Let m_1 and m_2 be the slopes of the lines given by $x^2 + 4xy + y^2 = 0$

$\therefore m_1 + m_2 = -4 \Rightarrow m_2 = -4 - m_1$

and $m_1.m_2 = 1 \Rightarrow m_1(-4 - m_1) = 1$

$\Rightarrow m_1^2 + 4m_1 + 1 = 0$

$\therefore m_1, m_2 = -2 \pm \sqrt{3}$

Slope of line $x - y = 4$ is
$m_3 = 1$

$\therefore$ Angle between first two lines,

$\tan^{-1}\theta_{12} = \left|\frac{m_1 - m_2}{1 + m_1.m_2}\right| = \left|\frac{(-2+\sqrt{3}) - (-2-\sqrt{3})}{1 + (-2+\sqrt{3})(-2-\sqrt{3})}\right|$

$\Rightarrow \theta_{12} = \tan^{-1}\left(\sqrt{3}\right) = 60°$

Angle between second and third line

$\theta_{23} = \tan^{-1}\left(\frac{-2-\sqrt{3}-1}{1+(-2-\sqrt{3})1}\right) = \tan^{-1}\left(\sqrt{3}\right) = 60°$

Similarly, we have, $\theta_{31} = 60°$

$\therefore$ The triangle formed by the lines is equilateral triangle.

34. Let m_1 and m_2 be the slopes of the lines given by $23x^2 - 48xy + 3y^2 = 0$

$\therefore m_1 + m_2 = \frac{48}{3} = 16 \Rightarrow m_2 = 16 - m_1$

and $m_1m_2 = \frac{23}{3} \Rightarrow m_1(16 - m_1) = \frac{23}{3}$

$\Rightarrow -m_1^2 + 16m_1 - \frac{23}{3} = 0$

$\Rightarrow 3m_1^2 - 48m_1 + 23 = 0$

$\Rightarrow m_1, m_2 = \frac{24 \pm 13\sqrt{3}}{3}$

slope of line is $2x+3y+4=0$ is

$m_3 = \dfrac{-2}{3}$

∴ Angle between first two lines,

$$\tan^{-1}\theta_{12} = \left|\frac{m_1 - m_2}{1+m_1m_2}\right|$$

$$= \left|\frac{\left(\frac{24+13\sqrt{3}}{3}\right) - \left(\frac{24-13\sqrt{3}}{3}\right)}{1+\left(\frac{24+13\sqrt{3}}{3}\right)\left(\frac{24-13\sqrt{3}}{3}\right)}\right|$$

$$= \left|\frac{\frac{26\sqrt{3}}{3}}{\frac{9+576-507}{9}}\right| = \left|\frac{\frac{26\sqrt{3}}{3}}{\frac{78}{9}}\right|$$

∴ $\tan^{-1}\theta_{12} = \sqrt{3}$

$\Rightarrow \theta_{12} = \tan^{-1}\left(\sqrt{3}\right) = 60°$

Angle between second and third line

$$\theta_{23} = \tan^{-1}\left(\frac{\frac{24-13\sqrt{3}}{3} - \left(-\frac{2}{3}\right)}{1+\left(\frac{24-13\sqrt{3}}{3}\right)\left(-\frac{2}{3}\right)}\right)$$

$$= \tan^{-1}\left(\frac{\frac{26-13\sqrt{3}}{3}}{\frac{9-48+26\sqrt{3}}{9}}\right) = \tan^{-1}\left(\frac{\frac{26-13\sqrt{3}}{3}}{\frac{-39+26\sqrt{3}}{9}}\right)$$

$$= \tan^{-1}\left(\frac{26-13\sqrt{3}}{3} \times \frac{9}{-39+26\sqrt{3}}\right)$$

$$= \tan^{-1}\left(\frac{13\left(2-\sqrt{3}\right)\times 3}{13\sqrt{3}\left(2-\sqrt{3}\right)}\right)$$

$$= \tan^{-1}\left(\sqrt{3}\right) = 60°$$

Similarly, we have, $\theta_{31} = 60°$

∴ The triangle formed by the lines is equilateral triangle.

35. Given equation of pair of lines is
$4x^2 + 12xy + 9y^2 = 0$
$a = 4, h = 6, b = 9$
Here,
$h^2 - ab = (6)^2 - (4)(9) = 36 - 36 = 0$
Hence, the lines are real and coincident.

36. Given equation of pair of lines is

∴ $a = 1, h = \dfrac{k}{2}, b = 4$

The pair of lines are coincident if $h^2 - ab = 0$

$\Rightarrow h^2 = ab \Rightarrow \dfrac{k^2}{4} = 4(1)$

$\Rightarrow k = \pm 4$

37. Given equation of pair of lines is
$px^2 - qy^2 = 0$

∴ $a = p, b = -q, c = 0$

Since, the lines are real and distinct

∴ $h^2 - ab > 0$

$\Rightarrow 0 - p(-q) > 0$

$\Rightarrow pq > 0$

38. Given equation of pair of lines is
$y^2 \sin^2\theta - xy \sin^2\theta + x^2 (\cos^2\theta - 1) = 0$

∴ $a = \sin^2\theta, b = \cos^2\theta - 1 = -(1-\cos^2\theta)$
$= -\sin^2\theta$

Now, $a + b = \sin^2\theta - \sin^2\theta = 0$

∴ The lines are perpendicular.

∴ $\theta = \dfrac{\pi}{2}$

$= 0 + 0 - 0 - \left(\dfrac{1}{4}\right) + 0 = \dfrac{-1}{4} \neq 0$

∴ The equation does not represent a pair of straight lines.

40. Given equation of pair of lines is
$3x^2 + 7xy + 2y^2 + 5x + 5y + 2 = 0$

$a = 3, b = 2, c = 2, f = \dfrac{5}{2}, g = \dfrac{5}{2}, h = \dfrac{7}{2}$

Consider $abc + 2fgh - af^2 - bg^2 - ch^2$

$$= (3)(2)(2) + 2\left(\frac{5}{2}\right)\left(\frac{5}{2}\right)\left(\frac{7}{2}\right) - 3\left(\frac{5}{2}\right)^2 - 2\left(\frac{5}{2}\right)^2 - 2\left(\frac{7}{2}\right)^2 = 0$$

∴ the given equation represents a pair of straight lines.

41. Given equation of pair of lines is
$xy + a^2 = ax + ay$
i.e. $ax + ay - xy - a^2 = 0$

$\therefore$ $A = 0, B = 0, C = -a^2, F = \frac{a}{2}, G = \frac{a}{2}, H = -\frac{1}{2}$

Now, $ABC + 2FGH - AF^2 - BG^2 - CH^2$

$= 0 - 2\left(\frac{a}{2}\right)\left(\frac{a}{2}\right)\left(\frac{-1}{2}\right) - (a^2)\left(\frac{-1}{2}\right)^2 = 0$

$\therefore$ the given equation represents a pair of straight lines.

42. Given equation of pair of lines is
$ax^2 - y^2 + 4x - y = 0$

$\therefore$ $A = a, B = -1, C = 0, F = \frac{-1}{2}, G = 2, H = 0$

The given equation represents a pair of straight lines,

$\therefore$ $ABC + 2FGH - AF^2 - BG^2 - CH^2 = 0$

$\Rightarrow 0 - 0 - a\left(\frac{1}{4}\right) - (-1)(4) = 0$

$\Rightarrow -\frac{a}{4} + 4 = 0 \Rightarrow a = 16$

43. Given equation of pair of lines is
$kxy + 10x + 6y + 4 = 0$

$\therefore$ $a = b = 0, c = 4, f = 3, g = 5, h = \frac{k}{2}$

Now, $abc + 2fgh - af^2 - bg^2 - ch^2 = 0$

$\Rightarrow 0 + 2(3)(5)\left(\frac{k}{2}\right) - 0 - 0 - 4\left(\frac{k}{2}\right)^2 = 0$

$\Rightarrow 15k - k^2 = 0 \Rightarrow k(15 - k) = 0$

$\Rightarrow k = 0$ or $k = 15$

44. Given equation of pair of lines is
$x^2 + kxy + y^2 - 5x - 7y + 6 = 0$

$\therefore$ $a = 1, b = 1, c = 6, f = \frac{-7}{2}, g = \frac{-5}{2}, h = \frac{k}{2}$

Now, $abc + 2fgh - af^2 - bg^2 - ch^2 = 0$

$\Rightarrow (1)(1)(6) + 2\left(\frac{-7}{2}\right)\left(\frac{-5}{2}\right)\left(\frac{k}{2}\right) - 1\left(-\frac{7}{2}\right)^2 - 1\left(\frac{-5}{2}\right)^2 - 6\left(\frac{k}{2}\right)^2 = 0$

$\Rightarrow 6 + \frac{35k}{4} - \frac{49}{4} - \frac{25}{4} - \frac{6k^2}{4} = 0$

$\Rightarrow -6k^2 + 35k - 50 = 0$

$\Rightarrow (2k - 5)(3k - 10) = 0$

$\Rightarrow k = \frac{5}{2}$ or $k = \frac{10}{3}$

45. Given equation of pair of lines is
$x^2 - y^2 + x + 3y - 2 = 0$

$\therefore$ $a = 1, b = -1, g = \frac{1}{2}, f = \frac{3}{2}, c = -2$

$\therefore$ point of intersection of the lines is
$\left(\frac{hf - bg}{ab - h^2}, \frac{gh - af}{ab - h^2}\right) = \left(\frac{-1}{2}, \frac{3}{2}\right)$

46. Given equation of pair of lines is
$2x^2 - 10xy + 2\lambda y^2 + 5x - 16y - 3 = 0$

$\therefore$ $a = 2, b = 2\lambda, c = -3, f = -8, g = \frac{5}{2}, h = -5$

Since the equation represents pair of lines,

$\therefore$ $abc + 2fgh - af^2 - bg^2 - ch^2 = 0$

$\Rightarrow 2(2\lambda)(-3) + 2(-8)\left(\frac{5}{2}\right)(-5) - 2(64) - 2\lambda\left(\frac{25}{4}\right) + 3(25) = 0$

$\Rightarrow \frac{49\lambda}{2} = 147 \Rightarrow \lambda = 6$

$\therefore$ Point of intersection of the lines is
$\left(\frac{hf - bg}{ab - h^2}, \frac{gh - af}{ab - h^2}\right)$

$\equiv \left(\frac{(-5)(-8) - 2(6)\left(\frac{5}{2}\right)}{2(12) - (-5)^2}, \frac{\frac{5}{2}(-5) - 2(-8)}{2(12) - (-5)^2}\right)$

$\equiv \left(-10, \frac{-7}{2}\right)$

47. Given equation of pair of lines is
$2x^2 - 3xy - 2y^2 + 10x + 5y = 0$

$\therefore$ $a = 2. b = -2, c = 0, f = \frac{5}{2}, g = 5, h = \frac{-3}{2}$

$\therefore$ Point of intersection of the lines is
$\left(\frac{hf - bg}{ab - h^2}, \frac{gh - af}{ab - h^2}\right) \equiv (-1, 2)$

Slope of line joining origin and $(-1, 2)$ $m = -2$

Slope of $kx + y + 3 = 0$ is $-k$

Now, $(-k)(-2) = -1 \Rightarrow k = \frac{-1}{2}$

48. The line $5x + y - 1 = 0$ is coincides
$5x^2 + xy - kx - 2y + 2 = 0$

$\therefore$ $a = 5, b = 0, c = 2, f = -1, g = -\frac{k}{2}, h = \frac{1}{2}$

$m_1 + m_2 = \frac{-2h}{b}$

As b = 0, this case is not defined

Slope of line $5x + y - 1 = 0$ is $m = -5$

∴ Slope of another line must be infinite

∴ equation of another line is $x = k_1$

∴ Combine equation is $(5x + y - 1)(x - k_1) = 0$

$\Rightarrow 5x^2 - 5xk_1 + xy - yk_1 - x + k_1 = 0$

$\Rightarrow 5x^2 + xy - (5k_1 + 1)x - yk_1 + k_1 = 0$

Comparing this equation with the given equation, we get k = 11

49. Given equation of pair of lines is

$3x^2 + 7xy + 2y^2 + 5x + 5y + 2 = 0$

∴ $a = 3, b = 2, h = \frac{7}{2}$

$\tan\theta = \left|\frac{2\sqrt{h^2 - ab}}{a + b}\right| = \left|\frac{2\sqrt{\frac{49}{4} - 6}}{3+2}\right| = \left|\frac{2\sqrt{\frac{25}{4}}}{5}\right|$

$\Rightarrow \tan\theta = 1$

$\Rightarrow \theta = \tan^{-1}(1) = \frac{\pi}{4}$

50. Given equation of pair of lines is

$x^2 - xy - 6y^2 - 7x + 31y - 18 = 0$

∴ $a = 1, b = -6, h = -\frac{1}{2}$

∴ $\tan\theta = \left|\frac{2\sqrt{\left(\frac{-1}{2}\right)^2 - 1(-6)}}{1-6}\right| = \left|\frac{2\sqrt{\frac{1}{4} + 6}}{-5}\right| = |-1| = 1$

$\Rightarrow \theta = \tan^{-1}(1) = 45°$

51. Given equation of pair of lines is

$x^2 - 3xy + \lambda y^2 + 3x + 5y + 2 = 0$

∴ $a = 1, b = \lambda, h = -\frac{3}{2}$

$\theta = \tan^{-1} 3 \Rightarrow \tan\theta = 3$

∴ $\tan\theta = \left|\frac{2\sqrt{\left(-\frac{3}{2}\right)^2 - (1)\lambda}}{1+\lambda}\right|$

$\Rightarrow 3 = \left|\frac{2\sqrt{\frac{9-4\lambda}{4}}}{1+\lambda}\right| = \left|\frac{\sqrt{9-4\lambda}}{1+\lambda}\right|$

$\Rightarrow \frac{9-4\lambda}{(1+\lambda)^2} = 9$

$\Rightarrow 9 - 4\lambda = 9(1 + \lambda)^2$

$\Rightarrow 9\lambda^2 + 22\lambda = 0$

$\Rightarrow \lambda(9\lambda + 22) = 0$

$\Rightarrow \lambda = 0$ or $\lambda = -\frac{22}{9}$

But λ is non-negative

∴ $\lambda = 0$

52. Given equation of pair of lines is

$2x^2 + 5xy + 3y^2 + 6x + 7y + 4 = 0$

$a = 2, b = 3, h = \frac{5}{2}$

$\theta = \tan^{-1} m \Rightarrow \tan\theta = m$

$\tan\theta = \left|\frac{2\sqrt{\frac{25}{4} - 6}}{2+3}\right| \Rightarrow m = \frac{1}{5}$

53. Given equation of pair of lines is

$x^2 + y^2 - 2x - 1 = 0$ ….(i)

$x + y = 1$ intersects the above pair of lines

∴ It satisfies equation (i)

∴ $x^2 + y^2 - 2x(x + y) - (x + y)^2 = 0$

$\Rightarrow 2x^2 + 4xy = 0 \Rightarrow x^2 + 2xy = 0$

∴ $a = 1, b = 0, h = 1$

∴ $\tan\theta = \frac{2\sqrt{1^2 - 0}}{1}$

$\Rightarrow \theta = \tan^{-1}(2)$

54. The joint equation of the pair of straight lines joining the origin to the points of intersection of the line $x + my + n = 0$ and $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ is

$ax^2 + 2hxy + by^2 + 2g\left(\frac{x+my}{-n}\right)x$

$+ 2f\left(\frac{x+my}{-n}\right)y + c\left(\frac{x+my}{-n}\right)^2 = 0$

Here, = 2, m = 1, n = –1 and

a = 3, b = 0, c = 1, f = 0, g = –2, h = 2

∴ $3x^2 + 4xy - 4x(2x + y) + (2x + y)^2 = 0$

$\Rightarrow 3x^2 + 4xy - 8x^2 - 4xy + 4x^2 + y^2 + 4xy = 0$

$\Rightarrow x^2 - 4xy - y^2 = 0$

∴ $A = 1, B = -1, H = -2$

∴ $\tan\theta = \frac{2\sqrt{4+1}}{0} = \infty$

$\Rightarrow \theta = \frac{\pi}{2}$

55. Given, $ax^2 + 2hxy + by^2 = -2gx$

$a_1x^2 + 2h_1xy + b_1y^2 = -2g_1x$

∴ $\frac{ax^2 + 2hxy + by^2}{a_1x^2 + 2h_1xy + b_1y^2} = \frac{g}{g_1}$

We have,

$(ag_1 - a_1g)x^2 + 2(hg_1 - h_1g)xy + (bg_1 - b_1g)y^2 = 0$

∴ $A = (ag_1 - a_1g), B = (bg_1 - b_1g)$

The lines are perpendicular

∴ $A + B = 0$

$\Rightarrow (ag_1 - a_1g) + (bg_1 - b_1g) = 0$

$\Rightarrow (a + b)g_1 = (a_1 + b_1)g$

56. The equation of line is $y = 2\sqrt{2}\,x + c$

$\Rightarrow \left(\frac{y - 2\sqrt{2}x}{c}\right) = 1$ ....(i)

Given equation of circle is

$x^2 + y^2 = 2\,(1)^2$ ....(ii)

$\therefore$ from (i) and (ii), we get

$x^2 + y^2 = 2\left(\frac{y - 2\sqrt{2}x}{c}\right)^2$

$\Rightarrow c^2(x^2 + y^2) = 2(y^2 - 4\sqrt{2}\,xy + 8x^2)$

$\Rightarrow (c^2 - 16)x^2 + (c^2 - 2)y^2 + 8\sqrt{2}xy = 0$

The lines are perpendicular if A + B = 0.

$\therefore$ $c^2 - 16 + c^2 - 2 = 0$

$\Rightarrow 2c^2 - 18 = 0$ $\Rightarrow c^2 - 9 = 0$

57. Lines represented by the equation $2y^2 - xy - 6x^2 = 0$ are

$y = 2x$ and $y = -\frac{3}{2}x$

The co-ordinates of the vertices of the triangle formed by above lines with $x + y = 1$ are

$(0, 0)$, $\left(\frac{1}{3}, \frac{2}{3}\right)$ and $(-2, 3)$

The altitude from vertex (0, 0) on $x + y = 1$ is $y = x$. ....(i)

The altitude from vertex $\left(\frac{1}{3}, \frac{2}{3}\right)$ on $y = \frac{-3}{2}x$

is $y - \frac{2}{3} = \frac{2}{3}\left(x - \frac{1}{3}\right)$

$\Rightarrow 6x - 9y + 4 = 0$ ....(ii)

Solving (i) and (ii), we get

$x = \frac{4}{3}$ and $y = \frac{4}{3}$,

$\therefore$ Orthocentre is $\left(\frac{4}{3}, \frac{4}{3}\right)$

58. Given equations of pair of lines are

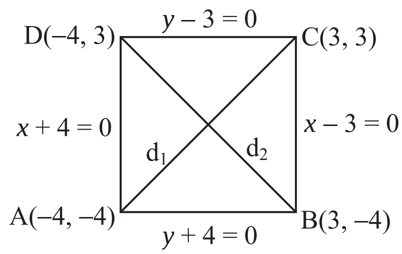
$xy + 4x - 3y - 12 = 0$ and

$xy - 3x + 4y - 12 = 0$

$\therefore$ $x(y + 4) - 3(y + 4) = 0$ and $x(y - 3) + 4(y - 3) = 0$

$\therefore$ $(y + 4)(x - 3) = 0$ and $(x + 4)(y - 3) = 0$

$\therefore$ The vertices of the square are as shown in the figure



Equation of diagonal d_1 is

$y + 4 = \frac{-4-3}{-4-3}(x + 4)$

$\Rightarrow y + 4 = x + 4$

$\Rightarrow x - y = 0$

and equation of diagonal d_2 is

$y + 4 = \frac{3+4}{-4-3}(x - 3)$

$\Rightarrow y + 4 = -1\,(x - 3)$

$\Rightarrow y + 4 = -x + 3$

$\Rightarrow x + y + 1 = 0$

$\therefore$ Combined equation of diagonals d_1 and d_2 is

$(x - y)(x + y + 1) = 0$

$\Rightarrow x^2 - y^2 + x - y = 0$

$\Rightarrow \frac{17}{4} = \frac{2\lambda+5}{\lambda+1} \Rightarrow \lambda = \frac{1}{3}$

16. If $A(\bar{a}), B(\bar{b}), C(\bar{c})$ are the vertices and $G(\bar{g})$ is the centroid of ΔABC, then

$\bar{g} = \frac{\bar{a}+\bar{b}+\bar{c}}{3}$

$\therefore$ $3\hat{i} + 2\hat{j} + n\hat{k} = \frac{(2\hat{i} + 3\hat{j} - 4\hat{k}) + (m\hat{i} + \hat{j} - \hat{k}) + (3\hat{i} + 2\hat{j} + 2\hat{k})}{3}$

$\Rightarrow 3(3\hat{i} + 2\hat{j} + n\hat{k}) = (5 + m)\hat{i} + 6\hat{j} + (-3)\hat{k}$

On comparing, we get

Since the points are collinear.

$\therefore$ $[\bar{p}\quad \bar{q}\quad \bar{r}] = 0$

$\Rightarrow \begin{vmatrix} 1 & -2 & 3 \\ 2 & m & -4 \\ 0 & -7 & 10 \end{vmatrix} = 0$

29. Let $\bar{a} = \hat{i} + 2\hat{j} + 3\hat{k}$, $\bar{b} = \lambda\hat{i} + 4\hat{j} + 7\hat{k}$, and $\bar{c} = -3\hat{i} - 2\hat{j} - 5\hat{k}$

Since the vectors are collinear,

$\therefore$ $\begin{vmatrix} 1 & 2 & 3 \\ \lambda & 4 & 7 \\ -3 & -2 & -5 \end{vmatrix} = 0$

$\Rightarrow -6 + 10\lambda - 42 - 6\lambda + 36 = 0$

$\Rightarrow \lambda = 3$

30. We know that,

$\therefore$ Vectors $\bar{a} - \bar{b}$, $\bar{b} - \bar{c}$ and $\bar{c} - \bar{a}$ are coplanar

31. Since, the vectors are coplanar,

$\therefore$ $\left[\bar{a}\ \ \bar{b}\ \ \bar{c}\right] = 0$

$\Rightarrow \begin{vmatrix} 1 & -1 & 1 \\ 1 & 2 & -1 \\ 3 & p & 5 \end{vmatrix} = 0$

$\Rightarrow 10 + p + 5 + 3 + p - 6 = 0$

$\Rightarrow p = -6$

32. Let $\bar{a} = \hat{i} + 3\hat{j} + 2\hat{k}$, $\bar{b} = 2\hat{i} - \hat{j} + 4\hat{k}$, and $\bar{c} = 3\hat{i} + 2\hat{j} + x\hat{k}$

Since the vectors are coplanar,

$\therefore$ $\begin{vmatrix} 1 & 3 & -2 \\ 2 & -1 & 4 \\ 3 & 2 & x \end{vmatrix} = 0$

$\Rightarrow -x - 8 - 6x + 36 - 14 = 0$

$\Rightarrow x = 2$

33. Let $\bar{a} = \hat{i} + \hat{j} + \hat{k}, \bar{b} = -\hat{i} + \hat{j}$ and $c = \hat{i} + 2\hat{j} + a\hat{k}$

Since $\bar{a}, \bar{b}$ and $\bar{c}$ are coplanar.

$\therefore$ $\begin{vmatrix} 1 & 1 & 1 \\ -1 & 1 & 0 \\ 1 & 2 & a \end{vmatrix} = 0$

$\Rightarrow 1(a - 0) - 1(-a - 0) + 1(-2 - 1) = 0$

$\Rightarrow 2a = 3 \Rightarrow a = \dfrac{3}{2}$

35. We have $[\bar{a}\ \ \bar{b}\ \ \bar{a} \times \bar{b}] = \bar{a} \cdot \left[\bar{b} \times (\bar{a} \times \bar{b})\right]$

41. A, B, C, D are vertices of tetrahedron.

$\therefore$ $\overline{AB}$, $\overline{AC}$ and $\overline{AD}$ are its edges.

Now, $\overline{AB} = -2\hat{i} - 2\hat{j} - 3\hat{k}$

$\overline{AC} = 4\hat{i} - 9\hat{k}$

$\overline{AD} = 6\hat{i} - 3\hat{j} - 3\hat{k}$

$= \dfrac{\bar{b}+\bar{c}}{2} - \bar{a} + \dfrac{\bar{a}+\bar{c}}{2} - \bar{b} + \dfrac{\bar{a}+\bar{b}}{2} - \bar{c} = 0$

Critical Thinking

1. Let $A(\bar{a}), B(\bar{b}), C(\bar{c})$ be the given points
$\bar{a} = 60\hat{i} + 3\hat{j},\ \bar{b} = 40\hat{i} - 8\hat{j},\ \bar{c} = a\hat{i} - 52\hat{j}$
$\therefore$ $\overline{AB} = k(\overline{BC})$
$\Rightarrow -20\hat{i} - 11\hat{j} = k\left[(a-40)\hat{i} - 44\hat{j}\right]$
On comparing, we get
$-11 = -44k \Rightarrow k = \dfrac{1}{4}$
and $-20 = \dfrac{1}{4}(a-40) \Rightarrow a = -40$

2. Let $\bar{a} = \hat{i} + 2\hat{k}$, $\bar{b} = \hat{j} + \hat{k}$ and $\bar{c} = \lambda\hat{i} + \mu\hat{j}$
$\therefore$ $\overline{AB} = m.\ \overline{BC}$
$\Rightarrow -\hat{i} + \hat{j} - \hat{k} = m[(\lambda\hat{i} + (\mu - 1)\hat{j} - \hat{k})]$
On comparing, we get
$-1 = -m \Rightarrow m = 1$,
$-1 = \lambda \cdot m \Rightarrow \lambda = -1$,
and $1 = m(\mu - 1) \Rightarrow \mu = 2$

3. Let $\bar{a} = -\hat{i} + 3\hat{j} + 2\hat{k}$, $\bar{b} = -4\hat{i} + 2\hat{j} - 2\hat{k}$ and $\bar{c} = 5\hat{i} + \lambda\hat{j} + \mu\hat{k}$
$\therefore$ $\overline{AB} = m.\overline{BC}$
$\Rightarrow -3\hat{i} - \hat{j} - 4\hat{k} = m\left[9\hat{i} + (\lambda - 2)\hat{j} + (\mu + 2)\hat{k}\right]$
On comparing, we get
$9m = -3 \Rightarrow m = \dfrac{-1}{3}$,
$-1 = m(\lambda - 2) \Rightarrow \lambda = 5$
and $-4 = m(\mu + 2) \Rightarrow \mu = 10$

4. Here $\bar{a} = \hat{i} + x\hat{j} + 3\hat{k}$, $\bar{b} = 3\hat{i} + 4\hat{j} + 7\hat{k}$, and $\bar{c} = y\hat{i} - 2\hat{j} - 5\hat{k}$
$\therefore$ $\overline{AB} = \lambda\overline{BC}$
$\Rightarrow 2\hat{i} + (4 - x)\hat{j} + 4\hat{k} = \lambda\left[(y-3)\hat{i} - 6\hat{j} - 12\hat{k}\right]$
On comparing, we get
$4 = -12\lambda \Rightarrow \lambda = \dfrac{-1}{3}$,
$4 - x = -6\lambda \Rightarrow x = 2$, and
$2 = \lambda(y - 3) \Rightarrow -6 = y - 3 \Rightarrow y = -3$

5. Here $\bar{a} = \hat{i} + \hat{j}$, $\bar{b} = \hat{i} - \hat{j}$, $\bar{c} = a\hat{i} + b\hat{j} + c\hat{k}$
The points are collinear
$\therefore$ $\overline{AB} = \lambda\overline{BC}$
$\Rightarrow -2\hat{j} = \lambda[(a - 1)\hat{i} + (b + 1)\hat{j} + c\hat{k}]$
On comparing, we get
$\lambda(a-1) = 0$, $\lambda(b+1) = -2$, $\lambda c = 0$
Hence a = 1, c = 0 and b is arbitrary scalar.

6. Let A, B, C be the three collinear point.
$\therefore$ $\overline{AB} = \lambda\overline{BC}$
Here, $\overline{AB} = -2b$, $\overline{BC} = (k + 1)\bar{b}$
$\therefore$ $\forall\ k \in R \Rightarrow \overline{AB} = \lambda\overline{BC}$

7. Since, $\bar{a} + 2\bar{b}$ is collinear with $\bar{c}$, and $\bar{b} + 3\bar{c}$ is collinear with $\bar{a}$.
$\therefore$ $\bar{a} + 2\bar{b} = x\bar{c}$ and $\bar{b} + 3\bar{c} = y\bar{a}$ $\forall\ x, y \in R$
$\therefore$ $\bar{a} + 2\bar{b} + 6\bar{c} = (x + 6)\bar{c}$
Also, $\bar{a} + 2\bar{b} + 6\bar{c} = \bar{a} + 2(\bar{b} + 3\bar{c}) = (1 + 2y)\bar{a}$
$\therefore$ $(x + 6)\bar{c} = (1 + 2y)\bar{a}$
Since, $\bar{a}$ and $\bar{c}$ are non-collinear.
$\therefore$ $x + 6 = 0$ and $1 + 2y = 0$
$\Rightarrow x = -6$ and $y = -\dfrac{1}{2}$
Now, $\bar{a} + 2\bar{b} = x\bar{c}$
$\Rightarrow \bar{a} + 2\bar{b} + 6\bar{c} = \bar{0}$

8. $\overline{AB} = \bar{a} + \bar{b}$
$\overline{BD} = 3\bar{a} + 3\bar{b} = 3\overline{AB}$
$\therefore$ Points A, B, D are collinear.

9. Let $\bar{R} = x\bar{a} + y\bar{b} + z\bar{c}$
$\Rightarrow \bar{R} = x(2\bar{p} + 3\bar{q} - \bar{r}) + y(\bar{p} - 2\bar{q} + 2\bar{r}) + z(-2\bar{p} + \bar{q} - 2\bar{r})$
$\Rightarrow 3\bar{p} - \bar{q} + 2\bar{r} = (2x + y - 2z)\bar{p} + (3x - 2y + z)\bar{q} + (-x + 2y - 2z)\bar{r}$
On comparing, we get
$2x + y - 2z = 3$, ...(i)
$3x - 2y + z = -1$, ...(ii)
$-x + 2y - 2z = 2$ ....(iii)
Solving above equations, we get
$x = 2, y = 5, z = 3$
$\therefore$ $\bar{R} = 2\bar{a} + 5\bar{b} + 3\bar{c}$

10. $\bar{a}+\bar{b}+\bar{c}+\bar{d} = (1+\lambda)\bar{d}$

Also, $\bar{a}+\bar{b}+\bar{c}+\bar{d} = (1+\mu)\bar{a}$

$\Rightarrow (1+\lambda)\bar{d} = (1+\mu)\bar{a}$

if $\lambda \neq -1$, then

$\bar{d} = \left(\frac{1+\mu}{1+\lambda}\right)\bar{a}$

Now, $\bar{a} + \bar{b} + \bar{c} + \bar{d} = (1+\mu)\bar{a}$

$\therefore$ $\bar{a} + \bar{b} + \bar{c} + \left(\frac{1+\mu}{1+\lambda}\right)\bar{a} = (1+\mu)\bar{a}$

$\Rightarrow \left[1+\left(\frac{1+\mu}{1+\lambda}\right)-(1+\mu)\right]\bar{a} + \bar{b} + \bar{c} = 0$

This contradicts the fact that $\bar{a}$, $\bar{b}$, $\bar{c}$ are non-coplanar

$\Rightarrow \lambda = -1$

$\therefore$ $\bar{a} + \bar{b} + \bar{c} + \bar{d} = \bar{0}$

11. The position vector of A is $6\bar{b} - 2\bar{a}$ and the position vector of P is $\bar{a} - \bar{b}$

Let the position vector of B be $\bar{r}$

Since, P divides AB in the ratio 1 : 2

$\therefore$ $\bar{a} - \bar{b} = \frac{1(\bar{r}) + 2(6\bar{b} - 2\bar{a})}{3}$

$\Rightarrow 3\bar{a} - 3\bar{b} - 12\bar{b} + 4\bar{a} = \bar{r}$

$\Rightarrow \bar{r} = 7\bar{a} - 15\bar{b}$

12. $2\bar{a} + 3\bar{b} - 5\bar{c} = 0$

$\Rightarrow 5\bar{c} = 2\bar{a} + 3\bar{b} \Rightarrow \bar{c} = \frac{3\bar{b}+2\bar{a}}{3+2}$

15. $2\bar{a} + \bar{b} = 3\bar{c}$

$\bar{r} = \frac{\bar{b}-2\bar{a}}{1-2}$

$= \frac{2\bar{p}-3\bar{q}}{-1}$ ….[From (i) and (ii)]

$\overline{AC} = -\hat{j} + \hat{k}$, and

$\overline{AD} = \hat{i} + \hat{j} - 2\hat{k}$

The points are coplanar.

$\therefore$ $\overline{AB}$, $\overline{AC}$ and $\overline{AD}$ are coplanar

$\left[\overline{AB}\ \overline{AC}\ \overline{AD}\right] = 0$

$\Rightarrow \begin{vmatrix} 1 & 0 & p-2 \\ 0 & -1 & 1 \\ 1 & 1 & -2 \end{vmatrix} = 0$

$\Rightarrow 1(2-1) + (p-2)(1) = 0$

$\Rightarrow 1 + p - 2 = 0 \Rightarrow p = 1$

19. Since the points are coplanar,

$\therefore \begin{vmatrix} 1 & 2 & 0 \\ 0 & 1 & 4 \\ \lambda-1 & 2 & 3 \end{vmatrix} = 0$

$\Rightarrow 1(3-8) - 2[(0-4(\lambda-1)] = 0$

$\Rightarrow -5 + 8\lambda - 8 = 0 \Rightarrow \lambda = \dfrac{13}{8}$

20. Since, the given vectors are coplanar,

$\therefore \begin{vmatrix} a & 1 & 1 \\ 1 & -b & 1 \\ 1 & 1 & -c \end{vmatrix} = 0$

$\Rightarrow a(bc-1) - 1(-c-1) + 1(1+b) = 0$

$\Rightarrow abc - a + c + 1 + 1 + b = 0$

$\Rightarrow abc + 2 = a - b - c$

26. $\bar{r} = (\bar{b}\times\bar{c}) + m(\bar{c}\times\bar{a}) + n(\bar{a}\times\bar{b})$

$\therefore$ $\bar{a}\cdot\bar{r} = \bar{a}.\left(\bar{b}\times\bar{c}\right) + m\bar{a}.\left(\bar{c}\times\bar{a}\right) + n\bar{a}\cdot\left(\bar{a}\times\bar{b}\right)$

$= \left[\bar{a}\ \bar{b}\ \bar{c}\right] + 0 + 0$

$\bar{a}\cdot\bar{r} = 2$ ....$\left[\because \left[\bar{a}\ \bar{b}\ \bar{c}\right] = 2\right]$ ....(i)

Similarly,

$\bar{b}\cdot\bar{r} = 2m,$ ....(ii)

$\bar{c}.\bar{r} = 2n$ ....(iii)

$\therefore$ On adding equations (i), (ii) and (iii) we get

$\left(\bar{a}+\bar{b}+\bar{c}\right).\bar{r} = 2(\ + m + n)$

$\therefore$ $\ + m + n = \dfrac{1}{2}\left(\bar{a}+\bar{b}+\bar{c}\right).\bar{r}$

$\Rightarrow 1(1-0) - 2(-1-0) - 1(-1+1) = k$

$\Rightarrow 1 + 2 - 0 = k \Rightarrow k = 3$

28. Volume of parallelopiped $= \begin{vmatrix} -p & 0 & 5 \\ 1 & -1 & q \\ 3 & -5 & 0 \end{vmatrix} = 8$

$\Rightarrow -p(0 + 5q) + 5(-5 + 3) = 8$

$\Rightarrow -5pq - 18 = 0$

$\Rightarrow 5pq + 18 = 0$

29. Let $A \equiv (1, 2, 0)$, $B \equiv (2, 0, 4)$, $C \equiv (-1, 2, 0)$ and $D \equiv (-1, 1, \lambda)$ be the vertices of the tetrahedron

$\therefore$ $\overline{AB} = \hat{i} - 2\hat{j} + 4\hat{k}$

$\overline{AC} = -2\hat{i}$

$\overline{AD} = -2\hat{i} - \hat{j} + \lambda\hat{k}$

Volume of tetrahedron = $\frac{1}{6}\left[\overline{AB}\ \overline{AC}\ \overline{AD}\right]$

$\Rightarrow \frac{2}{3} = \frac{1}{6}\begin{vmatrix} 1 & -2 & 4 \\ -2 & 0 & 0 \\ -2 & -1 & \lambda \end{vmatrix}$

$\Rightarrow 2(-2\lambda) + 4(2) = 4$

$\Rightarrow \lambda = 1$

30. $\overline{AB} + \overline{BC} + \overline{AC} = \overline{b} - \overline{a} + \overline{c} - \overline{b} + \overline{c} - \overline{a}$

$= 2(\overline{c} - \overline{a})$

$= 2(\overline{c} - \overline{d} + \overline{d} - \overline{a})$

$= 2(\overline{DC} + \overline{AD})$

$= 2(\overline{DC} - \overline{BD})$

....[$\because$ D is mid-point of AB]

31. If AD is the median,

$\therefore$ $\overline{AD} = \overline{d} - \overline{a} = \frac{\overline{b} + \overline{c}}{2} - \overline{a}$

$= \frac{(\overline{b} - \overline{a}) + (\overline{c} - \overline{a})}{2} = \frac{1}{2}(\overline{AB} + \overline{AC})$

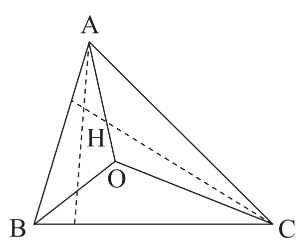
33.



$\overline{HA} = \overline{HO} + \overline{OA}$ ...(i)

$\overline{HB} = \overline{HO} + \overline{OB}$ ....(ii)

$\overline{HC} = \overline{HO} + \overline{OC}$ ....(iii)

$\therefore$ Adding (i), (ii) and (iii), we get

$\overline{HA} + \overline{HB} + \overline{HC}$

$= 3\overline{HO} + \overline{OA} + \overline{OB} + \overline{OC}$

Since, $\overline{OA} + \overline{OB} + \overline{OC} = \overline{OH} = -\overline{HO}$

$\therefore$ $\overline{HA} + \overline{HB} + \overline{HC} = 2\overline{HO}$

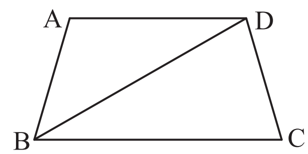
34. Let $\overline{a}, \overline{b}, \overline{c}, \overline{d}$ be the position vectors of A, B, C, D respectively

For parallelogram:

$\overline{a} + \overline{c} = \overline{b} + \overline{d}$

$\Rightarrow \overline{d} = \overline{a} + \overline{c} - \overline{b} \Rightarrow \overline{d} = -\hat{i} + \hat{j} + \hat{k}$

35.



We have, $\overline{p} = \overline{AC} + \overline{BD}$

$= \overline{AC} + \overline{BC} + \overline{CD}$

$= \overline{AC} + \lambda\overline{AD} + \overline{CD}$

$= \lambda\overline{AD} + (\overline{AC} + \overline{CD})$

$= \lambda\overline{AD} + \overline{AD}$

$= (\lambda + 1)\overline{AD}$

Also, $\overline{p} = \mu\overline{AD}$

$\therefore$ $\mu = \lambda + 1$

Competitive Thinking

1. Here, $\overline{a} = \hat{i}, \overline{b} = \hat{j}, \overline{c} = x\hat{i} + 8\hat{j}$

$\overline{AB} = -\hat{i} + \hat{j}, \overline{BC} = x\hat{i} + 7\hat{j}$

Since the points are collinear,

$\therefore$ $\overline{AB} = \lambda\ \overline{BC}$

$\Rightarrow -\hat{i} + \hat{j} = \lambda\left(x\hat{i} + 7\hat{j}\right)$

On comparing, we get

$7\lambda = 1 \Rightarrow \lambda = \frac{1}{7}$

$\lambda x = -1 \Rightarrow x = -7$

2. Let $A(\overline{a}), B(\overline{b}), C(\overline{c})$ be the given points

$\therefore$ $\overline{a} = 20\hat{i} + p\hat{j}, \overline{b} = 5\hat{i} - \hat{j}, \overline{c} = 10\hat{i} - 13\hat{j}$

$\therefore$ $\overline{AB} = k\overline{BC}$

$\Rightarrow -15\hat{i} - (p + 1)\hat{j} = k(5\hat{i} - 12\hat{j})$

On comparing, we get

$-15 = 5k \Rightarrow k = -3$ and

$-(p + 1) = -12k$

$\Rightarrow -(p + 1) = 36$

$\Rightarrow p = -37$

3. $\overline{PQ} = k\overline{QR}$

$\overline{a} + \overline{b} - \overline{c} = k(-2\overline{a} - 2\overline{b} + t\overline{c})$

On comparing, we get

$1 = -2k \Rightarrow k = \frac{-1}{2}$ and $-1 = kt \Rightarrow t = 2$

4. Here $\overline{AB} = \overline{b} - \overline{a}$ and
$\overline{AC} = 2\overline{a} - 2\overline{b} = -2(\overline{b} - \overline{a})$
$\therefore$ $\overline{AC} = m\overline{AB}$
Hence A, B, C are collinear.

5. Since, $\overline{a} + 3\overline{b}$ is collinear with $\overline{c}$, and $\overline{b} + 2\overline{c}$ is collinear with $\overline{a}$,
$\therefore$ $\overline{a} + 3\overline{b} = x\overline{c}$ and $\overline{b} + 2\overline{c} = y\overline{a}$ $\forall\, x, y \in R$.
$\therefore$ $\overline{a} + 3\overline{b} + 6\overline{c} = (x + 6)\overline{c}$
Also, $\overline{a} + 3\overline{b} + 6\overline{c} = \overline{a} + 3(\overline{b} + 2\overline{c}) = (1 + 3y)\overline{a}$
$\therefore$ $(x + 6)\overline{c} = (1 + 3y)\overline{a}$
$\Rightarrow (x + 6)\overline{c} - (1 + 3y)\overline{a} = 0$
$\therefore$ $x + 6 = 0$ and $1 + 3y = 0$
$\Rightarrow x = -6$ and $y = -\dfrac{1}{3}$
Now, $\overline{a} + 3\overline{b} = x\overline{c} \Rightarrow \overline{a} + 3\overline{b} + 6\overline{c} = \overline{0}$

6. Let $\overline{a} = 3\hat{i} + 2\hat{j} - \hat{k}$ and $\overline{b} = 6\hat{i} - 4x\hat{j} + y\hat{k}$
Since, $\overline{a}$ and $\overline{b}$ are parallel,
$\dfrac{3}{6} = \dfrac{2}{-4x} = \dfrac{-1}{y}$
$\Rightarrow x = -1$ and $y = -2$

7. The given vectors are collinear.
$\therefore$ $\dfrac{3}{a} = \dfrac{1}{b} = \dfrac{-5}{-15}$
$\Rightarrow a = 9, b = 3$

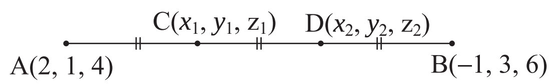
8. $x = 0$, $y = 0$, otherwise one vector will be a scalar multiple of the other and hence collinear which is a contradiction.

11. $\overline{c} = m\overline{a} + n\overline{b}$
$\therefore$ $3\hat{i} - \hat{k} = m(\hat{i} + \hat{j} - 2\hat{k}) + n(2\hat{i} - \hat{j} + \hat{k})$
Comparing the co-efficients of $\hat{i}$ and $\hat{j}$, we get
$3 = m + 2n$, and ....(i)
$m = n$ ....(ii)
$\therefore$ Solving the above two equations, we get
$m = n = 1$
$\therefore$ $m + n = 1 + 1 = 2$

12. Let $P(\overline{p})$ divide the line internally in the ratio 2 : 3
$\therefore$ $\overline{p} = \dfrac{3(2\overline{a} - 3\overline{b}) + 2(3\overline{a} - 2\overline{b})}{2 + 3} = \dfrac{12\overline{a} - 13\overline{b}}{5}$

13. $A \equiv (1, -1, 2)$, $B \equiv (2, 3, -1)$
Point P divides AB internally in the ratio 2 : 3.
$\therefore$ $P \equiv \left[\dfrac{2(2) + 3(1)}{2 + 3}, \dfrac{2(3) + 3(-1)}{2 + 3}, \dfrac{2(-1) + 3(2)}{2 + 3}\right]$
$\equiv \left(\dfrac{7}{5}, \dfrac{3}{5}, \dfrac{4}{5}\right)$
$\therefore$ the position vector of P is $\dfrac{1}{5}(7\hat{i} + 3\hat{j} + 4\hat{k})$

14.



C divides AB internally in the ratio 1 : 2 and D divides AB internally in the ratio 2 : 1.
$\therefore$ $z_1 + z_2 = \dfrac{1(6) + 2(4)}{1 + 2} + \dfrac{2(6) + 1(4)}{2 + 1}$
$= \dfrac{14}{3} + \dfrac{16}{3} = \dfrac{30}{3}$
$= 10$

15. Let position vector of B be $\overline{r}$
Since, $\overline{a}$ divides AB in the ratio 2 : 3
$\therefore$ $\dfrac{2\overline{r} + 3(\overline{a} + 2\overline{b})}{2 + 3} = \overline{a}$
$\Rightarrow 2\overline{r} = 5\overline{a} - 3\overline{a} - 6\overline{b} = 2\overline{a} - 6\overline{b}$
$\Rightarrow \overline{r} = \overline{a} - 3\overline{b}$

16. We know that, centroid of a triangle divides the line segment joining the orthocentre and circumcentre in the ratio 2 : 1.
The co-ordinates of orthocentre and circumcentre are (–1, 3, 2), (5, 3, 2) respectively.
$\therefore$ Co-ordinates of centroid
$\equiv \left(\dfrac{2(5) + 1(-1)}{2 + 1}, \dfrac{2(3) + 1(3)}{2 + 1}, \dfrac{2(2) + 1(2)}{2 + 1}\right)$
$\equiv (3, 3, 2)$

17. Let the co-ordinates of circumcentre be (x, y, z).
Co-ordinates of orthocentre and centroid are (–3, 5, 2) and (3, 3, 4) respectively.
We know that, centroid of triangle divides the line segment joining its orthocentre and circumcentre in the ratio 2 : 1.
$\therefore$ $\left(\dfrac{2x - 3}{3}, \dfrac{2y + 5}{3}, \dfrac{2z + 2}{3}\right) \equiv (3, 3, 4)$
$\Rightarrow \dfrac{2x - 3}{3} = 3, \dfrac{2y + 5}{3} = 3, \dfrac{2z + 2}{3} = 4$
$\Rightarrow x = 6, y = 2, z = 5$

18. Let N $\left(\bar{n}\right)$ divide line segment LM externally in the ratio 2 : 1.

$\therefore \quad \bar{n} = \dfrac{2\left(\bar{a} + 2\bar{b}\right) - \left(2\bar{a} - \bar{b}\right)}{2 - 1}$

$= \dfrac{2\bar{a} + 4\bar{b} - 2\bar{a} + \bar{b}}{1} = 5\,\bar{b}$

19. $R(\bar{r})$ divides PQ externally in the ratio 2 : 1

$\therefore \quad \bar{r} = \dfrac{2(-\hat{i} + \hat{j} - \hat{k}) - 1(\hat{i} + 2\hat{j} - \hat{k})}{2 - 1}$

$= -2\hat{i} + 2\hat{j} - 2\hat{k} - \hat{i} - 2\hat{j} + \hat{k}$

$\therefore \quad \bar{r} = -3\hat{i} - \hat{k}$

20. $3\overline{P} + 2\overline{R} - 5\overline{Q} = \bar{0}$

$\Rightarrow 3\overline{P} + 2\overline{R} = 5\overline{Q}$

$\Rightarrow \overline{Q} = \dfrac{3\overline{P} + 2\overline{R}}{5}$

$\therefore$ $\overline{Q}$ is the position vector of the point dividing P and R in the ratio 3 : 2 internally.
Thus, P, Q and R are collinear.

21. Let the point B divide AC in the ratio λ : 1

$\therefore \quad 5\hat{i} - 2\hat{k} = \dfrac{\lambda(11\hat{i} + 3\hat{j} + 7\hat{k}) + \hat{i} - 2\hat{j} - 8\hat{k}}{\lambda + 1}$

$\Rightarrow \lambda(5\hat{i} - 2\hat{k}) + (5\hat{i} - 2\hat{k})$

$= \lambda(11\hat{i} + 3\hat{j} + 7\hat{k}) + (\hat{i} - 2\hat{j} - 8\hat{k})$

$\Rightarrow -6\lambda\hat{i} - 3\lambda\hat{j} - 9\lambda\hat{k} = -4\hat{i} - 2\hat{j} - 6\hat{k}$

$\Rightarrow -6\lambda = -4$

$\Rightarrow \lambda = \dfrac{2}{3}$ i.e. ratio = 2 : 3

22. M and N are the midpoints of sides PQ and RS

$\therefore \quad \bar{m} = \dfrac{\bar{p} + \bar{q}}{2}$ and $\bar{n} = \dfrac{\bar{r} + \bar{s}}{2}$

$\Rightarrow 2\bar{m} = \bar{p} + \bar{q}$ and $2\bar{n} = \bar{r} + \bar{s}$

$\overline{PS} + \overline{QR} = \bar{s} - \bar{p} + \bar{r} - \bar{q}$

$\Rightarrow -3\lambda + 18 + 20\lambda + 35 + 93 = 0$

$\Rightarrow 17\,\lambda = -146$

$\Rightarrow \lambda = \dfrac{-146}{17}$

43. Let $\bar{s} = 2\bar{a} + 3\bar{b} - \bar{c}$, $\bar{t} = \bar{a} - 2\bar{b} + 3\bar{c}$, $\bar{u} = 3\bar{a} + 4\bar{b} - 2\bar{c}$, $\bar{v} = k\bar{a} - 6\bar{b} + 6\bar{c}$

$\therefore$ $\overline{ST} = -\bar{a} - 5\bar{b} + 4\bar{c}$, $\overline{SU} = \bar{a} + \bar{b} - \bar{c}$

$\overline{SV} = (k-2)\bar{a} - 9\bar{b} + 7\bar{c}$

Since, the given points are coplanar,

$\therefore$ $\left[\overline{ST}\ \overline{SU}\ \overline{SV}\right] = 0$

$\Rightarrow \begin{vmatrix} -1 & -5 & 4 \\ 1 & 1 & -1 \\ k-2 & -9 & 7 \end{vmatrix} = 0$

$\Rightarrow 2 + 5\,(7 + k - 2) + 4\,(-9 - k + 2) = 0$

$\Rightarrow 2 + 25 + 5k - 28 - 4k = 0$

$\Rightarrow -1 + k = 0$

$\Rightarrow k = 1$

44. Since, $a\hat{i} + \hat{j} + \hat{k}$, $\hat{i} + b\hat{j} + \hat{k}$ and $\hat{i} + \hat{j} + c\hat{k}$ are coplanar,

$\therefore \begin{vmatrix} a & 1 & 1 \\ 1 & b & 1 \\ 1 & 1 & c \end{vmatrix} = 0$

$\Rightarrow a\,(bc - 1) - 1\,(c - 1) + 1\,(1 - b) = 0$

$\Rightarrow abc - a - b - c + 2 = 0$

$\Rightarrow abc - (a + b + c) = -2$

45. Let $\bar{a}, \bar{b}$ and $\bar{c}$ be the given vectors.

The vectors are coplanar

$\therefore \begin{vmatrix} -\lambda^2 & 1 & 1 \\ 1 & -\lambda^2 & 1 \\ 1 & 1 & -\lambda^2 \end{vmatrix} = 0$

$\Rightarrow -\lambda^2(\lambda^4 - 1) - 1(-\lambda^2 - 1) + 1(1 + \lambda^2) = 0$

$\Rightarrow \lambda^6 - 3\lambda^2 - 2 = 0$

$\Rightarrow (1 + \lambda^2)^2\,(\lambda^2 - 2) = 0$

$\Rightarrow \lambda = \pm\sqrt{2}$

46. The given vectors are coplanar

$\therefore \begin{vmatrix} \lambda^3 & 0 & 1 \\ 1 & -\lambda^3 & 0 \\ 1 & 2\lambda - \sin\lambda & -\lambda \end{vmatrix} = 0$

$\Rightarrow \lambda^3(\lambda^4 - 0) + 1(2\lambda - \sin\lambda + \lambda^3) = 0$

$\Rightarrow \lambda^7 + \lambda^3 + 2\lambda = \sin\lambda$ ....(i)

This is true for $\lambda = 0$.

For non-zero values of λ, equation (i) is

$\lambda^6 + \lambda^2 + 2 = \dfrac{\sin\lambda}{\lambda}$ ....(ii)

We know that $\dfrac{\sin x}{x} < 1$ for all $x \neq 0$.

$\therefore$ L.H.S. of (ii) is greater than 2 and R.H.S. is less than 1.

So, (ii) is not true for any non-zero λ.

Hence, there is only one value of λ.

47. Let $\bar{\alpha}$, $\bar{\beta}$ and $\bar{\gamma}$ be the given vectors

$\bar{\alpha}$, $\bar{\beta}$ and $\bar{\gamma}$ are coplanar

$\therefore \begin{vmatrix} 1 & 2 & 3 \\ 0 & \lambda & 4 \\ 0 & 0 & (2\lambda-1) \end{vmatrix} = 0$

$\Rightarrow \lambda(2\lambda - 1) = 0 \Rightarrow \lambda = 0, \frac{1}{2}$

Hence, $\bar{\alpha}$, $\bar{\beta}$, $\bar{\gamma}$ are non-coplanar for all values of λ except 0 and $\frac{1}{2}$.

48. Since, O(0, 0, 0), P(2, 3, 4), Q(1, 2, 3), R(x, y, z) are co-planar

$\therefore \left[\overline{OR} \quad \overline{OP} \quad \overline{OQ}\right] = 0$

$\Rightarrow \begin{vmatrix} x & y & z \\ 2 & 3 & 4 \\ 1 & 2 & 3 \end{vmatrix} = 0$

$\Rightarrow x(9-8) - y(6-4) + z(4-3) = 0$

$\Rightarrow x - 2y + z = 0$

49. Let the vector be $a\hat{i} + b\hat{j} + c\hat{k}$.

It is perpendicular to $2\hat{i} + \hat{j} + \hat{k}$.

$\therefore$ 2a + b + c = 0 ….(i)

The vector is coplanar with $\hat{i} + 2\hat{j} + \hat{k}$ and $\hat{i} + \hat{j} + 2\hat{k}$

$\therefore \begin{vmatrix} a & b & c \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{vmatrix} = 0$

$\therefore$ 3a – b – c = 0 ….(ii)

On solving (i) and (ii), we get

a = 0, b = 5, c = –5

$\therefore$ The required vector is $5(\hat{j} - \hat{k})$

50. $\left[\bar{\alpha}\,\bar{\beta}\,\bar{\gamma}\right] = \begin{vmatrix} 5 & 6 & 7 \\ 7 & -8 & 9 \\ 3 & 20 & 5 \end{vmatrix}$

= 5(–40 – 180) – 6(35 – 27) + 7(140 + 24) = 0

$\therefore$ the given vectors are coplanar.

51. Since $\bar{x}$ is a non-zero vector, the given conditions will be satisfied, if either

i. at least one of the vectors $\bar{a}, \bar{b}, \bar{c}$ is zero or

ii. $\bar{x}$ is perpendicular to all the vectors $\bar{a}, \bar{b}, \bar{c}$

In case (ii), $\bar{a}, \bar{b}, \bar{c}$ are coplanar

$\Rightarrow \left[\bar{a}\,\bar{b}\,\bar{c}\right] = 0$

$|\overline{AB}| = 6$ and $(\overline{AC}) = 3$

$\therefore$ M divides BC internally is the ratio 2 : 1

$\therefore$ $\overline{M} = \dfrac{2(2\hat{i}+5\hat{j}+7\hat{k})+1(2\hat{i}+3\hat{j}+4\hat{k})}{2+1}$

$= \dfrac{6\hat{i}+13\hat{j}+18\hat{k}}{3}$

77. $\overline{AB} = -6\hat{i}-2\hat{j}+3\hat{k}$, $\overline{BC} = -2\hat{i}+3\hat{j}-6\hat{k}$

$\overline{CD} = 6\hat{i}+2\hat{j}-3\hat{k}$, $\overline{DA} = 2\hat{i}-3\hat{j}+6\hat{k}$

$\overline{AC} = -8\hat{i}+\hat{j}-3\hat{k}$ and $\overline{BD} = 4\hat{i}+5\hat{j}-9\hat{k}$

Here, $\left|\overline{AB}\right| = \left|\overline{BC}\right| = \left|\overline{CD}\right| = \left|\overline{DA}\right| = 7$

and $\overline{AC}.\overline{BD} = 0 \Rightarrow \overline{AC} \perp \overline{BD}$

Hence, ABCD is a rhombus.

78. In ΔABC, hypotenuse AB = p

$\therefore$ $\overline{AC} \perp \overline{CB}$

$\therefore$ $\overline{AC}.\overline{CB} = 0$ ....(i)

Now, $\overline{AB}.\overline{AC} + \overline{BC}.\overline{BA} + \overline{CA}.\overline{CB}$

$= \overline{AB}.\overline{AC} + \overline{BC}.\left(-\overline{AB}\right) + \left(-\overline{AC}\right).\overline{CB}$

$= \overline{AB}.\overline{AC} - \overline{BC}.\overline{AB} - \overline{AC}.\overline{CB}$

$= \overline{AB}.\left(\overline{AC} - \overline{BC}\right) - 0$ ....[From (i)]

$= \overline{AB}.\left(\overline{AC} + \overline{CB}\right)$

$= \overline{AB}.\overline{AB}$ ....$\left[\because \overline{AC} + \overline{CB} = \overline{AB}\right]$

$= |\overline{AB}|^2 = p^2$

79. Since, $\bar{c}$ is coplanar with $\bar{a}$ and $\bar{b}$

$\therefore$ $\bar{c} = x\bar{a} + y\bar{b}$

$\Rightarrow \bar{c} = x(2\hat{i}+\hat{j}+\hat{k}) + y(\hat{i}+2\hat{j}-\hat{k})$

$\Rightarrow \bar{c} = (2x+y)\hat{i} + (x+2y)\hat{j} + (x-y)\hat{k}$

Also, $\bar{a}\,.\,\bar{c} = 0$ ....$[\because \bar{c} \perp \bar{a}]$

$\therefore$ $2(2x+y) + x + 2y + x - y = 0$

$\Rightarrow y = -2x$

$\bar{c} = -3x\hat{j} + 3x\hat{k} = 3x(-\hat{j}+\hat{k})$

Now, $|\bar{c}| = 1$

$\therefore$ $9x^2 + 9x^2 = 1$

$\Rightarrow x = \pm\dfrac{1}{3\sqrt{2}}$

$\therefore$ $\bar{c} = \dfrac{1}{\sqrt{2}}(-\hat{j}+\hat{k})$

Evaluation Test

1. Since, $\bar{a}+\bar{b}$ and $\bar{b}+\bar{c}$ are collinear with $\bar{c}$ and $\bar{a}$ respectively

$\therefore$ $\bar{a}+\bar{b} = t\bar{c}$ …(i)

$\bar{b}+\bar{c} = s\bar{a}$ …(ii)

From (i) and (ii), we get

$\bar{a}-\bar{c} = t\bar{c} - s\bar{a} \Rightarrow \bar{a}(1+s) = \bar{c}(1+t)$

But $\bar{a}$ and $\bar{c}$ are non-collinear

$\therefore$ $1 + s = 0$, $1 + t = 0$ $\Rightarrow s = -1, t = -1$

Substituting value of t in (i) and value of s in (ii), we get

$\bar{a}+\bar{b} = -\bar{c}$ and $\bar{b}+\bar{c} = -\bar{a}$

Hence, $\bar{a}+\bar{b}+\bar{c} = 0$.

2. Given, $\bar{r} = \lambda_1\bar{r}_1 + \lambda_2\bar{r}_2 + \lambda_3\bar{r}_3$

$\Rightarrow 2\bar{a} - 3\bar{b} + 4\bar{c} = (\lambda_1 - \lambda_2 + \lambda_3)\bar{a}$

$+(-\lambda_1 + \lambda_2 + \lambda_3)\bar{b} + (\lambda_1 + \lambda_2 + \lambda_3)\bar{c}$

$\Rightarrow \lambda_1 - \lambda_2 + \lambda_3 = 2, -\lambda_1 + \lambda_2 + \lambda_3 = -3,$

$\lambda_1 + \lambda_2 + \lambda_3 = 4$

$\Rightarrow \lambda_1 = \dfrac{7}{2},\ \lambda_2 = 1, \lambda_3 = -\dfrac{1}{2}$

$\therefore$ $\lambda_1 + \lambda_3 = 3$

3. Since, the given vectors are coplanar

$\therefore$ $\begin{vmatrix} a & a & c \\ 1 & 0 & 1 \\ c & c & b \end{vmatrix} = 0$

Applying $C_2 \to C_2 - C_1$,

$\begin{vmatrix} a & 0 & c \\ 1 & -1 & 1 \\ c & 0 & b \end{vmatrix} = 0$

$\Rightarrow$ a (–b) + c (c) = 0 $\Rightarrow c^2 = ab$

Hence, c is the geometric mean of a and b.

4. $\hat{a}\cdot\hat{a} = 1, \hat{b}\cdot\hat{b} = 1, \hat{c}\cdot\hat{c} = 1,$

$\hat{a}\cdot\hat{b} = \hat{b}\cdot\hat{c} = \hat{c}\cdot\hat{a} = \dfrac{1}{2}$

$\therefore$ $[\bar{a}\,\bar{b}\,\bar{c}]^2 = \begin{vmatrix} \hat{a}\cdot\hat{a} & \hat{a}\cdot\hat{b} & \hat{a}\cdot\hat{c} \\ \hat{b}\cdot\hat{a} & \hat{b}\cdot\hat{b} & \hat{b}\cdot\hat{c} \\ \hat{c}\cdot\hat{a} & \hat{c}\cdot\hat{b} & \hat{c}\cdot\hat{c} \end{vmatrix}$

$= \begin{vmatrix} 1 & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & 1 & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & 1 \end{vmatrix} = \dfrac{1}{2}$

$\therefore$ $[\bar{a}\,\bar{b}\,\bar{c}] = \dfrac{1}{\sqrt{2}}$ cubic units

5. Since, $\begin{vmatrix} a & 1 & 1 \\ 1 & b & 1 \\ 1 & 1 & c \end{vmatrix} = 0$

Applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, we get

$\begin{vmatrix} a & 1 & 1 \\ 1-a & b-1 & 0 \\ 1-a & 0 & c-1 \end{vmatrix} = 0$

$\Rightarrow$ $a(b-1)(c-1) - (1-a)(c-1) - (1-a)(b-1) = 0$

Dividing by $(1-a)(1-b)(1-c)$, we get

$\dfrac{a}{1-a} + \dfrac{1}{1-b} + \dfrac{1}{1-c} = 0$ ….(i)

Consider, $\dfrac{1}{1-a} + \dfrac{1}{1-b} + \dfrac{1}{1-c}$

$= \dfrac{1}{1-a} - \dfrac{a}{1-a}$ ….[From (i)]

$= 1$

6. Volume of the parallelopiped formed by vectors is

i.e., $V = \begin{vmatrix} 1 & a & 1 \\ 0 & 1 & a \\ a & 0 & 1 \end{vmatrix} = 1 - a\ + a^3$

$\therefore \quad \frac{dV}{da} = -1 + 3a^2,\ \frac{d^2V}{da^2} = 6a$

For max. or min. of V, $\frac{dV}{da} = 0$

$\therefore \quad a^2 = \frac{1}{3} \qquad \therefore \quad a = \frac{1}{\sqrt{3}}$

$\frac{d^2V}{da^2} = 6a > 0$ for $a = \frac{1}{\sqrt{3}}$

$\therefore$ V is minimum for $a = \frac{1}{\sqrt{3}}$

7. Given, $\bar{a}.\bar{b} = \bar{b}.\bar{c} = \bar{c}.\bar{a} = 0$

The scalar triple product of three vectors is

$[\bar{a}\ \bar{b}\ \bar{c}] = (\bar{a} \times \bar{b}).\bar{c}$

$\because \quad \bar{a}.\bar{b} = 0 \qquad \therefore \quad \bar{a} \perp \bar{b}$

$\therefore$ angle between $\bar{a}$ and $\bar{b}$ is $\theta = 90°$

Similarly, $[\bar{a}\ \bar{b}\ \bar{c}] = |\bar{a}||\bar{b}|\hat{n}.\bar{c}$ where $\hat{n}$ is a normal vector.

$\therefore$ $\hat{n}$ and $\bar{c}$ are parallel to each other

$\therefore \quad [\bar{a}\ \bar{b}\ \bar{c}] = |\bar{a}||\bar{b}||\hat{n}|.|\bar{c}| = |a||b||c|.$

8. Given, $\bar{r} \times \bar{b} = \bar{c} \times \bar{b}$

$\Rightarrow (\bar{r} - \bar{c}) \times \bar{b} = \bar{0}$

$\therefore$ $\bar{r} - \bar{c}$ is parallel to $\bar{b}$

$\Rightarrow \bar{r} - \bar{c} = \lambda\bar{b}$ for some scalar λ

$\Rightarrow \bar{r} = \bar{c} + \lambda\bar{b}$ ….(i)

$\Rightarrow \bar{r}.\bar{a} = \bar{c}.\bar{a} + \lambda(\bar{b}\cdot\bar{a})$

$\Rightarrow 0 = \bar{c}.\bar{a} + \lambda(\bar{b}\cdot\bar{a})$ ….$[\because \bar{r}\cdot\bar{a} = 0 \text{(given)}]$

$\Rightarrow \lambda = -\frac{\bar{a}.\bar{c}}{\bar{a}.\bar{b}}$

Substituting the value of λ in (i), we get

$\bar{r} = \bar{c} - \frac{\bar{a}.\bar{c}}{\bar{a}.\bar{b}}\bar{b}$

$\Rightarrow \bar{r}.\bar{b} = \bar{c}.\bar{b} - \frac{\bar{a}.\bar{c}}{\bar{a}.\bar{b}}(\bar{b}.\bar{b})$

$\Rightarrow \bar{r}.\bar{b} = 1 - \frac{(-4)}{1} \times 2 = 9$

9. Let $\bar{c} = 2\hat{i} + 3\hat{j} + 4\hat{k}$

$\therefore \quad \bar{a} \times \bar{c} = \bar{c} \times \bar{b}$

$\Rightarrow \bar{a} \times \bar{c} = -\bar{b} \times \bar{c} \Rightarrow (\bar{a} + \bar{b}) \times \bar{c} = 0 \Rightarrow (\bar{a} + \bar{b}) \parallel \bar{c}$

Let $(\bar{a} + \bar{b}) = \lambda\bar{c}$

$\Rightarrow |\bar{a} + \bar{b}| = |\lambda|\,|\bar{c}| \Rightarrow \sqrt{29} = |\lambda|.\sqrt{29} \Rightarrow \lambda = \pm 1$

$\therefore \quad \bar{a} + \bar{b} = \pm(2\hat{i} + 3\hat{j} + 4\hat{k})$

Now, $(\bar{a} + \bar{b}).(-7\hat{i} + 2\hat{j} + 3\hat{k}) = \pm(-14 + 6 + 12)$

$= \pm 4$

10. Given,

$[\ \bar{a} + m\bar{b} + n\bar{c} \quad \bar{b} + m\bar{c} + n\bar{a} \quad \bar{c} + m\bar{a} + n\bar{b}\ ] = 0$

$\Rightarrow [\ \bar{a} + m\bar{b} + n\bar{c} \quad n\bar{a} + \ \bar{b} + m\bar{c} \quad m\bar{a} + n\bar{b} + \ \bar{c}\ ] = 0$

$\Rightarrow \begin{vmatrix} & m & n \\ n & & m \\ m & n & \end{vmatrix} [\bar{a}\ \bar{b}\ \bar{c}] = 0$

$\Rightarrow \begin{vmatrix} & m & n \\ n & & m \\ m & n & \end{vmatrix} = 0$ ….$[\because [\bar{a}\ \bar{b}\ \bar{c}] \neq 0]$

$\Rightarrow\ ^3 + m^3 + n^3 - 3\ mn = 0$

$\Rightarrow (\ + m + n)\ (\ ^2 + m^2 + n^2 - \ m - mn - n\ ) = 0$

$\Rightarrow\ + m + n = 0$

Let point O be the circumcentre of ΔABC.

Let $\bar{a}$, $\bar{b}$, $\bar{c}$, $\bar{p}$, $\bar{d}$, $\bar{h}$, $\bar{m}$ be the position vectors of the respective points.

Since, $\bar{h} = \bar{a} + \bar{b} + \bar{c}$ ….(Standard formula)

$\therefore \quad \bar{m} = \frac{\bar{p} + \bar{h}}{2} = \frac{\bar{p} + \bar{a} + \bar{b} + \bar{c}}{2}$

$\therefore \quad \overline{DM} = \bar{m} - \bar{d} = \frac{\bar{p} + \bar{a} + \bar{b} + \bar{c}}{2} - \frac{\bar{b} + \bar{c}}{2} = \frac{\bar{p} + \bar{a}}{2}$

$\therefore \quad \overline{DM}\cdot\overline{PA} = \left(\frac{\bar{p} + \bar{a}}{2}\right)\cdot(\bar{a} - \bar{p}) = \frac{1}{2}(a^2 - p^2) = 0$

….[$\because$ O is circumcentre, $\therefore$ OA = OP i.e., a = p]

$\therefore$ DM is perpendicular to PA.

15. Let position vector of Q be $\bar{r}$

Since, $\bar{p}$ divides PQ in the ratio 3 : 4

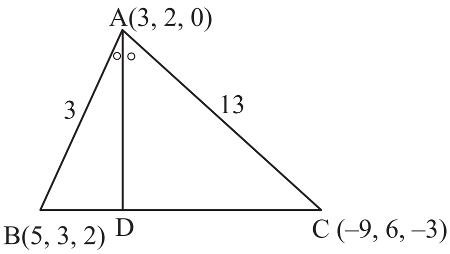
$\therefore \quad \dfrac{3\bar{r} + 4(3\bar{p} + \bar{q})}{3+4} = \bar{p}$

$\Rightarrow 7\bar{p} = 3\bar{r} + 12\bar{p} + 4\bar{q}$

$\Rightarrow -5\bar{p} - 4\bar{q} = 3\bar{r}$

$\Rightarrow \bar{r} = \dfrac{-1}{3}\left(5\bar{p} + 4\bar{q}\right)$

16.



By distance formula,

$AB = \sqrt{(5-3)^2 + (3-2)^2 + (2-0)^2}$

$= \sqrt{4+1+4} = \sqrt{9} = 3$

$AC = \sqrt{(3+9)^2 + (2-6)^2 + (0+3)^2}$

$= \sqrt{144+16+9} = \sqrt{169} = 13$

$\therefore$ Point D divides seg BC in the ratio of 3 : 13

$\therefore$ By section formula,

$D \equiv \left(\dfrac{mx_2 + nx_1}{m+n}, \dfrac{my_2 + ny_1}{m+n}, \dfrac{mz_2 + nz_1}{m+n}\right)$

$\equiv \left(\dfrac{3(-9)+13(5)}{3+13}, \dfrac{3(6)+13(3)}{3+13}, \dfrac{3(-3)+13(2)}{3+13}\right)$

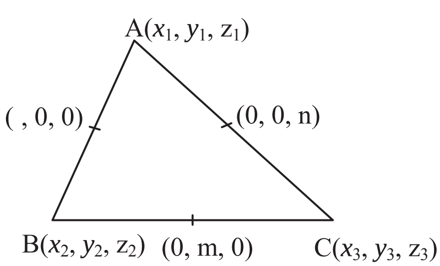
$\equiv \left(\dfrac{38}{16}, \dfrac{57}{16}, \dfrac{17}{16}\right) \equiv \left(\dfrac{19}{8}, \dfrac{57}{16}, \dfrac{17}{16}\right)$

17.



$x_1 + x_2 = 2\ , x_2 + x_3 = 0, x_3 + x_1 = 0$

On solving we get $x_1 = \ , x_2 = \ , x_3 = -$

$y_1 + y_2 = 0, y_2 + y_3 = 2m, y_3 + y_1 = 0$

On solving we get $y_1 = -m, y_2 = m, y_3 = m$

$z_1 + z_2 = 0, z_2 + z_3 = 0, z_3 + z_1 = 2n$

On solving we get $z_1 = n, z_3 = n, z_2 = -n$

$\therefore$ A(, –m, n), B(, m, –n), C(– , m, n)

By distance formula,

$AB^2 = (\ -\ )^2 + (-m-m)^2 + (n+n)^2 = 4m^2 + 4n^2$

$BC^2 = (\ +\ )^2 + (m-m)^2 + (-n-n)^2 = 4\ {}^2 + 4n^2$

$CA^2 = (\ +\ )^2 + (-m-m)^2 + (n-n)^2 = 4\ {}^2 + 4m^2$

$\therefore \quad \dfrac{AB^2 + BC^2 + CA^2}{{}^2 + m^2 + n^2}$

$= \dfrac{4m^2 + 4n^2 + 4\ {}^2 + 4n^2 + 4\ {}^2 + 4m^2}{{}^2 + m^2 + n^2}$

$= 8\dfrac{\left({}^2 + m^2 + n^2\right)}{{}^2 + m^2 + n^2} = 8$

Let D be the foot of perpendicular and let it divide BC in the ratio λ : 1 internally

$\overline{BC} = 3\hat{i} + 5\hat{j} + 3\hat{k} - \left(4\hat{i} + 7\hat{j} + \hat{k}\right)$

$= -\hat{i} - 2\hat{j} + 2\hat{k}$

Since, $\overline{AD} \perp \overline{BC}$.

$\overline{AD} \cdot \overline{BC} = 0$

$\Rightarrow \left(\dfrac{2\lambda+3}{\lambda+1}\right)(-1) + \left(\dfrac{5\lambda+7}{\lambda+1}\right)(-2) + \left(\dfrac{-2}{\lambda+1}\right)(2) = 0$

$\Rightarrow -2\lambda - 3 - 10\lambda - 14 - 4 = 0$

7. For option (B),
$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma \neq 1$

$\therefore$ option (B) is correct answer.

8. Since, $^2 + m^2 + n^2 = 1$

$\therefore$ $k^2 + \left(\frac{1}{2}\right)^2 + 0^2 = 1$

$\Rightarrow k^2 = 1 - \frac{1}{4} = \frac{3}{4}$

$\Rightarrow k = \pm \frac{\sqrt{3}}{2}$

9. Since, $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

$\therefore$ $\cos^2 45^{\circ} + \cos^2 60^{\circ} + \cos^2 \gamma = 1$

$\Rightarrow \cos^2 \gamma = 1 - \frac{1}{2} - \frac{1}{4} = \frac{1}{4}$

$\Rightarrow \cos \gamma = \pm \frac{1}{2}$

$\Rightarrow \gamma = 60^{\circ}$ or 120°

10. $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

$\Rightarrow \cos^2 \alpha + \cos^2(90^{\circ} - \alpha) + \cos^2 \gamma = 1$ ....[$\because \alpha + \beta = 90^{\circ}$]

$\Rightarrow \cos^2 \alpha + \sin^2 \alpha + \cos^2 \gamma = 1$

i.e., $-5, 3, -6$

17. On Y-axis, x and z co-ordinates are zero.
Hence, (B) is the correct option.

18. Since $(- \;)^2 + (-m)^2 + (-n)^2 = 1$, we can say that – , –m, –n are the direction cosines of the line.

Also that $\frac{-}{} = \frac{-m}{m} = \frac{-n}{n} = -1$

Hence, we can say that – , –m, –n are the d.r.s. of the line.

19. Let a, b, c be the d.r.s of the line.

∴ The d.c.s are given by

$$\frac{a}{\sqrt{a^2+b^2+c^2}}, \frac{b}{\sqrt{a^2+b^2+c^2}}, \frac{c}{\sqrt{a^2+b^2+c^2}}$$

i.e., $\frac{2}{\sqrt{2^2+(-1)^2+(-2)^2}}, \frac{-1}{\sqrt{2^2+(-1)^2+(-2)^2}}, \frac{-2}{\sqrt{2^2+(-1)^2+(-2)^2}}$

i.e., $\frac{2}{3}, \frac{-1}{3}, \frac{-2}{3}$

21. The d.r.s of line through (1, 2, –3) and (–2, 3, 1) are –2 – 1, 3 – 2, 1 – (–3)

i.e. –3, 1, 4

∴ d.c.s are

i.e. $\frac{-3}{\sqrt{26}}, \frac{1}{\sqrt{26}}, \frac{4}{\sqrt{26}}$

22. The d.r.s of AB are 2 –14, –3 –5, 1 + 3

∴ The d.c.s are $\frac{3}{\sqrt{14}}, \frac{2}{\sqrt{14}}, \frac{-1}{\sqrt{14}}$

23. Let O(0, 0, 0) and P(1, 2, 3) be two points.

∴ Then the d.r.s of OP are 1, 2, 3

∴ The d.c.s of OP are

$$\frac{1}{\sqrt{14}}, \frac{2}{\sqrt{14}}, \frac{3}{\sqrt{14}}$$

24. D.r.s. of line through A(3, 1, 2), B(4, λ, 0) are $4 - 3, \lambda - 1, 0 - 2 \Rightarrow 1, \lambda - 1, -2 \equiv a_1, b_1, c_1$

D.r.s. of line through C(1, 2, 1), D(2, 3, –1) are $2 - 1, 3 - 2, -1 - 1 \Rightarrow 1, 1, -2 \equiv a_2, b_2, c_2$

Since, AB || CD,

∴ $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$

$\Rightarrow \frac{1}{1} = \frac{\lambda-1}{1} = \frac{-2}{-2}$

i.e., $\lambda - 1 = 1 \Rightarrow \lambda = 2$

25. Let A ≡ (5, 2, 4), B ≡ (6, –1, 2) and C ≡ (8, –7, k)

i.e., 1, –3, –2, and

The d.r.s of BC are 8 – 6, –7 + 1, k – 2

i.e. 2, –6, k – 2

Since, the points A, B, C are collinear, AB || BC

∴ $\frac{2}{1} = \frac{-6}{-3} = \frac{k-2}{-2}$

$\Rightarrow k - 2 = -4$

$\Rightarrow k = 2 - 4 = -2$

26. Let A≡ (–2, 4, λ), B≡ (3, –6, –8), C≡ (1, –2, –2)

The d.r.s of AB are

–5, 10, λ+8, and

The d.r.s of AC are

–3, 6, λ+2

Since, the points A,B,C are collinear, AB || AC

∴ $\frac{-5}{-3} = \frac{10}{6} = \frac{\lambda+8}{\lambda+2}$

∴ $5(\lambda + 2) = 3(\lambda + 8)$

$\Rightarrow \lambda = 7$

27. Let, $_1 = \frac{1}{\sqrt{6}}, m_1 = \frac{-1}{\sqrt{6}}, n_1 = \frac{2}{\sqrt{6}}$

and $_2 = \frac{2}{\sqrt{6}}, m_2 = \frac{1}{\sqrt{6}}, n_2 = \frac{-1}{\sqrt{6}}$

∴ angle between the lines is

$\cos\theta = |\;_1\;_2 + m_1m_2 + n_1n_2|$

$\Rightarrow \cos\theta = \left|\frac{1}{\sqrt{6}}\left(\frac{2}{\sqrt{6}}\right) + \left(\frac{-1}{\sqrt{6}}\right)\left(\frac{1}{\sqrt{6}}\right) + \left(\frac{2}{\sqrt{6}}\right)\left(\frac{-1}{\sqrt{6}}\right)\right|$

$\Rightarrow \cos\theta = \left|\frac{-1}{6}\right|$

∴ $\theta = \cos^{-1}\left(\frac{1}{6}\right)$

28. Let, $a_1, b_1, c_1 = 5, -12, 13$

$= \left|\dfrac{5(-3) + (-12)4 + 13(5)}{\sqrt{5^2 + (-12)^2 + 13^2} \cdot \sqrt{(-3)^2 + 4^2 + 5^2}}\right|$

$= \left|\dfrac{-15 - 48 + 65}{13\sqrt{2} \cdot 5\sqrt{2}}\right|$

$= \dfrac{1}{65}$

$\therefore$ $\theta = \cos^{-1}\left(\dfrac{1}{65}\right)$

29. Here, $A \equiv (1, 2, 3)$, $B \equiv (4, 5, 7)$,
$C \equiv (-4, 3, -6)$ and $D \equiv (2, 9, 2)$

$\therefore$ d.r.s of lines AB and CD are 3, 3, 4 and 6, 6, 8 respectively.

$\therefore$ $\theta = \cos^{-1}\left[\dfrac{(3)(6) + (3)(6) + (4)(8)}{\sqrt{34}.\sqrt{136}}\right]$

$= \cos^{-1}\left[\dfrac{68}{2 \times 34}\right] = 0°$

30. $\cos 45° = \left|\dfrac{2a - 3 + 10}{\sqrt{2^2 + (-1)^2 + 2^2}\ \sqrt{a^2 + 3^2 + 5^2}}\right|$

$\Rightarrow \dfrac{1}{\sqrt{2}} = \left|\dfrac{2a + 7}{3\sqrt{a^2 + 34}}\right|$

$\Rightarrow 9(a^2 + 34) = 2(2a + 7)^2$

$\Rightarrow 9a^2 + 306 = 8a^2 + 56a + 98$

$\Rightarrow a^2 - 56a + 208 = 0$

$\Rightarrow a = 4$

31. Let $a_1, b_1, c_1 = 1, -2, 1$ and

Critical Thinking

1. If α, β, λ are direction angles of any vector $\overline{OL}$, then those of $\overline{OL'}$ are $\pi - \alpha, \pi - \beta, \pi - \gamma$ respectively

$\therefore$ correct answer is option (B).

2. We know that, $^2 + m^2 + n^2 = 1$

Consider option (D)

$\left(\dfrac{2}{\sqrt{25}}\right)^2 + \left(\dfrac{3}{\sqrt{25}}\right)^2 + \left(\dfrac{4}{\sqrt{25}}\right)^2 = \dfrac{4 + 9 + 16}{25}$

$= \dfrac{29}{25} \neq 1$

$\therefore$ correct answer is option (D).

3. Consider option (B)

$\therefore$ $\cos^2\dfrac{\pi}{4} + \cos^2\dfrac{\pi}{3} + \cos^2\dfrac{\pi}{3}$

$= \dfrac{1}{2} + \dfrac{1}{4} + \dfrac{1}{4} = 1$

$\therefore$ correct answer is option (B).

4. $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\therefore$ $\cos\gamma = \pm\sqrt{1 - \left(\dfrac{14}{15}\right)^2 - \left(\dfrac{1}{3}\right)^2} = \pm\sqrt{\dfrac{8}{9} - \left(\dfrac{196}{225}\right)} = \pm\dfrac{2}{15}$

5. Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\therefore$ $\cos^2\alpha + \cos^2 60° + \cos^2 60° = 1$

$\therefore$ $\cos^2\alpha = 1 - \dfrac{1}{4} - \dfrac{1}{4} = 1 - \dfrac{1}{2} = \dfrac{1}{2}$

$\Rightarrow \cos\alpha = \pm\dfrac{1}{\sqrt{2}}$

$\Rightarrow \alpha = 45°$ or $\alpha = 135°$

6. Since, the line lies in ZOX plane, it makes an angle 90° with Y-axis

Also, line makes angle 30° and $\pi - 30°$ with positive Z-axis and 60° and $\pi - 60°$ with positive X-axis

$\therefore$ d.c.s of the required line are

$\pm\cos\alpha, \pm\cos\beta, \pm\cos\gamma$

i.e., $\pm\cos 60°, \pm\cos 0°, \pm\cos 30°$

i.e. $\pm\dfrac{1}{2}, 0, \pm\dfrac{\sqrt{3}}{2}$

7. $\cos\gamma = \sqrt{1 - \dfrac{3}{4} - \dfrac{1}{2}} = \sqrt{\dfrac{-1}{4}}$ which is not possible.

8. Let , m, n be the d.c.s of $\bar{r}$.

$= m = n$

....[$\because \alpha = \beta = \gamma \Rightarrow \cos\alpha = \cos\beta = \cos\gamma$]

Now, $^2 + m^2 + n^2 = 1$

$\Rightarrow \ = \pm\dfrac{1}{\sqrt{3}}$

9. Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\Rightarrow \cos^2\alpha + \cos^2\alpha + \cos^2\alpha = 1 \quad (\because \alpha = \beta = \gamma)$

$\Rightarrow \cos^2\alpha = \frac{1}{3} \Rightarrow \cos\alpha = \frac{1}{\sqrt{3}}$

Now, sum of d.c.s. = $\ + m + n$

$= \cos\alpha + \cos\alpha + \cos\alpha$

$= 3\cos\alpha = \sqrt{3}$

10. $\cos 2\alpha + \cos 2\beta + \cos 2\gamma$

$= 2\cos^2\alpha - 1 + 2\cos^2\beta - 1 + 2\cos^2\gamma - 1$

$= 2(\cos^2\alpha + \cos^2\beta + \cos^2\gamma) - 3$

$= 2(1) - 3 = -1$

11. $\sin^2\alpha + \sin^2\beta + \sin^2\gamma$

$= (1 - \cos^2\alpha) + (1 - \cos^2\beta) + (1 - \cos^2\gamma)$

$= 3 - (\cos^2\alpha + \cos^2\beta + \cos^2\gamma) = 3 - (1) = 2$

12. Let $\alpha = \frac{\pi}{6}$ and $\beta = \frac{\pi}{4}$

$\therefore$ $\cos\alpha = \frac{\sqrt{3}}{2}$ and $\cos\beta = \frac{1}{\sqrt{2}}$

Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\therefore$ $\frac{3}{4} + \frac{1}{2} + \cos^2\gamma = 1$

$\Rightarrow \cos^2\gamma = -\frac{1}{4}$

Square of a real number cannot be negative.

$\therefore$ option (A) is the correct answer.

13. The line makes angle θ with X–axis and Z–axis and β with Y–axis.

$\therefore$ $\ = \cos\theta, m = \cos\beta, n = \cos\theta$

$\cos^2\theta + \cos^2\beta + \cos^2\theta = 1$

$\Rightarrow 2\cos^2\theta = 1 - \cos^2\beta$

$\Rightarrow 2\cos^2\theta = \sin^2\beta$ …(i)

But $\sin^2\beta = 3\sin^2\theta$ …(ii)

From (i) and (ii), we get

$3\sin^2\theta = 2\cos^2\theta$

$\Rightarrow 3(1 - \cos^2\theta) = 2\cos^2\theta$

$\Rightarrow 3 = 5\cos^2\theta \Rightarrow \cos^2\theta = \frac{3}{5}$

14. Let the length of the line segment be r and its d.c.s be , m, n.

$\therefore$ The projections on the co-ordinate axes are r, mr, nr.

$\therefore$ r = 4, mr = 6 and nr = 12

$\therefore$ $^2r^2 + m^2r^2 + n^2r^2 = (4)^2 + (6)^2 + (12)^2$

$\Rightarrow r^2(\ ^2 + m^2 + n^2) = 16 + 36 + 144$

$\Rightarrow r^2 = 196$ ….$[\because\ ^2 + m^2 + n^2 = 1]$

$\Rightarrow r = 14$

$\therefore$ The d.c.s. of line are $\frac{4}{r}, \frac{6}{r}, \frac{12}{r}$

i.e., $\frac{2}{7}, \frac{3}{7}, \frac{6}{7}$

15. Let α, β, γ be the angles which OP makes with the co-ordinates axes,

$\therefore$ $x = r\cos\alpha, y = r\cos\beta, z = r\cos\gamma$

$\therefore$ $\cos\alpha = \frac{x}{r}; \cos\beta = \frac{y}{r}; \cos\gamma = \frac{z}{r}$

So, the direction cosines are $\frac{x}{r}, \frac{y}{r}, \frac{z}{r}$.

16. We have $\ = \cos 45° = \frac{1}{\sqrt{2}}$,

$m = \cos 60° = \frac{1}{2}$ and $n = \cos\gamma$

We know that $\ ^2 + m^2 + n^2 = 1$

$\therefore$ $\frac{1}{2} + \frac{1}{4} + n^2 = 1$

$\Rightarrow n^2 = 1 - \frac{3}{4} = \frac{1}{4} \Rightarrow n = \pm\frac{1}{2}$

$\Rightarrow \cos\gamma = \pm\frac{1}{2}$

$\bar{r} = r\left(\ \hat{i} + m\hat{j} + n\hat{k}\right)$

$\Rightarrow \bar{r} = 12\left(\frac{1}{\sqrt{2}}\hat{i} + \frac{1}{2}\hat{j} \pm \frac{1}{2}\hat{k}\right)$

17. Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\Rightarrow \cos^2\alpha + \cos^2\alpha + \cos^2\alpha = 1 \quad (\because \alpha = \beta = \gamma)$

$\Rightarrow \cos^2\alpha = \frac{1}{3} \Rightarrow \cos\alpha = \frac{1}{\sqrt{3}}$

$\therefore$ The d.c.s are $\pm\frac{1}{\sqrt{3}}, \pm\frac{1}{\sqrt{3}}, \pm\frac{1}{\sqrt{3}}$.

The magnitude of the given vector is 6.

$\therefore$ $\bar{r} = 6(\cos\alpha\,\hat{i} + \cos\beta\,\hat{j} + \cos\gamma\,\hat{k})$

$= \frac{\pm 6}{\sqrt{3}}(\hat{i} + \hat{j} + \hat{k}) = \pm 2\sqrt{3}(\hat{i} + \hat{j} + \hat{k})$

18. For a line passing through origin, d.r.s are the co-ordinates of the point.

19. D.c.s. of the line are $\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}$

$\therefore$ $\cos\alpha = \frac{1}{\sqrt{3}}, \cos\beta = \frac{1}{\sqrt{3}}, \cos\gamma = \frac{1}{\sqrt{3}}$

Hence, line is equally inclined to axes.

20. $\cos \gamma = \dfrac{c}{\sqrt{a^2 + b^2 + c^2}}$

$= \dfrac{5}{\sqrt{9+16+25}} = \dfrac{5}{5\sqrt{2}} = \dfrac{1}{\sqrt{2}}$

$\Rightarrow \gamma = \dfrac{\pi}{4}$

21. The d.r.s. of the given line are

$2 - 6, -3 + 7, 1 + 1$

i.e., $-2, 2, 1$. i.e., $2, -2, -1$

$\because$ angle α is acute, $\cos \alpha > 0$

$\Rightarrow \cos \alpha = \dfrac{2}{3}$

Thus, required d.c.s are $\dfrac{2}{3}, \dfrac{-2}{3}, \dfrac{-1}{3}$

22. $^2 + m^2 + n^2 = 1$

$\therefore \left(\dfrac{2}{7}\right)^2 + \left(\dfrac{-3}{7}\right)^2 + n^2 = 1$

$\therefore n^2 = 1 - \dfrac{13}{49} = \dfrac{36}{49}$

Let a, b, c be the d.r.s. of the line.

$\therefore$ a = 2, b = –3, c = z

Since, $n = \dfrac{c}{\sqrt{a^2+b^2+c^2}}$

$\therefore \dfrac{z}{\sqrt{4+9+z^2}} = \pm\dfrac{6}{7}$

$\Rightarrow \dfrac{z^2}{13+z^2} = \dfrac{36}{49}$

$\Rightarrow 49z^2 - 36z^2 = 13 \times 36$

$\Rightarrow z^2 = 36$

$\Rightarrow z = \pm 6$

i.e., 1, 4 – a, b + 1

d.r.s of BC are 1 –3, –2 –4, 3 – b

i.e., –2, –6, 3 – b

Since, the points A, B and C are collinear, AB || BC

$\therefore \dfrac{1}{-2} = \dfrac{4-a}{-6} = \dfrac{b+1}{3-b}$

$\Rightarrow \dfrac{4-a}{-6} = \dfrac{1}{-2}, \dfrac{b+1}{3-b} = \dfrac{1}{-2}$

$\Rightarrow 4 - a = 3, -2b - 2 = 3 - b$

$\Rightarrow a = 1, b = -5$

24. Let A ≡ (1, a, 1), B ≡ (3, –1, 2) and C ≡ (1, a^2, 1)

i.e. 2, –1 –a, 1

d.r.s of BC are 1 –3, a^2 + 1, 1 –2

i.e. –2, a^2 + 1, –1

Since, the points are collinear, AB || BC

$\therefore \dfrac{2}{-2} = \dfrac{-1-a}{a^2+1} = \dfrac{1}{-1}$

$\Rightarrow \dfrac{-1-a}{a^2+1} = -1$

$\Rightarrow a^2 + 1 = 1 + a$

$\Rightarrow a^2 - a = 0$

$\Rightarrow a(a - 1) = 0$

$\Rightarrow$ a = 0 or a = 1

25. Here, $\dfrac{3-(-2)}{1-3} = \dfrac{-6-4}{-2-(-6)} = \dfrac{-8-7}{-2-(-8)}$

If m = –n, then $= 0$

∴ $\frac{}{0} = \frac{m}{-1} = \frac{n}{1}$

∴ the d.r.s of the lines are proportional to –1, 0, 1 and 0, –1, 1

∴ angle between them is

$\cos\theta = \left|\frac{0+0+1}{\sqrt{1+0+1}\sqrt{0+1+1}}\right| = \frac{1}{2}$

∴ $\theta = \frac{\pi}{3}$

31. $+ m - n = 0$ and $^2 + m^2 - n^2 = 0$
$\Rightarrow\ + m = n$ and $^2 + m^2 = n^2$
Putting $+ m = n$ in $^2 + m^2 = n^2$, we get
$^2 + m^2 = (\ + m)^2$
$\Rightarrow 2\ m = 0 \Rightarrow\ = 0$ or $m = 0$
If $= 0$, then m = n

∴ $\frac{}{0} = \frac{m}{1} = \frac{n}{1}$

If m = 0, then $= n$

∴ $\frac{}{1} = \frac{m}{0} = \frac{n}{1}$

∴ the d.r.s of the lines are proportional to 0, 1, 1 and 1, 0, 1.

∴ $\cos\theta = \left|\frac{0(1)+1(0)+1(1)}{\sqrt{0+1+1}\sqrt{1+0+1}}\right| = \frac{1}{2}$

$\Rightarrow \theta = \cos^{-1}\left(\frac{1}{2}\right) \Rightarrow \theta = \frac{\pi}{3}$

32. Since, the three lines are mutually perpendicular

$\Rightarrow (\ _1 + \ _2 + \ _3)^2 + (m_1 + m_2 + m_3)^2 + (n_1 + n_2 + n_3)^2 = 3$

Hence, direction cosines of required line are :

The d.r.s of diagonal EB = a, a, –a
The d.r.s of diagonal AD = –a, a, a

34. As d.r.s. are proportional, the required lines are parallel to the given lines.

∴ $(\text{d.r.s.})_1 \equiv 2, 3, -6$ and $(\text{d.r.s.})_2 \equiv 3, -4, 5$

∴ $\cos\theta = \left|\frac{6-12-30}{\sqrt{49}\sqrt{50}}\right| = \frac{36}{7(5\sqrt{2})} = \frac{18\sqrt{2}}{7(5)}$

2. $\cos 2\alpha + \cos 2\beta + \cos 2\gamma$

$= 2\cos^2\alpha - 1 + 2\cos^2\beta - 1 + 2\cos^2\gamma - 1$

$= 2(\cos^2\alpha + \cos^2\beta + \cos^2\gamma) - 3 = 2(1) - 3 = -1$

3. $^2 + m^2 + n^2 = 1$

$\therefore$ $\left(\dfrac{1}{2}\right)^2 + \left(\dfrac{1}{3}\right)^2 + n^2 = 1$

$\Rightarrow n^2 = \dfrac{23}{36} \Rightarrow n = \pm\dfrac{\sqrt{23}}{6}$

4. $^2 + m^2 + n^2 = 1$

$\therefore$ $\dfrac{1}{c^2} + \dfrac{1}{c^2} + \dfrac{1}{c^2} = 1$

$\Rightarrow c^2 = 3 \Rightarrow c = \pm\sqrt{3}$

5. Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\therefore$ $\cos^2 45° + \cos^2 120° + \cos^2\theta = 1$

$\Rightarrow \cos^2\theta = 1 - \dfrac{1}{2} - \dfrac{1}{4} = \dfrac{1}{4} \Rightarrow \cos\theta = \pm\dfrac{1}{2}$

Since, θ is an acute angle.

$\therefore$ $\cos\theta = \dfrac{1}{2} \Rightarrow \theta = 60°$

6. Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\therefore$ $\cos^2 120° + \cos^2\beta + \cos^2 60° = 1$

$\Rightarrow \left(\dfrac{-1}{2}\right)^2 + \cos^2\beta + \left(\dfrac{1}{2}\right)^2 = 1$

$\Rightarrow \cos^2\beta = 1 - \dfrac{1}{4} - \dfrac{1}{4}$

$\Rightarrow \cos^2\beta = \dfrac{1}{2}$

$\Rightarrow \cos\beta = \pm\dfrac{1}{\sqrt{2}} \Rightarrow \beta = 45°$ or $135°$

7. Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\therefore$ $\cos^2\dfrac{\pi}{4} + \cos^2\dfrac{\pi}{4} + \cos^2\gamma = 1$

$\Rightarrow \cos^2\gamma = 1 - \dfrac{1}{2} - \dfrac{1}{2} = 0$

$\Rightarrow \cos\gamma = 0 \Rightarrow \gamma = \dfrac{\pi}{2}$

8. Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\therefore$ $\cos^2\left(\dfrac{\pi}{4}\right) + \cos^2\left(\dfrac{5\pi}{4}\right) + \cos^2\gamma = 1$

$\Rightarrow \cos^2\gamma = 1 - \dfrac{1}{2} - \dfrac{1}{2}$

$\Rightarrow \cos^2\gamma = 0 \Rightarrow \gamma = \dfrac{\pi}{2}$

9. $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

$\Rightarrow \cos^2 45° + \cos^2 \beta + \cos^2 \beta = 1$ ....($\because \beta = \gamma$)

$\Rightarrow 2\cos^2 \beta = 1 - \frac{1}{2} = \frac{1}{2}$

$\Rightarrow \cos^2 \beta = \frac{1}{4}$

$\therefore$ $\beta = 60° = \gamma$

$\Rightarrow \alpha + \beta + \gamma = 165°$

10. Since, $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$

$\therefore$ $\cos^2 \alpha + \cos^2 \alpha + \cos^2 \alpha = 1$ ....($\alpha = \beta = \gamma$)

$\Rightarrow 3 \cos^2 \alpha = 1$

$\Rightarrow \cos^2 \alpha = \frac{1}{3}$

$\Rightarrow \cos \alpha = \pm \frac{1}{\sqrt{3}}$

Now, $= m = n = \cos \alpha$

$\therefore$ $= m = n = \pm \frac{1}{\sqrt{3}}$

11. Since,

$\alpha = \beta = \gamma \Rightarrow \cos^2 \alpha + \cos^2 \alpha + \cos^2 \alpha = 1$

$\Rightarrow \cos \alpha = \left(\pm \frac{1}{\sqrt{3}}\right)$

So, there are four lines whose direction cosines are

$\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$, $\left(\frac{-1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$ $\left(\frac{1}{\sqrt{3}}, \frac{-1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$,

$\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{-1}{\sqrt{3}}\right)$.

12. Since, the vector is equally inclined to the co-ordinate axes,

$= m = n = \pm \frac{1}{\sqrt{3}}$

13. $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

$\Rightarrow \frac{1+\cos 2\alpha}{2} + \frac{1+\cos 2\beta}{2} + \frac{1+\cos 2\gamma}{2} = 1$

$\Rightarrow \cos 2\alpha + \cos 2\beta + \cos 2\gamma + 3 = 2$

$\Rightarrow \cos 2\alpha + \cos 2\beta + \cos 2\gamma + 1 = 0$

14. $\cos^2 \frac{\alpha}{2} + \cos^2 \frac{\beta}{2} + \cos^2 \frac{\gamma}{2} = 1$

Now, $\cos \alpha + \cos \beta + \cos \gamma$

$= 2\cos^2 \frac{\alpha}{2} - 1 + 2\cos^2 \frac{\beta}{2} - 1 + 2\cos^2 \frac{\gamma}{2} - 1$

$= 2(1) - 3 = -1$

15. Let the length of the line segment be r and its direction cosines be , m, n.

$\therefore$ The projections on the co-ordinate axes are r, mr, nr.

$\therefore$ r = 3, mr = 4 and nr = 5

$\therefore$ $^2r^2 + m^2r^2 + n^2r^2 = 3^2 + 4^2 + 5^2$

$\Rightarrow r^2 (\ ^2 + m^2 + n^2) = 9 + 16 + 25$

$\Rightarrow r^2 = 50$ ....[$\because\ ^2 + m^2 + n^2 = 1$]

$\Rightarrow r = \sqrt{50} = 5\sqrt{2}$

16. The projections on the co-ordinate axes are r, mr, nr.

$\therefore$ r = 2, mr = 3 and nr = 6

$\therefore$ $^2r^2 + m^2r^2 + n^2r^2 = 4 + 9 + 36$

$\Rightarrow r^2 (\ ^2 + m^2 + n^2) = 49$

$\Rightarrow r = 7$

17. d.r.s. of line are $-2 - 4, 1 - 3, -8 - (-5)$

i.e., $-6, -2, -3$

i.e. 6, 2, 3

18. AD is the median

$\therefore$ $D \equiv \left(\frac{\lambda-1}{2}, \frac{5+3}{2}, \frac{\mu+2}{2}\right) \equiv \left(\frac{\lambda-1}{2}, 4, \frac{\mu+2}{2}\right)$

$\therefore$ d.r.s. of AD are $\frac{\lambda-1}{2} - 2, 4 - 3, \frac{\mu+2}{2} - 5$

i.e. $\frac{\lambda-5}{2}, 1, \frac{\mu-8}{2}$ ...(i)

Since AD is equally inclined to co-ordinate axes, its d.r.s. are ±1, ±1, ±1

Option (D) satisfies (i).

19. The d.c.s. are

$\frac{1}{\sqrt{1+9+4}}, \frac{-3}{\sqrt{1+9+4}}, \frac{2}{\sqrt{1+9+4}}$

$\Rightarrow \frac{1}{\sqrt{14}}, \frac{-3}{\sqrt{14}}, \frac{2}{\sqrt{14}}$.

20. d.r.s. of line are $-2 - 4, 1 - 3, -8 + 5$

i.e., $-6, -2, -3$ i.e., 6, 2, 3

$\therefore$ The d.c.s. are $\frac{6}{7}, \frac{2}{7}, \frac{3}{7}$

21. The d.r.s of OP are 3, 12, 4

$\therefore$ The required d.c.s. are

i.e., $\frac{3}{13}, \frac{12}{13}, \frac{4}{13}$

22. Let the length of the line segment be r and its direction cosines be , m, n.

$\therefore$ The projections on the co-ordinate axes are r, mr, nr.

$\therefore$ r = 6, mr = –3 and nr = 2

$\therefore$ $^2r^2 + m^2r^2 + n^2r^2 = (6)^2 + (-3)^2 + (2)^2$

$\Rightarrow r^2(\ ^2 + m^2 + n^2) = 36 + 9 + 4$

$\Rightarrow r^2 = 49$ ....$[\because\ ^2 + m^2 + n^2 = 1]$

$\Rightarrow r = 7$

Now, d.c.s. of line are $\frac{6}{r}, \frac{-3}{r}, \frac{2}{r}$

i.e., $\frac{6}{7}, -\frac{3}{7}, \frac{2}{7}$.

23. Here, $\bar{a} = 3\hat{i} + 5\hat{j} - 2\hat{k}$, $\bar{b} = 6\hat{i} + 2\hat{j} + 3\hat{k}$

$\therefore$ Projection $= \frac{\bar{a}.\bar{b}}{|\bar{b}|} = \frac{18+10-6}{7} = \frac{22}{7}$

24. For option (C), $\frac{4-(-2)}{-3-4} \neq \frac{-3-4}{-2-(-3)}$

$\therefore$ option (C) is the correct answer.

25. Let A(5, –2, 7), B(2, 2, β), C(–1, 6, –1) be the given points

d.r.s. of AB are 2 – 5, 2 + 2, β – 7

i.e., –3, 4, β – 7

d.r.s. of BC are –1 – 2, 6 – 2, –1 – β

i.e., –3, 4, –1 – β

Since, the points are collinear

$\therefore$ AB || BC

$\therefore$ $\frac{4}{4} = \frac{\beta-7}{-1-\beta} \Rightarrow \beta - 7 = -1 - \beta \Rightarrow \beta = 3$

26. Let A (–1, 2, –3), B (4, a, 1) and C (b, 8, 5)

Since, the given points are collinear.

$\therefore$ AB || BC

$\therefore$ $\frac{4-(-1)}{b-4} = \frac{a-2}{8-a} = \frac{1-(-3)}{5-1}$

$\Rightarrow \frac{5}{b-4} = 1, \frac{a-2}{8-a} = 1$

$\Rightarrow b = 9, a = 5$

27. P(4, 5, x), Q(3, y, 4) and R(5, 8, 0)

Since, the points are collinear

$\therefore$ PQ || QR

$\therefore$ $\frac{-1}{2} = \frac{y-5}{8-y} = \frac{4-x}{-4}$

$\Rightarrow \frac{-1}{2} = \frac{y-5}{8-y}$ and $\frac{4-x}{-4} = \frac{-1}{2}$

$\Rightarrow y - 8 = 2y - 10$ and $8 - 2x = 4$

$\Rightarrow y = 2$ and $x = 2$

$\therefore$ $x + y = 4$

28. d.r.s. of AB and BC are (–2, 2, 2) and (1, –1, –1) respectively.

$\therefore$ $\frac{-2}{1} = \frac{2}{-1} = \frac{2}{-1}$

$\therefore$ the given points are collinear.

29. The d.r.s. of the diagonal of the line joining the origin to the opposite corner of cube are a – 0, a – 0, a – 0 i.e. 1, 1, 1.

30. Here, $a_1, b_1, c_1 = 1, 1, 2$ and

$a_2, b_2, c_2 = \sqrt{3} - 1, -\sqrt{3} - 1, 4$

$\therefore$ $\cos\theta = \frac{1(\sqrt{3}-1) + 1(-\sqrt{3}-1) + 2(4)}{\sqrt{1+1+4}\sqrt{(\sqrt{3}-1)^2 + (-\sqrt{3}-1)^2 + 16}}$

$= \frac{6}{\sqrt{6}\sqrt{4+4+16}} = \frac{6}{\sqrt{6}\sqrt{24}} = \frac{1}{2}$

$\therefore$ θ = 60°

31. D.r.s. are 2, 2, 1 and

7 – 3, 2 – 1, 12 – 4 ≡ 4, 1, 8

$\therefore$ $\cos\theta = \frac{2\times4 + 2\times1 + 1\times8}{\sqrt{2^2+2^2+1^2}\sqrt{4^2+1^2+8^2}} = \frac{18}{3\times9} = \frac{2}{3}$

$\therefore$ $\theta = \cos^{-1}\left(\frac{2}{3}\right)$

32. The direction ratios of AB = 1, 2, – 2 and the direction ratios of CD = 2, 3, 4

$a_1a_2 + b_1b_2 + c_1c_2 = (1)(2) + (2)(3) + (-2)(4) = 0$

$\therefore$ AB ⊥ CD $\therefore$ $\theta = \frac{\pi}{2}$

33. Putting $= -m - n$ in $^2 = m^2 + n^2$, we get

$(-m - n)^2 = m^2 + n^2$

$\Rightarrow mn = 0 \Rightarrow m = 0$ or $n = 0$

If m = 0, then $= -n$

$\therefore$ $\frac{}{-1} = \frac{m}{0} = \frac{n}{1}$

If n = 0, then $= -m$

$\therefore$ $\frac{}{-1} = \frac{m}{1} = \frac{n}{0}$

$\therefore$ $a_1, b_1, c_1 = -1, 0, 1$ and

$a_2, b_2, c_2 = -1, 1, 0$

$\therefore$ The angle between the lines is given by

$\cos\theta = \frac{1+0+0}{\sqrt{1+0+1}\sqrt{1+1+0}} = \frac{1}{2}$

$\therefore$ $\theta = \frac{\pi}{3}$

34. Let the direction ratios of the line perpendicular to both the lines be a, b, c.
The line is perpendicular to the lines with
Direction ratios –1, 2, 2 and 0, 2, 1

∴ $-a + 2b + 2c = 0$ ….(i)
$2b + c = 0$ ….(ii)
Solving (i) and (ii), we get
$\frac{a}{-2} = \frac{b}{1} = \frac{c}{-2}$

∴ The d.r.s. of the line are 2, –1, 2.

∴ The required d.c.s. of the line are $\frac{2}{3}, \frac{-1}{3}, \frac{2}{3}$.

35. The d.r.s. of the two lines are 1, –1, 2 and 2, 1, –1
Let d.r.s. of the line be a, b, c.

∴ $a - b + 2c = 0$ ….(i)
and $2a + b - c = 0$ ….(ii)
Solving (i) and (ii), we get
$\frac{a}{-1} = \frac{b}{5} = \frac{c}{3}$

∴ d.r.s. of the line are –1, 5, 3.

∴ the required d.c.s. are $\frac{-1}{\sqrt{35}}, \frac{5}{\sqrt{35}}, \frac{3}{\sqrt{35}}$.

36. If the straight line makes angles α, β, γ, δ with diagonals of a cube, then
$\cos^2\alpha + \cos^2\beta + \cos^2\gamma + \cos^2\delta = \frac{4}{3}$

∴ $\frac{1+\cos 2\alpha}{2} + \frac{1+\cos 2\beta}{2} + \frac{1+\cos 2\gamma}{2} + \frac{1+\cos 2\delta}{2} = \frac{4}{3}$

$\Rightarrow \cos 2\alpha + \cos 2\beta + \cos 2\gamma + \cos 2\delta = \frac{8}{3} - 4$

$\Rightarrow \cos 2\alpha + \cos 2\beta + \cos 2\gamma + \cos 2\delta = \frac{-4}{3}$

37. $\cos^2\alpha + \cos^2\beta + \cos^2\gamma + \cos^2\delta = \frac{4}{3}$

∴ $1 - \sin^2\alpha + 1 - \sin^2\beta + 1 - \sin^2\gamma + 1 - \sin^2\delta = \frac{4}{3}$

$\Rightarrow \sin^2\alpha + \sin^2\beta + \sin^2\gamma + \sin^2\delta = 4 - \frac{4}{3} = \frac{8}{3}$

Evaluation Test

1. $\alpha = \beta = 2\gamma$

$\Rightarrow \beta = \alpha, \gamma = \frac{\alpha}{2}$

Since, $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$

∴ $\cos^2\alpha + \cos^2\alpha + \cos^2\frac{\alpha}{2} = 1$

$\Rightarrow 2\cos^2\alpha + \frac{1+\cos\alpha}{2} = 1$

$\Rightarrow 4\cos^2\alpha + \cos\alpha - 1 = 0$

$\Rightarrow \cos\alpha = \frac{-1 \pm \sqrt{1+16}}{2(4)} = \frac{-1 \pm \sqrt{17}}{8}$

If α is acute, then cos α is positive.

∴ $\cos\alpha = \frac{\sqrt{17}-1}{8}$

2. $\cos\theta = l_1l_2 + m_1m_2 + n_1n_2$
$\sin^2\theta = 1 - \cos^2\theta$
$= 1.1 - \cos^2\theta$
$= \left(l_1^2 + m_1^2 + n_1^2\right)\left(l_2^2 + m_2^2 + n_2^2\right) - (l_1l_2 + m_1m_2 + n_1n_2)^2$

$= l_1^2l_2^2 + l_1^2m_2^2 + l_1^2n_2^2 + l_2^2m_1^2 + m_1^2m_2^2 + m_1^2n_2^2 + l_2^2n_1^2 + m_2^2n_1^2 + n_1^2n_2^2 - l_1^2l_2^2 - m_1^2m_2^2 - n_1^2n_2^2 - 2l_1l_2m_1m_2 - 2m_1m_2n_1n_2 - 2n_1n_2l_1l_2$

$= l_1^2m_2^2 - 2l_1l_2m_1m_2 + l_2^2m_1^2 + m_1^2n_2^2 - 2m_1m_2n_1n_2 + m_2^2n_1^2 + l_2^2n_1^2 - 2l_1l_2n_1n_2 + l_1^2n_2^2$

$= (l_1m_2 - l_2m_1)^2 + (m_1n_2 - m_2n_1)^2 + (n_1l_2 - n_2l_1)^2$

3. Given, A(2, 3, 7), B(–1, 3, 2), C(p, 5, r)
Let D be the midpoint of BC.

∴ $D \equiv \left(\frac{-1+p}{2}, \frac{3+5}{2}, \frac{2+r}{2}\right) \equiv \left(\frac{p-1}{2}, 4, \frac{r+2}{2}\right)$

∴ d.r.s. of AD are $\frac{p-1}{2} - 2, 4 - 3, \frac{r+2}{2} - 7$

i.e., $\frac{p-5}{2}, 1, \frac{r-12}{2}$

Since, AD is equally inclined to the axes

∴ $\frac{p-5}{2} = 1 = \frac{r-12}{2}$

$\Rightarrow p = 7, r = 14$

4. The d.r.s of AB are 3 – 1, 2 – 4, 6 – 5
i.e. 2, –2, 1
Let $a_1, b_1, c_1 = 2, -2, 1$
d.r.s. of BC are 1 – 3, 4 – 5, 5 – 3
i.e., –2, –1, 2
Let $a_2, b_2, c_2 = -2, -1, 2$
∴ $a_1a_2 + b_1b_2 + c_1c_2 = 2(-2) + (-2)(-1) + 1(2)$
$= -4 + 2 + 2 = 0$
⇒ AB and BC are perpendicular.
∴ $m\angle ABC = 90°$

5. The given equations are
$6mn - 2n\ \ + 5\ \ m = 0$, and ….(i)
$3\ \ + m + 5n = 0$
$\Rightarrow m = -3\ \ - 5n$ ….(ii)
Substituting value of m in equation (i), we get
$6(-3\ \ - 5n)n - 2n\ \ + 5\ (-3\ \ - 5n) = 0$
$\Rightarrow -18\ n - 30n^2 - 2n\ \ - 15\ ^2 - 25n\ \ = 0$
$\Rightarrow 15\ ^2 + 45\ n + 30n^2 = 0$
$\Rightarrow\ ^2 + 3\ n + 2n^2 = 0$
$\Rightarrow (\ \ + n)(\ \ + 2n) = 0$
$\Rightarrow\ \ = -n$ or $\ \ = -2n$
If $\ \ = -n$, then $m = -2n$
$\Rightarrow \frac{}{1} = \frac{n}{-1}$ and $\frac{m}{2} = \frac{n}{-1}$
$\Rightarrow \frac{}{1} = \frac{m}{2} = \frac{n}{-1}$
∴ d.r.s. of the 1st line are 1, 2, –1.
If $\ \ = -2n$, then $m = n$
$\Rightarrow \frac{}{-2} = \frac{n}{1}$ and $\frac{m}{1} = \frac{n}{1}$
$\Rightarrow \frac{}{-2} = \frac{m}{1} = \frac{n}{1}$
∴ d.r.s. of the 2nd line are –2, 1, 1.
∴ $\cos\theta = \frac{1\times(-2) + 2\times1 + (-1)\times1}{\sqrt{1^2 + 2^2 + (-1)^2}\sqrt{(-2)^2 + 1^2 + 1^2}}$
$= \frac{-2 + 2 - 1}{\sqrt{6}\sqrt{6}} = \frac{-1}{6}$
∴ $\theta = \cos^{-1}\left(\frac{-1}{6}\right)$

6. Since, $(\ \ - m)^2 \geq 0$
∴ $\ ^2 - 2\ m + m^2 \geq 0$
∴ $\ ^2 + m^2 \geq 2\ m$ ….(i)
Similarly, $m^2 + n^2 \geq 2mn$ ….(ii)
and $n^2 +\ ^2 \geq 2n$ ….(iii)
Adding (i), (ii) and (iii), we get
$2(\ ^2 + m^2 + n^2) \geq 2(\ m + mn + n\ )$
∴ $\ m + mn + n\ \leq 1$
∴ The maximum value of $\ m + mn + n\ $ is 1.

7. Let A = (a, 2, 3), B ≡ (3, b, 7) and C ≡ (–3, –2, –5)
d.r.s of AB are 3 – a, b – 2, 4
d.r.s of BC are –6, –2–b, –12
Since the points are collinear
∴ $\frac{3-a}{-6} = \frac{b-2}{-2-b} = \frac{4}{-12}$
⇒ a = 2, b = 4

8. Let the d.r.s of the line perpendicular to both the lines be a, b, c.
d.r.s of lines is 1, –1, 0 and 2, –1, 1
∴ $a - b = 0$ ….(i)
$2a - b + c = 0$ ….(ii)
On solving (i) and (ii), we get
$\frac{a}{-1} = \frac{b}{-1} = \frac{c}{1}$
∴ d.r.s of the line are –1, –1, 1
∴ the required d.c.s are $\frac{-1}{\sqrt{3}}, \frac{-1}{\sqrt{3}}, \frac{1}{\sqrt{3}}$

9. Since $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$
∴ $\cos^2\alpha + \cos^2\alpha + \cos^2\alpha = 1$ ….[∵ $\alpha = \beta = \gamma$]
$\Rightarrow 3\cos^2\alpha = 1$
$\Rightarrow \cos\alpha = \pm\frac{1}{\sqrt{3}}$
∴ $\ \ = m = n = \cos\alpha = \pm\frac{1}{\sqrt{3}}$

$\Rightarrow 3\left(x - \frac{2}{3}\right) = 2\left(y + \frac{1}{2}\right) = 3(z - 1)$
$\Rightarrow \frac{x - \frac{2}{3}}{2} = \frac{y + \frac{1}{2}}{3} = \frac{z - 1}{2}$
∴ The given line passes through $\left(\frac{2}{3}, \frac{-1}{2}, 1\right)$, and has direction ratios proportional to 2, 3, 2.
∴ The vector equation is
$\bar{r} = \left(\frac{2}{3}\hat{i} - \frac{1}{2}\hat{j} + \hat{k}\right) + \lambda(2\hat{i} + 3\hat{j} + 2\hat{k})$

9. Given cartesian equation of the line is
$6x - 2 = 3y + 1 = 1 - 2z$
$\Rightarrow 6\left(x - \frac{1}{3}\right) = 3\left(y + \frac{1}{3}\right) = -2\left(z - \frac{1}{2}\right)$
$\Rightarrow \frac{x - \frac{1}{3}}{1} = \frac{y + \frac{1}{3}}{2} = \frac{z - \frac{1}{2}}{-3}$
The given line passes through $\left(\frac{1}{3}, \frac{-1}{3}, \frac{1}{2}\right)$ and the direction ratios are proportional to 1, 2, – 3
∴ The vector equation is
$\bar{r} = \left(\frac{1}{3}\hat{i} - \frac{1}{3}\hat{j} + \frac{1}{2}\hat{k}\right) + \lambda(\hat{i} + 2\hat{j} - 3\hat{k})$

11. The given vector equation is
$\bar{r} = 3\hat{i} - 5\hat{j} + 7\hat{k} + \lambda(2\hat{i} + \hat{j} - 3\hat{k})$
∴ The line passes through (3, –5, 7) and has direction ratios 2, 1, –3
∴ The equation of line is $\frac{x - 3}{2} = \frac{y + 5}{1} = \frac{z - 7}{-3}$

12. The required lines passes through (2, –1, 1) and has d.r.s. proportional to 2, 7, –3
∴ The equation of line is
$\bar{r} = 2\hat{i} - \hat{j} + \hat{k} + \lambda(2\hat{i} + 7\hat{j} - 3\hat{k})$

13. The line is parallel to $\frac{x - 2}{3} = \frac{y - 3}{-1} = \frac{z + 1}{2}$
∴ d.r.s of line are 3, –1, 2
also, the line passes through origin
∴ The equation of line is
$\bar{r} = \lambda(3\hat{i} - \hat{j} + 2\hat{k})$

14. $\frac{2x-1}{2}=\frac{1-y}{1}=\frac{z}{3}$ $\Rightarrow \frac{x-\frac{1}{2}}{1}=\frac{y-1}{-1}=\frac{z}{3}$

$\therefore$ The direction ratios of the required line are 1, –1, 3.

Also line passes through (2, –1, 3)

$\therefore$ Equation of the line is $\frac{x-2}{1}=\frac{y+1}{-1}=\frac{z-3}{3}$

15. Let $\bar{a}$ and $\bar{b}$ be the position vectors of the points

$\therefore$ $\bar{a} = 3\hat{i} - 2\hat{j} - 5\hat{k}$ and $\bar{b} = 3\hat{i} - 2\hat{j} + 6\hat{k}$

$\therefore$ $\bar{b}-\bar{a} = 3\hat{i} - 2\hat{j} + 6\hat{k} - 3\hat{i} + 2\hat{j} + 5\hat{k}$

$= 11\hat{k}$

The vector equation of line is given by

$\bar{r} = \bar{a} + \lambda(\bar{b}-\bar{a})$

$\Rightarrow \bar{r} = 3\hat{i} - 2\hat{j} - 5\hat{k} + \lambda(11\hat{k})$

16. Let $\bar{a} = -2\hat{i}+\hat{j}+3\hat{k}$ and $\bar{b}=\hat{i}-2\hat{j}+5\hat{k}$

$\therefore$ $\bar{b}-\bar{a}=3\hat{i}-3\hat{j}+2\hat{k}$

The vector equation of the line is $\bar{r}=\bar{a}+\lambda\left(\bar{b}-\bar{a}\right)$

$\bar{r}=-2\hat{i}+\hat{j}+3\hat{k}+\lambda(3\hat{i}-3\hat{j}+2\hat{k})$

17. The equation of line passing through (x_1, y_1, z_1) and (x_2, y_2, z_2)

$\frac{x-x_1}{x_2-x_1}=\frac{y-y_1}{y_2-y_1}=\frac{z-z_1}{z_2-z_1}$

$\therefore$ The equation of line passing through (4, –5, –2) and (–1, 5, 3) is

$\frac{x-4}{-1-4}=\frac{y+5}{5+5}=\frac{z+2}{3+2}$

$\Rightarrow \frac{x-4}{1}=\frac{y+5}{-2}=\frac{z+2}{-1}$

18. The required equation of line which passes through the points (1, 2, 3) and (0, 0, 0) is

$\frac{x-1}{0-1}=\frac{y-2}{0-2}=\frac{z-3}{0-3}$

$\Rightarrow \frac{x-1}{1}=\frac{y-2}{2}=\frac{z-3}{3}$

19. The equation of the line joining the points (– 2, 4, 2) and (7, – 2, 5) is

$\frac{x+2}{7-(-2)}=\frac{y-4}{-2-4}=\frac{z-2}{5-2}$

$\Rightarrow \frac{x+2}{3}=\frac{y-4}{-2}=\frac{z-2}{1}$

20. $2x + z - 4 = 0$

$\Rightarrow 2x + z = 4$

$\Rightarrow z = 4 - 2x$ ….(i)

$2y + z = 0$

$\Rightarrow z = -2y$ ….(ii)

$\therefore$ $4 - 2x = -2y = z$ ….[From (i) and (ii)]

$\Rightarrow -2(x-2) = -2y = z$

$\Rightarrow x - 2 = y = \frac{z}{-2}$

$\Rightarrow x - 2 + 2 = y + 2 = \frac{z}{-2} + 2$

$\Rightarrow \frac{x}{1}=\frac{y+2}{1}=\frac{z-4}{-2}$

21. $a_1, b_1, c_1 = 1, 2, 2$ and $a_2, b_2, c_2 = 3, 2, 6$

$\therefore$ $\cos\theta = \left|\frac{1\times3+2\times2+2\times6}{\sqrt{1^2+2^2+2^2}\sqrt{3^2+2^2+6^2}}\right|$

$=\frac{19}{3\times7}=\frac{19}{21}$

22. $a_1, b_1, c_1 = 2, 2, -1$ and $a_2, b_2, c_2 = 1, 2, 2$

$\cos\theta = \left|\frac{2\times1+2\times2+(-1)\times2}{\sqrt{2^2+2^2+(-1)^2}\sqrt{1^2+2^2+2^2}}\right|$

$=\left|\frac{2+4-2}{3\times3}\right|=\frac{4}{9}$

$\Rightarrow \theta = \cos^{-1}\left(\frac{4}{9}\right)$

23. $a_1, b_1, c_1 = 3, -2, 0$ and $a_2, b_2, c_2 = 2, 3, 4$

$\Rightarrow \cos\theta = \left|\frac{3\times2+(-2)\times3+0\times4}{\sqrt{3^2+(-2)^2+0}.\sqrt{2^2+3^2+4^2}}\right|$

$\Rightarrow \cos\theta = 0$

$\Rightarrow \theta = \frac{\pi}{2}$

24. $a_1, b_1, c_1 = 1, 2, 3$ and $a_2, b_2, c_2 = 2, 2, -2$

$a_1a_2 + b_1b_2 + c_1c_2 = 1(2) + 2(2) + 3(-2) = 0$

$\therefore$ The lines are at right angles.

25. $a_1, b_1, c_1 = 1, 2, 3$ and $a_2, b_2, c_2 = -5, 1, 1$

$a_1a_2 + b_1b_2 + c_1c_2 = (1)(-5) + (2)(1) + (3)(1) = 0$

$\therefore$ Lines are at right angle.

26. The given equation of line is,

$\frac{x-2}{3}=\frac{y-3}{4}$; $z = 4$

$\therefore$ The line is perpendicular to Z-axis.

Hence parallel to XY-plane.

27. Line L_1: $\bar{r} = (2\hat{j} - 3\hat{k}) + \lambda(\hat{i} + 2\hat{j} + 3\hat{k})$
Line L_2: $\bar{r} = (2\hat{i} + 6\hat{j} + 3\hat{k}) + \mu(2\hat{i} + 3\hat{j} + 4\hat{k})$
L_1 and L_2 can be written in cartesian form as
L_1: $\frac{x}{1} = \frac{y-2}{2} = \frac{z+3}{3}$ and
L_2: $\frac{x-2}{2} = \frac{y-6}{3} = \frac{z-3}{4}$
The point (2, 6, 3) satisfies both the equations.
∴ it is the point of intersection.
Alternate method:
L_1: $\frac{x}{1} = \frac{y-2}{2} = \frac{z+3}{3} = \lambda$
$\Rightarrow x = \lambda, y = 2\lambda + 2, z = 3\lambda - 3.$
L_2: $\frac{x-2}{2} = \frac{y-6}{3} = \frac{z-3}{4} = \mu$
$\Rightarrow x = 2\mu + 2, y = 3\mu + 6, z = 4\mu + 3$
Co-ordinates of a point on the line L_1 are
$(\lambda, 2\lambda + 2, 3\lambda - 3)$
Co-ordinates of a point on the line L_2 are
$(2\mu + 2, 3\mu + 6, 4\mu + 3)$
They intersect. Therefore, their co-ordinates must be same.
∴ $\lambda = 2\mu + 2, 2\lambda + 2 = 3\mu + 6, 3\lambda - 3 = 4\mu + 3$
$\Rightarrow \lambda - 2\mu = 2$ ….(i)
$2\lambda - 3\mu = 4$ .....(ii)
$3\lambda - 4\mu = 6$ ….(iii)
Solving equations (i) and (ii), we get
$\lambda = 2, \mu = 0.$
Equation (i) holds true for these values.
∴ Intersection is (2, 6, 3).

28. The point (–1, –1, –1) satisfies both the equations so it is the point of intersection
Alternate method:
Let $\frac{x-1}{2} = \frac{y-2}{3} = \frac{z-3}{4} = \lambda$
$\Rightarrow x = 1 + 2\lambda, y = 2 + 3\lambda, z = 3 + 4\lambda.$
Let $\frac{x-4}{5} = \frac{y-1}{2} = \frac{z}{1} = \mu$
$\Rightarrow x = 4 + 5\mu, y = 1 + 2\mu, z = \mu$
Co-ordinates of a point on the first line are
$(1 + 2\lambda, 2 + 3\lambda, 3 + 4\lambda)$
Co-ordinates of a point on the second line are
$(4 + 5\mu, 1 + 2\mu, \mu)$
They intersect. Therefore, their co-ordinates must be same.
∴ $1 + 2\lambda = 4 + 5\mu, 2 + 3\lambda = 1 + 2\mu, 3 + 4\lambda = \mu$
$\Rightarrow 2\lambda - 5\mu = 3$ ….(i)
$3\lambda - 2\mu = -1$ .....(ii)
$4\lambda - \mu = -3$ ….(iii)
Solving equations (ii) and (iii), we get
$\lambda = -1, \mu = -1.$
Equation (i) holds true for these values.
∴ Intersection is (– 1, – 1, – 1).

29. The point (4, 0, –1) satisfies both equations.
∴ The two lines intersect at (4, 0, –1)
Alternate method:
Let $\frac{x-1}{3} = \frac{y-1}{-1} = \lambda; z = -1$
$\Rightarrow$ general point on this line is
$(3\lambda + 1, -\lambda + 1, -1)$
Also, $\frac{x-4}{2} = \frac{z+1}{3} = \mu; y = 0$
$\Rightarrow$ general point on this line is
$(2\mu + 4, 0, 3\mu - 1)$
For $\lambda = 1$ and $\mu = 0$, they have a common point on them. i.e., (4, 0, –1)

30. Co-ordinate of any point on Y-axis is
$x = 0, z = 0$ i.e. $(0, y, 0)$
∴ The foot of perpendicular from the point (α, β, γ) on Y-axis is $(0, \beta, 0)$

31. Any point on Z-axis is (0, 0, z)
∴ The foot of perpendicular from the point (a, b, c) on Z-axis is (0, 0, c)

32. Distance from X-axis = $\sqrt{y^2 + z^2} = \sqrt{b^2 + c^2}$

33. Distance = $\sqrt{y^2 + z^2} = \sqrt{9 + 16} = 5$

34. Distance from Z-axis = $\sqrt{x^2 + y^2} = 5$

35. Distance from Y-axis = $\sqrt{1 + 9} = \sqrt{10}$

36. Let $p(\bar{\alpha}) = 2\hat{i} + \hat{j} + \hat{k}$
Comparing the equation of line with
$\bar{r} = \bar{a} + \lambda\bar{b}$, we get
$\bar{a} = -\hat{i} + 2\hat{j} + 2\hat{k}$, $\bar{b} = 3\hat{i} + \hat{k}$
Now,
$\bar{\alpha} - \bar{a} = 3\hat{i} - \hat{j} - \hat{k}$
$|\bar{\alpha} - \bar{a}| = \sqrt{3^2 + (-1)^2 + (-1)^2}$
$= \sqrt{11}$
$(\bar{\alpha} - \bar{a}).\bar{b} = (3\hat{i} - \hat{j} - \hat{k}).(3\hat{i} + \hat{k})$
$= 9 - 1$
$= 8$

∴ The distance of point from the line is

$$d = \sqrt{\left|\bar{\alpha} - \bar{a}\right|^2 - \left[\frac{(\bar{\alpha} - \bar{a}).\bar{b}}{|\bar{b}|}\right]^2}$$

$$= \sqrt{11 - \frac{8\times 8}{10}} = \sqrt{\frac{46}{10}} = \sqrt{\frac{23}{5}}$$

37. Let A ≡ (2, 4, – 1)

Let $\frac{x+5}{1} = \frac{y+3}{4} = \frac{z-6}{-9} = \lambda$

Any point on the line is

P ≡ (λ – 5, 4λ – 3, – 9 λ + 6)

The d.r.s. of the line AP are

2 – λ + 5, 4 – 4λ + 3, – 1 + 9λ – 6

Since, AP is perpendicular to the given line,

1(2 – λ + 5) + 4(4 – 4λ + 3) – 9(–1 + 9λ – 6) = 0

∴ 2 – λ + 5 + 16 – 16λ + 12 + 9 – 81λ + 54 = 0

∴ 98 – 98λ = 0 ⇒ λ = 1

The point P is (1 – 5, 4 – 3, –9 + 6) ≡ (–4, 1, –3)

$$AP = \sqrt{(2-(-4))^2 + (4-1)^2 + (-1+3)^2}$$

$$= \sqrt{36+9+4} = 7$$

Alternate method:

Since the point is (2, 4, –1)

∴ a = 2, b = 4, c = –1

Given equation of line is

$$\frac{x+5}{1} = \frac{y+3}{4} = \frac{z-6}{-9}$$

Comparing with

$$\frac{x-x_1}{a} = \frac{y-y_1}{b} = \frac{z-z_1}{c},$$

$x_1 = -5$, $y_1 = -3$, $z_1 = 6$

d.r.s. are 1, 4, –9

∴ d.c.s. are $\frac{1}{\sqrt{98}}, \frac{4}{\sqrt{98}}, \frac{-9}{\sqrt{98}}$

∴ Perpendicular distance of point from the line is

$$\sqrt{\left[(a-x_1)^2 + (b-y_1)^2 + (c-z_1)^2\right] - \left[(a-x_1) + (b-y_1)m + (c-z_1)n\right]^2}$$

$$= \sqrt{\left[(2+5)^2 + (4+3)^2 + (-1-6)^2\right] - \left[(2+5)\frac{1}{\sqrt{98}} + (4+3)\frac{4}{\sqrt{98}} + (-1-6)\frac{-9}{\sqrt{98}}\right]^2}$$

$$= \sqrt{49 + 49 + 49 - \frac{98\times 98}{98}}$$

$= \sqrt{49}$

= 7

38. $\frac{x}{1} = \frac{y-1}{2} = \frac{z-2}{3}$

Any point on the line is P (λ, 2λ + 1, 3λ + 2)

Given point is A (1, 6, 3)

∴ the d.r.s of the line AP are

λ – 1, 2λ + 1 – 6, 3λ + 2 – 3

⇒ λ – 1, 2λ – 5, 3λ – 1

Since, AP is perpendicular to the given line,

(1)(λ – 1) + (2)(2λ – 5) + (3)(3λ – 1) = 0

⇒ λ – 1 + 4 λ – 10 + 9λ – 3 = 0

⇒ 14λ – 14 = 0 ⇒ λ = 1

∴ P ≡ (1, 3, 5)

∴ $AP = \sqrt{(1-1)^2 + (6-3)^2 + (3-5)^2} = \sqrt{13}$

40. First line passes through

$(x_1, y_1, z_1) = (4, -1, 0)$ and has d.r.s

$a_1, b_1, c_1 = 1, 2, -3$

Second line passes through

$(x_2, y_2, z_2) = (1, -1, 2)$ and has d.r.s

$a_2, b_2, c_2 = 2, 4, -5$

∴ Shortest distance between them is

$$d = \left|\frac{\begin{vmatrix} x_2-x_1 & y_2-y_1 & z_2-z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix}}{\sqrt{(b_1c_2-b_2c_1)^2 + (c_1a_2-c_2a_1)^2 + (a_1b_2-a_2b_1)^2}}\right|$$

$$\Rightarrow d = \left|\frac{\begin{vmatrix} 1-4 & -1+1 & 2-0 \\ 1 & 2 & -3 \\ 2 & 4 & -5 \end{vmatrix}}{\sqrt{(-10+12)^2 + (-6+5)^2 + (4-4)^2}}\right|$$

$$= \left|\frac{-3(2)+0+2(0)}{\sqrt{5}}\right| = \frac{6}{\sqrt{5}}$$

Alternate method:

Shortest distance between the lines

$\bar{r}_1 = \bar{a}_1 + \lambda\bar{b}_1$ and $\bar{r}_2 = \bar{a}_2 + \mu\bar{b}_2$ is given by

$$d = \left|\frac{(\bar{a}_2 - \bar{a}_1)\cdot(\bar{b}_1\times\bar{b}_2)}{|\bar{b}_1\times\bar{b}_2|}\right|$$

Here $\bar{a}_1 = 4\hat{i} - \hat{j}$, $\bar{a}_2 = \hat{i} - \hat{j} + 2\hat{k}$

$\bar{b}_1 = \hat{i} + 2\hat{j} - 3\hat{k}$, $\bar{b}_2 = 2\hat{i} + 4\hat{j} - 5\hat{k}$

Now $\bar{a}_2 - \bar{a}_1 = -3\hat{i} + 2\hat{k}$

$$\bar{b}_1\times\bar{b}_2 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & -3 \\ 2 & 4 & -5 \end{vmatrix} = 2\hat{i} - \hat{j}$$

$\therefore$ Shortest distance (d) $= \left|\dfrac{\left(-3\hat{i}+2\hat{k}\right).\left(2\hat{i}-\hat{j}\right)}{\sqrt{4+1+0}}\right|$

$= \left|-\dfrac{6}{\sqrt{5}}\right|$

$= \dfrac{6}{\sqrt{5}}$

41. Here, $(x_1, y_1, z_1) = (1, -1, 0)$

$(x_2, y_2, z_2) = (2, -1, 0)$

$(a_1, b_1, c_1) = (2, 0, 1)$

$(a_2, b_2, c_2) = (1, -1, -1)$

$$d = \left|\frac{\begin{vmatrix} 2-1 & -1+1 & 0-0 \\ 2 & 0 & 1 \\ 1 & -1 & -1 \end{vmatrix}}{\sqrt{(0+1)^2+(1+2)^2+(-2-0)^2}}\right|$$

$= \left|\dfrac{1(0+1)}{\sqrt{14}}\right|$

$= \dfrac{1}{\sqrt{14}}$

42. Here, $(x_1, y_1, z_1) = (3, 5, 7)$

$(a_2, b_2, c_2) = (7, -6, 1)$

$$d = \left|\frac{\begin{vmatrix} -4 & -6 & -8 \\ 1 & -2 & 1 \\ 7 & -6 & 1 \end{vmatrix}}{\sqrt{(-2+6)^2+(7-1)^2+(-6+14)^2}}\right|$$

$= \left|\dfrac{-16-36-64}{2\sqrt{29}}\right|$

$= \dfrac{116}{2\sqrt{29}}$

$= 2\sqrt{29}$

43. Here, $(x_1, y_1, z_1) = (1, 2, 3)$

$(x_2, y_2, z_2) = (2, 4, 5)$

$(a_1, b_1, c_1) = (2, 3, 4)$

$(a_2, b_2, c_2) = (3, 4, 5)$

$$d = \left|\frac{\begin{vmatrix} 2-1 & 4-2 & 5-3 \\ 2 & 3 & 4 \\ 3 & 4 & 5 \end{vmatrix}}{\sqrt{(15-16)^2+(12-10)^2+(8-9)^2}}\right|$$

$= \left|\dfrac{1(-1)-2(-2)+2(-1)}{\sqrt{(-1)^2+(2)^2+(-1)^2}}\right|$

$= \dfrac{1}{\sqrt{6}}$

44. The given equation of lines are

$x+a = 2y = -12z$ and $x = y+2a = 6z-6a$

i.e., $\dfrac{x+a}{-12} = \dfrac{y}{-6} = \dfrac{z}{1}$ and $\dfrac{x}{6} = \dfrac{y+2a}{6} = \dfrac{z-a}{1}$

$$d = \left|\frac{\begin{vmatrix} -a & 2a & -a \\ -12 & -6 & 1 \\ 6 & 6 & 1 \end{vmatrix}}{\sqrt{(-6-6)^2+(6+12)^2+(-72+36)^2}}\right|$$

$= \left|\dfrac{-a(-12)-2a(-12-6)-a(-72+36)}{\sqrt{12^2+18^2+36^2}}\right|$

$= \dfrac{12a+36a+36a}{\sqrt{1764}} = \dfrac{84a}{42} = 2a$

45. Since, the line intersect each other,

$$\therefore \begin{vmatrix} x_2-x_1 & y_2-y_1 & z_2-z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix}$$

$$\Rightarrow \begin{vmatrix} 2-1 & 2-k & -1+1 \\ 3 & 6 & -2 \\ -1 & 4 & -1 \end{vmatrix} = 0$$

$\Rightarrow 1(-6+8) - (2-k)(-3-2) + 0 = 0$

$\Rightarrow 2 + (2-k)5 = 0$

$\Rightarrow 12 - 5k = 0$

$\Rightarrow k = \dfrac{12}{5}$

46. Comparing the given equations with

$\bar{r} = \bar{a}_1 + \lambda\bar{b}_1$ and

$\bar{r} = \bar{a}_2 + \lambda\bar{b}_2$ we get

$\bar{a}_1 = -\hat{i}+3\hat{j}+\hat{k}$, and $\bar{a}_2 = 3\hat{i}+\hat{j}$

$\bar{b}_1 = \bar{b}_2 = \bar{b} = 5\hat{i}+\hat{j}+4\hat{k}$

$\therefore$ The lines are parallel

$\bar{a}_2 - \bar{a}_1 = 4\hat{i} - 2\hat{j} - \hat{k}$

$$(\bar{a}_2 - \bar{a}_1) \times \bar{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 4 & -2 & -1 \\ 5 & 1 & 4 \end{vmatrix}$$

$$= \hat{i}(-8+1) - \hat{j}(16+5) + \hat{k}(4+10)$$

$$= -7\hat{i} - 21\hat{j} + 14\hat{k}$$

$\therefore$ The distance between the parallel lines is

$$d = \left| \frac{(\bar{a}_2 - \bar{a}_1) \times \bar{b}}{|\bar{b}|} \right|$$

$\therefore$ $d = \left| \dfrac{-7\hat{i} - 21\hat{j} + 14\hat{k}}{\sqrt{25+1+16}} \right|$

$$= \sqrt{\frac{49+441+196}{42}} = \frac{7}{\sqrt{3}}$$

Critical Thinking

2. The d.r.s. of line are 3, 2, –8 and its passes through (5, 2, –4)

$\therefore$ the vector equation of line is

$\bar{r} = 5\hat{i} + 2\hat{j} - 4\hat{k} + \lambda(3\hat{i} + 2\hat{j} - 8\hat{k})$

The cartesian equation of the line is

$\dfrac{x-5}{3} = \dfrac{y-2}{2} = \dfrac{z+4}{-8}$

3. The line passes through (2, – 3, 4) and has direction ratios proportional to 3, 4, –5.

$\therefore$ the cartesian equation of the line is

$\dfrac{x-2}{3} = \dfrac{y+3}{4} = \dfrac{z-4}{-5}$

$\therefore$ $4x - 8 = 3y + 9$ and $-5y - 15 = 4z - 16$

i.e., $4x - 3y = 17$ and $5y + 4z = 1$

4. Line || Z-axis

$\therefore$ d.r.s. are 0, 0, 1

$\therefore$ Required equation is

$\bar{r} = 2\hat{i} + 3\hat{j} + 4\hat{k} + \lambda(0.\hat{i} + 0.\hat{j} + 1\hat{k})$

$\Rightarrow \bar{r} = (2\hat{i} + 3\hat{j} + 4\hat{k}) + \lambda\hat{k}$

5. Let a, b, c, be the direction ratios of the required line.

Since, the line is perpendicular to the lines with d.r.s 3, –16, 7 and 3, 8, –5

$\therefore$ $3a - 16b + 7c = 0$ ….(i)

and $3a + 8b - 5c = 0$ ….(ii)

$\Rightarrow \dfrac{a}{2} = \dfrac{b}{3} = \dfrac{c}{6}$ ….[From (i) and (ii)]

$\therefore$ Equation of the required line is

$\dfrac{x-1}{2} = \dfrac{y-2}{3} = \dfrac{z+4}{6}$

6. Let A ≡ (–1, 3, –2) and B ≡ (–5, 3, –6)

Midpoint of AB = (–3, 3,–4)

Since the line is equally inclined to the axis

$\therefore$ d.r.s. are 1, 1, 1.

$\therefore$ equation of the line is

$\dfrac{x+3}{1} = \dfrac{y-3}{1} = \dfrac{z+4}{1}$

$\Rightarrow x + 3 = y - 3 = z + 4$

7. Co-ordinates of G ≡ (1, 1, 1)

D.r.s of OG are 1, 1, 1 and it passes through (0, 0, 0)

$\therefore$ equation of line OG is

$\dfrac{x-0}{1} = \dfrac{y-0}{1} = \dfrac{z-0}{1}$

$\Rightarrow x = y = z$

8. $\bar{r} = (3\hat{i} + 4\hat{j} + \hat{k}) + t(2\hat{i} - 3\hat{j} + 5\hat{k})$

$= (3 + 2t)\hat{i} + (4 - 3t)\hat{j} + (1 + 5t)\hat{k}$

When the line crosses XY plane $\Rightarrow Z = 0$

$\therefore$ $1 + 5t = 0 \Rightarrow t = \dfrac{-1}{5}$

9. The equation of the line joining the points (– 2, 1, – 8) and (a, b, c) is

$\dfrac{x-(-2)}{a+2} = \dfrac{y-1}{b-1} = \dfrac{z-(-8)}{c+8}$

The above line is in the direction of vector $6\hat{i} + 2\hat{j} + 3\hat{k}$

$\therefore$ $a + 2 = 6$, $b - 1 = 2$, $c + 8 = 3$

$\Rightarrow a = 4$, $b = 3$ and $c = -5$

10. The equation of the line joining the points (2, 2, 1) and (5, 1, – 2) is

$\dfrac{x-2}{5-2} = \dfrac{y-2}{1-2} = \dfrac{z-1}{-2-1}$

$\Rightarrow \dfrac{x-2}{3} = \dfrac{y-2}{-1} = \dfrac{z-1}{-3}$ ….(i)

Since, x co-ordinate is 4

∴ It satisfies (i)

∴ $\frac{4-2}{3} = \frac{y-2}{-1} = \frac{z-1}{-3}$

∴ $\frac{z-1}{-3} = \frac{2}{3}$

∴ $3z - 3 = -6$

∴ $z = -1$

11. The equation of the line joining the points (3, 4, 1) and (5, 1, 6) is

$\frac{x-3}{5-3} = \frac{y-4}{1-4} = \frac{z-1}{6-1}$

$\Rightarrow \frac{x-3}{2} = \frac{y-4}{-3} = \frac{z-1}{5}$ ....(i)

Co-ordinate of any point on the XY-plane is $z = 0$

∴ $\frac{x-3}{2} = \frac{y-4}{-3} = \frac{0-1}{5}$

∴ $\frac{x-3}{2} = \frac{-1}{5}$

$\Rightarrow x - 3 = -\frac{2}{5}$

$\Rightarrow x = \frac{13}{5}$

Also we have $\frac{y-4}{-3} = -\frac{1}{5}$

$\Rightarrow y - 4 = \frac{3}{5} \Rightarrow y = \frac{23}{5}$

∴ The line meets the XY-plane at $\left(\frac{13}{5}, \frac{23}{5}, 0\right)$

12. Here, $(x_1, y_1, z_1) = (3, -6, 10)$ and $|r| = \sqrt{17}$

$x_2 = x_1 + \ r = 3 - \frac{2}{\sqrt{17}}\left(\sqrt{17}\right) = 1$

$y_2 = y_1 + mr = -6 + \frac{3}{\sqrt{17}}\left(\sqrt{17}\right) = -3$

$z_2 = z_1 + nr = 10 - \frac{2}{\sqrt{17}}\left(\sqrt{17}\right) = 8$

13. The d.r.s. of the two lines are 2, –1, 1 and 4, –1, λ

Since, the lines are perpendicular

$a_1a_2 + b_1b_2 + c_1c_2 = 0$

$\Rightarrow 2(4) + (-1)(-1) + (1)(\lambda) = 0$

$\Rightarrow \lambda + 9 = 0$

$\Rightarrow \lambda = -9$

14. $a_1, b_1, c_1 = 2, p, 5$ and

$a_2, b_2, c_2 = 3, -p, p$

Since, the given lines are perpendicular.

∴ $(2)(3) + p(-p) + (5)(p) = 0$

$\Rightarrow 6 - p^2 + 5p = 0$

$\Rightarrow p^2 - 5p - 6 = 0$

$\Rightarrow (p - 6)(p + 1) = 0$

$\Rightarrow p = 6$ or $p = -1$

15. $a_1, b_1, c_1 = 2, \lambda, 0$ and $a_2, b_2, c_2 = 1, 3, 1$

Since, the lines are perpendicular.

$a_1a_2 + b_1b_2 + c_1c_2 = 0$

∴ $2(1) + \lambda(3) + 0(1) = 0$

∴ $2 + 3\lambda = 0$

∴ $\lambda = \frac{-2}{3}$

16. Given lines pass through common point (1, 2, 3)

Also, $a_1a_2 + b_1b_2 + c_1c_2 = 2(3) + 3(4) + 4(5) \neq 0$

∴ lines are intersecting

17. Let $\bar{r} = x\hat{i} + y\hat{j} + z\hat{k}$, then

$\bar{r} \times \bar{a} = \bar{b} \times \bar{a} \Rightarrow (\bar{r} - \bar{b}) \times \bar{a} = 0$

∴ $\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x-2 & y & z+1 \\ 1 & 1 & 0 \end{vmatrix} = 0$

$\Rightarrow (-z-1)\hat{i} - (-z-1)\hat{j} + (x - y - 2)\hat{k} = 0$

$\Rightarrow z = -1, x - y = 2$ ....(i)

Now, $\bar{r} \times \bar{b} = \bar{a} \times \bar{b} \Rightarrow (\bar{r} - \bar{a}) \times \bar{b} = 0$

∴ $\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x-1 & y-1 & z \\ 2 & 0 & -1 \end{vmatrix} = 0$

$\Rightarrow (1 - y)\hat{i} - (1 - x - 2z)\hat{j} + (2 - 2y)\hat{k} = 0$

$\Rightarrow y = 1, x + 2z = 1$ ....(ii)

Solving (i) and (ii), we get

$x = 3, y = 1, z = -1$

18. Let P (x, y, z) be any point

Now by the given condition, we get

$\left[\sqrt{(x^2+y^2)}\right]^2 + \left[\sqrt{(y^2+z^2)}\right]^2 + \left[\sqrt{(z^2+x^2)}\right]^2 = 36$

i.e., $x^2 + y^2 + z^2 = 18$

∴ The distance from origin

$= \sqrt{x^2 + y^2 + z^2} = \sqrt{18} = 3\sqrt{2}$

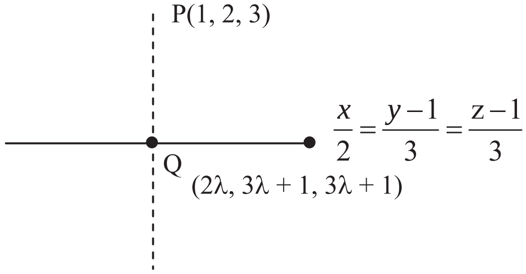
19. Let $\frac{x}{2} = \frac{y-1}{3} = \frac{z-1}{3} = \lambda$

$\therefore$ Any general point on this line is

Q $(2\lambda, 3\lambda+1, 3\lambda+1)$

Let P $\equiv (1, 2, 3)$.

$\therefore$ D.r.s. of PQ are $2\lambda - 1, 3\lambda - 1, 3\lambda - 2$



Since, PQ is perpendicular to given line

$\therefore$ $a_1a_2 + b_1b_2 + c_1c_2 = 0$.

$\therefore$ $(2\lambda - 1)2 + (3\lambda - 1)3 + (3\lambda - 2)3 = 0$

$\therefore$ $\lambda = \frac{1}{2}$

$\therefore$ $Q \equiv \left(1, \frac{5}{2}, \frac{5}{2}\right)$

20. Let $\frac{x}{2} = \frac{y-2}{3} = \frac{z-3}{4} = \lambda$

Any point on the line is

$P \equiv (2\lambda, 3\lambda + 2, 4\lambda + 3)$

Given point is A $(3, -1, 11)$

$\therefore$ The d.r.s. of AP are

$2\lambda - 3, 3\lambda + 3, 4\lambda - 8$

Since, the line AP is perpendicular to the given line

$\therefore$ $2(2\lambda - 3) + 3(3\lambda + 3) + 4(4\lambda - 8) = 0$

$\Rightarrow 29\lambda - 29 = 0$

$\Rightarrow \lambda = 1$

$\therefore$ $P \equiv (2, 5, 7)$

21. Let $\frac{x+3}{5} = \frac{y-1}{2} = \frac{z+4}{3} = \lambda$

$\therefore$ Any general point on this line is

Q $(5\lambda - 3, 2\lambda + 1, 3\lambda - 4)$

Let P $\equiv (0, 2, 3)$.

$\therefore$ The d.r.s. of PQ are $5\lambda - 3, 2\lambda - 1, 3\lambda - 7$

Since, PQ is perpendicular to given line

$\therefore$ $5(5\lambda - 3) + 2(2\lambda - 1) + 3(3\lambda - 7) = 0$

$\Rightarrow \lambda = 1$

$\therefore$ $Q \equiv (2, 3, -1)$

22. Distance of point $P(\overline{\alpha})$ from the line $\overline{r} = \overline{a} + \lambda\overline{b}$ is

$$\sqrt{\left|\overline{\alpha} - \overline{a}\right|^2 - \left[\frac{(\overline{\alpha} - \overline{a}).\overline{b}}{|\overline{b}|}\right]^2}$$

Given, $P(\overline{\alpha}) \equiv (0,0,0)$ and

$\overline{t} = 4\hat{i} + 2\hat{j} + 4\hat{k} + \lambda(3\hat{i} + 4\hat{j} - 5\hat{k})$

$\therefore$ $\overline{a} = 4\hat{i} + 2\hat{j} + 4\hat{k}$ and

$\overline{b} = 3\hat{i} + 4\hat{j} - 5\hat{k}$

$\therefore$ Distance of point

$$= \sqrt{\left[(-4)^2 + (-2)^2 + (-4)^2\right] - \left[\frac{-4(3) - 2(4) - 4(-5)}{\sqrt{3^2 + 4^2 + (-5)^2}}\right]^2}$$

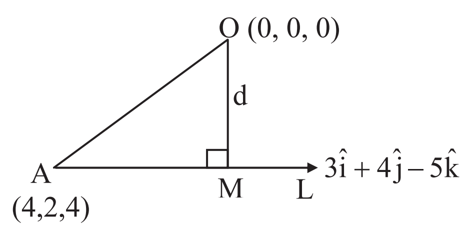
$= \sqrt{16 + 4 + 16}$

$= 6$

Alternate method:

$\overline{AO} = 4\hat{i} + 2\hat{j} + 4\hat{k}$

$\therefore$ $OA = \sqrt{16 + 4 + 16} = 6$



AM = Projection of OA on AL

$= \frac{12 + 8 - 20}{\sqrt{9 + 16 + 25}} = 0$

In right angled ΔOAM, $d^2 = OA^2 - AM^2$

$\Rightarrow d^2 = 6^2 - 0 \Rightarrow d = 6$

23. Any point on the line $\frac{x-1}{2} = \frac{y}{9} = \frac{z}{5} = \lambda$ is

P $(2\lambda + 1, 9\lambda, 5\lambda)$

Let A $\equiv (5, 4, -1)$

The d.r.s. of the line AP are

$2\lambda + 1 - 5, 9\lambda - 4, 5\lambda - (-1)$

$\Rightarrow 2\lambda - 4, 9\lambda - 4, 5\lambda + 1$

Since, AP is perpendicular to the given line

$\therefore$ $2(2\lambda - 4) + 9(9\lambda - 4) + 5(5\lambda + 1) = 0$

$\Rightarrow 4\lambda - 8 + 81\lambda - 36 + 25\lambda + 5 = 0$

$\Rightarrow \lambda = \frac{39}{110}$

$\therefore$ $P \equiv \left(\frac{188}{110}, \frac{351}{110}, \frac{195}{110}\right)$

$\therefore$ $AP = \sqrt{\left(5-\frac{188}{110}\right)^2 + \left(4-\frac{351}{110}\right)^2 + \left(-1-\frac{195}{110}\right)^2}$

$= \frac{1}{\sqrt{110^2}}\sqrt{131044+7921+93025}$

$= \sqrt{\frac{2109}{110}}$

24. Let $\frac{x-11}{10} = \frac{y+2}{-4} = \frac{z+8}{-11} = \lambda$

Any point on the line is

P(10λ + 11, – 4 λ – 2, – 11λ – 8)

Let A ≡ (2, – 1, 5)

The d.r.s. of the line AP are

10λ + 11 – 2, – 4λ – 2 – (– 1), – 11λ – 8 – 5

i.e., 10λ + 9, – 4λ – 1, –11λ – 13

Since, AP is perpendicular to the given line

$\therefore$ 10(10λ + 9) – 4(– 4λ – 1) – 11(– 11λ – 13) = 0

⇒ 100λ + 90 + 16λ + 4 + 121λ + 143 = 0

⇒ 237λ + 237 = 0 ⇒ λ = – 1

$\therefore$ P ≡ (1, 2, 3)

$\therefore$ $AP = \sqrt{(2-1)^2 + (-1-2)^2 + (5-3)^2}$

$= \sqrt{1+9+4} = \sqrt{14}$

25. The given equation of line is

$\frac{x-1}{2} = \frac{y+1}{-3} = z$

The co-ordinates of any point on the given line are (2λ + 1, – 3λ – 1, λ)

The distance of this point from the point (1, – 1, 0) is $4\sqrt{14}$.

$\therefore$ $(2\lambda)^2 + (-3\lambda)^2 + (\lambda)^2 = (4\sqrt{14})^2 \Rightarrow \lambda = \pm 4$

$\therefore$ The co-ordinates of the required point are (9, – 13, 4) or (– 7, 11, – 4)

The point nearer to the origin is (–7, 11, –4).

26. The equation of the line joining the points A(2, – 3, – 1) and B(8, – 1, 2) is

$\frac{x-2}{8-2} = \frac{y+3}{-1+3} = \frac{z+1}{2+1}$

$\Rightarrow \frac{x-2}{6} = \frac{y+3}{2} = \frac{z+1}{3} = \lambda$

Any point on the line is

(6λ + 2, 2λ – 3, 3λ – 1)

The distance of this point from the point A(2, – 3, – 1) is 14 units.

$\therefore$ $(6\lambda)^2 + (2\lambda)^2 + (3\lambda)^2 = (14)^2$

$\therefore$ $49\lambda^2 = 196$

$\therefore$ $\lambda^2 = 4 \Rightarrow \lambda = \pm 2$

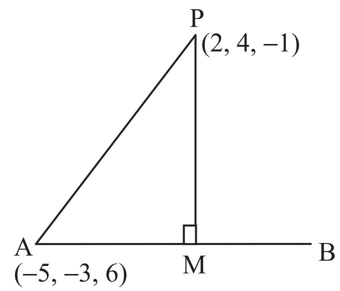
$\therefore$ The points are (14, 1, 5) and (– 10, – 7, – 7)

$\therefore$ The point nearer to the origin is (–10, –7, –7).

27. Any point on the line

$\frac{x+5}{1} = \frac{y+3}{4} = \frac{z-6}{-9} = \lambda$ is given by

M ≡ (λ – 5, 4λ – 3, – 9λ + 6).



The d.r.s. of PM are

λ – 7, 4λ – 7, –9λ + 7

Since, PM is perpendicular to AM,

$\therefore$ 1(λ – 7) + 4 (4λ – 7) – 9(–9λ + 7) = 0

⇒ 98λ – 98 = 0 ⇒ λ = 1

$\therefore$ M = (– 4, 1, – 3)

Now, Equation of perpendicular passing through P(2, 4, –1) and M(–4, 1, –3) is

$\frac{x-2}{-4-2} = \frac{y-4}{1-4} = \frac{z+1}{-3+1}$

$\Rightarrow \frac{x-2}{6} = \frac{y-4}{3} = \frac{z+1}{2}$

28. The direction ratios are same. Also both lines pass through origin.

$\therefore$ Given lines are coinciding lines.

29. The lines can be rewritten as

$\bar{r} = (\hat{i} - 2\hat{j} + 3\hat{k}) + t(-\hat{i} + \hat{j} - \hat{k})$ and

$\bar{r} = (\hat{i} - \hat{j} - \hat{k}) + s(\hat{i} + 2\hat{j} - 2\hat{k})$

Here, $(x_1, y_1, z_1) = (1, -2, 3)$

$(x_2, y_2, z_2) = (1, -1, -1)$

$(a_1, b_1, c_1) = (-1, 1, -1)$

$(a_2, b_2, c_2) = (1, 2, -2)$

$\therefore$ Shortest distance (d)

$$d = \left| \frac{\begin{vmatrix} 1-1 & -1+2 & -1-3 \\ -1 & 1 & -1 \\ 1 & 2 & -2 \end{vmatrix}}{\sqrt{(-2+2)^2 + (-1-2)^2 + (-2-1)^2}} \right|$$

$$= \left| \frac{0-1(3)-4(-3)}{3\sqrt{2}} \right| = \frac{9}{3\sqrt{2}} = \frac{3}{\sqrt{2}}$$

30. The equations of the given lines are

$\bar{r} = (-\hat{i}+\hat{j}-\hat{k})+\lambda(\hat{i}+\hat{j}-\hat{k})$ and

$\bar{r} = \left(\hat{i}-\hat{j}+2\hat{k}\right)+\mu\left(-\hat{i}+2\hat{j}+\hat{k}\right)$

Here, $(x_1, y_1, z_1) = (-1, 1, -1)$

$(x_2, y_2, z_2) = (1, -1, 2)$

$(a_1, b_1, c_1) = (1, 1, -1)$

$(a_2, b_2, c_2) = (-1, 2, 1)$

∴ Shortest Distance (d)

$$= \left|\frac{\begin{vmatrix}1+1 & -1-1 & 2+1\\ 1 & 1 & -1\\ -1 & 2 & 1\end{vmatrix}}{\sqrt{(1+2)^2+(1-1)^2+(2+1)^2}}\right|$$

$$= \left|\frac{2(3)+2(0)+3(3)}{3\sqrt{2}}\right| = \frac{5}{\sqrt{2}}$$

31. The given equation of lines are

$\frac{x-1}{k}=\frac{y+1}{3}=\frac{z-1}{4}$ and

$\frac{x-3}{1}=\frac{2y-9}{2k}=\frac{z}{1}$

i.e. $\frac{x-3}{1}=\frac{y-\frac{9}{2}}{k}=\frac{z}{1}$

Since the line intersect,

$$\begin{vmatrix}x_2-x_1 & y_2-y_1 & z_2-z_1\\ a_1 & b_1 & c_1\\ a_2 & b_2 & c_2\end{vmatrix}=0$$

∴ $\begin{vmatrix}2 & \frac{11}{2} & -1\\ k & 3 & 4\\ 1 & k & 1\end{vmatrix}=0$

∴ $2(3-4k)-\frac{11}{2}(k-4)-1(k^2-3)=0$

∴ $6-8k-\frac{11}{2}k+22-k^2+3=0$

∴ $2k^2+27k-62=0$

∴ $2k^2-4k+31k-62=0$

∴ $2k(k-2)+31(k-2)=0$

∴ $k=2$ or $k=\frac{-31}{2}$

32. $\bar{a}_2-\bar{a}_1=-3\hat{i}+2\hat{k}$

$\bar{b}_1\times\bar{b}_2=\begin{vmatrix}\hat{i} & \hat{j} & \hat{k}\\ 1 & 2 & -3\\ 1 & 4 & -5\end{vmatrix}$

$=\hat{i}(-10+12)-\hat{j}(-5+3)+\hat{k}(4-2)$

$=2\hat{i}+2\hat{j}+2\hat{k}$

∴ $\left(\bar{a}_2-\bar{a}_1\right).\left(\bar{b}_1\times\bar{b}_2\right)=\left(-3\hat{i}+2\hat{k}\right).\left(2\hat{i}+2\hat{j}+2\hat{k}\right)$

$=-6+4=-2$

33. Let the components of the line vector be a, b, c.

$a^2+b^2+c^2=(63)^2$ ….(i)

$\frac{a}{3}=\frac{b}{-2}=\frac{c}{6}=\lambda$(say)

$\Rightarrow a=3\lambda, b=-2\lambda, c=6\lambda$

∴ $9\lambda^2+4\lambda^2+36\lambda^2=(63)^2$ ….[From (i)]

∴ $49\lambda^2=(63)^2\Rightarrow\lambda=\pm\frac{63}{7}=\pm 9$

Since, as the line makes an obtuse angle with X-axis, $a=3\lambda<0$, $\lambda=-9$

∴ The required components are – 27, 18, – 54.

Competitive Thinking

1. The line passes through (1, –2, –1)

Let other point be (x_2, y_2, z_2)

∴ $x_2-1=0\Rightarrow x_2=1$

$y_2-(-2)=6\Rightarrow y_2=4$

$z_2-(-1)=-1\Rightarrow z_2=-2$

2. The equation of line passing through (a, b, c) and having d.r.s. 0, 0, 1 is $\frac{x-a}{0}=\frac{y-b}{0}=\frac{z-c}{1}$

3. Let a, b, c be the d.r.s. of the required line

d.r.s. of the given lines are 2, –2, 1 and 1, –2, 2.

∴ $2a-2b+c=0$ …(i)

$a-2b+2c=0$ …(ii)

∴ $\frac{a}{-4+2}=\frac{-b}{4-1}=\frac{c}{-4+2}$

$\Rightarrow\frac{a}{-2}=\frac{b}{-3}=\frac{c}{-2}$

∴ Equation of the required line is

$\frac{x-3}{-2}=\frac{y+1}{-3}=\frac{z-2}{-2}$

$\Rightarrow\frac{x-3}{2}=\frac{y+1}{3}=\frac{z-2}{2}$

4. $\frac{x+2}{2} = \frac{2y-5}{3}$, z = −1

∴ $\frac{x+2}{2} = \frac{y-\frac{5}{2}}{\frac{3}{2}}$, z = −1

∴ $\frac{x+2}{4} = \frac{y-\frac{5}{2}}{3}$, z = −1

∴ d.r.s of given line are 4, 3, 0

∴ d.c.s of the line are

5. d.r.s. of given line are 1, 1, 1

∴ d.c.s. are $\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}$

6. Given equation of line $x = 4z + 3$, $y = 2 - 3z$

$\Rightarrow z = \frac{x-3}{4}, z = \frac{y-2}{-3}$

∴ Equation of line is $\frac{x-3}{4} = \frac{y-2}{-3} = \frac{z-0}{1}$

d.r.s of line are 4, –3, 1

∴ $\cos\alpha = \frac{4}{\sqrt{4^2+(-3)^2+1^2}} = \frac{4}{\sqrt{26}}$,

$\cos\beta = \frac{-3}{\sqrt{26}}$, $\cos\gamma = \frac{1}{\sqrt{26}}$

∴ $\cos\alpha + \cos\beta + \cos\gamma = \frac{4}{\sqrt{26}} - \frac{3}{\sqrt{26}} + \frac{1}{\sqrt{26}}$

$= \frac{2}{\sqrt{26}}$

7. The given equation is $\frac{x-3}{3} = \frac{y-2}{1} = \frac{z-1}{0}$

The direction ratios of the above line are 3, 1, 0

$\Rightarrow n = \cos\gamma = 0 \Rightarrow \gamma = 90°$

∴ The given straight line is perpendicular to Z-axis.

8. Let a, b, c be the direction ratios of the line.

∴ a – b + c = 0 and ….(i)

a – 3b = 0 ….(ii)

∴ $\frac{a}{3} = \frac{b}{1} = \frac{c}{-2}$

∴ the direction ratios of the line are 3, 1, –2.

9. If a line is equally inclined to axes, then

$= m = n = \pm\frac{1}{\sqrt{3}}$

∴ d.r.s. of the line are 1, 1, 1

Given that the line passes through the point (– 3, 2, – 5)

∴ The equation of line is $\frac{x+3}{1} = \frac{y-2}{1} = \frac{z+5}{1}$

10. Here, $(x_1, y_1, z_1) \equiv (a, b, c)$

and $(x_2, y_2, z_2) \equiv (a - b, b - c, c - a)$

Required equation of line is

$\frac{x-a}{a-b-a} = \frac{y-b}{b-c-b} = \frac{z-c}{c-a-c}$

i.e., $\frac{x-a}{b} = \frac{y-b}{c} = \frac{z-c}{a}$

11. Given equation is $\frac{x-1}{} = \frac{y-2}{m} = \frac{z+1}{n}$

The equation of line passing through (1, 2, –1) and (–1, 0, 1) is

$\frac{x-1}{-1-1} = \frac{y-2}{0-2} = \frac{z+1}{1+1}$

$\Rightarrow \frac{x-1}{-2} = \frac{y-2}{-2} = \frac{z+1}{2}$

$\Rightarrow \frac{x-1}{1} = \frac{y-2}{1} = \frac{z+1}{-1}$ ….(i)

Comparing (i) with given equation, we get

= 1, m = 1, n = –1

12. Equation of line AB in vector form is

$\bar{r} = 6\bar{a} - 4\bar{b} + 4\bar{c} + \lambda\left(-4\bar{c} - \{6\bar{a} - 4\bar{b} + 4\bar{c}\}\right)$

$\Rightarrow \bar{r} = 6\bar{a} - 4\bar{b} + 4\bar{c} + \lambda\left(-6\bar{a} + 4\bar{b} - 8\bar{c}\right)$ ....(i)

Equation of line CD in vector form is

$\bar{r}' = \bar{a} + 2\bar{b} - 5\bar{c} + \lambda'\left(-\bar{a} - 2\bar{b} - 3\bar{c} - \{\bar{a} + 2\bar{b} - 5\bar{c}\}\right)$

$\Rightarrow \bar{r}' = \bar{a} + 2\bar{b} - 5\bar{c} + \lambda'\left(-2\bar{a} - 4\bar{b} + 2\bar{c}\right)$ ....(ii)

The point of intersection of AB and CD will satisfy

$\bar{r} = \bar{r}'$

$\Rightarrow 6\bar{a} - 4\bar{b} + 4\bar{c} + \lambda(-6\bar{a} + 4\bar{b} - 8\bar{c})$

$= \bar{a} + 2\bar{b} - 5\bar{c} + \lambda'(-2\bar{a} - 4\bar{b} + 2\bar{c})$

Comparing the coefficients of $\bar{a}$ and $\bar{b}$, we get

$6\lambda - 2\lambda' = 5$ …(iii)

$2\lambda + 2\lambda' = 3$ …(iv)

$\Rightarrow \lambda = 1$ and $\lambda' = \frac{1}{2}$

Substituting value of λ in equation (i), we get the point of intersection

∴ Point of intersection $\bar{r} = -4\bar{c}$ i.e. point B.

13. The equation of the line joining the points (3, 5, – 7) and (– 2, 1, 8) is

$$\frac{x-3}{-2-3} = \frac{y-5}{1-5} = \frac{z-(-7)}{8-(-7)}$$

Let $\frac{x-3}{-5} = \frac{y-5}{-4} = \frac{z+7}{15} = \lambda$

$\Rightarrow x = 3 - 5\lambda, y = 5 - 4\lambda, z = -7 + 15\lambda$

For YZ plane, $x = 0$

$\therefore$ $3 - 5\lambda = 0 \Rightarrow \lambda = \frac{3}{5}$

Now, $y = 5 - 4\lambda = 5 - 4\left(\frac{3}{5}\right) = 5 - \frac{12}{5} = \frac{13}{5}$

$z = -7 + 15\lambda = -7 + 15\left(\frac{3}{5}\right) = 2$

$\therefore$ The required point is $\left(0, \frac{13}{5}, 2\right)$

14. Given equations of line are

$\bar{r} = (\hat{i}+2\hat{j}-\hat{k}) + \lambda(3\hat{i}-4\hat{k})$ ….(i)

and $\bar{r} = (1-t)(4\hat{i}-\hat{j}) + t(2\hat{i}+\hat{j}-3\hat{k})$

i.e., $\bar{r} = (4\hat{i}-\hat{j}) + t(-2\hat{i}+2\hat{j}-3\hat{k})$ ….(ii)

Now, d.r.s. of line (i) and (ii) are

$a_1, b_1, c_1 = 3, 0, -4$

and $a_2, b_2, c_2 = -2, 2, -3$

$$\cos\theta = \left|\frac{3(-2)+0(2)+(-4)(-3)}{\sqrt{9+0+16}\sqrt{4+4+9}}\right|$$

$\Rightarrow \cos\theta = \frac{6}{5\sqrt{17}}$

$\Rightarrow \theta = \cos^{-1}\left(\frac{6}{5\sqrt{17}}\right)$

15. The d.r.s. of the lines are 2, 5, –3 and –1, 8, 4

$\therefore$ $$\cos\theta = \left|\frac{2(-1)+5(8)+(-3)(4)}{\sqrt{2^2+5^2+(-3)^2}\sqrt{(-1)^2+8^2+4^2}}\right|$$

$\Rightarrow \cos\theta = \frac{26}{9\sqrt{38}}$

$\Rightarrow \theta = \cos^{-1}\left(\frac{26}{9\sqrt{38}}\right)$

16. The d.r.s. of the lines are 1, 0, –1 and 3, 4, 5

$\therefore$ $$\cos\theta = \left|\frac{1(3)+0(4)+(-1)(5)}{\sqrt{1^2+0^2+(-1)^2}\sqrt{3^2+4^2+5^2}}\right| = \left|\frac{-2}{10}\right|$$

$\therefore$ $\theta = \cos^{-1}\left(\frac{1}{5}\right)$

17. $$\cos\theta = \left|\frac{2(1)+2(2)+(-1)(2)}{\sqrt{4+4+1}\sqrt{1+4+4}}\right| = \left|\frac{4}{\sqrt{9}.\sqrt{9}}\right| = \frac{4}{9}$$

$\Rightarrow \theta = \cos^{-1}\left(\frac{4}{9}\right)$

18. The d.r.s. of the line joining the points (2, 1, –3) and (–3, 1, 7) are –5, 0, 10

The d.r.s. of the line parallel to line $\frac{x-1}{3} = \frac{y}{4} = \frac{z+3}{5}$ are 3, 4, 5

$\therefore$ The angle between the lines having d.r.s. –5, 0, 10 and 3, 4, 5 is

$$\cos\theta = \left|\frac{-5(3)+0(4)+10(5)}{\sqrt{25+0+100}\sqrt{9+16+25}}\right|$$

$\Rightarrow \cos\theta = \frac{35}{25\sqrt{10}}$

$\Rightarrow \theta = \cos^{-1}\left(\frac{7}{5\sqrt{10}}\right)$

19. $a_1a_2 + b_1b_2 + c_1c_2 = (2)(1) + (5)(2) + (4)(-3)$
$= 0$

$\therefore$ Lines are perpendicular

$\therefore$ $\theta = 90°$

20. The equation of given lines are

$\frac{x}{3} = \frac{y}{2} = \frac{z}{-6}$ and $\frac{x}{2} = \frac{y}{-12} = \frac{z}{-3}$

$a_1a_2 + b_1b_2 + c_1c_2 = 3(2) + 2(-12) + (-6)(-3)$
$= 0$

$\therefore$ Lines are perpendicular

$\therefore$ $\theta = 90°$

21. The first line is parallel to Z-axis and the second line is parallel to X-axis.

$\therefore$ The angle between them is 90°.

22. Let the d.r.s of the given line be a, b, c

Then, according to given condition of perpendicularity,

$-1.a + 2.b + 2.c = 0$ ....(i)

$0.a + 2.b + 1.c = 0$ ....(ii)

On solving (i) and (ii), we get

$a = 2, b = -1$ and $c = 2$

23. $a_1, b_1, c_1, = -3, 2k, 2$ and $a_2, b_2, c_2 = 3k, 1, -5$

Since, the lines are perpendicular to each other,

$a_1a_2 + b_1b_2 + c_1c_2 = 0$

$\therefore$ $(-3)(3k) + (2k)(1) + (2)(-5) = 0$

$\Rightarrow -9k + 2k - 10 = 0$

$\Rightarrow k = \frac{-10}{7}$

24. Given equations of lines are
$x = ay + b, z = cy + d$
$\Rightarrow \frac{x-b}{a} = \frac{y}{1}, \frac{z-d}{c} = \frac{y}{1}$
$\Rightarrow \frac{x-b}{a} = \frac{y}{1} = \frac{z-d}{c}$
and $x = a'y + b', z = c'y + d'$
$\Rightarrow \frac{x-b'}{a'} = \frac{y}{1}, \frac{z-d'}{c'} = \frac{y}{1}$
$\Rightarrow \frac{x-b'}{a'} = \frac{y}{1} = \frac{z-d'}{c'}$
Since, the lines are perpendicular to each other.
$a_1a_2 + b_1b_2 + c_1c_2 = 0$
$\Rightarrow aa' + 1(1) + cc' = 0$
$\Rightarrow aa' + cc' = -1$

25. Equation of line BC is
$\frac{x-0}{2-0} = \frac{y+11}{-3+11} = \frac{z-4}{1-4}$
$\Rightarrow \frac{x}{2} = \frac{y+11}{8} = \frac{z-4}{-3}$
Let $\frac{x}{2} = \frac{y+11}{8} = \frac{z-4}{-3} = \lambda$
Any point D on the line is
$\equiv (2\lambda, 8\lambda - 11, -3\lambda + 4)$
Given point $A \equiv (1, 8, 4)$
∴ d.r.s of AD are $2\lambda - 1, 8\lambda - 11 - 8, -3\lambda + 4 - 4$
$= 2\lambda - 1, 8\lambda - 19, -3\lambda$
Since, $AD \perp BC$,
∴ $aa_1 + bb_1 + cc_1 = 0$
$\Rightarrow 2(2\lambda - 1) + 8(8\lambda - 19) - 3(-3\lambda) = 0$
$\Rightarrow 4\lambda - 2 + 64\lambda - 152 + 9\lambda = 0$
$\Rightarrow 77\lambda = 154$
$\Rightarrow \lambda = 2$
∴ $D \equiv (4, 5, -2)$

26. Given equation of line is
$\bar{r} = (3 + t)\hat{i} + (1 - t)\hat{j} + (-2 - 2t)\hat{k}$
$\Rightarrow \bar{r} = 3\hat{i} + \hat{j} - 2\hat{k} + (\hat{i} - \hat{j} - 2\hat{k})t$, where $t \in R$
∴ The line passes through (3, 1, –2) and is parallel to the vector $\hat{i} - \hat{j} - 2\hat{k}$.
Equation of second line is
$x = 4 + k, y = -k, z = -4 - 2k$,
$\Rightarrow \frac{x-4}{1} = \frac{y}{-1} = \frac{z+4}{-2} = k$, where $k \in R$
∴ d.r.s. of the line are 1, –1, –2. Also, it passes through (3, 1, – 2).
∴ Both lines are coincident.

27. Consider option (A)

and $\frac{x+3}{-36} = \frac{y-3}{2} = \frac{z-6}{4} = \mu$
∴ $x = 3\lambda + 5,\ y = -\lambda + 7, z = \lambda - 2$ and
$x = -36\mu - 3, y = 2\mu + 3, z = 4\mu + 6$
On solving, we get $x = 21, y = \frac{5}{3}, z = \frac{10}{3}$

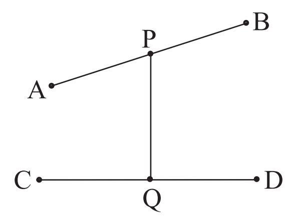
31.



Let the two lines be AB and CD having equations $\frac{x}{1} = \frac{y+a}{1} = \frac{z}{1} = \lambda$ and
$\frac{x+a}{2} = \frac{y}{1} = \frac{z}{1} = \mu$.
Then, $P \equiv (\lambda, \lambda - a, \lambda)$ and $Q \equiv (2\mu - a, \mu, \mu)$
According to the given condition,
$\frac{\lambda - 2\mu + a}{2} = \frac{\lambda - a - \mu}{1} = \frac{\lambda - \mu}{2}$
$\Rightarrow \mu = a$ and $\lambda = 3a$
∴ $P \equiv (3a, 2a, 3a)$ and $Q \equiv (a, a, a)$

32. d.r.s. of the line joining (0, – 11, 4) and (2, – 3, 1) are 2, 8, – 3.

$\Rightarrow 9\lambda + 15 + 4\lambda + 10 + 4\lambda - 8 = 0$

$\Rightarrow 17\lambda + 17 = 0$

$\Rightarrow \lambda = -1$

$\therefore$ $M \equiv (3, 5, 9)$

$\therefore$ $PM = \sqrt{(3-1)^2 + (5-2)^2 + (9-3)^2}$

Let $A \equiv (1, -1, -1)$

Now, PA = 3

$\therefore$ $\sqrt{(2\lambda+1-1)^2 + (-2\lambda-1+1)^2 + (\lambda-1+1)^2} = 3$

$\Rightarrow \sqrt{4\lambda^2 + 4\lambda^2 + \lambda^2} = 3$

$\Rightarrow 9\lambda^2 = 9$

$\Rightarrow \lambda = \pm 1$

$\therefore$ $P \equiv (3, -3, 0)$ or $P \equiv (-1, 1, -2)$

$$= \left|\frac{\begin{vmatrix} -6 & -15 & 3 \\ 3 & -1 & 1 \\ -3 & 2 & 4 \end{vmatrix}}{\sqrt{(-4-2)^2 + (-3-12)^2 + (6-3)^2}}\right|$$

$$= \left|\frac{-6(-4-2) + 15(12+3) + 3(6-3)}{\sqrt{36+225+9}}\right|$$

$$= \frac{270}{\sqrt{270}} = 3\sqrt{30}$$

$$\therefore \begin{vmatrix} x_2-x_1 & y_2-y_1 & z_2-z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 3-1 & k+1 & 0-1 \\ 2 & 3 & 4 \\ 1 & 2 & 1 \end{vmatrix} = 0$$

$\Rightarrow 2(3-8)-(k+1)(2-4)-1(4-3)=0$

$\Rightarrow -10+2k+2-1=0$

$\Rightarrow k=\dfrac{9}{2}$

$\Rightarrow a+3b+5c=0$ and $3a+b-5c=0$

$\Rightarrow \dfrac{a}{5}=\dfrac{b}{-5}=\dfrac{c}{2}$

Thus, the equation of the line through the origin intersecting the given lines is

$(\lambda_1+2, -2\lambda_1+1, \lambda_1-1)$.

If these two lines intersect, then

$5\lambda=\lambda_1+2$, $-5\lambda=-2\lambda_1+1$ and $2\lambda=\lambda_1-1$

$\Rightarrow \lambda_1=3$ and $\lambda=1$

So, the co-ordinates of P are $(5, -5, 2)$.

Similarly, co-ordinates of Q are $\left(\dfrac{10}{3}, \dfrac{-10}{3}, \dfrac{8}{3}\right)$

$\therefore \quad PQ^2=\left(\dfrac{10}{3}-5\right)^2+\left(\dfrac{-10}{3}+5\right)^2+\left(\dfrac{8}{3}-2\right)^2=6$

45. Lines L_1 and L_2 are parallel to the vectors $\bar{b}_1=3\hat{i}+\hat{j}+2\hat{k}$ and $\bar{b}_2=\hat{i}+2\hat{j}+3\hat{k}$ respectively.

$\therefore$ The unit vector perpendicular to both L_1 and L_2 is

$\hat{n}=\dfrac{\bar{b}_1\times\bar{b}_2}{|\bar{b}_1\times\bar{b}_2|}$

Now, $\bar{b}_1\times\bar{b}_2=\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & 1 & 2 \\ 1 & 2 & 3 \end{vmatrix}=-\hat{i}-7\hat{j}+5\hat{k}$

$\therefore \quad \hat{n}=\dfrac{1}{5\sqrt{3}}\left(-\hat{i}-7\hat{j}+5\hat{k}\right)$

Evaluation Test

1. Let $\dfrac{x+1}{-1}=\dfrac{y-12}{5}=\dfrac{z-7}{2}=r$

$\therefore \quad x=-r-1, y=5r+12, z=2r+7$

$\therefore$ Co-ordinates of any point on the line are $(-r-1, 5r+12, 2r+7)$.

This point lies on the curve $11x^2-5y^2+z^2=0$

$\therefore \quad 11(-r-1)^2-5(5r+12)^2+(2r+7)^2=0$

$\Rightarrow 11r^2+22r+11-125r^2-600r-720$
$+4r^2+28r+49=0$

$\Rightarrow -110r^2-550r-660=0$

$\Rightarrow r^2+5r+6=0$

$\Rightarrow (r+2)(r+3)=0$

$\Rightarrow r=-2$ or $r=-3$

If $r=-2$, then the point is $(1, 2, 3)$

and if $r=-3$, then the point is $(2, -3, 1)$

$\therefore$ option (A) is correct.

2. The given equation of line is
$x = 4y + 5$, $z = 3y - 6$.
It can be written as
$\frac{x-5}{4} = y = \frac{z+6}{3} = r$, say

∴ co-ordinates of the any point on the line are $(4r + 5, r, 3r - 6)$.
This point is at a distance of $3\sqrt{26}$ from the point $(5, 0, -6)$

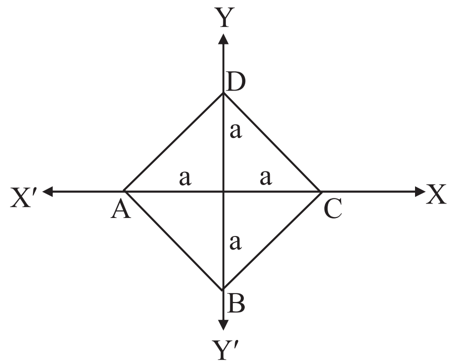
∴ $(4r + 5 - 5)^2 + (r - 0)^2 + (3r - 6 + 6)^2 = \left(3\sqrt{26}\right)^2$
$\Rightarrow 16r^2 + r^2 + 9r^2 = 234$
$\Rightarrow 26r^2 = 234$
$\Rightarrow r^2 = 9$
$\Rightarrow r = \pm 3$
If $r = 3$, then the point is
$(4 \times 3 + 5, 3, 3 \times 3 - 6) \equiv (17, 3, 3)$

3. Let the components of the line vector be a, b, c.
∴ $a^2 + b^2 + c^2 = (63)^2$ ….(i)
Also, $\frac{a}{3} = \frac{b}{-2} = \frac{c}{6} = k$, say
∴ $a = 3k$, $b = -2k$, $c = 6k$
Substituting value of a, b and c in equation (i), we get
$9k^2 + 4k^2 + 36k^2 = 63^2$
∴ $49k^2 = 63 \times 63$
∴ $k^2 = \frac{63 \times 63}{49} = 81$
∴ $k = \pm 9$
Since, the line makes obtuse angle with X-axis component along X-axis is negative.
∴ $k = -9$
∴ The components of the line vector are 3k, –2k, 6k i.e., –27, 18, –54

4. Let M be the foot of the perpendicular drawn from the point P(3, –1, 11) to the given line.
Let $\frac{x}{2} = \frac{y-2}{3} = \frac{z-3}{4} = \lambda$
$\Rightarrow x = 2\lambda$, $y = 3\lambda + 2$, $z = 4\lambda + 3$
∴ $M \equiv (2\lambda, 3\lambda + 2, 4\lambda + 3)$
d.r.s. of PM are $2\lambda - 3$, $3\lambda + 3$, $4\lambda - 8$
Since, PM is perpendicular to the given line
∴ $(2\lambda - 3)(2) + (3\lambda + 3)(3) + (4\lambda - 8)(4) = 0$
$\Rightarrow 4\lambda - 6 + 9\lambda + 9 + 16\lambda - 32 = 0$
$\Rightarrow \lambda = 1$
∴ $M \equiv (2, 5, 7)$

∴ length of perpendicular (PM)
$= \sqrt{(3-2)^2 + (-1-5)^2 + (11-7)^2}$
$= \sqrt{1 + 36 + 16}$
$= \sqrt{53}$

5. When square is folded co-ordinates will be D(0, 0, a), C(a, 0, 0), A(– a, 0, 0), B(0, – a, 0).



Equation AB is, $\frac{x+a}{a} = \frac{y}{-a} = \frac{z}{0}$

and equation of DC is $\frac{x}{a} = \frac{y}{0} = \frac{z-a}{-a}$

∴ shortest distance

$$= \left| \frac{\begin{vmatrix} -a & 0 & -a \\ a & -a & 0 \\ a & 0 & -a \end{vmatrix}}{\sqrt{(a^2 - 0)^2 + (0 + a^2)^2 + (0 + a^2)^2}} \right|$$

$$= \left| \frac{-a(a^2) - a(a^2)}{\sqrt{a^4 + a^4 + a^4}} \right| = \left| \frac{-2a^3}{\sqrt{3a^4}} \right| = \frac{2a}{\sqrt{3}}$$

6. Given equation of motion of a rocket is
$x = 2t$, $y = -4t$, $z = 4t$
i.e., the equation of the path is $\frac{x}{2} = \frac{y}{-4} = \frac{z}{4}$
i.e., $\frac{x}{1} = \frac{y}{-2} = \frac{z}{2}$
Thus, the path of the rocket represents a straight line passing through the origin.
For t = 10 sec.
we have, $x = 20$, $y = -40$, $z = 40$
Let M(20, –40, 40)
∴ $\left|\overline{OM}\right| = \sqrt{x^2 + y^2 + z^2}$
$= \sqrt{400 + 1600 + 1600} = 60$ km
∴ Rocket will be at 60 km from the starting point O(0, 0, 0) in 10 seconds.

7. d.r.s. of L_1 are 3, 1, 2 and d.r.s. of L_2 are 1, 2, 3

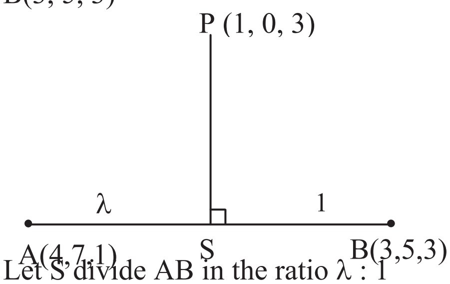
∴ vector perpendicular to L_1 and L_2 = $\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & 1 & 2 \\ 1 & 2 & 3 \end{vmatrix}$

$= \hat{i}(3-4) - \hat{j}(9-2) + \hat{k}(6-1)$

$= -\hat{i} - 7\hat{j} + 5\hat{k}$

∴ unit vector = $\dfrac{-\hat{i} - 7\hat{j} + 5\hat{k}}{\sqrt{1+49+25}} = \dfrac{-\hat{i} - 7\hat{j} + 5\hat{k}}{5\sqrt{3}}$

8. Let S be the foot of perpendicular drawn from P(1, 0, 3) to the join of points A(4, 7, 1) and B(3, 5, 3)



Let S divide AB in the ratio λ : 1

∴ $S \equiv \left(\dfrac{3\lambda+4}{\lambda+1}, \dfrac{5\lambda+7}{\lambda+1}, \dfrac{3\lambda+1}{\lambda+1}\right)$ ….(i)

Now, d.r.s. of PS are

$\dfrac{3\lambda+4}{\lambda+1} - 1, \dfrac{5\lambda+7}{\lambda+1} - 0, \dfrac{3\lambda+1}{\lambda+1} - 3$

i.e., $\dfrac{2\lambda+3}{\lambda+1}, \dfrac{5\lambda+7}{\lambda+1}, \dfrac{-2}{\lambda+1}$

i.e., $2\lambda + 3, 5\lambda + 7, -2$

Also, d.r.s. of AB are $-1, -2, 2$

Since, PS ⊥ AB

∴ $(2\lambda + 3)(-1) + (5\lambda + 7)(-2) + (-2)(2) = 0$

$\Rightarrow -2\lambda - 3 - 10\lambda - 14 - 4 = 0$

$\Rightarrow \lambda = -\dfrac{7}{4}$

Substituting the value of λ in (i), we get

$S = \left(\dfrac{5}{3}, \dfrac{7}{3}, \dfrac{17}{3}\right)$

9. Equation of the line passing through the points (5, 1, a) and (3, b, 1) is

$\dfrac{x-3}{5-3} = \dfrac{y-b}{1-b} = \dfrac{z-1}{a-1}$ ….(i)

The line passes through the point $\left(0, \dfrac{17}{2}, \dfrac{-13}{2}\right)$

∴ $\dfrac{-3}{2} = \dfrac{\frac{17}{2} - b}{1-b} = \dfrac{\frac{-13}{2} - 1}{a-1}$ ….[From (i)]

∴ $a - 1 = \dfrac{\frac{-15}{2}}{\frac{-3}{2}} = 5$

∴ $a = 5 + 1 = 6$

and $-3 + 3b = 17 - 2b$

∴ $5b = 20 \Rightarrow b = 4$

∴ $a = 6, b = 4$

Classical Thinking

1. Here, $\overline{n} = \hat{i} - 2\hat{j} + 3\hat{k}$ and p = 1

$$\hat{n} = \frac{\overline{n}}{|\overline{n}|} = \frac{\hat{i} - 2\hat{j} + 3\hat{k}}{\sqrt{1+4+9}} = \frac{\hat{i} - 2\hat{j} + 3\hat{k}}{\sqrt{14}}$$

∴ The vector equation of the plane is

$\overline{r}.\hat{n} = p$

$$\Rightarrow \overline{r}.\left(\frac{\hat{i} - 2\hat{j} + 3\hat{k}}{\sqrt{14}}\right) = 1$$

$$\Rightarrow \overline{r}.\left(\hat{i} - 2\hat{j} + 3\hat{k}\right) = \sqrt{14}$$

2. The given vector equation is

$$\overline{r}.\left(3\hat{i} - 2\hat{j} + 2\hat{k}\right) = 12 \quad \text{....(i)}$$

$\overline{r}.\overline{n} = 12$, where $\overline{n} = 3\hat{i} - 2\hat{j} + 2\hat{k}$

$$\hat{n} = \frac{\overline{n}}{|\overline{n}|} = \frac{3\hat{i} - 2\hat{j} + 2\hat{k}}{\sqrt{9+4+4}} = \frac{3\hat{i} - 2\hat{j} + 2\hat{k}}{\sqrt{17}}$$

$$\Rightarrow \hat{n} = \frac{3}{\sqrt{17}}\hat{i} - \frac{2}{\sqrt{17}}\hat{j} + \frac{2}{\sqrt{17}}\hat{k}$$

∴ Normal form is

$$\overline{r}.\left(\frac{3}{\sqrt{17}}\hat{i} - \frac{2}{\sqrt{17}}\hat{j} + \frac{2}{\sqrt{17}}\hat{k}\right) = \frac{12}{\sqrt{17}}$$

3. Given equation of plane is

$$\overline{r}.\left(2\hat{i} - 3\hat{j} + \hat{k}\right) + 9 = 0$$

$$\Rightarrow \overline{r}.\left(2\hat{i} - 3\hat{j} + \hat{k}\right) = -9 \quad \text{....(i)}$$

$\overline{n} = 2\hat{i} - 3\hat{j} + \hat{k}$

∴ $$\hat{n} = \frac{2\hat{i} - 3\hat{j} + \hat{k}}{\sqrt{4+9+1}} = \frac{2\hat{i} - 3\hat{j} + \hat{k}}{\sqrt{14}}$$

∴ The d.c.s. of normal to the plane are

$$\frac{2}{\sqrt{14}}, \frac{-3}{\sqrt{14}}, \frac{1}{\sqrt{14}}$$

4. Given that $x + my + nz = p$ is the equation of the plane in normal form.

∴ , m, n are the direction cosines.

Also $^2 + m^2 + n^2 = 1$,

Since, p is the distance from the origin, p should be greater than zero.

∴ All the statements are true,

∴ correct answer is option (D)

For equal intercepts, $\frac{7}{a} = 7 \quad \Rightarrow a = 1$

8. Equation of plane in intercept form is

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$$

Here, a = b = c and point (1, –1, 2) lies in the plane,

∴ $\frac{1}{a} + \frac{-1}{a} + \frac{2}{a} = 1 \Rightarrow a = 2$

∴ the required equation of a plane is $x + y + z = 2$.

9. Here, $\overline{a} = \hat{i} + \hat{j} + 2\hat{k}$ and $\overline{n} = 3\hat{i} - 2\hat{j} + 3\hat{k}$

The vector equation of the plane is

$\overline{r}.\overline{n} = \overline{a}.\overline{n}$

$$\Rightarrow \overline{r}.\left(3\hat{i} - 2\hat{j} + 3\hat{k}\right) = \left(\hat{i} + \hat{j} + 2\hat{k}\right).\left(3\hat{i} - 2\hat{j} + 3\hat{k}\right)$$

$$\Rightarrow \overline{r}.\left(3\hat{i} - 2\hat{j} + 3\hat{k}\right) = 7$$

10. Let $\overline{a} = \hat{j} - 3\hat{k}$ and $\overline{n} = \hat{i} + 2\hat{j} + 4\hat{k}$

The vector equation of plane is

$$\overline{r}.\left(\hat{i} + 2\hat{j} + 4\hat{k}\right) = \left(\hat{j} - 3\hat{k}\right).\left(\hat{i} + 2\hat{j} + 4\hat{k}\right)$$

$$\Rightarrow \overline{r}.\left(\hat{i} + 2\hat{j} + 4\hat{k}\right) = -10$$

$=\hat{i}(2-1)-\hat{j}(4-0)+\hat{k}(2-0)$

$=\hat{i}-4\hat{j}+2\hat{k}$

Now, $\bar{b}\times\bar{c}=\hat{i}-4\hat{j}+2\hat{k}$

∴ the vector equation of required plane is

$\bar{r}.(\bar{b}\times\bar{c})=\bar{a}.(\bar{b}\times\bar{c})$

$\Rightarrow \bar{r}.(\hat{i}-4\hat{j}+2\hat{k})=(\hat{i}-\hat{j}+\hat{k}).(\hat{i}-4\hat{j}+2\hat{k})$

$\Rightarrow \bar{r}.(\hat{i}-4\hat{j}+2\hat{k})=7$

17. Let $(x_1, y_1, z_1)=(0, 1, 2)$,
$a_1, b_1, c_1 = 3, 1, 1$ and

∴ the equation of required plane is

$\begin{vmatrix}x-x_1 & y-y_1 & z-z_1\\ a_1 & b_1 & c_1\\ a_2 & b_2 & c_2\end{vmatrix}=0$

$\Rightarrow \begin{vmatrix}x-0 & y-1 & z-2\\ 3 & 1 & 1\\ -1 & 2 & -5\end{vmatrix}=0$

$\Rightarrow -7x+14y-14+7z-14=0$

$\Rightarrow x-2y-z+4=0$

18. Let $(x_1, y_1, z_1)=(1, 2, -1)$,
$a_1, b_1, c_1 = 2, 1, 3$ and $a_2, b_2, c_2 = 4, 1, 2$
∴ the equation of required plane is

$\begin{vmatrix}x-1 & y-2 & z+1\\ 2 & 1 & 3\\ 4 & 1 & 1\end{vmatrix}=0$

$\Rightarrow (x-1)(-2)+(y-2)(10)+(z+1)(-2)=0$

$\Rightarrow -2x+2+10y-20-2z-2=0$

$\Rightarrow x-5y+z+10=0$

∴ their normals are parallel to the required plane
∴ $a_1, b_1, c_1 = 1, 2, 2$ and $a_2, b_2, c_2 = 3, 3, 2$
∴ the equation of required plane is

$\begin{vmatrix}x-1 & y+3 & z+2\\ 1 & 2 & 2\\ 3 & 3 & 2\end{vmatrix}=0$

$\Rightarrow 2x-4y+3z-8=0$

20. The equation $\bar{r}=\bar{a}+\lambda\bar{b}+\mu\bar{c}$ represents a plane passing through vector $\bar{a}$ and parallel to $\bar{b}$ and $\bar{c}$
∴ $\bar{a}=3\hat{i}+\hat{j}$, $\bar{b}=-\hat{j}+\hat{k}$, $\bar{c}=\hat{i}+2\hat{j}+3\hat{k}$

Now, $\bar{b}\times\bar{c} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 0 & -1 & 1 \\ 1 & 2 & 3 \end{vmatrix}$

$= -5\hat{i}+\hat{j}+\hat{k}$

∴ the equation of required plane is

$\bar{r}.(-5\hat{i}+\hat{j}+\hat{k}) = (3\hat{i}+\hat{j}).(-5\hat{i}+\hat{j}+\hat{k})$

$\Rightarrow \bar{r}.(-5\hat{i}+\hat{j}+\hat{k}) = -14$

21. Consider option (B)

$\bar{r}.\left(\hat{i}+11\hat{j}+3\hat{k}\right) = 14$

Its Cartesian form is

$x + 11y + 3z = 14$

$$\Rightarrow \begin{vmatrix} x-1 & y-2 & z+3 \\ 2 & -1 & 3 \\ -1 & -1 & 4 \end{vmatrix} = 0$$

$\Rightarrow (x-1)(-1) - (y-2)(11) + (z+3)(-3) = 0$

$\Rightarrow -x - 11y - 3z + 14 = 0$

$\Rightarrow x + 11y + 3z = 14$

Its vector form is

$\bar{r}.\left(\hat{i}+11\hat{j}+3\hat{k}\right) = 14$

22. Consider option (B)

$\bar{r}.(3\hat{i} + \hat{j} - \hat{k}) + 4 = 0$

Its Cartesian form is

$3x + y - z = -4$

∴ correct answer is option (B).

23. Consider option (B)

$\bar{r}.(9\hat{i} + 3\hat{j} - \hat{k}) = 14$

Its Cartesian form is

$9x + 3y - z = 14$

Since, given points (1, 1, –2), (2, –1, 1) and (1, 2, 1) satisfy the above plane,

∴ correct answer is option (B)

24. Consider option (D)

$2x + 2y - 5z = 0$

Since, the given points (4, 1, 2), (1, –1, 0) and (0, 0, 0) satisfy the above plane,

∴ correct answer is option (D)

25. Consider option (C)

$3x - 4z + 1 = 0$

Since, the given points (1, 1, 1), (1, –1, 1) and (–7, –3, –5) satisfy the above plane,

∴ correct answer is option (C)

26. Here $\bar{n}_1 = \hat{i}-\hat{j}+2\hat{k}$ and $\bar{n}_2 = 3\hat{i}-\hat{j}-\hat{k}$

The vector equation of plane passing through intersection of $\bar{r}.\bar{n}_1 = p_1$ and $\bar{r}.\bar{n}_2 = p_2$ is

$\bar{r}.\left(\bar{n}_1 + \lambda\bar{n}_2\right) = p_1 + \lambda p_2$

$\Rightarrow \bar{r}.\left[\hat{i}-\hat{j}+2\hat{k}+\lambda\left(3\hat{i}-\hat{j}-\hat{k}\right)\right] = 3+\lambda(4)$

$\Rightarrow \bar{r}.\left[(1+3\lambda)\hat{i}-(1+\lambda)\hat{j}+(2-\lambda)\hat{k}\right] = 3+4\lambda$

27. Consider option (B)

$\bar{r}\cdot(10\hat{i} + 11\hat{j} + 12\hat{k}) = 33$

Its Cartesian form is

$10x + 11y + 12z = 33$

Since, the given point (1, 1, 1) is satisfies the above plane

∴ correct answer is option (B)

Alternate method:

The equation of plane through the intersection of given planes is

$(x + y + z - 4) + \lambda(x + 2y + 3z + 3) = 0$

Since, it passes through (1, 1, 1)

∴ $(1 + 1 + 1 - 4) + \lambda(1 + 2 + 3 + 3) = 0 \Rightarrow \lambda = \frac{1}{9}$

$\Rightarrow (x + y + z - 4) + \frac{1}{9}(x + 2y + 3z + 3) = 0$

$\Rightarrow 10x + 11y + 12z - 33 = 0$

∴ the equation of plane in vector form is

$\bar{r}\cdot(10\hat{i} + 11\hat{j} + 12\hat{k}) = 33$

28. Consider option (D)

$\bar{r}.\left(11\hat{i}+3\hat{j}-5\hat{k}\right) = 22$

Its Cartesian form is

$11x + 3y - 5z = 22$

Since, the given point (1, 2, –1) is satisfies the above plane,

∴ correct answer is option (D)

29. Equation of plane passing through intersection of given planes is,
$(x + y + z - 1) + \lambda(2x + 3y - z + 4) = 0$
$(1 + 2\lambda)x + (1 + 3\lambda)y + (1 - \lambda)z + 4\lambda - 1 = 0$
Since, the plane is parallel to X-axis,
∴ $(1 + 2\lambda) = 0 \Rightarrow \lambda = -\frac{1}{2}$
Hence, the equation of required plane is
$y - 3z + 6 = 0$

30. Plane passes through (1, 2, 3)
The point (1, 2, 3) satisfies the equation of plane represented by option (B)
∴ option (B) is correct

$= \frac{2(3) + 3(2) + 4(-3)}{\sqrt{2^2 + 3^2 + 4^2}\sqrt{(3)^2 + (2)^2 + (-3)^2}}$

$\Rightarrow \sin\theta = 0$

$\Rightarrow \theta = 0°$

53. Let $a, b, c = 3, 2, 4$ and $a_1, b_1, c_1 = 2, 1, -3$

$\therefore$ $\sin\theta = \frac{6 + 2 - 12}{\sqrt{9+4+16}\sqrt{4+1+9}}$

$\Rightarrow \sin\theta = \frac{-4}{\sqrt{29 \times 14}} = \frac{-4}{\sqrt{406}}$

$\Rightarrow \theta = \sin^{-1}\left(\frac{-4}{\sqrt{406}}\right)$

54. The d.r.s. of line and plane are a, b, c

$\therefore$ $\sin\theta = \frac{aa + bb + cc}{\sqrt{a^2 + b^2 + c^2} \cdot \sqrt{a^2 + b^2 + c^2}}$

$= \frac{a^2 + b^2 + c^2}{a^2 + b^2 + c^2} = 1$

55. Given equation of line is $6x = 4y = 3z$

i.e. $\frac{x}{2} = \frac{y}{3} = \frac{z}{4}$

$\therefore$ the d.r.s. of line are 2, 3, 4

the d.r.s. of plane are 3, 2, –3

$\therefore$ $\sin\theta = \frac{2(3) + 3(2) + 4(-3)}{\sqrt{4+9+16} . \sqrt{9+4+9}} = 0$

$\therefore$ $\bar{b}.\bar{n} = 0$

$\Rightarrow (2\hat{i} - m\hat{j} - 3\hat{k}) . (m\hat{i} + 3\hat{j} + \hat{k}) = 0$

$\Rightarrow 2(m) - m(3) - 3(1) = 0$

$\Rightarrow 4(2) + 4(3) - k(4) = 0$
$\Rightarrow 4k = 20 \Rightarrow k = 5$

59. The equation of plane is
$3x - 2y + 6z - 5 = 0$ and the point is (2, 3, 4)
∴ The distance of point from the plane is

$$d = \left|\frac{ax_1 + by_1 + cz_1 + d}{\sqrt{a^2 + b^2 + c^2}}\right|$$

$$= \left|\frac{2(3) + 3(-2) + 4(6) - 5}{\sqrt{3^2 + 2^2 + 6^2}}\right| = \frac{19}{7}$$

Alternate method:
Let $A(\bar{a}) = (2, 3, 4)$
Given equation of plane is
$\bar{r}.(3\hat{i} - 2\hat{j} + 6\hat{k}) = 5$
∴ $\bar{a} = 2\hat{i} + 3\hat{j} + 4\hat{k}$, and $\bar{n} = 3\hat{i} - 2\hat{j} + 6\hat{k}$
∴ The distance of point from plane is

$$d = \frac{|(\bar{a}.\bar{n}) - p|}{|\bar{n}|} = \left|\frac{2(3) + 3(-2) + 4(6) - 5}{\sqrt{3^2 + 2^2 + 6^2}}\right| = \frac{19}{7}$$

60. Here, a = 1, b = 1, c = 1, d = –3 and $x = y = z = 0$
∴ $d = \left|\frac{-3}{\sqrt{1^2 + 1^2 + 1^2}}\right| = \sqrt{3}$

61. Here, a = 3, b = –6, c = 2, z = 11 and $x = 2$, $y = 3$, z = 4

62. Let the intercepts made by the plane a, b, c = 2, 1, –2
∴ The distance of plane from origin is

$$d = \frac{1}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}}} = \frac{1}{\sqrt{\frac{1}{4} + 1 + \frac{1}{4}}} = \frac{2}{\sqrt{6}}$$

Alternate method:
The equation of plane is
$\frac{x}{2} + \frac{y}{1} + \frac{z}{-2} = 1$
i.e. $x + 2y - z - 2 = 0$
∴ distance of plane from the origin is

$$d = \left|\frac{-2}{\sqrt{1 + 4 + 1}}\right|$$

$$d = \frac{2}{\sqrt{6}}$$

63. Let a, b, c = –6, 3, 4
∴ The length of perpendicular from origin is

$$d = \frac{1}{\sqrt{\frac{1}{(-6)^2} + \frac{1}{3^2} + \frac{1}{4^2}}} = \frac{1}{\sqrt{\frac{29}{144}}} = \frac{12}{\sqrt{29}}$$

64. The distance of (1,1,1) from the origin is
$d = \sqrt{(1)^2 + (1)^2 + (1)^2} = \sqrt{3}$
Distance of (1,1,1) from
$x + y + z + k = 0$ is

$$d_1 = \left|\frac{(1) + (1) + (1) + k}{\sqrt{(1)^2 + (1)^2 + (1)^2}}\right| = \pm\frac{k + 3}{\sqrt{3}}$$

Now, $\sqrt{3} = \pm\frac{1}{2}\left(\frac{k + 3}{\sqrt{3}}\right)$ ….(given)
$\Rightarrow 6 = \pm (k + 3)$
$\Rightarrow k = 3, -9$

65. Since, the points (1, 1, k) and (–3, 0 , 1) are equidistance from the given plane
∴ $\left|\frac{3 + 4 - 12k + 13}{\sqrt{9 + 16 + 144}}\right| = \left|\frac{-9 - 12 + 13}{\sqrt{9 + 16 + 144}}\right|$
$\Rightarrow |3 + 4 - 12k + 13| = |-9 - 12 + 13|$
$\Rightarrow 20 - 12k = \pm 8 \Rightarrow k = 1, \frac{5}{7}$

66. Given line passes through (1, –2, 1) and the d.r.s. of normal to the plane are 2, 2, –1
∴ $d = \left|\frac{2(1) + 2(-2) - 1(1) - 6}{\sqrt{2^2 + 2^2 + (-1)^2}}\right| = \frac{9}{\sqrt{9}} = 3$

67. Given planes are parallel and can be written as
$2x - 2y + z + 3 = 0$ and $2x - 2y + z + \frac{5}{2} = 0$
∴ the distance between these planes is

$$d = \left|\frac{d_1 - d_2}{\sqrt{a^2 + b^2 + c^2}}\right|$$

$$= \left|\frac{3 - \frac{5}{2}}{\sqrt{4 + 4 + 1}}\right| = \frac{\left(\frac{1}{2}\right)}{3} = \frac{1}{6}$$

68. Given planes are parallel, and can be written as

$x + 2y + 3z + 7 = 0$ and $x + 2y + 3z + \frac{7}{2} = 0$

∴ the distance between these planes is

$$d = \left|\frac{7-\frac{7}{2}}{\sqrt{1+4+9}}\right| = \frac{\sqrt{7}}{2\sqrt{2}}$$

This point satisfies the equation of plane in option (A)

Also, it has d.r.s = $\overline{b}\times\overline{c} = \begin{vmatrix}\hat{i} & \hat{j} & \hat{k}\\ 1 & 2 & -1\\ 1 & 1 & 3\end{vmatrix}$

$= 7\hat{i} - 4\hat{j} - \hat{k}$

i.e., 7, –4, –1

∴ option (A) is correct answer.

Alternate Method

Let $\overline{a} = \hat{i} - \hat{j} + \hat{k}$, $\overline{b} = 2\hat{i} + \hat{j} + \hat{k}$ and $\overline{c} = \hat{j} + 2\hat{k}$

Now, $\overline{b}\times\overline{c} = \hat{i} - 4\hat{j} + 2\hat{k}$

∴ the vector equation of required plane is

$\overline{r}.\left(\overline{b}\times\overline{c}\right) = \overline{a}.\left(\overline{b}\times\overline{c}\right)$

$\Rightarrow \overline{r}(7\hat{i} - 4\hat{j} - \hat{k}) = (\hat{i} - 2\hat{j} - \hat{k}).(7\hat{i} - 4\hat{j} - \hat{k})$

$\Rightarrow \overline{r}.(7\hat{i} - 4\hat{j} - \hat{k}) = 0$

Critical Thinking

1. Let x_1, y_1, z_1 be the intercepts made by the plane

∴ Equation of plane is

$$\frac{x}{x_1} + \frac{y}{y_1} + \frac{z}{z_1} = 1$$

Since it passes through (a, b, c),

$$\Rightarrow \frac{a}{x_1} + \frac{b}{y_1} + \frac{c}{z_1} = 1$$

∴ Locus of (x_1, y_1, z_1) is $\frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 1$

2. Since, the plane contains the X-axis, it passes through the origin

∴ d = 0

∴ The equation of the plane is

$ax + by + cz = 0$ ….(i)

Also, plane passes through (1, 1, 1)

∴ a + b + c = 0 ….(ii)

The equation of the X-axis is $\frac{x}{1} = \frac{y}{0} = \frac{z}{0}$

As the plane contains the X-axis, the d.r.s of the normal to the plane are perpendicular to X-axis

∴ a(1) + b(0) + c(0) = 0

⇒ a = 0

Substituting value of a in (ii) we get

b + c = 0 ⇒ b = – c

∴ The equation of the required plane is

$by – bz = 0$

$\Rightarrow y – z = 0$

3. The plane passes through (1, –1, 3) and (2, 3 –4)

The points satisfies the equation of plane in option (B)

∴ option (B) is correct answer.

Alternate method:

Let $ax + by + cz + d = 0$ be the equation of the required plane.

Since, the plane is parallel to X-axis,

∴ a = 0

The points (1, –1, 3) and (2, 3, – 4) lie in the plane,

∴ – b + 3c + d = 0, and ….(i)

3b – 4c + d = 0 ….(ii)

Solving the equations (i) and (ii), we get

$$\frac{b}{3-(-4)} = \frac{c}{3+1} = \frac{d}{4-9}$$

$$\Rightarrow \frac{b}{7} = \frac{c}{4} = \frac{d}{-5}$$

∴ Equation of the required plane is $7y + 4z – 5 = 0$

$\therefore$ equation of plane passing through the vector $2\hat{j} - \hat{k}$ and perpendicular to $\overline{AB} = -2\hat{i} - 10\hat{k}$ is

$\overline{r}.(-2\hat{i} - 10\hat{k}) = (2\hat{j} - \hat{k}).(-2\hat{i} - 10\hat{k})$

$\therefore$ the d.r.s. of the normal to the plane are

$3 - (-1), -5 - 2, 6 - 3$

i.e. 4, –7, 3

Since, the mid-point $\left(1, -\frac{3}{2}, \frac{9}{2}\right)$ lies in the plane,

$\therefore$ The equation of the plane is

$4(x - 1) - 7\left(y + \frac{3}{2}\right) + 3\left(z - \frac{9}{2}\right) = 0$

$\Rightarrow 4x - 7y + 3z = 28$

7.

i.e. –2, 1, 1

$\therefore$ The equation of the plane is

$-2(x + 1) + 1(y - 3) + 1(z - 4) = 0$

$\overline{r}.(-\hat{i} + 3\hat{k}) = 2$

i.e. $-x + 3z = 2$

$\Rightarrow z_1 = 1$

10. (3, 2, –1) lies on the plane $5x + 3y - 2z = \lambda$

$\therefore$ $5(3) + 3(2) - 2(-1) = \lambda$

$\Rightarrow \lambda = 23$

11. The equation of the plane passing through the intersection of the planes $\overline{r} \cdot \overline{a} = p$ and $\overline{r} \cdot \overline{b} = q$ is

$\overline{r} \cdot (\overline{a} + \lambda\overline{b}) = p + \lambda q$ ….(i)

Since, the plane passes through the origin,

$p + \lambda q = 0$

$\Rightarrow \lambda = \frac{-p}{q}$

Substituting the value of λ in (i), we get

$\overline{r} \cdot \left(\overline{a} - \frac{p}{q}\overline{b}\right) = p + \left(\frac{-p}{q}\right)(q)$

$\Rightarrow \overline{r} \cdot (\overline{a}q - \overline{b}p) = pq - pq$

$\Rightarrow \overline{r} \cdot (q\overline{a} - p\overline{b}) = 0$

12. The line of intersection of the planes $\overline{r} . (3\hat{i} - \hat{j} + \hat{k}) = 1$ and $\overline{r} . (\hat{i} + 4\hat{j} - 2\hat{k}) = 2$ is perpendicular to each of the normal vectors $\overline{n_1} = 3\hat{i} - \hat{j} + \hat{k}$ and $\overline{n_2} = \hat{i} + 4\hat{j} - 2\hat{k}$.

$\therefore$ The line is parallel to the vector $\overline{n}_1 \times \overline{n}_2$

$\therefore$ $\overline{n}_1 \times \overline{n}_2 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & -1 & 1 \\ 1 & 4 & -2 \end{vmatrix}$

$= -2\hat{i} + 7\hat{j} + 13\hat{k}$

13. The equation of the required plane is

$\Rightarrow (1 + 2\lambda)x + (2 + \lambda)y + (3 - \lambda)z - 4 + 5\lambda = 0$ ….(i)

Let a, b, c be the d.r.s of the required plane

$\therefore$ From equation (i), $a = 1 + 2\lambda$; $b = 2 + \lambda$; $c = 3 - \lambda$

The required plane is perpendicular to $5x + 3y - 6z + 8 = 0$

$\therefore$ $5a + 3b - 6c = 0$

$\Rightarrow 5(1 + 2\lambda) + 3(2 + \lambda) - 6(3 - \lambda) = 0$

$\Rightarrow 5 + 10\lambda + 6 + 3\lambda - 18 + 6\lambda = 0$

$\Rightarrow -7 + 19\lambda = 0$

$\Rightarrow \lambda = \dfrac{7}{19}$

Substituting the value of λ in equation (i), we get

$$\left(1+2\times\frac{7}{19}\right)x + \left(2+\frac{7}{19}\right)y + \left(3-\frac{7}{19}\right)z - 4 + 5\left(\frac{7}{19}\right) = 0$$

$\Rightarrow \dfrac{33}{19}x + \dfrac{45}{19}y + \dfrac{50}{19}z - \dfrac{41}{19} = 0$

i.e., $\dfrac{x}{6} = \dfrac{y}{3} = \dfrac{z}{2}$

$\therefore$ the d.r.s. of the line are 6, 3, 2

$\therefore$ the d.r.s. of the normal to the plane are 6, 3 and 2.

$\therefore$ $a(0) + b(0) + c(1) = 0$

$\Rightarrow c = 0$

Given that the required plane is perpendicular to $\dfrac{x-1}{\cos\theta} = \dfrac{y+2}{\sin\theta} = \dfrac{z-3}{0}$

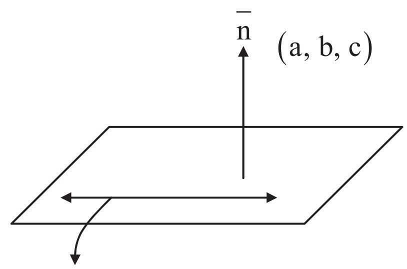
$\therefore$ d.r.s of normal to plane are $\cos\theta$, $\sin\theta$, 0

$\therefore$ the equation of required plane is

$x\cos\theta + y\sin\theta = 0$

$\Rightarrow x + y\tan\theta = 0$

16.



$$\frac{x-1}{1} = \frac{y-2}{3} = \frac{z-3}{2}$$

$$\bar{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 3 & 2 \\ 2 & 7 & 5 \end{vmatrix} = \hat{i} - \hat{j} + \hat{k}$$

$\therefore$ the d.r.s of the normal to the plane are 1, –1, 1

$\therefore$ the equation of plane passing through the point (1, 2, 3)

$1(x - 1) - 1(y - 2) + 1(z - 3) = 0$

$\Rightarrow x - y + z = 2$

17. Equation of any plane through (x_1, y_1, z_1) is

$a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$ ….(i)

it contains the line

$\dfrac{x-x_2}{d_1} = \dfrac{y-y_2}{d_2} = \dfrac{z-z_2}{d_3} = 0$

i.e. it passes through (x_2, y_2, z_2)

$\therefore$ $a(x_2 - x_1) + b(y_2 - y_1) + c(z_2 - z_1) = 0$ ….(ii)

Also, $ad_1 + bd_2 + cd_3 = 0$ ….(iii)

Eliminating a, b, c from (i), (ii), (iii), we get the equation of the required plane as

$$\begin{vmatrix} x-x_1 & y-y_1 & z-z_1 \\ x_2-x_1 & y_2-y_1 & z_2-z_1 \\ d_1 & d_2 & d_3 \end{vmatrix} = 0$$

18. Vector perpendicular to plane is

$\bar{n} = 6\hat{i} - 3\hat{j} + 5\hat{k}$

Thus, the line perpendicular to the given line will be parallel to $\bar{n}$

$\therefore$ The equation of line which passes through $\bar{a} = 2\hat{i} - 3\hat{j} - 5\hat{k}$ and parallel to $\bar{n}$ is

$\bar{r} = \bar{a} + \lambda\bar{n}$

$\Rightarrow \bar{r} = (2\hat{i} - 3\hat{j} - 5\hat{k}) + \lambda(6\hat{i} - 3\hat{j} + 5\hat{k})$

19. The d.r.s. of the line are 3, – 4, 5 and it passes through is 3, – 5, 7

$\therefore$ The equation of line is

$\bar{r} = 3\hat{i} - 5\hat{j} + 7\hat{k} + \lambda\left(3\hat{i} - 4\hat{j} + 5\hat{k}\right)$

20. The line is perpendicular to the plane
$x + 2y - 5z + 9 = 0$
∴ the d.r.s are 1, 2, –5
Also it passes through (1, 2, 3)
∴ The equation of line is $\frac{x-1}{1} = \frac{y-2}{2} = \frac{z-3}{-5}$

21. $\bar{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -1 & 2 \\ 3 & 1 & 1 \end{vmatrix} = -3\hat{i} + 5\hat{j} + 4\hat{k}$
∴ the d.r.s. of line are – 3, 5, 4
∴ The equation of the line passing through (1, 2, 3) and having d.r.s. –3, 5, 4 is
$\frac{x-1}{-3} = \frac{y-2}{5} = \frac{z-3}{4}$

22. Here, $\bar{n}_1 = \left(x\hat{i} + \hat{j} - \hat{k}\right)$, and
$\bar{n}_2 = \left(\hat{i} + x\hat{j} - \hat{k}\right)$
∴ $\cos\theta = \left|\frac{\bar{n}_1 . \bar{n}_2}{|\bar{n}_1||\bar{n}_2|}\right|$
$\Rightarrow \cos\frac{\pi}{3} = \left|\frac{\left(x\hat{i} + \hat{j} - \hat{k}\right).\left(\hat{i} + x\hat{j} + \hat{k}\right)}{\sqrt{x^2+1+1}.\sqrt{1+x^2+1}}\right|$
$\Rightarrow \frac{1}{2} = \pm\left(\frac{x+x-1}{x^2+2}\right)$
$\Rightarrow \frac{2x-1}{x^2+2} = \frac{1}{2}$ ....(considering positive value)
$\Rightarrow x^2 + 2 - 4x + 2 = 0$
$\Rightarrow (x-2)^2 = 0$
$\Rightarrow x = 2$

23. Consider plane OPQ
the equation of plane is
$ax + by + cz = 0$
The plane passes through P(1, 2, 1) and Q(2, 3, 0)
∴ $a + 2b + c = 0$ and ....(i)
$2a + 3b = 0$ ....(ii)
On solving (i) and (ii), we get
$\frac{a}{-3} = \frac{b}{2} = \frac{c}{-1}$
∴ The equation of plane OPQ is
$-3x + 2y - z = 0$ ....(iii)
The equation of plane PQR is
$a_1(x-1) + b_1(y-2) + c_1(z-1) = 0$
On solving for a_1, b_1, c_1, we get
$a_1 = -3$, $b_1 = 3$, $c_1 = 0$
∴ The equation of PQR is
$x - y + 1 = 0$ ....(iv)
∴ The angle between the planes represented by equations (iii) and (iv) is
$\cos\theta = \left|\frac{(-3)(1)+2(-1)}{\sqrt{9+4+1}.\sqrt{1+1}}\right|$
$= \left|\frac{-5}{\sqrt{14}.\sqrt{2}}\right|$
$\Rightarrow \theta = \cos^{-1}\left(\frac{5}{\sqrt{28}}\right)$

24. The d.r.s. of normal to the plane are 2, 3, –1
The d.r.s. of X-axis are 1, 0, 0
∴ the angle between the plane and X-axis is
$\sin\theta = \frac{aa_1 + bb_1 + cc_1}{\sqrt{a^2+b^2+c^2}.\sqrt{a_1^2+b_1^2+c_1^2}}$
$\Rightarrow \sin\theta = \frac{2(1)+0+0}{\sqrt{4+9+1}.\sqrt{1}}$
$\Rightarrow \sin\theta = \frac{2}{\sqrt{14}}$
$\Rightarrow \theta = \sin^{-1}\left(\frac{2}{\sqrt{14}}\right)$

25. Here a = 1, b = k, c = 4 and
$a_1 = 1$, $b_1 = -3$, $c_1 = 2$
The angle between the line and plane is
$\sin\theta = \frac{aa_1 + bb_1 + cc_1}{\sqrt{a^2+b^2+c^2}.\sqrt{a_1^2+b_1^2+c_1^2}}$
Now, $\theta = \sin^{-1}\left(\frac{3}{7\sqrt{6}}\right) \Rightarrow \sin\theta = \frac{3}{7\sqrt{6}}$
∴ $\frac{3}{7\sqrt{6}} = \frac{1-3k+8}{\sqrt{1+k^2+16}.\sqrt{1+9+4}}$
$\Rightarrow k^2 + 21k - 46 = 0$
$\Rightarrow k = 2$ or -23

26. Equation of the line L: $\frac{x-1}{2} = \frac{y}{3} = \frac{z-3}{2}$ and equation of the plane P: $4x - 2y - z = 1$.
The d.r.s of the line are 2, 3, 2, and
The d.r.s of the normal to the plane are 4, –2, –1.
Now consider
$a_1a_2 + b_1b_2 + c_1c_2 = 8 - 6 - 2 = 0$
∴ Line L and plane P are parallel.
Since the point (1, 0, 3), which lies on the line L also satisfies the equation of the plane,
∴ The line L lies in the plane P.

27. Equation of the line

L: $\frac{x+3}{2} = \frac{y-4}{3} = \frac{z+5}{1}$

and equation of the plane

P : $2x - 3y + 5z = 1$.

The d.r.s of the line are 2, 3, 1

The d.r.s of the normal to the plane are 2, –3, 5.

Now consider

$a_1a_2 + b_1b_2 + c_1c_2 = 4 - 9 + 5 = 0$

∴ Line L is parallel to the plane P.

28. Since, the line $\frac{x-3}{2} = \frac{y-4}{3} = \frac{z-5}{4}$ lies in the plane $4x + 4y - cz - d = 0$,

∴ $aa_1 + bb_1 + cc_1 = 0$

$\Rightarrow 2(4) + 3(4) + 4(-c) = 0$

$\Rightarrow 20 - 4c = 0$

$\Rightarrow c = 5$

Also, the plane passes through (3, 4, 5)

∴ $4(3) + 4(4) - 5(5) - d = 0$

$\Rightarrow d = 3$

29. Given equation of plane

$\frac{x-1}{2} = \frac{y-1}{3} = \frac{z+2}{2}$

∴ The line passes through (1, 1, –2)

The above point lies on the plane

$x + By - 3z + D = 0$

∴ $1 + B + 6 + D = 0$

$\Rightarrow B + D = -7$ ....(i)

Also the given line is perpendicular to the normal to the plane

$a_1a_2 + b_1b_2 + c_1c_2 = 0$

$\Rightarrow 2(1) + 3(B) + 2(-3) = 0$

$\Rightarrow B = \frac{4}{3}$

Substituting value of B is equation (i), we get

$D = \frac{-25}{3}$

30. Since both the given lines pass through the point with position vector $\hat{i} + \hat{j}$, the required plane also passes through $\hat{i} + \hat{j}$, and normal to the plane is perpendicular to the vectors

$\hat{i} + 2\hat{j} - \hat{k}$ and $-\hat{i} + \hat{j} - 2\hat{k}$.

Let a, b, c be the d.r.s. of the normal to the plane.

∴ $\bar{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & -1 \\ -1 & 1 & -2 \end{vmatrix}$

$\Rightarrow \bar{n} = -3\hat{i} + 3\hat{j} + 3\hat{k}$

i.e. $\bar{n} = -\hat{i} + \hat{j} + \hat{k}$

∴ Vector equation of the plane passing through $\hat{i} + \hat{j}$ and containing the given lines is

$\bar{r}.(-\hat{i} + \hat{j} + \hat{k}) = (\hat{i} + \hat{j}).(-\hat{i} + \hat{j} + \hat{k})$

$\Rightarrow \bar{r}.(-\hat{i} + \hat{j} + \hat{k}) = 0$

31. The plane passes through

(0, 2, –3) and (2, 6, 3)

The two points satisfy the equation of plane is option (A)

∴ option (A) is correct.

Alternate Method:

The equation of the plane is

$$\begin{vmatrix} x-\alpha & y-\beta & z-\gamma \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x & y-2 & z+3 \\ 1 & 2 & 3 \\ 2 & 3 & 4 \end{vmatrix} = 0$$

$\Rightarrow -x - (y-2)(-2) + (z+3)(-1) = 0$

$\Rightarrow -x + 2y - 4 - z - 3 = 0$

$\Rightarrow x - 2y + z + 7 = 0$

32. The plane passes through

(5, 7, –3) and (8, 4, 5)

The two points satisfy the equation of plane is option (A)

∴ option (A) is correct.

33. Let a, b, c be the d.r.s of the normal to the plane

∴ $\bar{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & 5 & 7 \\ 1 & 4 & 7 \end{vmatrix} = \hat{i} - 2\hat{j} + \hat{k}$

Since, the plane passes through (– 1, – 3, – 5)

∴ $1(x + 1) - 2(y + 3) + 1(z + 5) = 0$

$\Rightarrow x - 2y + z = 0$

From the given options only (0, 0, 0) satisfies the equation of the plane.

∴ The plane passes through (0, 0, 0).

34. Here $x_1, y_1, z_1 = -\ , -3, -5$ and $x_2, y_2, z_2 = 2, 4, 6$

$a_1, b_1, c_1 = 3, 5, 7$ and $a_2, b_2, c_2 = 1, 3, 5$

Since the given lines are coplanar

∴ $\begin{vmatrix} x_2-x_1 & y_2-y_1 & z_2-z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} - -2 & -3-4 & -5-6 \\ 3 & 5 & 7 \\ 1 & 3 & 5 \end{vmatrix} = 0$$

$\Rightarrow (- \ -2)(25-21) - (-3-4)(15-7)$
$\qquad + (-5-6)(9-5) = 0$

$\Rightarrow 12 = 4(\ +2)$

$\Rightarrow \ = 1.$

35. The lines are coplanar

$\therefore$ $\begin{vmatrix} -1-2 & -3-4 & -5-6 \\ 1 & 4 & k \\ 3 & 5 & k \end{vmatrix} = 0$

$\Rightarrow -3(4k-5k) + 7(k-3k) - 11(-7) = 0$

$\Rightarrow k = 7$

36. Since the given lines are coplanar, then

$\therefore$ $\begin{vmatrix} 3-1 & 1-2 & 3-1 \\ 1 & 2 & -\lambda \\ \lambda & 3 & 4 \end{vmatrix} = 0$

$\Rightarrow \begin{vmatrix} 2 & -1 & 2 \\ 1 & 2 & -\lambda \\ \lambda & 3 & 4 \end{vmatrix} = 0$

$\Rightarrow \lambda^2 + 2\lambda + 26 = 0$

$\Delta = 4 - 4(1)(26) < 0$

$\therefore$ Roots are imaginary

So no real value of λ exists.

37. $\dfrac{x}{1} = \dfrac{y-2}{2} = \dfrac{z+3}{3}$ and

$\dfrac{x-2}{2} = \dfrac{y-6}{3} = \dfrac{z-3}{4}$

The d.r.s. of the first line are 1, 2, 3 and

The d.r.s. of the second line are 2, 3, 4

Ratio of the d.r.s. are not same

i.e. $\dfrac{2}{1} \neq \dfrac{3}{2} \neq \dfrac{4}{3}$

$\therefore$ The lines are not parallel.

Sum of the products of the d.r.s. is not equal to 0 i.e., $2(1) + 2(3) + 3(4) \neq 0$

$\therefore$ The lines are not perpendicular.

Consider $\begin{vmatrix} 0+2 & -2+6 & 3+3 \\ 1 & 2 & 3 \\ 2 & 3 & 4 \end{vmatrix} = \begin{vmatrix} 2 & 4 & 6 \\ 1 & 2 & 3 \\ 2 & 3 & 4 \end{vmatrix}$

$= 2\begin{vmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ 2 & 3 & 4 \end{vmatrix} = 0$ ($\because$ the two rows are same)

$\therefore$ The two lines are coplanar.

38. Let d_1 be the distance of the point (1, 2, −1) from the plane $2x - 3y + z + k = 0$

$\therefore$ $d_1 = \left|\dfrac{2(1) - 3(2) + (-1) + k}{\sqrt{2^2 + (-3)^2 + 1^2}}\right| = \left|\dfrac{-5+k}{\sqrt{4+9+1}}\right|$

$= \left|\dfrac{k-5}{\sqrt{14}}\right|$

Let d_2 be the distance of the point (1, 2, −1) from the plane $x + 2y + 3z = 0$

$\therefore$ $d_2 = \left|\dfrac{(1) + 2(2) + 3(-1)}{\sqrt{1^2 + 2^2 + 3^2}}\right| = \left|\dfrac{2}{\sqrt{14}}\right|$

Given that $d_1.d_2 = 1$.

$\therefore$ $\left|\dfrac{k-5}{\sqrt{14}}\right|\left|\dfrac{2}{\sqrt{14}}\right| = 1$

$\Rightarrow (k-5)\,2 = 14$

$\Rightarrow k - 5 = 7$

$\Rightarrow k = 12$

39. $P_1 = \left|\dfrac{3(2) - 6(3) + 2(4) + 11}{\sqrt{3^2 + (-6)^2 + (2)^2}}\right| = 1$

$P_2 = \left|\dfrac{3(1) - 6(1) + 2(4) + 11}{\sqrt{3^2 + (-6)^2 + (2)^2}}\right| = \dfrac{16}{7}$

the equation P_1 and P_2 satisfies

$7P^2 - 23P + 16 = 0.$

$\therefore$ P_1 and P_2 are the roots of the equation (B).

40. Equation of plane parallel to $x - 2y + 2z = 5$ is

$x - 2y + 2z + k = 0$ ….(i)

distance of the above plane from (1, 2, 3) is 1.

$\therefore$ $\left|\dfrac{1-4+6+k}{\sqrt{9}}\right| = 1$

i.e. $k + 3 = \pm 3$

$\Rightarrow k = 0$ or -6

41. Let x, y, z be any point

$d_1^2 + d_2^2 + d_3^2 = 36$

$\therefore$ $\left|\dfrac{x-z}{\sqrt{2}}\right|^2 + \left|\dfrac{x-2y+z}{\sqrt{6}}\right|^2 + \left|\dfrac{x+y+z}{\sqrt{3}}\right|^2 = 36$

$\Rightarrow \dfrac{1}{6}[3x^2 - 6xz + 3z^2 + x^2 + 4y^2 + z^2 - 4xy$
$\quad - 4yz + 2xz + 2x^2 + 2y^2 + 2z^2 + 4xy + 4yz$
$\quad + 4xz] = 36$

$\therefore$ $\Rightarrow x^2 + y^2 + z^2 = 36$

42. Since all the planes are parallel,

$\therefore$ $p_1 = \dfrac{|2-6|}{\sqrt{2^2+(-3)^2+4^2}} = \dfrac{4}{\sqrt{29}}$

Equation of the plane $4x - 6y + 8z + 3 = 0$ can be written as $2x - 3y + 4z + \dfrac{3}{2} = 0$

$\therefore$ $p_2 = \dfrac{\left|2-\dfrac{3}{2}\right|}{\sqrt{2^2+(-3)^2+4^2}} = \dfrac{1}{2\sqrt{29}}$

and $p_3 = \dfrac{|2+6|}{\sqrt{2^2+(-3)^2+4^2}} = \dfrac{8}{\sqrt{29}}$

Now consider $p_1 + 8p_2 - p_3$

$= \dfrac{4}{\sqrt{29}} + \dfrac{4}{\sqrt{29}} - \dfrac{8}{\sqrt{29}}$

$= 0$

43. Let A ≡ (a, 0, 0), B ≡ (0, b, 0) and c ≡ (0, 0, c)
The equation of the plane in intercept form is

$\dfrac{x}{a} + \dfrac{y}{b} + \dfrac{z}{c} = 1$

Since, centroid is (3, 3, 3)

$\therefore$ $3 = \dfrac{x_1+x_2+x_3}{3} = \dfrac{a+0+0}{3} = 3$

$\Rightarrow a = 9$

Similarly $\dfrac{0+b+0}{3} = 3 \Rightarrow b = 9$, and

$\dfrac{0+0+c}{3} = 3 \Rightarrow c = 9$

$\therefore$ The equation of plane is $\dfrac{x}{9} + \dfrac{y}{9} + \dfrac{z}{9} = 1$

$\Rightarrow x + y + z = 9$

44. Let A ≡ (a, 0, 0), B ≡ (0, b, 0) and C ≡ (0, 0, c).
Since, centroid is (α, β, γ)

$\therefore$ $a = 3\alpha, b = 3\beta, c = 3\gamma$

$\therefore$ the equation of the plane is $\dfrac{x}{a} + \dfrac{y}{b} + \dfrac{z}{c} = 1$

$\dfrac{x}{3\alpha} + \dfrac{y}{3\beta} + \dfrac{z}{3\gamma} = 1$

$\Rightarrow \dfrac{x}{\alpha} + \dfrac{y}{\beta} + \dfrac{z}{\gamma} = 3$

45. The given equation of plane is $6x - 3y + 2z = 18$

i.e. $\dfrac{x}{3} + \dfrac{y}{-6} + \dfrac{z}{9} = 1$

If a, b, c are intercepts made by the plane, then

Centroid $\equiv \left(\dfrac{a+0+0}{3}, \dfrac{0+b+0}{3}, \dfrac{0+0+c}{3}\right)$

$\therefore$ $G \equiv \left(\dfrac{3+0+0}{3}, \dfrac{0-6+0}{3}, \dfrac{9+0+0}{3}\right)$

$\Rightarrow G \equiv (1, -2, 3)$

46. The given equations of plane is $ax + by + cz = 1$

i.e. $\dfrac{x}{\frac{1}{a}} + \dfrac{y}{\frac{1}{b}} + \dfrac{}{\frac{1}{c}} = 1$

$\therefore$ The intercepts made by the plane are $\dfrac{1}{a}, \dfrac{1}{b}, \dfrac{1}{c}$

$\therefore$ $A \equiv \left(\dfrac{1}{a}, 0, 0\right)$; $B \equiv \left(0, \dfrac{1}{b}, 0\right)$; $C \equiv \left(0, 0, \dfrac{1}{c}\right)$

$\therefore$ centroid $\equiv \left(\dfrac{\frac{1}{a}+0+0}{3}, \dfrac{0+\frac{1}{b}+0}{3}, \dfrac{0+0+\frac{1}{c}}{3}\right)$

$\Rightarrow G \equiv \left(\dfrac{1}{3a}, \dfrac{1}{3b}, \dfrac{1}{3c}\right)$

47. Let equation of plane be $x + my + nz = p$

i.e., $\dfrac{x}{p} + \dfrac{y}{\frac{p}{m}} + \dfrac{z}{\frac{p}{n}} = 1$

$\therefore$ $A \equiv \left(\dfrac{p}{}, 0, 0\right)$, $B \equiv \left(0, \dfrac{p}{m}, 0\right)$, $C \equiv \left(0, 0, \dfrac{p}{n}\right)$

If centroid of ΔABC is (x_1, y_1, z_1), then

$x_1 = \dfrac{p}{3}$, $y_1 = \dfrac{p}{3m}$, $z_1 = \dfrac{p}{3n}$

Now, $^2 + m^2 + n^2 = 1$

$\therefore$ $\dfrac{p^2}{9x_1^2} + \dfrac{p^2}{9y_1^2} + \dfrac{p^2}{9z_1^2} = 1$

$\Rightarrow \dfrac{1}{x_1^2} + \dfrac{1}{y_1^2} + \dfrac{1}{z_1^2} = \dfrac{9}{p^2}$

48. The equation of line perpendicular to given plane passing through (2, 2, 2) is

$\dfrac{x-2}{1} = \dfrac{y-2}{1} = \dfrac{z-2}{1} = \lambda$ (say)

Any general point on it is $P \equiv (\lambda+2, \lambda+2, \lambda+2)$

Since, P lies the plane $x + y + z = 0$

$\therefore$ $\lambda + 2 + \lambda + 2 + \lambda + 2 = 9 \Rightarrow \lambda = 1$

$\therefore$ The foot of perpendicular is (3, 3, 3).

49. The required plane is perpendicular to the line

$\dfrac{x-2}{1} = \dfrac{y-4}{2} = \dfrac{z-5}{2} = \lambda$ (say)

the d.r.s of normal to the plane are proportional to 1, 2, 2

$\therefore$ Equation of the plane is

$x + 2y + 2z + d = 0$ ....(i)

Since it passes through the point (5, 1, 2), we have

$(5) + 2(1) + 2(2) + d = 0$

$\Rightarrow d = -11$

$\therefore$ The equation (i) becomes $x + 2y + 2z - 11 = 0$

Any general point on the given line is given by

$\lambda + 2, 2\lambda + 4, 2\lambda + 5$.

This point lies in the required plane

$\therefore$ $\lambda + 2 + 2(2\lambda + 4) + 2(2\lambda + 5) - 11 = 0$

$\Rightarrow \lambda + 2 + 4\lambda + 8 + 4\lambda + 10 - 11 = 0$

$\Rightarrow 9\lambda + 9 = 0 \Rightarrow \lambda = -1$

$\therefore$ The point of intersection is

$[(-1) + 2, 2(-1) + 4, 2(-1)+5]$

$\Rightarrow (1, 2, 3)$

50. The equation of plane passing through the intersection of the given planes is

$(2x - 5y + z - 3) + \lambda(x + y + 4z - 5) = 0$

$\Rightarrow (2 + \lambda)x + (-5 + \lambda)y + (1 + 4\lambda) z - 3 - 5\lambda = 0$ ....(i)

This plane is parallel to the plane $x + 3y + 6z = 1$

$\therefore$ $\frac{2+\lambda}{1} = \frac{-5+\lambda}{3} = \frac{1+4\lambda}{6}$

$\Rightarrow \lambda = \frac{-11}{2}$

$\therefore$ Substituting value of λ in equation (i), we get

$-\frac{7}{2}x - \frac{21}{2}y - \frac{42}{2}z + \frac{49}{2} = 0$

$\therefore$ $x + 3y + 6z = 7$

Comparing with $x + 3y + 6z = k$, we get

$k = 7$

51. The equation of the plane through the line of intersection of the planes,

$4x + 7y + 4z + 81 = 0$ and $5x + 3y + 10z = 25$

is $(4x + 7y + 4z + 81) + \lambda(5x + 3y + 10z - 25) = 0$

$\Rightarrow (4+ 5\lambda) x + (7+ 3\lambda) y + (4 + 10\lambda)z + 81 - 25\lambda = 0$ ....(i)

It is parallel to $x - 4y + 6z = k$,

$\therefore$ $\frac{4+5\lambda}{1} = \frac{7+3\lambda}{-4} = \frac{4+10\lambda}{6}$

$\Rightarrow \lambda = -1$

Substituting value of λ in equation (i), we get

$-x + 4y - 6z + 106 = 0$

$\Rightarrow x - 4y + 6z = 106$

Hence $k = 106$

$$\Rightarrow \frac{2x-y+2z+3}{\sqrt{2^2+(-1)^2+2^2}} = \pm \frac{3x-2y+6z+8}{\sqrt{3^2+(-2)^2+6^2}}$$

$\Rightarrow 7(2x - y + 2z + 3) = \pm 3(3x - 2y + 6z + 8)$

$\Rightarrow 7(2x - y + 2z + 3) = 3(3x - 2y + 6z + 8)$

or $7(2x - y + 2z + 3) = -3(3x - 2y + 6z + 8)$

$\Rightarrow 5x - y - 4z - 3 = 0$ or $23x - 13y + 32z + 45 = 0$

$4x + 5y + 3z - 5 = 0$

$\therefore$ $4(3\lambda - 3) + 5(-2\lambda + 2) + 3(\lambda - 1) - 5 = 0$

$\Rightarrow \lambda = 2$.

Any general point on the line is

$(\lambda + 2, -\lambda - 3, -6\lambda + 1)$

The above point lies on the plane

$2x + y + z = 7$

$\therefore$ $2(\lambda + 2) + (-\lambda - 3) + (-6\lambda + 1) = 7$

$\Rightarrow -5\lambda + 2 = 7$

$\Rightarrow \lambda = -1$

$\therefore$ The point is (1, –2, 7)

Since the point lies on the plane $x + y + z = 17$

$\therefore$ $\lambda + 3 + 2\lambda + 4 + 2\lambda + 5 = 17 \Rightarrow \lambda = 1$

$\therefore$ The point is (4, 6, 7).

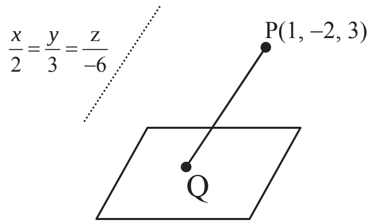
∴ The equation of the line passing through P(1, −2, 3) and parallel to the given line is

$$\frac{x-1}{2} = \frac{y+2}{3} = \frac{z-3}{-6} = \lambda(\text{say}) \quad \text{....(i)}$$



Any point on the line is

Q ≡ (2λ + 1, 3λ − 2, −6λ + 3)

The point Q lies on the plane $x - y + z = 5$.

∴ (2λ + 1) − (3λ − 2) + (−6λ + 3) = 5

$\Rightarrow -7\lambda = -1 \Rightarrow \lambda = \frac{1}{7}$

∴ $Q \equiv \left(\frac{9}{7}, \frac{-11}{7}, \frac{15}{7}\right)$

∴ $d = \sqrt{\left(\frac{9}{7}-1\right)^2 + \left(\frac{-11}{7}+2\right)^2 + \left(\frac{15}{7}-3\right)^2}$

$= \sqrt{\left(\frac{2}{7}\right)^2 + \left(\frac{3}{7}\right)^2 + \left(\frac{-6}{7}\right)^2}$

$= \sqrt{\frac{4}{49} + \frac{9}{49} + \frac{36}{49}} = \sqrt{\frac{49}{49}} = 1$

$\Rightarrow (p - 3)^2 = 0$

$\Rightarrow p = 3$

40. Let the d.r.s of the normal to the plane be proportional to a, b, c.

It passes through (1, 0, 0)

∴ the equation of the plane is

$a(x - 1) + b(y - 0) + c(z - 0) = 0$ ....(i)

Also, the plane passses through (0, 1, 0).

∴ $a(-1) + b(1) + c(0) = 0$

$\Rightarrow a = b$ ....(ii)

Now, the angle between the required plane and the plane $x + y = 3$ is $\dfrac{\pi}{4}$.

∴ $\cos\dfrac{\pi}{4} = \dfrac{a(1) + b(1) + c(0)}{\sqrt{a^2+b^2+c^2}\sqrt{1+1}}$

$\Rightarrow \dfrac{1}{\sqrt{2}} = \dfrac{a+b}{\sqrt{a^2+b^2+c^2}\sqrt{2}}$

Squaring both sides, we get

$\Rightarrow a^2 + b^2 + c^2 = a^2 + b^2 + 2ab$

$\Rightarrow c^2 = 2ab$ ....(iii)

From (ii) and (iii), we get

$a : b : c = a : a : \sqrt{2}a = 1 : 1 : \sqrt{2}$

41. For perpendicular planes, $a_1a_2 + b_1b_2 + c_1c_2 = 0$

$\Rightarrow 2(1) + 1(2) - 2(k) = 0$

$\Rightarrow k = 2$

42. Since the planes are perpendicular,

∴ $(3)(2) + (-6)(1) + (-2)(-k) = 0$

$\Rightarrow k = 0$

43. Since, the planes are perpendicular to each other.

∴ $3(4) + (-2)(3) + 2 \times (-k) = 0$

$\Rightarrow k = 3$

44. The equation of plane passing through (4, 4, 0) is $a(x - 4) + b(y - 4) + c(z - 0) = 0$

$\Rightarrow a(x - 4) + b(y - 4) + cz = 0$ …(i)

Since, plane (i) is perpendicular to the planes $2x + y + 2z + 3 = 0$ and $3x + 3y + 2z - 8 = 0$

∴ $2a + b + 2c = 0$, and …(ii)

$3a + 3b + 2c = 0$ …(iii)

On solving (i) and (ii), we get

$a = -4, b = 2, c = 3$

Substituting the values of a, b, c in (i), we get

$-4(x - 4) + 2(y - 4) + 3z = 0$

$\Rightarrow -4x + 16 + 2y - 8 + 3z = 0$

$\Rightarrow 4x - 2y - 3z = 8$

45. Comparing with $\overline{r} = \overline{a} + \lambda\overline{b}$ and $\overline{r}.\overline{n} = p$, we get

$\overline{b} = -\hat{i} + \hat{j} + \hat{k}$ and $\overline{n} = 3\hat{i} + 2\hat{j} - \hat{k}$

∴ Angle between the line and plane is given by

$\sin\theta = \dfrac{\overline{b}.\overline{n}}{|\overline{b}||\overline{n}|}$

$= \dfrac{(-1)(3) + (1)(2) + (1)(-1)}{\sqrt{3}\sqrt{14}} = \dfrac{-2}{\sqrt{42}}$

$\Rightarrow \theta = \sin^{-1}\left(\dfrac{-2}{\sqrt{42}}\right)$

46. The d.r.s. of line are 3, 4, 5 and

the d.r.s. of normal to the plane are 2, –2, 1

∴ The angle between line and plane is

$\sin\theta = \dfrac{aa_1 + bb_1 + cc_1}{\sqrt{a^2+b^2+c^2} \cdot \sqrt{a_1^2+b_1^2+c_1^2}}$

$= \dfrac{(2)(3) + (-2)(4) + (1)(5)}{\sqrt{2^2 + (-2)^2 + (1)^2} \cdot \sqrt{3^2+4^2+5^2}}$

$= \dfrac{3}{\sqrt{9}\sqrt{50}} = \dfrac{1}{5\sqrt{2}} = \dfrac{\sqrt{2}}{10}$

47. The d.r.s. of line are 1, 2, 2 and

the d.r.s. of normal to the plane are 2, –1, $\sqrt{\lambda}$

∴ $\sin\theta = \dfrac{1(2) + 2(-1) + 2(\sqrt{\lambda})}{\sqrt{1+4+4} \cdot \sqrt{4+1+\lambda}}$

$\Rightarrow \dfrac{1}{3} = \dfrac{2\sqrt{\lambda}}{3\sqrt{5+\lambda}}$

$\Rightarrow 2\sqrt{\lambda} = \sqrt{5+\lambda}$

$\Rightarrow 4\lambda = 5 + \lambda$

$\Rightarrow \lambda = \dfrac{5}{3}$

48. d.r.s. of normal to the plane are 2, –3, 6
d.r.s. of X-axis are 1, 0, 0.
∴ The angle between the plane and X-axis is

$$\sin\theta = \frac{aa_1 + bb_1 + cc_1}{\sqrt{a^2+b^2+c^2}\sqrt{a_1^2+b_1^2+c_1^2}}$$

$$= \frac{2(1)-3(0)+6(0)}{\sqrt{4+9+36}\cdot\sqrt{1}}$$

$$= \frac{2}{7}$$

∴ $\theta = \sin^{-1}\left(\frac{2}{7}\right)$

But $\theta = \sin^{-1}\alpha$

∴ $\alpha = \frac{2}{7}$

49. The d.r.s. of line are 1, 2, λ and
The d.r.s. of normal to the plane are 1, 2, 3.

∴ $\sin\theta = \frac{1(1)+2(2)+\lambda(3)}{\sqrt{1+4+9}\sqrt{1+4+\lambda^2}}$

$\Rightarrow \sin\theta = \frac{5+3\lambda}{\sqrt{14}\sqrt{5+\lambda^2}}$

$\Rightarrow \sin^2\theta = \frac{(5+3\lambda)^2}{14(5+\lambda^2)}$

$\Rightarrow 1 - \frac{5}{14} = \frac{(5+3\lambda)^2}{14(5+\lambda^2)}$ ....$\left[\because \cos\theta = \sqrt{\frac{5}{14}} \text{ (given)}\right]$

$\Rightarrow \frac{9}{14} = \frac{25+30\lambda+9\lambda^2}{14(5+\lambda^2)}$

On solving, we get

$\lambda = \frac{2}{3}$

50. Let a, b, c = 3, 2 + λ, –1 and a_1, b_1, c_1 = 1, –2, 0
Since, the line lies on the plane
∴ $aa_1 + bb_1 + cc_1 = 0$
$\Rightarrow 3(1) + (2 + \lambda)(-2) + (-1)(0) = 0$
$\Rightarrow \lambda = \frac{-1}{2}$

51. The line is parallel to the plane if
$aa_1 + bb_1 + cc_1 = 0$
Consider option (B), 2(3) + 1(4) – 2(5) = 0
∴ $2x + y - 2z = 0$ is the required plane.

52. The equation of the plane is $ax + by + cz + d = 0$
∴ the d.r.s. of the normal to the plane are a, b, c
Since the given line is parallel to the plane,
∴ a + bm + cn = 0

53. line $\frac{x-4}{1} = \frac{y-2}{1} = \frac{z-k}{2}$ lies on the plane $2x - 4y + z = 7$.
∴ Point (4, 2, k) lies on the plane $2x - 4y + z = 7$
∴ 2(4) – 4(2) + k = 7
⇒ k = 7

54. Line is perpendicular to normal of plane
$\Rightarrow \left(2\hat{i} - \hat{j} + 3\hat{k}\right).\left(\ \hat{i} + m\hat{j} - \hat{k}\right) = 0$
2 – m – 3 = 0 ....(i)
(3, – 2, –4) lies on the plane $x + my - z = 9$
∴ 3 – 2m + 4 = 9
⇒ 3 – 2m = 5 ....(ii)
Solving (i) and (ii)
= 1, m = –1
$^2 + m^2 = 2$

55. The d.r.s. of the XY-plane are 0, 0, 1
the d.r.s. of the given line are , m, n
Since, the line is parallel to the plane
∴ $aa_1 + bb_1 + cc_1 = 0$
⇒ (0) + m(0) + n(1) = 0
⇒ n = 0

56. Let the position vector of Q be
$\left(\hat{i} - \hat{j} + 2\hat{k}\right) + \mu\left(-3\hat{i} + \hat{j} + 5\hat{k}\right)$
$= (-3\mu + 1)\hat{i} + (\mu - 1)\hat{j} + (5\mu + 2)\hat{k}$
∴ $\overline{PQ} = (-3\mu - 2)\hat{i} + (\mu - 3)\hat{j} + (5\mu - 4)\hat{k}$
Since, $\overline{PQ}$ is parallel to the plane
∴ (–3μ–2)(1) + (μ–3)(–4) + (5μ–4)(3) = 0
$\Rightarrow \mu = \frac{1}{4}$

57. The plane passes through points (– 3, 0, 2) and (3, 2, 6)
This points satisfies the equation of plane in option (D)
∴ option (D) is correct answer.

58. Lines are coplanar if

$$\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = 0$$

∴ $\begin{vmatrix} 1-2 & 4-3 & 5-4 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = 0$

$\Rightarrow \begin{vmatrix} -1 & 1 & 1 \\ 1 & 1 & -k \\ k & 2 & 1 \end{vmatrix} = 0$

$\Rightarrow -1(1 + 2k) - 1(1 + k^2) + 1(2 - k) = 0$

$\Rightarrow k^2 + 3k = 0$

$\Rightarrow k = 0, -3$

59. The planes are concurrent,

$\therefore \begin{vmatrix} 1 & -c & -b \\ c & -1 & a \\ b & a & -1 \end{vmatrix} = 0$

$\Rightarrow a^2 + b^2 + c^2 + 2abc - 1 = 0$

$\Rightarrow a^2 + b^2 + c^2 = 1 - 2abc$

60. The equation of the plane is $\frac{x}{8} + \frac{y}{4} + \frac{z}{4} = 1$

i.e., $x + 2y + 2z = 8$

$\therefore$ The length of the perpendicular from origin to the plane is

$d = \left|\frac{-8}{\sqrt{1+4+4}}\right| = \frac{8}{3}$

61. The equations of the plane with reference to the two systems of rectangular axes are

$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ ....(i)

and $\frac{X}{a'} + \frac{Y}{b'} + \frac{Z}{c'} = 1$ ....(ii)

Since the origin of axes is same.

$\therefore$ Length of the perpendicular from (0, 0, 0) on plane (i)

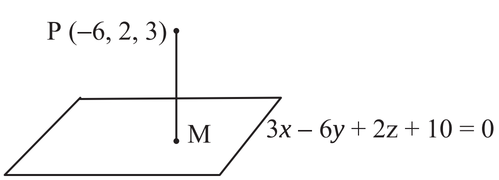
= Length of the perpendicular from (0, 0, 0) on plane (ii)

$\Rightarrow \left|\frac{-1}{\sqrt{\frac{1}{a^2}+\frac{1}{b^2}+\frac{1}{c^2}}}\right| = \left|\frac{-1}{\sqrt{\frac{1}{a'^2}+\frac{1}{b'^2}+\frac{1}{c'^2}}}\right|$

$\Rightarrow \frac{1}{a^2}+\frac{1}{b^2}+\frac{1}{c^2}-\frac{1}{a'^2}-\frac{1}{b'^2}-\frac{1}{c'^2} = 0$

62. Since the line is parallel to XY-plane, the distance of the point P (6, 7, 8) from this plane is equal to its Z co-ordinate i.e. 8 units.

63.



Distance of point P from the given plane is given by

$d = \left|\frac{3(-6) - 6(2) + 2(3) + 10}{\sqrt{(3)^2 + (-6)^2 + (2)^2}}\right|$

$= \left|\frac{-18 - 12 + 6 + 10}{\sqrt{9 + 36 + 4}}\right|$

$= \left|\frac{-14}{\sqrt{49}}\right| = \frac{14}{7}$

$\therefore$ d = 2

64. Given equation of plane is $\bar{r} \cdot \left(3\hat{i} + 2\hat{j} + 6\hat{k}\right) = 13$

The vector form of the equation is

$3x + 2y + 6z = 13$

$\Rightarrow 3x + 2y + 6z - 13 = 0$

Given point $\equiv (2, 3, \lambda)$

$\therefore$ Distance of the point from the plane

$= \left|\frac{ax_1 + by_1 + cz_1 + d}{\sqrt{a^2 + b^2 + c^2}}\right|$

$\Rightarrow 5 = \left|\frac{3(2) + 2(3) + 6(\lambda) - 13}{\sqrt{9 + 4 + 36}}\right|$

$\Rightarrow 5 = \left|\frac{6\lambda - 1}{7}\right|$

$\Rightarrow 6\lambda - 1 = \pm 35$

$\Rightarrow \lambda = 6, \frac{-17}{3}$

65. Here, a = 2, b = 1, c = 2, d = 5, $x = 2$, $y = 1$, z = 0

$\therefore d = \left|\frac{2(2) + 1(1) + 2(0) + 5}{\sqrt{2^2 + 1^2 + 2^2}}\right|$

$= \left|\frac{10}{\sqrt{9}}\right| = \frac{10}{3}$

66. Normal vector $\hat{n} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & 3 \\ 2 & -1 & -1 \end{vmatrix}$

$= \hat{i}(2+3) - \hat{j}(-1-6) + \hat{k}(-1+4)$

$= 5\hat{i} + 7\hat{j} + 3\hat{k}$

Let A $\equiv$ (1, −1, −1)

$\therefore \bar{a} = \hat{i} - \hat{j} - \hat{k}$

$\therefore$ Equation of the plane is

$5(x - 1) + 7(y + 1) + 3(z + 1) = 0$

$\Rightarrow 5x + 7y + 3z + 5 = 0$

Distance of (1, 3, –7) from the above plane is

$$d = \left|\frac{5(1)+7(3)+3(-7)+5}{\sqrt{25+49+9}}\right|$$

$$= \frac{10}{\sqrt{83}} \text{ units}$$

67. $\bar{n} = 2\hat{i}+\hat{j}+2\hat{k}$ and p = 5

$$\hat{n} = \frac{\bar{n}}{|\bar{n}|} = \frac{2\hat{i}+\hat{j}+2\hat{k}}{\sqrt{4+1+4}} = \frac{2\hat{i}+\hat{j}+2\hat{k}}{3}$$

∴ The vector equation of the plane is $\bar{r}.\hat{n} = p$

$$\Rightarrow \bar{r}.\left(\frac{2\hat{i}+\hat{j}+2\hat{k}}{3}\right) = 5$$

$$\Rightarrow \bar{r}.\left(2\hat{i}+\hat{j}+2\hat{k}\right) = 15$$

68. Let a, b, c = –3, 2, 6

∴ the equation of plane is

∴ $-3x + 2y + 6z + d = 0$ ….(i)

Now, the perpendicular distance (D) from origin is

$$D = \left|\frac{d}{\sqrt{(-3)^2+2^2+6^2}}\right|$$

$$\Rightarrow 7 = \frac{|d|}{7} \Rightarrow d = \pm 49$$

∴ The equation of plane is

$-3x + 2y + 6z + 49 = 0$

or $-3x + 2y + 6z - 49 = 0$

69. The equation of a plane passing through (1, – 2, 1) is

$a(x - 1) + b(y + 2) + c(z - 1) = 0$ ….(i)

Plane (i) is perpendicular to planes

$2x - 2y + z = 0$ and $x - y + 2z = 4$.

∴ $2a - 2b + c = 0$, and ….(ii)

$a - b + 2c = 0$ ….(iii)

Solving (ii) and (iii), we get

$a = -3, b = -3, c = 0$

Substituting the values of a, b, c in equation (i), we get

$x + y + 1 = 0$

∴ The distance of this plane from (1, 2, 2) is

$$d = \left|\frac{1+2+1}{\sqrt{1+1}}\right| = 2\sqrt{2}$$

70. Equation of L_1 i.e., the line of intersection of the first two given planes is

$(2x - 2y + 3z - 2) + \lambda(x - y + z + 1) = 0$

$\Rightarrow (\lambda + 2)x - (2 + \lambda)y$

$+ (\lambda + 3)z + (\lambda - 2) = 0$ …(i)

Equation of L_2 i.e., the line of intersection of the next two given planes is

$(1 + 3\mu)x + (2 - \mu)y$

$+ (2\mu - 1)z - (\mu + 3) = 0$ …(ii)

Since, equations (i) and (ii) represent the same plane.

∴ by comparing, we get

$$\frac{2+\lambda}{1+3\mu} = \frac{-(2+\lambda)}{2-\mu}$$

$$\Rightarrow 1 + 3\mu = \mu - 2 \qquad \Rightarrow \mu = -\frac{3}{2}$$

Substituting $\mu = -\frac{3}{2}$ in (ii), we get

$7x - 7y + 8z + 3 = 0$

Perpendicular distance from the origin (0, 0, 0)

$$= \left|\frac{7(0) - 7(0) + 8(0) + 3}{\sqrt{7^2 + 7^2 + 8^2}}\right| = \frac{3}{\sqrt{162}}$$

$$= \frac{3}{9\sqrt{2}} = \frac{1}{3\sqrt{2}}$$

71. The equation of a plane passing through the line of intersection of the planes

$x + 2y + 3z = 2$ and $x - y + z = 3$ is

$(x + 2y + 3z - 2) + \lambda(x - y + z - 3) = 0$

$\Rightarrow x(1 + \lambda) + y(2 - \lambda) + z(3 + \lambda) - 2 - 3\lambda = 0$ …. (i)

This plane is at a distance of $\frac{2}{\sqrt{3}}$ units from (3, 1, – 1).

$$\therefore \frac{|3(1+\lambda)+1(2-\lambda)-1(3+\lambda)-2-3\lambda|}{\sqrt{(1+\lambda)^2+(2-\lambda)^2+(3+\lambda)^2}} = \frac{2}{\sqrt{3}}$$

$$\Rightarrow \frac{|-2\lambda|}{\sqrt{3\lambda^2+4\lambda+14}} = \frac{2}{\sqrt{3}}$$

Squaring both sides, we get

$$3\lambda^2 + 4\lambda + 14 = 3\lambda^2 \Rightarrow 4\lambda = -14 \Rightarrow \lambda = \frac{-7}{2}$$

Substituting value of λ in equation (i), we get

$$-\frac{5}{2}x + \frac{11}{2}y - \frac{z}{2} + \frac{17}{2} = 0$$

$\Rightarrow 5x - 11y + z - 17 = 0$

72. The equation of the plane passing through (–1, 3, 0) is

$a(x + 1) + b(y - 3) + c(z - 0) = 0$ ....(i)

Also, the plane passes through the points (2, 2, 1) and (1, 1, 3).

∴ $3a - b + c = 0$ ....(ii)

$2a - 2b + 3c = 0$ ....(iii)

Solving (ii) and (iii), we get

a = – 1, b = – 7, c = – 4

Substituting the values of a, b, c in equation (i), we get

$-1(x+1) - 7(y-3) - 4(z) = 0$

$\Rightarrow x + 7y + 4z - 20 = 0$

∴ The distance of this plane from the point (5, 7, 8) is

$$d = \left|\frac{1(5)+7(7)+4(8)-20}{\sqrt{1^2+7^2+4^2}}\right| = \frac{66}{\sqrt{66}} = \sqrt{66}$$

73. Given planes are

$2x + y + 2z - 8 = 0$

$4x + 2y + 4z - 16 = 0$ ….(i)

and $4x + 2y + 4z + 5 = 0$ ….(ii)

The distance between two parallel planes is

$$d = \left|\frac{d_1 - d_2}{\sqrt{a^2+b^2+c^2}}\right| = \left|\frac{-16-5}{\sqrt{4^2+2^2+4^2}}\right| = \frac{21}{6} = \frac{7}{2}$$

74. $x^2 - 5x + 6 = 0$

$\Rightarrow (x-2) = 0$ or $(x-3) = 0$, which represents a plane.

75. Here, the co-ordinates of A, B, C are (3a, 0, 0) (0, 3b, 0) and (0, 0, 3c) respectively.

∴ The centroid is (a, b, c).

76. Let A ≡ (a, 0, 0), B ≡ (0, b, 0) and C ≡ (0, 0, c)

The equation of the plane in intercept form is

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$$

Since, centriod is (6, 6, 3)

∴ $6 = \dfrac{x_1 + x_2 + x_3}{3}$

$\Rightarrow 6 = \dfrac{a+0+0}{3} \Rightarrow a = 18$

Similarly $\dfrac{0+b+0}{3} = 6 \Rightarrow b = 18$

$\dfrac{0+0+c}{3} = 3 \Rightarrow c = 9$

∴ The equation of plane is $\dfrac{x}{18} + \dfrac{y}{18} + \dfrac{z}{9} = 1$

$\Rightarrow x + y + 2z - 18 = 0$

77. Given equation of plane is $ax + by + cz = 1$

∴ $A \equiv \left(\dfrac{1}{a}, 0, 0\right)$, $B \equiv \left(0, \dfrac{1}{b}, 0\right)$ and

$C \equiv \left(0, 0, \dfrac{1}{c}\right)$

∴ Centroid $\equiv \left(\dfrac{1}{3a}, \dfrac{1}{3b}, \dfrac{1}{3c}\right) = \left(\dfrac{1}{6}, \dfrac{-1}{3}, 1\right)$

∴ $3a = 6 \Rightarrow a = 2$

$3b = -3 \Rightarrow b = -1$

$3c = 1 \Rightarrow c = \dfrac{1}{3}$

∴ $a + b + 3c = 2 - 1 + 3\left(\dfrac{1}{3}\right) = 2$

78. $[a\ b\ c]\begin{bmatrix}1 & 9 & 7\\ 8 & 2 & 7\\ 7 & 3 & 7\end{bmatrix} = [0\ 0\ 0]$

$\Rightarrow a + 8b + 7c = 0,\ 9a + 2b + 3c = 0,$

$7a + 7b + 7c = 0$

$\Rightarrow a = 1, b = 6, c = -7$

P(a, b, c) lies on the plane $2x + y + z = 1$.

∴ $7a + b + c = 7 + 6 - 7 = 6$

79. The equation of the required plane is

$(2x - 5y + z - 3) + \lambda(x + y + 4z - 5) = 0$ ….(i)

∴ $(2+\lambda)x + (-5+\lambda)y + (1+4\lambda)z + (-3-5\lambda) = 0$

Since, this plane is parallel to $x + 3y + 6z = 1$

∴ $\dfrac{2+\lambda}{1} = \dfrac{-5+\lambda}{3} = \dfrac{1+4\lambda}{6}$

On solving, we get

$\lambda = -\dfrac{11}{2}$

Substituting the value of λ in equation (i), we get

$(2x - 5y + z - 3) - \dfrac{11}{2}(x + y + 4z - 5) = 0$

$\Rightarrow -7x - 21y - 42z + 49 = 0$

$\Rightarrow x + 3y + 6z - 7 = 0$

80. The point $\left(\dfrac{-1}{11}, \dfrac{9}{11}, \dfrac{-25}{11}\right)$ satisfies both the equations

∴ it is the point of intersection.

Alternate method:

Let $\dfrac{x}{1} = \dfrac{y-1}{2} = \dfrac{z+2}{3} = \lambda$(say)

Any general point on the line is (λ, 2λ+1, 3λ–2)

This point lies on the plane $2x + 3y + z = 0$

∴ $2\lambda + 3(2\lambda + 1) + (3\lambda - 2) = 0$

$\Rightarrow \lambda = \dfrac{-1}{11}$

∴ $x = \dfrac{-1}{11},\ y = \dfrac{9}{11},\ z = \dfrac{-25}{11}$

∴ The point is $\left(\dfrac{-1}{11}, \dfrac{9}{11}, \dfrac{-25}{11}\right)$

81. The point (5, –1, 1) satisfies both the equations

∴ it is the point of intersection

∴ option (D) is correct

82. The point (10, 10, 3) satisties both the equations.

∴ it is the point of intersection.

∴ option (B) is correct

83. The point (–4, –3, 0) satisfies the given equations

∴ correct answer is option (D).

84. Let $\frac{x-2}{3} = \frac{y+1}{4} = \frac{z-2}{12} = \lambda$

∴ the co-ordinates of any point on the line are

$P \equiv (3\lambda + 2, 4\lambda - 1, 12\lambda + 2)$

This point lies on the plane $x - y + z = 16$

∴ $3\lambda + 2 - 4\lambda + 1 + 12\lambda + 2 = 16$

$\Rightarrow 11\lambda = 11 \Rightarrow \lambda = 1$

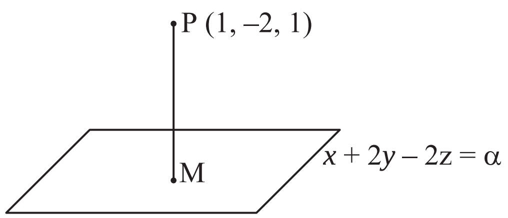
∴ $P \equiv (5, 3, 14)$

∴ Let $Q \equiv (1, 0, 2)$

∴ distance PQ is given by

$d = \sqrt{(5-1)^2 + (3-0)^2 + (14-2)^2} = 13$

85.



Distance of point P (1, –2, 1) from the $x + 2y - 2z = \alpha$ plane is 5

∴ $\frac{|1-4-2-\alpha|}{\sqrt{1+4+4}} = 5$

$\Rightarrow |\alpha + 5| = 15$

$\Rightarrow \alpha + 5 = \pm 15$

$\Rightarrow \alpha = 10, -20$

$\Rightarrow \alpha = 10$ ...($\because$ $\alpha > 0$)

The equation of line PM whose d.r.s. are 1, 2, –2 is

$\frac{x-1}{1} = \frac{y+2}{2} = \frac{z-1}{-2} = \lambda$(say)

The co-ordinates of M are $(\lambda + 1, 2\lambda - 2, -2\lambda + 1)$

Since, M lies on the plane

$x + 2y - 2z = 10$

∴ $\lambda + 1 + 4\lambda - 4 + 4\lambda - 2 = 10$

$\Rightarrow 9\lambda = 15 \Rightarrow \lambda = \frac{5}{3}$

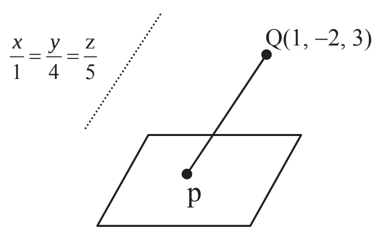
Hence, the co-ordinates of M are $\left(\frac{8}{3}, \frac{4}{3}, \frac{-7}{3}\right)$.

86. The d.r.s. of the line $\frac{x}{1} = \frac{y}{4} = \frac{z}{5}$ are 1, 4, 5

∴ The d.r.s. of any line parallel to it are also 1, 4, 5

The equation of the line passing through Q (1, –2, 3)

$\frac{x-1}{1} = \frac{y+2}{4} = \frac{z-3}{5} = \lambda$(say) ...(i)



Any point on the line is

$P \equiv (\lambda + 1, 4\lambda - 2, 5\lambda + 3)$

The point P lies on the plane

$2x + 3y - 4z + 22 = 0$

∴ $2(\lambda + 1) + 3(4\lambda - 2) - 4(5\lambda + 3) + 22 = 0$

$\Rightarrow 6\lambda = 6$ $\Rightarrow \lambda = 1$

∴ $P = (2, 2, 8)$

∴ Required distance = (PQ) = d

$d = \sqrt{(2-1)^2 + (2+2)^2 + (8-3)^2}$

$= \sqrt{1+16+25}$

∴ $d = \sqrt{42}$ units

87. Since line PQ is parallel to line $\frac{x}{1} = \frac{y}{4} = \frac{z}{5}$

∴ d.r.s. of PQ are 1, 4, 5

∴ Equation of line PQ passing through P(1, –2, 3) is

$\frac{x-1}{1} = \frac{y+2}{4} = \frac{z-3}{5}$

Let $\frac{x-1}{1} = \frac{y+2}{4} = \frac{z-3}{5} = \lambda$

Any point R on $PQ \equiv (\lambda + 1, 4\lambda - 2, 5\lambda + 3)$

Since point R lies in the plane

$2x + 3y - 4z + 22 = 0$

$\therefore$ $2(\lambda + 1) + 3(4\lambda - 2) - 4(5\lambda + 3) + 22 = 0$

$\Rightarrow -6y + 6 = 0$

$\Rightarrow \lambda = 1$

$\therefore$ $R \equiv (2, 2, 8)$

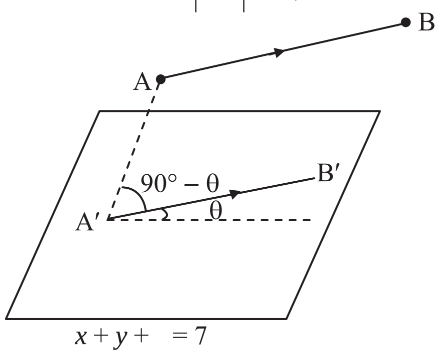
$PQ = 2PR$

$= 2\sqrt{(2-1)^2 + (2+2)^2 + (8-3)^2}$

$= 2\sqrt{42}$ units

88. Let A = (5, –1, 4), B = (4, –1, 3)

$\overline{AB} = -\hat{i} - \hat{k} \Rightarrow \left|\overline{AB}\right| = \sqrt{2}$



Projection of $\overline{AB}$ in the plane $x + y + z = 7$

is $\left|\overline{AB}\right| \cos\theta = \left|\overline{A'B'}\right| \cos\theta$

Direction ratios of normal to the given plane is 1, 1, 1.

$$\cos(90^\circ - \theta) = \left|\frac{1(-1) + 1(0) + 1(-1)}{\sqrt{1^2 + 1^2 + 1^2}\sqrt{1^2 + 0^2 + 1^2}}\right|$$

$$\Rightarrow \sin\theta = \frac{2}{\sqrt{6}} \Rightarrow \cos\theta = \sqrt{1 - \frac{4}{6}} = \sqrt{\frac{1}{3}}$$

Required projection $= \left|\overline{AB}\right| \cos\theta$

$$= \sqrt{2} \times \frac{1}{\sqrt{3}} = \sqrt{\frac{2}{3}}$$

89. The line of intersection of first two planes is

$$\frac{x-5}{0} = \frac{y}{-3} = \frac{z + \frac{8}{3}}{-5a}$$

It must lie on third plane.

$\therefore$ $3b(0) + (-3)(1) + (-3)(-5a) = 0$

and $3b(5) + 0(1) + (-3)\left(\frac{-8}{3}\right) = 0$

$\Rightarrow a = \frac{1}{5}$ and $15b + 8 = 0$

$\Rightarrow a = \frac{1}{5}$ and $b = -\frac{8}{15}$

Evaluation Test

1. Given planes are

$x - cy - bz = 0$ ….(i)

$cx - y + az = 0$ ….(ii)

$bx + ay - z = 0$ ….(iii)

Equation of a plane passing through the line of intersection of planes (i) and (ii) is

$x - cy - bz + k(cx - y + az) = 0$

$\Rightarrow (1 + ck)x - (c + k)y - (b - ak)z = 0$ ….(iv)

Now, planes (iii) and (iv) are same for some value of k,

$$\therefore \frac{1 + ck}{b} = -\frac{c + k}{a} = \frac{-(b - ak)}{-1}$$

$$\Rightarrow \frac{1 + ck}{b} = -\frac{c + k}{a}$$

$\Rightarrow a + ack = -bc - bk$

$\Rightarrow k(b + ac) = -(a + bc)$

$$\Rightarrow k = -\left(\frac{a + bc}{b + ac}\right)$$

Also, $-\frac{c + k}{a} = b - ak$

$$\Rightarrow -\left(\frac{c - \frac{a + bc}{b + ac}}{a}\right) = b + a\left(\frac{a + bc}{b + ac}\right)$$

$$\Rightarrow \frac{-bc - ac^2 + a + bc}{a} = b^2 + abc + a^2 + abc$$

$\Rightarrow 1 - c^2 = a^2 + b^2 + 2abc$

$\Rightarrow a^2 + b^2 + c^2 + 2abc = 1$

2. Let a, b, c be the intercepts form by the plane on co-ordinate axes.

Since, $\frac{1}{a} + \frac{1}{b} + \frac{1}{c} = \frac{1}{2}$

$$\therefore \frac{2}{a} + \frac{2}{b} + \frac{2}{c} = 1$$

∴ The point (2, 2, 2) satisfies the equation of the plane $\frac{x}{a}+\frac{y}{b}+\frac{z}{c}=1$.

∴ the required point is (2, 2, 2).

3. Given euation of line and plane are

$\bar{r} = \hat{i}+\hat{j}+\lambda\left(2\hat{i}+\hat{j}+4\hat{k}\right)$, and

$\bar{r}.\left(\hat{i}+2\hat{j}-\hat{k}\right)=3$

∴ $\bar{b}=2\hat{i}+\hat{j}+4\hat{k}$ and

$\bar{n}=\hat{i}+2\hat{j}-\hat{k}$

Consider $\bar{b}\cdot\bar{n} = \left(2\hat{i}+\hat{j}+4\hat{k}\right)\cdot\left(\hat{i}+2\hat{j}-\hat{k}\right)$

$= 2 + 2 - 4$

$= 0$

∴ the line lies in the plane.

4. The equation of the given line is

$x = 2 + t, y = 1 + t, z = -\frac{1}{2}-\frac{1}{2}t$

$\Rightarrow \frac{x-2}{1}=\frac{y-1}{1}=\frac{z+\frac{1}{2}}{-\frac{1}{2}}$

∴ The given line passes through the point $\left(2,1,-\frac{1}{2}\right)$ and it's d. r.s are $1, 1, -\frac{1}{2}$

The equation of the given plane is $x + 2y + 6z = 10$

∴ d.r.s of the normal to the plane are 1, 2, 6

∴ $p = \left|\frac{ax_1+by_1+cz_1+d}{\sqrt{a^2+b^2+c^2}}\right|$

$= \left|\frac{1(2)+2(1)+6\left(-\frac{1}{2}\right)-10}{\sqrt{1^2+2^2+6^2}}\right|$

$= \left|\frac{2+2-3-10}{\sqrt{1+4+36}}\right| = \frac{9}{\sqrt{41}}$

∴ $\frac{\lambda}{\sqrt{\mu}}=\frac{9}{\sqrt{41}}$

$\Rightarrow \lambda = 9, \mu = 41$

∴ $5\lambda - \mu = 5(9) - 41 = 45 - 41 = 4$

5. Let $\bar{a}$ be the vector along the line of intersection of the planes $3x - 7y - 5z = 1$ and $8x - 11y + 2z = 0$. the d.r.s of the normals to the planes are 3, −7, −5 and 8, −11, 2.

∴ $\bar{a} = \begin{vmatrix}\hat{i} & \hat{j} & \hat{k}\\ 3 & -7 & -5\\ 8 & -11 & 2\end{vmatrix}$

$= \hat{i}(-14-55)-\hat{j}(6+40)+\hat{k}(-33+56)$

$= -69\hat{i}-46\hat{j}+23\hat{k}$

Similarly, let $\bar{b}$ the vector along the line of intersection of the planes $5x - 13y + 3z + 2 = 0$ and $8x - 11y + 2z = 0$

the d.r.s of the normals to the planes are 5, −13, 3 and 8, −11, 2

∴ $\bar{b} = \begin{vmatrix}\hat{i} & \hat{j} & \hat{k}\\ 5 & -13 & 3\\ 8 & -11 & 2\end{vmatrix}$

$= \hat{i}(-26+33)-\hat{j}(10-24)+\hat{k}(-55+104)$

$= 7\hat{i}+14\hat{j}+49\hat{k}$

Consider,

$\bar{a}\,.\,\bar{b} = \left(-69\hat{i}-46\hat{j}+23\hat{k}\right).\left(7\hat{i}+14\hat{j}+49\hat{k}\right)$

$= -69 \times 7 + (-46) \times 14 + 23 \times 49$

$= -483 - 644 + 1127$

$= - 1127 + 1127$

$= 0$

∴ $\bar{a}$ and $\bar{b}$ are perpendicular

$\Rightarrow \theta = 90°$

∴ $\sin\theta = \sin 90° = 1$

6. The equation of the given plane is

$2\lambda x - (1 + \lambda)y + 3z = 0$

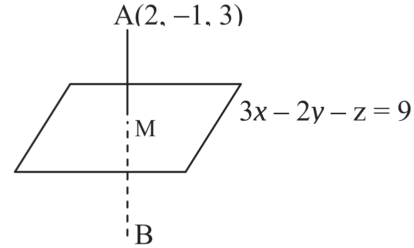
$\Rightarrow 2\lambda x - y - \lambda y + 3z = 0$

$\Rightarrow (2x - y)\lambda - (y - 3z) = 0$

$\Rightarrow (2x - y) - \frac{1}{\lambda}(y - 3z) = 0$

∴ The plane passes through the point of intersection of the planes $2x - y = 0$ and $y - 3z = 0$

7.



Let A ≡ (2, −1, 3), AM be ⊥ to the given plane and let B ≡ (x, y, z) be the image of A in the Plane.

the d.r.s. of the normal to the plane are 3, −2, −1

$\therefore$ The equation of the line AM is

$$\frac{x-2}{3}=\frac{y+1}{-2}=\frac{z-3}{-1}=\text{k, say}$$

$\therefore$ $x = 3\text{k} + 2,\ y = -2\text{k} - 1,\ z = -\text{k} + 3$

Let $\text{M} \equiv (3\text{k} + 2, -2\text{k} - 1, -\text{k} + 3)$

$\therefore$ equation of plane becomes

$3(3\text{k} + 2) - 2(-2\text{k} - 1) - (-\text{k} + 3) = 9$

$\therefore$ $\text{k} = \frac{2}{7}$

$\therefore$ $\text{M} \equiv \left(\frac{6}{7}+2,-\frac{4}{7}-1,-\frac{2}{7}+3\right) \equiv \left(\frac{20}{7},-\frac{11}{7},\frac{19}{7}\right)$

Since, M is the mid point of AB.

$\therefore$ $\frac{x_1+2}{2}=\frac{20}{7},\ \frac{y_1-1}{2}=-\frac{11}{7},\ \frac{z_1+3}{2}=\frac{19}{7}$

$\therefore$ $x_1=\frac{26}{7},\ y_1=-\frac{15}{7},\ z_1=\frac{17}{7}$

Image of A is $\text{B}\left(\frac{26}{7},-\frac{15}{7},\frac{17}{7}\right)$

8. Since, $\overline{a}$ and $\overline{b}$ are coplanar, $\overline{a}\times\overline{b}$ is a vector perpendicular to the plane containing $\overline{a}$ and $\overline{b}$.
Similarly, $\overline{c}\times\overline{d}$ is a vector perpendicular to the plane containing $\overline{c}$ and $\overline{d}$.
The two planes will be parallel, if their normals $\overline{a}\times\overline{b}$ and $\overline{c}\times\overline{d}$ are parallel.

$\therefore$ $\left(\overline{a}\times\overline{b}\right)\times\left(\overline{c}\times\overline{d}\right)=\overline{0}$

9. Equation of the plane containing the given lines is

$$\begin{vmatrix} x-1 & y-2 & z-3 \\ 2 & 3 & 4 \\ 3 & 4 & 5 \end{vmatrix}=0$$

$\Rightarrow (x-1)(15-16)-(y-2)(10-12)$
$+ (z-3)(8-9)=0$

$\Rightarrow (x-1)(-1)-(y-2)(-2)+(z-3)(-1)=0$

$\Rightarrow -x+1+2y-4-z+3=0$

$\Rightarrow -x+2y-z=0$

$\Rightarrow x-2y+z=0$ ….(i)

Given equation of plane is

$\text{A}x-2y+z=\text{d}$ ….(ii)

The planes given by equation (i) and (ii) are parallel.

$\therefore$ A = 1

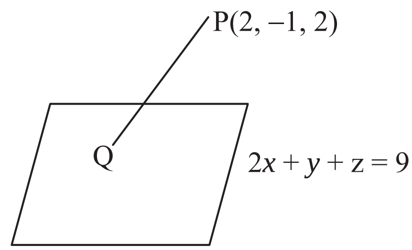
distance between the planes (D) is

$$\text{D}=\left|\frac{\text{d}}{\sqrt{1^2+(-2)^2+1^2}}\right|=\left|\frac{\text{d}}{\sqrt{6}}\right|$$

$\therefore$ $\left|\frac{\text{d}}{\sqrt{6}}\right|=\sqrt{6}$

$\Rightarrow |\text{d}| = 6$

10.



Since, direction cosines of PQ are equal and positive

$\therefore$ the d.r.s. of PQ are $\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}},\frac{1}{\sqrt{3}}$

$\therefore$ The equation of the line PQ is

$$\frac{x-2}{\frac{1}{\sqrt{3}}}=\frac{y+1}{\frac{1}{\sqrt{3}}}=\frac{z-2}{\frac{1}{\sqrt{3}}}$$

$\Rightarrow x-2=y+1=z-2=\text{k, say}$

$\therefore$ Co-ordinate of the point Q are

$(\text{k}+2, \text{k}-1, \text{k}+2)$

The point Q lies on the plane $2x+y+z=9$

$\therefore$ $2(\text{k}+2)+\text{k}-1+\text{k}+2=9$

$\Rightarrow 4\text{k}+5=9$ $\Rightarrow \text{k}=1$

$\therefore$ $\text{Q} \equiv (3, 0, 3)$

$\therefore$ $\text{PQ}=\sqrt{(3-2)^2+(0+1)^2+(3-2)^2}$

$=\sqrt{1+1+1}=\sqrt{3}$

11. Let $\text{A} \equiv (\text{a}, 0, 0), \text{B} \equiv (0, \text{b}, 0), \text{C} \equiv (0, 0, \text{c})$

$\therefore$ $\text{G} \equiv (x, y, z) \equiv \left(\frac{\text{a}}{3},\frac{\text{b}}{3},\frac{\text{c}}{3}\right)$

$\Rightarrow \frac{\text{a}}{3}=x,\ \frac{\text{b}}{3}=y,\ \frac{\text{c}}{3}=z$

$\Rightarrow \text{a}=3x, \text{b}=3y, \text{c}=3z$ ….(i)

The equation of the plane is

$$\frac{x}{a}+\frac{y}{b}+\frac{z}{c}=1$$

Since, this plane is at a distance of 1 unit from the origin,

$$\left|\frac{-1}{\sqrt{\frac{1}{a^2}+\frac{1}{b^2}+\frac{1}{c^2}}}\right|=1$$

$$\Rightarrow \frac{1}{a^2}+\frac{1}{b^2}+\frac{1}{c^2}=1$$

$$\Rightarrow \frac{1}{9x^2}+\frac{1}{9y^2}+\frac{1}{9z^2}=1 \quad \text{....[From (i)]}$$

$$\Rightarrow \frac{1}{x^2}+\frac{1}{y^2}+\frac{1}{z^2}=9$$

$$\Rightarrow k = 9$$

12. Let the equation of the plane OAB be $ax + by + cz = d$

This plane passes through the points A(1, 2, 1) and B(2, 1, 3)

$\therefore$ $a + 2b + c = 0,$ …(i)

and $2a + b + 3c = 0$ …(ii)

$\therefore$ on solving (i) and (ii), we get

$$\frac{a}{5}=\frac{b}{-1}=\frac{c}{-3}$$

Similarly, let the equation of the plane ABC be $a'(x + 1) + b'(y - 1) + c'(z - 2) = 0$

Substituting the co-ordinates of A and B, we get

$2a' + b' - c' = 0,$

and $3a' + c' = 0$

$$\therefore \frac{a'}{1}=\frac{b'}{-5}=\frac{c'}{-3}$$

If θ is the angle between two planes, then it is the angle between their normals.

$$\therefore \cos\theta = \frac{5\times1+(-1)\times(-5)+(-3)\times(-3)}{\sqrt{25+1+9}\ \sqrt{1+25+9}}$$

$$= \frac{5+5+9}{\sqrt{35}\sqrt{35}}$$

$$= \frac{19}{35}$$

$$\Rightarrow \theta = \cos^{-1}\left(\frac{19}{35}\right)$$

13. The equation of the given plane can be written as $\frac{x}{20}+\frac{y}{15}+\frac{z}{-12}=1$

Let the plane intersects the x, y and z axes in the points A(20, 0, 0), B(0, 15, 0), C(0, 0, –12)

$\therefore$ $\bar{a}=20\hat{i}, \bar{b}=15\hat{j}$, and $\bar{c}=-12\hat{k}$

$\therefore$ Volume of tetrahedron = $\frac{1}{6}\left[\bar{a}\quad\bar{b}\quad\bar{c}\right]$

$$= \frac{1}{6}\begin{vmatrix}20 & 0 & 0\\ 0 & 15 & 0\\ 0 & 0 & -12\end{vmatrix} = |-600| = 600$$

14. Given lines are coplanar.

$$\therefore \begin{vmatrix}1-2 & 4-3 & 5-4\\ 1 & 1 & -k\\ k & 2 & 1\end{vmatrix}=0$$

$\Rightarrow -1(1 + 2k) - 1(1 + k^2) + 1(2 - k) = 0$

$\Rightarrow -1 - 2k - 1 - k^2 + 2 - k = 0$

5. Let the consumption per day be, x grams of food X and Y grams of food Y.

$\therefore$ $x \ge 0$ and $y \ge 0$ ....[$\because$ the quantities cannot be negative]

Representing the given information in table form, we get

Type of food	Food X (x)	Food Y (y)	Minimum requirement
Vitamin A per gram (units)	4	6	90
Vitamin B per gram (units)	7	11	130
Cost per gram (paise)	15	22	z

$\therefore$ $4x + 6y \ge 90$,
$7x + 11y \ge 130$, and $z = 15x + 22y$

$\therefore$ Required LLP is formulated as,
Minimize $z = 15x + 22y$, subject to constraints
$4x + 6y \ge 90$, $7x + 11y \ge 130$, $x \ge 0$, $y \ge 0$

6. Suppose x kg of food A and y kg of food B are consumed to form a weekly diet.

∴ $x \geq 0, y \geq 0$. ….[Since quantity of food cannot be negative]

Representing the given information in table form, we get

	Food A (x)	**Food B (y)**	**Minimum requirement**
Fats (units)	4	12	18
Carbohydrates (units)	16	4	24
Protein (units)	8	6	16
Cost (₹)	6	5	z

∴ Required LPP is formulated as

Minimize, $z = 6x + 5y$ subject to constraints,

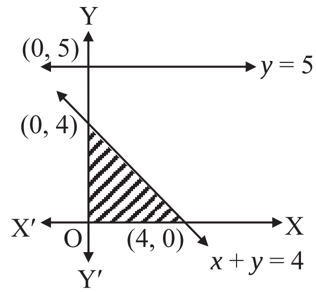
$4x + 12y \geq 18$, $16x + 4y \geq 24$, $8x + 6y \geq 24$, $x \geq 0$, $y \geq 0$

7. Converting the given inequalities into equations, we get $x + y = 4$

The equation intersects the axes at (4 , 0) and (0 , 4)

The feasible region lies on origin side of lines $y = 5$ and $x + y = 4$ and in first quadrant.

It is bounded in first quadrant.



8. Converting given inequalities into equations, we get

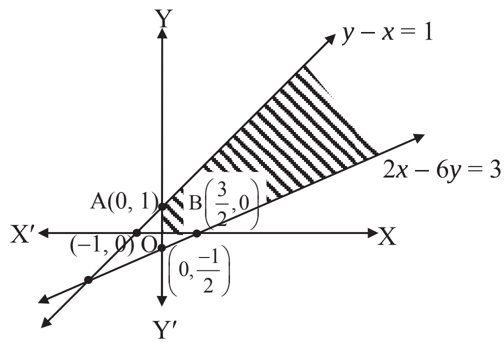
$y - x = 1$ i.e. $\frac{x}{(-1)} + \frac{y}{1} = 1$ ….(i)

$2x - 6y = 3$ i.e. $\frac{x}{\frac{3}{2}} + \frac{y}{\left(\frac{-1}{2}\right)} = 1$ ….(ii)

$x = 0, y = 0$

∴ Equation (i) intersects the axes at (–1, 0) and (0, 1)

Equation (ii) intersects the axes at $\left(\frac{3}{2}, 0\right)$ and $\left(0, \frac{-1}{2}\right)$



Substituting $x = 0, y = 0$ in given inequalities, we get

$(0) - (0) = 0 \leq 1$, and $2(0) - 6(0) = 0 \leq 3$

∴ Feasible region lies on the origin side of both the lines, in first quadrant.

It is unbounded and convex.

11. Feasible region lies on origin side of line $2x - 3y = 5$.

$\therefore$ O lies inside the region

Substituting P (2, –2) in given inequality, we get

$2(2) - 3(-2) = 10 \nleq 5$

$\therefore$ P lies outside the region.

13. The shaded region lies;

On origin side of line $x + 2y = 8 \Rightarrow x + 2y \le 8$,

On non-origin side of line $2x + y = 2 \Rightarrow 2x + y \ge 2$,

On origin side of line $x - y = 1 \Rightarrow x - y \le 1$

and in first quadrant $\Rightarrow x \ge 0,\ y \ge 0$.

14. The feasible region lies on non-origin side of line $2x + y = 2$ and origin side of line $x - y = 3$ as shown in the figure.

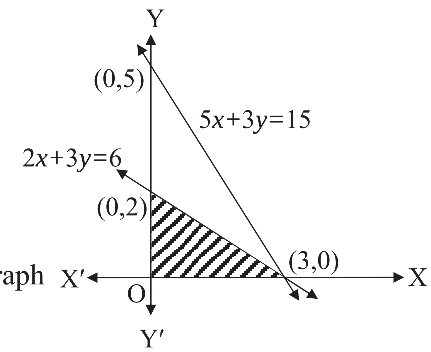
$5x + 3y = 15$ i.e. $\frac{x}{3} + \frac{y}{5} = 1$ ….(ii)



∴ Equation (i) intersects the axes at points (3, 0) and (0, 2)
Equation (ii), intersects at points (3, 0) and (0, 5).
Also substituting origin (0, 0) in both in equalities we get,
$2(0) + 3(0) = 0 \leq 6$ and $5(0) + 3(0) = 0 \leq 15$
∴ Feasible region lies on origin side of both the lines as shown in the graph
∴ the vertices of feasible region are (0, 2), (0, 0) and (3, 0)

The corners of feasible region are

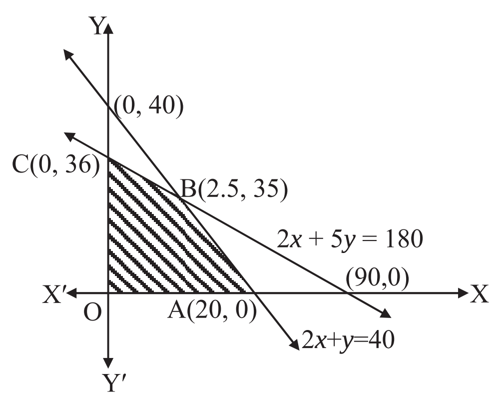
O(0, 0), A(20, 0), B(2.5, 35), C(0, 36)

∴ At A (20, 0), $z = 3(20) + 0 = 60$

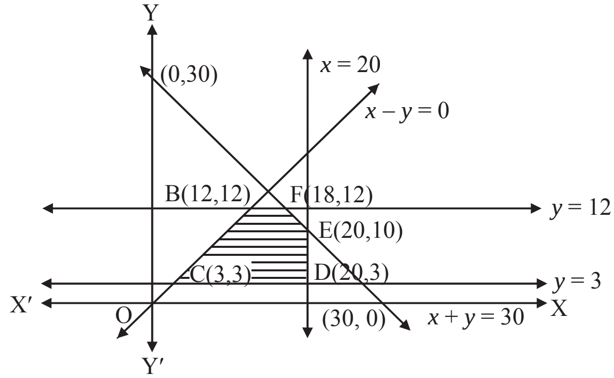
At B (2.5,35), $z = 3(2.5) + 4(35) = 147.5$

At C (0, 36), $z = 0 + 3(36) = 108$

∴ z is maximum at B(2.5, 35).



3. Objective function P = $2x + 3y$
The corner points of feasible region are
B(12, 12), C(3,3), D(20, 3), E(20, 10), F(18, 12)
At B = $P_B = 2(12) + 3(12) = 60$
At C = $P_C = 2(3) + 3(3) = 15$
At D = $P_D = 2(20) + 3(3) = 49$
At E = $P_E = 2(20) + 3(10) = 70$
At F = $P_F = 2(18) + 3(12) = 72$
∴ P is maximum at F(18, 12).



4. For (1, 3), $3x + 2y = 3 + 6 > 0$,
for (5, 0), $3 \times 5 + 0 > 0$,
and for (−1, 2), $-3 + 4 > 0$
Similarly, other inequalities satisfies the given points.
∴ Option (D) is the correct answer.

5.

∴ O(0, 0), A(0, 600), B(800, 600), C(1000, 500), D(1500, 0)
$z = x_1 + x_2$
At point C and D, z is maximum. Max z = 1500
∴ Infinite optimal solutions exist along CD.

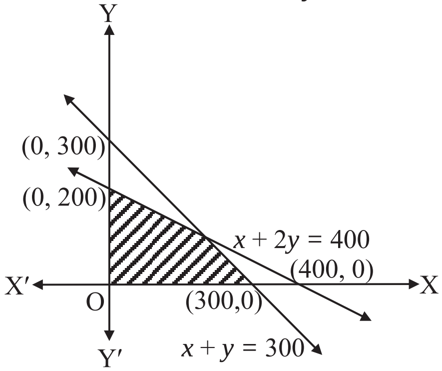
6. Consider option (C)
$3 + 2(4) \geq 11$
$3(3) + 4(4) \leq 30$
$2(3) + 5(4) \leq 30$
∴ All the above three in-equalities hold for point (3, 4).
∴ Option (C) is the correct answer.

7. Let the manufacturer produce x and y bottles of medicines A and B.
He must have $\frac{3x}{1000} + \frac{y}{1000} \leq 66$, $x + y \leq 45000$, $x \leq 20000$, $y \leq 40,000$, $x \geq 0$, $y \geq 0$.
∴ the number of constraints is 6.

8. Let the company produce x telephones of A type and y telephones of B type.

$\therefore$ Constraints are $2x + 4y \le 800 \Rightarrow x + 2y \le 400$, $x + y \le 300$

Maximize $z = 300x + 400y$



$\therefore$ the feasible region of the LPP is bounded.

9. Given that $4x + 2y \le 8$, $2x + 5y \le 10$

$\therefore$ the feasible region lies on origin side of $4x + 2y = 8$ and $2x + 5y = 10$.

Also, $x, y \ge 0$

$\therefore$ the feasible region lies in first quadrant.

$\therefore$ option (C) is correct.

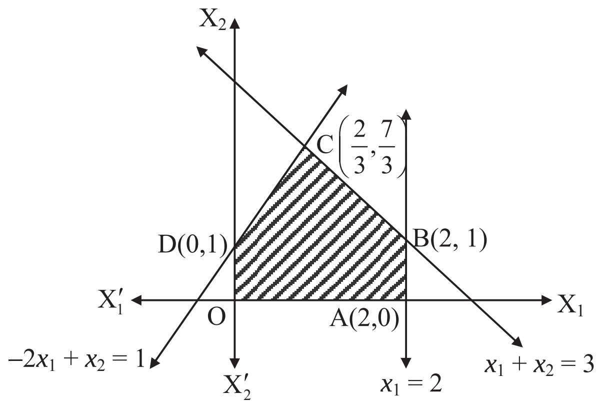
10. Objective function $z = x_1 + x_2$

The corner points of feasible region are

O(0, 0), A(2, 0), B(2, 1), $C\left(\frac{2}{3}, \frac{7}{3}\right)$ and D(0, 1)

At B(2, 1) and $C\left(\frac{2}{3}, \frac{7}{3}\right)$, z is maximum. Max z = 3

$\therefore$ Infinite number of solutions exists along BC.



11. Objective function $z = 3x + 2y$

The corner points of feasible region are

$A\left(\frac{1}{4}, \frac{5}{4}\right)$, $B\left(\frac{1}{6}, \frac{5}{6}\right)$, C(1, 0), D(3, 0), E(3, 3), $F\left(\frac{5}{2}, \frac{7}{2}\right)$

At A = $z_A = 3\left(\frac{1}{4}\right) + 2\left(\frac{5}{4}\right) = 3.25$

At B = $z_B = 3\left(\frac{1}{6}\right) + 2\left(\frac{5}{6}\right) = 2.167$

At C = $z_C = 3(1) + 2(0) = 3$

At D = $z_D = 3(3) + 2(0) = 9$

At E = $z_E = 3(3) + 2(3) = 15$

At F = $z_F = 3\left(\frac{5}{2}\right) + 2\left(\frac{7}{2}\right) = 14.5$

$\therefore$ Maximum value of z at (3,3) is 15.

$\Rightarrow \left(\dfrac{1}{2}\right)^2 + \alpha = 2$
$\Rightarrow \dfrac{1}{4} + \alpha = 2 \qquad \Rightarrow \alpha = \dfrac{7}{4}$
$\beta = \alpha - 2 = \dfrac{7}{4} - 2 = -\dfrac{1}{4}$

$\Rightarrow k = \frac{1}{4}$

38. Since, f( ) is continuous at = 0.

∴ $f(0) = \lim_{\to 0} f(\ )$

$= \lim_{\to 0} \frac{\log_e(1 + \ ^2\tan\ )}{\sin\ ^3}$

$= \lim_{\to 0} \left(\frac{\log_e(1 + \ ^2\tan\ )}{\ ^2\tan} \cdot \frac{\ ^2\tan}{\sin\ ^3} \right)$

$= \lim_{\to 0} \left(\frac{\log_e(1 + \ ^2\tan\ )}{\ ^2\tan} \cdot \frac{\ ^3}{\sin\ ^3} \cdot \frac{\tan}{\ } \right)$

∴ f(0) = 1

39. Since, f( ) is continuous at = 0.

$= \lim_{\to 0} \frac{e^{2} - 1 - 2}{(e^{2} - 1)}$

Applying L'Hospital rule on R.H.S., we get

$f(0) = \lim_{\to 0} \frac{2e^{2} - 2}{(2e^{2}) + 1(e^{2} - 1)}$

Applying L'Hospital rule on R.H.S., we get

$f(0) = \lim_{\to 0} \frac{4e^{2}}{2(2e^{2}) + e^{2}(2) + 2e^{2}}$

$\Rightarrow f(0) = \frac{4}{2+2} = 1$

40. Since, f( ) is continuous at = 0.

∴ $f(0) = \lim_{\to 0} f(\ )$

$\Rightarrow \left(\frac{k}{16}\right) \log\left(\frac{10}{3}\right) \cdot \log 2 = \lim_{\to 0} \frac{20 + 3 - 6 - 10}{1 - \cos 8}$

∴ $\left(\frac{k}{16}\right) \log\left(\frac{10}{3}\right) . \log 2 = \frac{1}{32} \log\left(\frac{10}{3}\right) \log 2$

$\Rightarrow \frac{k}{16} = \frac{1}{32}$

$\Rightarrow k = \frac{1}{2}$

$\Rightarrow k = 3^{\log_3\left(\frac{1}{2}\right)}$ ....$\left[\because a^{\log_a} = \ \right]$

$= \lim_{h\to 0} \frac{2 + h - 2}{|2 + h - 2|} + b = b + 1$

and f(2) = a + b

Since, f( ) is continuous at = 2,

∴ $\lim_{\to 2^-} f(\ ) = f(2) = \lim_{\to 2^+} f(\ )$

⇒ b = – 1 and a = 1

42. Given, f( ) = | | + | – 1|

∴ $f(\ ) = \begin{cases} - \ - (\ - 1), & \text{if } \ < 0 \\ \ - (\ - 1), & \text{if } 0 \le \ < 1 \\ \ + (\ - 1), & \text{if } \ \ge 1 \end{cases}$

∴ $f(\ ) = \begin{cases} -2\ + 1, & \text{if } \ < 0 \\ 1, & \text{if } 0 \le \ < 1 \\ 2\ - 1, & \text{if } \ \ge 1 \end{cases}$

$\lim_{\to 0^-} f(\ ) = \lim_{\to 0} (-2\ + 1) = 1$

$\lim_{\to 0^+} f(\ ) = \lim_{\to 0} 1 = 1$

f(0) = 1

∴ $\lim_{\to 0^-} f(\ ) = \lim_{\to 0^+} f(\ ) = f(0)$

∴ f( ) is continuous at = 0.

$\lim_{\to 1^-} f(\ ) = \lim_{\to 1} 1 = 1$

$\lim_{\to 1^+} f(\ ) = \lim_{\to 1} (2\ - 1) = 1$

f (1) = 2(1) – 1 = 1

∴ $\lim_{\to 1^-} f(\ ) = \lim_{\to 1^+} f(\ ) = f(1)$

∴ f( ) is continuous at = 1.

43. $\lim\limits_{\to 1} f(\ ) = \lim\limits_{\to 1} \dfrac{^2 - 4\ \ + 3}{^2 - 1} = \lim\limits_{\to 1} \dfrac{(\ \ - 3)}{(\ \ + 1)} = -1$

$f(1) = 2$

∴ $\lim\limits_{\to 1} f(\ ) \neq f(1)$

∴ f( ) is discontinuous at = 1.

44. $\lim\limits_{\to a^-} f(\ ) = -1$

$\lim\limits_{\to a^+} f(\ ) = 1$

∴ f( ) is discontinuous at = a.

45. | | is continuous at = 0 and $\dfrac{|\ |}{}$ is discontinuous at = 0.

∴ f( ) = | | + $\dfrac{|\ |}{}$ is discontinuous at = 0.

46. $f(\ ) = \dfrac{2\ ^2 + 7}{^2(\ \ + 3) - 1(\ \ + 3)} = \dfrac{2\ ^2 + 7}{(\ ^2 - 1)(\ \ + 3)}$

$= \dfrac{2\ ^2 + 7}{(\ \ - 1)(\ \ + 1)(\ \ + 3)}$

∴ the points of discontinuity are = 1, = – 1 and = – 3 only.

47. $\lim\limits_{\to 1^+} f(\ ) = \lim\limits_{\to 1} 2 - \ ^2 = 1$

$f(1) = 1 - 1 = 0$

$\lim\limits_{\to 1} f(\ ) \neq f(1)$

∴ The function is discontinuous at = 1

$\lim\limits_{\to 5^-} f(\ ) = \lim\limits_{\to 5} \ \ - 10 = -5$

$f(5) = 2(5) = 10$

$\lim\limits_{\to 5} f(\ ) \neq f(5)$

∴ The function is discontinuous at = 5

$\lim\limits_{\to 3^+} f(\ ) = \ \ - 10 = -7$

$f(3) = 2 - 3^2 = -7$

$\lim\limits_{\to 3} f(\ ) = f(3)$

∴ The function is continuous at = 3

48. Since, f( ) is not defined at = 0, 1, – 1 and at all other points f( ) is continuous.

∴ the given function is discontinuous at 3 points.

49. Given, f( ) = [ ], ∈ (– 3.5, 100)
As we know greatest integer function is discontinuous on integer values.
In given interval, the integer values are (– 3, – 2, – 1, 0, …., 99).

∴ the total number of integers are 103.

50. Since, f( ) is continuous at every point of its domain.

∴ it is continuous at = 1.

∴ $\lim\limits_{\to 1^-} f(\ ) = \lim\limits_{\to 1^+} f(\ )$

$\Rightarrow \lim\limits_{\to 1} (5\ \ - 4) = \lim\limits_{\to 1} (4\ ^2 + 3b\ )$

$\Rightarrow 1 = 4 + 3b$

$\Rightarrow b = -1$

51. Since, f( ) is continuous for all .

∴ f( ) is continuous at = 2.

∴ $f(2) = \lim\limits_{\to 2} f(\ )$

$\Rightarrow k = \lim\limits_{\to 2} \dfrac{^3 + \ ^2 - 16\ \ + 20}{(\ \ - 2)^2}$

$= \lim\limits_{\to 2} \dfrac{(\ \ - 2)(\ ^2 + 3\ \ - 10)}{(\ \ - 2)^2}$

$= \lim\limits_{\to 2} \dfrac{(\ \ - 2)^2(\ \ + 5)}{(\ \ - 2)^2}$

$= 7$

52. Since, f( ) = [ ] is continuous at every non integer points.

∴ option (C) is the correct answer.

53. Let g( ) = | | and h( ) = sin .
Then, f( ) = (hog) ( ) for all ∈ R.
As both g and h are continuous functions on R.

∴ f( ) is also continuous for all ∈ R.

54. Since, f( ) is continuous in $\left[0, \dfrac{\pi}{2}\right]$.

∴ it is continuous at $= \dfrac{\pi}{4}$.

∴ $f\left(\dfrac{\pi}{4}\right) = \lim\limits_{\to \frac{\pi}{4}} f(\ ) = \lim\limits_{\to \frac{\pi}{4}} \dfrac{1 - \tan}{4\ \ - \pi}$

Applying L'Hospital rule on R.H.S., we get

$$f\left(\frac{\pi}{4}\right) = \lim_{\to\frac{\pi}{4}} \frac{-\sec^2}{4}$$

$$\Rightarrow f\left(\frac{\pi}{4}\right) = \frac{-2}{4} = \frac{-1}{2}$$

55. Since, f( ) is continuous at each point of its domain.

∴ it is continuous at = 0.

∴ $f(0) = \lim_{\to 0} f(\ )$

$$= \lim_{\to 0}\left(\frac{2\ \ - \sin^{-1}}{2\ \ + \tan^{-1}}\right)$$

Applying L'Hospital rule on R.H.S., we get

$$f(0) = \lim_{\to 0}\frac{\left(2 - \frac{1}{\sqrt{1-\ ^2}}\right)}{\left(2 + \frac{1}{1+\ ^2}\right)}$$

$$= \frac{2-1}{2+1} = \frac{1}{3}$$

56. The given function is defined only in the interval [1,∞). For > 2, = 3 – 2 which is a straight line, hence continuous. Also, the given function is continuous at = 2.

∴ option (C) is the correct answer.

57. $\lim_{\to 1^-} f(\ ) = 0,\ \lim_{\to 1^+} f(\ ) = 0$ and

f(1) = 0

∴ $\lim_{\to 1^-} f(\ ) = \lim_{\to 1^+} f(\ ) = f(1)$

∴ f( ) is continuous at = 1.

$\lim_{\to 2^-} f(\ ) = 0$ and $\lim_{\to 2^+} f(\ ) = 1$

∴ $\lim_{\to 2^-} f(\ ) \neq \lim_{\to 2^+} f(\ )$

∴ f( ) is not continuous at = 2.

58. Since, f( ) is continuous over [– π, π].

∴ it is continuous at $= -\frac{\pi}{2}$ and $= \frac{\pi}{2}$.

∴ $\lim_{\to\frac{-\pi}{2}^-} f(\ ) = \lim_{\to\frac{-\pi}{2}^+} f(\ )$

$$\Rightarrow \lim_{\to\frac{-\pi}{2}}(-2\sin\ \ )\quad \lim_{\to\frac{-\pi}{2}}(\alpha\sin\ \ + \beta)$$

$\Rightarrow -2\ (-1) = \alpha(-1) + \beta$

$\Rightarrow -\alpha + \beta = 2$ ....(i)

Also, $\lim_{\to\frac{\pi}{2}^-} f(\ ) = \lim_{\to\frac{\pi}{2}^+} f(\ )$

$$\Rightarrow \lim_{\to\frac{\pi}{2}}(\alpha\sin\ \ + \beta) = \lim_{\to\frac{\pi}{2}}(\cos\ \ )$$

$\Rightarrow \alpha(1) + \beta = 0$

$\Rightarrow \alpha + \beta = 0$ ....(ii)

From (i) and (ii), we get

$\alpha = -1,\ \beta = 1$

59. For f( ) to be continuous at $= \frac{-\pi}{2}$,

$$\lim_{\to\frac{-\pi}{2}^+} f(\ ) = \lim_{\to\frac{-\pi}{2}^-} f(\ ) = f\left(\frac{-\pi}{2}\right)$$

∴ $\lim_{\to\frac{-\pi}{2}} A\sin\ \ + B = -2\sin\left(\frac{-\pi}{2}\right)$

$\Rightarrow -A + B = 2$

$\Rightarrow A - B = -2$ …(i)

For f( ) to be continuous at $= \frac{\pi}{2}$,

$$\lim_{\to\frac{\pi}{2}^+} f(\ ) = \lim_{\to\frac{\pi}{2}^-} f(\ ) = f\left(\frac{\pi}{2}\right)$$

∴ $\lim_{\to\frac{\pi}{2}} A\sin\ \ + B = \cos\frac{\pi}{2}$

$\Rightarrow A + B = 0$ …(ii)

On solving (i) and (ii), we get

A = –1 , B = 1

60. Since, f( ) is continuous for all in R.

∴ f( ) is continuous at = 0.

∴ $f(0) = \lim_{\to 0^-} f(\ )$

$$\Rightarrow q = \lim_{\to 0}\frac{\sin(p+1)\ \ + \sin\ \ }{}$$

$$\Rightarrow q = \lim_{\to 0}\left[(p+1)\times\frac{\sin(p+1)}{(p+1)} + \frac{\sin}{}\right]$$

$\Rightarrow q = (p + 1) + 1$

$\Rightarrow q = p + 2$

The values of p and q in option (C) satisfies this condition.

61. Since, f is continuous at every point in R.

$\therefore$ f is continuous at = 2n.

$\therefore \quad \lim\limits_{\to(2n)^-} f(\ ) = \lim\limits_{\to(2n)^+} f(\ ) = f(2n)$

$\Rightarrow \lim\limits_{\to(2n)^-} (b_n + \cos\pi\ ) = \lim\limits_{\to(2n)^+} (a_n + \sin\pi\ )$

$\Rightarrow b_n + \cos 2n\pi = a_n + \sin 2n\pi$

$\Rightarrow b_n + 1 = a_n \Rightarrow a_n - b_n = 1$

So, option (C) is correct.

Also, f is continuous at = 2n + 1.

$\lim\limits_{\to(2n+1)^-} f(\ ) = \lim\limits_{\to(2n+1)^+} f(\ ) = f(2n + 1)$

$\Rightarrow \lim\limits_{\to(2n+1)^-} (a_n + \sin\pi\ ) = \lim\limits_{\to(2n+1)^+} (b_{n+1} + \cos\pi\ )$

$\Rightarrow a_n + \sin(2n + 1)\pi = b_{n+1} + \cos(2n + 1)\pi$

....[$\because$ f( ) = $b_{n+1} + \cos\pi$, $\in$ (2n + 1, 2n + 2)]

$\Rightarrow a_n = b_{n+1} - 1$

$\Rightarrow a_n - b_{n+1} = -1$

Replacing n by n − 1, we get

$a_{n-1} - b_n = -1$

So, options (A) and (D) are correct.

Hence, option (B) does not hold.

63. For f( ) to be continuous at = 0,

$$f(0) = \lim_{\to 0} f(\ ) = \lim_{\to 0} \frac{(1+\ )^{\frac{1}{2}} - (1+\ )^{\frac{1}{3}}}{}$$

$$= \lim_{\to 0} \frac{\left(1+\frac{1}{2} - \frac{1}{8}\ ^2 + \right) - \left(1+\frac{1}{3} - \frac{1}{9}\ ^2 + \right)}{}$$

$$= \lim_{\to 0} \frac{\left(\frac{1}{2}-\frac{1}{3}\right) + \left(\frac{1}{9}-\frac{1}{8}\right)\ ^2 + }{}$$

$$= \lim_{\to 0}\left[\left(\frac{1}{2}-\frac{1}{3}\right) + \left(\frac{1}{9}-\frac{1}{8}\right) + \right]$$

$$\therefore \quad f(0) = \frac{1}{6}$$

Evaluation Test

1. $$f(0) = \lim_{\to 0} \frac{1-\cos(1-\cos\ )}{^4}$$

$$= \lim_{\to 0} \frac{2\sin^2\left[\frac{2\sin^2\left(\frac{}{2}\right)}{2}\right]}{^4}$$

$$= \lim_{\to 0} \frac{2\sin^2\left[\sin^2\left(\frac{}{2}\right)\right]\left[\sin^2\left(\frac{}{2}\right)\right]^2}{^4\left[\sin^2\left(\frac{}{2}\right)\right]^2}$$

$$= 2\lim_{\to 0} \frac{\sin^4\left(\frac{}{2}\right)}{\left(\frac{}{2}\right)^4 2^4} = \frac{1}{2^3} = \frac{1}{8}$$

2. f is continuous at = 0.

$$\therefore \quad f(0) = \lim_{\to 0}\left[\frac{\log(1+\ ^2) - \log(1-\ ^2)}{\sec\ - \cos}\right]$$

$$= \lim_{\to 0}\left[\frac{\log(1+\ ^2) - \log(1-\ ^2)}{\left[\frac{1-\cos^2}{\cos}\right]}\right]$$

$$= \lim_{\to 0}\left[\frac{\cos\ \left[\log\left(1+\ ^2\right) - \log\left(1-\ ^2\right)\right]}{\sin^2}\right]$$

$$= \lim_{\to 0}\left[\frac{\cos\ \left[\frac{\log\left(1+\ ^2\right)}{^2} + \frac{\log\left(1-\ ^2\right)}{-\ ^2}\right]}{\frac{\left(\sin^2\ \right)}{^2}}\right]$$

$$= (\cos 0)\left[\frac{1+1}{1^2}\right] = 2$$

3. For f( ) to be continuous at = 0, we must have $f(0) = \lim_{\to 0} f(\ )$

$$= \lim_{\to 0} \frac{\sqrt{a^2 - a\ \ + \ ^2} - \sqrt{a^2 + a\ \ + \ ^2}}{\sqrt{a + \ } - \sqrt{a - }}$$

$$= \lim_{\to 0} \frac{\sqrt{a^2 - a\ \ + \ ^2} - \sqrt{a^2 + a\ \ + \ ^2}}{\sqrt{a + \ } - \sqrt{a - }} \times \frac{\sqrt{a + \ } + \sqrt{a - }}{\sqrt{a + \ } + \sqrt{a - }} \times \frac{\sqrt{a^2 - a\ \ + \ ^2} + \sqrt{a^2 + a\ \ + \ ^2}}{\sqrt{a^2 - a\ \ + \ ^2} + \sqrt{a^2 + a\ \ + \ ^2}}$$

$$= \lim_{\to 0} \frac{\left[\left(a^2 - a\ \ + \ ^2\right) - \left(a^2 + a\ \ + \ ^2\right)\right]\left[\sqrt{a + \ } + \sqrt{a - }\right]}{\left[(a + \ ) - (a - \ )\right]\left[\sqrt{a^2 - a\ \ + \ ^2} + \sqrt{a^2 + a\ \ + \ ^2}\right]}$$

$$= \lim_{\to 0} \frac{-2a\ \left(\sqrt{a + \ } + \sqrt{a - }\right)}{2\ \left(\sqrt{a^2 - a\ \ + \ ^2} + \sqrt{a^2 + a\ \ + \ ^2}\right)}$$

$$= \frac{-a\left(\sqrt{a} + \sqrt{a}\right)}{\sqrt{a^2} + \sqrt{a^2}}$$

∴ $f(0) = -\sqrt{a}$

4. $$\lim_{\to 0} \frac{5\ .2\ + 7\ - 7\ .2\ - 5}{2\sin^2 \frac{}{2}}$$

$$= \lim_{\to 0} \frac{5\ (2\ - 1) - 7\ (2\ - 1)}{2\sin^2 \frac{}{2}}$$

$$= \lim_{\to 0} \frac{1}{2}\left(\frac{2\ - 1}{}\right)\left(\frac{5\ - 1}{} - \frac{7\ - 1}{}\right)\frac{1}{\frac{\sin^2\ /2}{^2/4} \times \frac{1}{4}}$$

$$= 2(\log 2)\left(\log \frac{5}{7}\right)$$

It is discontinuous at = 0 and it is removable.

5. $$a = \lim_{\to 0} \frac{\sin^3 \sqrt{\ }\ \log(1 + 3\ )}{\left(\tan^{-1}\sqrt{\ }\right)^2 \left(e^{5\sqrt{\ }} - 1\right)}$$

$$= \lim_{\to 0} \frac{\frac{\sin^3\sqrt{\ }}{\left(\sqrt{\ }\right)^3} \cdot \left(\sqrt{\ }\right)^3 \cdot \frac{\log(1 + 3\ )}{3} \cdot 3}{\frac{\left(\tan^{-1}\sqrt{\ }\right)^2}{\left(\sqrt{\ }\right)^2} \cdot \left(\sqrt{\ }\right)^2 \cdot \frac{e^{5\sqrt{\ }} - 1}{5\sqrt{\ }} \cdot 5\sqrt{\ }\ .}$$

$$= \frac{(1)^3\left(\sqrt{\ }\right)^3 . (1)3}{(1)^2\left(\sqrt{\ }\right)^2 (1) 5\sqrt{\ }\ .}$$

$$= \frac{3}{5}$$

6. For f to be continuous at = 2,

$$f(2) = \lim_{\to 0} (\ \ - 1)^{\frac{1}{(2 - \ )}}$$

$$= \lim_{\to 0} \left(1 + (\ \ - 2)\right)^{\frac{-1}{(\ -2)}} = e^{-1}$$

7. Given function is continuous at (– ∞, 6).

∴ at = 1 and = 3, function is continuous.

If the function f( ) is continuous at = 1, then

$\lim_{\to 1^-} f(\ ) = \lim_{\to 1^+} f(\ )$

$\Rightarrow 1 + \sin\frac{\pi}{2} = a + b$

If the function is continuous at = 3, then

$\lim_{\to 3^-} f(\ ) = \lim_{\to 3^+} f(\ )$

$\Rightarrow 3a + b = 6\tan\frac{3\pi}{12}$

∴ 3a + b = 6 .....(ii)

From (i) and (ii), a = 2, b = 0

8. Since, and | | are continuous for all .

$$= \lim_{\to 0^+} e^{\left(\frac{\tan 2}{2} \times 2\ \right)/\left(\frac{\tan 3}{3} \times 3\ \right)}$$

$$= e^{\frac{2}{3}}$$

$f(0) = \lim_{\to 0^+} f(\ )$

$\Rightarrow b = e^{\frac{2}{3}}$

$$\lim_{\to 0^-} f(\ ) = \lim_{\to 0^-} (1 + |\sin\ \ |)^{a/|\sin\ \ |}$$

$$= e^{\lim_{\to 0}\left(|\sin\ \ | \times \frac{a}{|\sin\ \ |}\right)} = e^a$$

$f(0) = \lim_{\to 0^-} f(\ )$

$\Rightarrow b = e^a \Rightarrow e^{\frac{2}{3}} = e^a$

$\Rightarrow a = \frac{2}{3}$

10. Given, $f(\ ) = [\ ]^2 - [\ ^2]$

$-1 < \ < 0,\ f(\ ) = (-1)^2 - 0 = 1$

$\ = 0,\ f(\ ) = 0^2 - 0 = 0$

$0 < \ < 1,\ f(\ ) = 0^2 - 0 = 0$

$\ = 1,\ f(\ ) = 1^2 - 1 = 0$

$1 < \ < \sqrt{2},\ f(\ ) = 1^2 - 1 = 0$

$\sqrt{3} < \ < 2,\ f(\ ) = 1^2 - 3 = -2$

$\ = 2,\ f(\ ) = 2^2 - 4 = 0$

$2 < \ < \sqrt{5},\ f(\ ) = 2^2 - 4 = 0$

$\ = \sqrt{5},\ f(\ ) = 2^2 - 5 = -1$

Hence, the given function is discontinuous at all integers except 1.

$Rf'(0) = \lim_{h \to 0^+} \frac{f(0+h) - f(0)}{h} = \lim_{h \to 0} \frac{e^{-h} - 1}{h} = -1$

So, f( ) is not differentiable at = 0.

$\therefore$ f( ) is continuous every where but not differentiable at = 0.

13. $f(\ ) = \begin{cases} e^{-\left(-\frac{1}{\ } + \frac{1}{\ }\right)} = \ , & < 0 \\ e^{-2/}\ , & > 0 \\ 0\ , & = 0 \end{cases}$

$\lim_{\to 0^-} f(\ ) = \lim_{\to 0}\ = 0$

$\lim_{\to 0^+} f(\ ) = \lim_{\to 0}\ e^{-2/} = 0$ and $f(0) = 0$

$\therefore$ $\lim_{\to 0^-} f(\ ) = \lim_{\to 0^+} f(\ ) = f(0)$

So, f( ) is continuous at = 0

Also,

$Lf'(0) = 1$ and

$$Rf'(0) = \lim_{h\to 0^+} \frac{f(0+h)-f(0)}{h}$$

$$= \lim_{h\to 0^+} \frac{he^{-2/h} - 0}{h} = \lim_{h\to 0} e^{-2/h} = 0$$

∴ f is not differentiable at = 0.

Thus, f( ) is everywhere continuous but not differentiable at = 0.

14. $$f(\ ) = \begin{cases} \frac{\ ^2}{\ } = \ , & > 0 \\ 0, & = 0 \\ \frac{\ ^2}{-\ } = -\ , & < 0 \end{cases}$$

$\lim_{\to 0^-} f(\ ) = \lim_{\to 0^-}(-\ ) = 0,\ \lim_{\to 0^+} f(\ ) = \lim_{\to 0^+} \ = 0$

and $f(0) = 0$.

So, f( ) is continuous at = 0.

Also, f( ) is continuous for all other values of .

Hence, f( ) is continuous everywhere.

Here, $Lf'(0) = -1$ and $Rf'(0) = 1$.

∴ f( ) is not differentiable at = 0.

15. $$Lf'(0) = \lim_{\to 0^-} \frac{f(\ )-f(0)}{-0} = \lim_{\to 0} \frac{e\ + a\ - b}{\ }$$

$$Rf'(0) = \lim_{\to 0^+} \frac{f(\ )-f(0)}{-0}$$

$$= \lim_{\to 0} \frac{b(\ -1)^2 - b}{\ }$$

$$= \lim_{\to 0} \frac{b(\ ^2 - 2\ + 1 - 1)}{\ }$$

$$= \lim_{\to 0} b(\ -2) = -2b$$

Since $f'(0)$ exists.

∴ $Lf'(0)$ must exist.

∴ $1 - b = 0 \Rightarrow b = 1$

$Lf'(0) = Rf'(0) = -2$

and $$Lf'(0) = \lim_{\to 0} \frac{e\ + a\ - 1}{\ }$$

$$= \lim_{\to 0}\left(\frac{e\ - 1}{\ } + a\right) = 1 + a$$

∴ $1 + a = -2 \Rightarrow a = -3$

∴ (a, b) = (–3, 1)

16. $$Lf'(1) = \lim_{h\to 0} \frac{f(1-h)-f(1)}{-h}$$

$$= \lim_{h\to 0} \frac{m(1-h)^2 - m}{-h} = \lim_{h\to 0} \frac{m(1+h^2-2h-1)}{-h}$$

$$= \lim_{h\to 0} m(2-h) = 2m$$

$$Rf'(1) = \lim_{h\to 0} \frac{f(1+h)-f(1)}{h} = \lim_{h\to 0} \frac{2(1+h)-m}{h}$$

For differentiability, $Lf'(1) = Rf'(1)$.

But for any value of m, $Lf'(1) = Rf'(1)$ is not possible.

17. $$Lf'(0) = \lim_{\to 0^-} \frac{f(\ )-f(0)}{-0}$$

$$= \lim_{\to 0}\left(\frac{-a\sin\ + be^{-}\ - b}{\ }\right)$$

Applying L′ Hospital rule, we get

$$Lf'(0) = \lim_{\to 0}\left(\frac{-a\cos\ - be^{-}}{1}\right) = -(a+b)$$

$$Rf'(0) = \lim_{\to 0^+} \frac{f(\ )-f(0)}{-0}$$

$$= \lim_{\to 0}\left(\frac{a\sin\ + be\ - b}{\ }\right)$$

Applying L′ Hospital rule, we get

$$Rf'(0) = \lim_{\to 0}\left(\frac{a\cos\ + be}{1}\right) = a + b$$

Since, f( ) is differentiable at = 0.

∴ $Lf'(0) = Rf'(0)$

$\Rightarrow -(a+b) = a+b$

$\Rightarrow a + b = 0$

$Rg'(3) = \lim\limits_{\to 3^+} \dfrac{g(\ ) - g(3)}{\ - 3} = \lim\limits_{\to 3^+} \dfrac{m\ + 2 - 2k}{\ - 3}$

Applying L'Hospital rule, we get

$Rg'(3) = m$

Since, g′(3) exists.

∴ Rg′(3) must exist.

∴ 3m + 2 – 2k = 0 ….(i)

Since, g( ) is differentiable.

∴ Lg′(3) = Rg′(3)

∴ $\dfrac{k}{4} = m \Rightarrow k = 4m$ ….(ii)

Solving (i) and (ii), we get

∴ $k + m = \dfrac{8}{5} + \dfrac{2}{5} = 2$

$\Rightarrow 3t^2 - 22t - 45 = 0 \Rightarrow t = 9 \quad \ldots\left[\because t \neq -\frac{5}{3}\right]$

17. Given, $s = a \sin t + b \cos 2t$

$\therefore \quad \frac{ds}{dt} = a \cos t - 2b \sin 2t$

$\therefore \quad \frac{d^2s}{dt^2} = - a \sin t - 4b \cos 2t$

At $t = 0$, $\frac{d^2s}{dt^2} = -a \sin 0^{\circ} - 4b \cos 0^{\circ} = -4b$

18. $s = 2t^3 - 9t^2 + 12t$

$\Rightarrow \frac{ds}{dt} = 6t^2 - 18t + 12$

$\Rightarrow \frac{d^2s}{dt^2} = 12t - 18 = \text{acceleration}$

When acceleration of the particle will be zero,
$12t - 18 = 0$

$\Rightarrow t = \frac{3}{2}$ sec

Hence, the acceleration of the particle will be zero after $\frac{3}{2}$ sec.

19. $s = \frac{1}{2}gt^2 \Rightarrow \frac{ds}{dt} = gt \Rightarrow \frac{d^2s}{dt^2} = g$

∴ the acceleration of the stone is uniform.

20. $\frac{dr}{dt} = 3$

$A = \pi r^2 \Rightarrow \frac{dA}{dt} = 2\pi r \frac{dr}{dt}$

$\Rightarrow \left(\frac{dA}{dt}\right)_{r=10} = 2\pi \times 10 \times 3 = 60\pi \text{ cm}^2\text{/sec}$

21. $A = s^2$

∴ $\frac{dA}{dt} = 2s\frac{ds}{dt}$

∴ $\frac{dA}{dt} = 2 \times 10 \times 0.5 = 2 \times 5 = 10 \text{ cm}^2\text{/sec}$

22. $V = 5\quad - \frac{\quad^2}{6}$

$\Rightarrow \frac{dV}{dt} = 5\frac{d}{dt} - \frac{}{3}.\frac{d}{dt}$

$\Rightarrow \frac{d}{dt} = \frac{\frac{dV}{dt}}{\left(5 - \frac{}{3}\right)}$

$\Rightarrow \left(\frac{d}{dt}\right)_{=2} = \frac{5}{5 - \frac{2}{3}} = \frac{15}{13}$ cm/sec

23. Let f( ) = $\sqrt{\quad}$

∴ $f'(\ ) = \frac{1}{2\sqrt{\quad}}$

Here, a = 25 and h = 0.2

∴ $f(a) = f(25) = \sqrt{25} = 5$

and $f'(a) = f'(25) = \frac{1}{2\sqrt{25}} = \frac{1}{10}$

∴ $f(a + h) \approx f(a) + h f'(a)$

$\approx 5 + (0.2)\left(\frac{1}{10}\right)$

$\approx 5 + 0.02$

∴ $\sqrt{25.2} \approx 5.02$

24. Let f( ) = $\quad^{\frac{1}{3}}$

∴ $f'(\ ) = \frac{1}{3}\quad^{-\frac{2}{3}} = \frac{1}{3\quad^{\frac{2}{3}}}$

Here, a = 27 and h = 2

∴ $f(a + h) \approx f(a) + h f'(a)$

$\approx (27)^{\frac{1}{3}} + 2\left[\frac{1}{3(27)^{\frac{2}{3}}}\right]$

$\approx 3 + 2\left(\frac{1}{27}\right)$

$\approx 3 + 0.07407$

∴ $(29)^{\frac{1}{3}} \approx 3.07407$

Only option (B) satisfies this condition.

26. According to Lagrange's mean value theorem, in interval [a, b] for f( ),

$f'(c) = \frac{f(b) - f(a)}{b - a}$, where a < c < b

∴ $a < \ _1 < b$

27. f( ) = 2 – 3

∴ $f'(\ ) = -5^{-}\ \log_e 5 = -\frac{\log_e 5}{5}$

⇒ f ′( ) < 0 for all
i.e., f( ) is decreasing for all .

$\Rightarrow \ {}^3 > \frac{1}{8}$
$\Rightarrow \ > \frac{1}{2}$

34. $f(\ ) = 2\ {}^3 + 9\ {}^2 + 12\ + 20$
$\therefore$ $f'(\ ) = 6\ {}^2 + 18\ + 12$

$\Rightarrow (\ + 2)(\ + 1) > 0$
$\Rightarrow \ \in (-\infty, -2) \cup (-1, \infty)$

35. $f(\ ) = 2\ {}^3 - 3\ {}^2 - 12\ + 12$
$\therefore$ $f'(\ ) = 6\ {}^2 - 6\ - 12$

$\Rightarrow (\ - 3)(\ - 1) < 0$
$\Rightarrow \ \in (1, 3)$

37. Let $f(\ ) = 2\ {}^3 - 6\ + 5$

$\Rightarrow 6\ {}^2 - 6 > 0 \Rightarrow (\ - 1)(\ + 1) > 0$
$\Rightarrow \ > 1$ or $\ < -1$

38. Let $f(\ ) = \frac{1}{1 + \ {}^2}$
$\therefore$ $f'(\ ) = -\frac{2}{(1 + \ {}^2)^2}$
For $f(\ )$ to be decreasing,
$f'(\ ) < 0 \Rightarrow -\frac{2}{(1 + \ {}^2)^2} < 0$
$\Rightarrow \ > 0 \Rightarrow \ \in (0, \infty)$

39. Let $f(\ ) = \log(\sin\ ) \Rightarrow f'(\ ) = \cot$
$\therefore$ the given function is increasing in the interval $\left(0, \frac{\pi}{2}\right)$.

40. $f(\ ) = 2\ {}^3 - 3\ {}^2 - 36\ + 7$
$\therefore$ $f'(\ ) = 6\ {}^2 - 6\ - 36$
For decreasing function, $f'(\ ) < 0$
$\Rightarrow \ {}^2 - \ - 6 < 0$
$\Rightarrow (\ - 3)(\ + 2) < 0$
$\Rightarrow \ \in (-2, 3)$

41. $f(\ ) = 2\ {}^3 - 3\ {}^2 - 12\ + 5$
$\therefore$ $f'(\ ) = 6\ {}^2 - 6\ - 12$
For maximum or minimum,
$f'(\ ) = 0$
$\Rightarrow \ {}^2 - \ - 2 = 0$
$\Rightarrow (\ - 2)(\ + 1) = 0$
$\Rightarrow \ = 2, -1$
Now, $f''(\ ) = 12\ - 6$
$\therefore$ $f''(2) = 18 > 0$
$\therefore$ $f(\ )$ is minimum at $\ = 2$.

43. $f(\ ) = 7 - 20\ + 11\ {}^2$
$\therefore$ $f'(\ ) = -20 + 22$
For maximum or minimum,
$f'(\ ) = 0 \Rightarrow -20 + 22\ = 0$
$\Rightarrow \ = 10/11$
Now, $f''(\ ) = 22 > 0$
$\therefore$ $f(\ )$ is minimum at $\ = \frac{10}{11}$.
$\therefore$ $[f(\ )]_{min} = f\left(\frac{10}{11}\right)$
$$= 7 - \frac{200}{11} + \frac{100 \times 11}{121} = -\frac{23}{11}$$

44. Let $f(\ ) = 2\ {}^2 + \ - 1$
$\therefore$ $f'(\ ) = 4\ + 1$
For maximum or minimum,
$f'(\ ) = 0 \Rightarrow \ = -\frac{1}{4}$
Now, $f''(\ ) = 4 > 0$
$\therefore$ $f(\ )$ is minimum at $\ = \frac{-1}{4}$.
$\therefore$ $[f(\ )]_{min} = \left[f\left(-\frac{1}{4}\right)\right] = \frac{2}{16} - \frac{1}{4} - 1 = \frac{-9}{8}$

45. $f(\ ) = 2\ ^3 - 3\ ^2 - 12\ + 4$

∴ $f'(\ ) = 6\ ^2 - 6\ - 12$

For maximum or minimum,

$f'(\ ) = 0 \Rightarrow\ ^2 -\ - 2 = 0 \Rightarrow\ = 2, -1$

Now, $f''(\ ) = 12\ - 6$

∴ $f''(2) = 18 > 0$ and $f''(-1) = -18 < 0$

∴ the given function has one maximum and one minimum.

46. $= 1 - \cos$

∴ $' = \sin$

For maximum or minimum,

$' = 0 \Rightarrow \sin\ = 0 \Rightarrow\ = 0, \pi$

Now, $'' = \cos$

$\Rightarrow\ ''(0) = 1 > 0$ and $''(\pi) = -1 < 0$

∴ is maximum when $= \pi$.

Critical Thinking

1. $= 15$

∴ $= \frac{15}{\ }$

∴ $' = -\frac{15}{\ ^2}$

At (3, 5), $' = -\frac{15}{9}$

∴ Slope of normal at (3,5) = $\frac{9}{15}$

∴ $\theta = \tan^{-1}\left(\frac{9}{15}\right)$

2. $^2 = 2$

Differentiating both sides w.r.t. , we get

$2\ = \frac{2d}{d}$

$\Rightarrow \frac{d}{d} =$

∴ $\left(\frac{d}{d}\right)_{\left(1,\frac{1}{2}\right)} = 1$

$\Rightarrow \tan\theta = 1$

$\Rightarrow \theta = 45^\circ$ ….[∵ $\tan 45^\circ = 1$]

3. $^3 - 8a^2\ = 0$ ....(i)

Differentiating w.r.t. , we get

$3\ ^2 - 8a^2\frac{d}{d} = 0$

$\Rightarrow \frac{d}{d} = \frac{3\ ^2}{8a^2}$

∴ Slope of the normal = $-\frac{1}{\frac{d}{d}} = -\frac{1}{\frac{3\ ^2}{8a^2}} = -\frac{8a^2}{3\ ^2}$

According to the given condition,

$\frac{-8a^2}{3\ ^2} = \frac{-2}{3}$

$\Rightarrow 4a^2 =\ ^2$

$\Rightarrow\ = 2a$

From (i), $8a^3 - 8a^2\ = 0 \Rightarrow\ = a$

∴ the required point is (2a, a).

4. $^2 = 3 - 2$ ….(i)

Differentiating both sides w.r.t. , we get

$2\ = -2\frac{d}{d} \Rightarrow \frac{d}{d} = -$

∴ Slope of the tangent = –

Slope of the given line is –1.

Since, the tangent is parallel to the given line.

∴ $-\ = -1 \Rightarrow\ = 1$

From (i), $= 1$

∴ the required point is (1, 1).

5. $= 6\ -\ ^2$ ….(i)

∴ $\frac{d}{d} = 6 - 2$

Slope of the given line is 2.

Since, the tangent is parallel to the given line.

∴ $6 - 2\ = 2 \Rightarrow\ = 2$

From (i), $= 8$

∴ the point of tangency will be (2, 8).

6. Let the coordinates of P be $(\ _1,\ _1)$.

Then, $_1 = 2\ _1^2 -\ _1 + 1$ ....(i)

Now, $= 2\ ^2 -\ + 1$

∴ $\frac{d}{d} = 4\ - 1$

∴ $\left(\frac{d}{d}\right)_{(\ _1,\ _1)} = 4\ _1 - 1$

Slope of the given line is 3.

Since, the tangent is parallel to the given line.

∴ slope of the tangent = 3

$\Rightarrow 4\ _1 - 1 = 3$

$\Rightarrow\ _1 = 1$

From (i), $_1 = 2$

∴ the coordinates of P are (1, 2).

7. $= \log$ ….(i)

$\therefore \dfrac{d}{d} = 1 + \log$

Slope of the normal $= -\dfrac{1}{\left(\dfrac{d}{d}\right)} = \dfrac{-1}{1+\log}$

Slope of the given line is 1.

Since, the normal is parallel to the given line.

$\therefore \dfrac{-1}{1+\log} = 1$

$\Rightarrow \log \quad = -2$

$\Rightarrow \quad = e^{-2}$

From (i), $\quad = -2e^{-2}$

$\therefore$ Co-ordinates of the point are $(e^{-2}, -2e^{-2})$.

8. $= (\quad - 3)^2$

$\therefore \quad ' = 2(\quad - 3)$

Since, the tangent is parallel to the line joining (3, 0) and (4, 1).

$\therefore 2(\quad - 3) = \dfrac{1-0}{4-3}$

$\Rightarrow 2 \quad - 6 = 1 \Rightarrow \quad = \dfrac{7}{2}$

When $\quad = \dfrac{7}{2}$,

$= \left(\dfrac{7}{2} - 3\right)^2 = \dfrac{1}{4}$

$\therefore$ the required point is $\left(\dfrac{7}{2}, \dfrac{1}{4}\right)$.

9. $= \quad^2 - 4 \quad + 5$ ….(i)

$\therefore \dfrac{d}{d} = 2 \quad - 4$

Slope of the given line $= -\dfrac{1}{2}$

Since, the tangent is perpendicular to the given line.

$\therefore (2 \quad - 4)\left(-\dfrac{1}{2}\right) = -1$

$\Rightarrow 2 \quad - 4 = 2$

$\Rightarrow \quad = 3$

From (i), $\quad = 2$

$\therefore$ the required point is (3, 2).

10. $\quad^2 + \quad^2 - 2 \quad - 3 = 0$ ….(i)

Differentiating w.r.t. , we get

$2 \quad + 2 \quad \dfrac{d}{d} - 2 = 0$

$\therefore \dfrac{d}{d} = \dfrac{1-}{}$

Since, the tangent is parallel to X-axis.

$\therefore \dfrac{d}{d} = 0$

$\Rightarrow \dfrac{1-}{} = 0 \Rightarrow \quad = 1$

From (i),

$= \pm 2$

11. $\quad^3 + 3 \quad^2 - 12 \quad = 0$ ….(i)

Differentiating w.r.t. , we get

$\dfrac{d}{d} = -\dfrac{6}{3 \quad^2 - 12}$

Since, the tangent is parallel to Y-axis.

$\therefore \dfrac{d}{d} = 0$

$\Rightarrow 3 \quad^2 - 12 = 0$

$\Rightarrow \quad^2 = 4 \Rightarrow \quad = \pm 2$

$\therefore \quad = 2$ ….$[\because \quad \neq -2]$

From (i),

$= \pm \dfrac{4}{\sqrt{3}}$

12. $= a \quad^2 + b$

$\therefore \dfrac{d}{d} = 2a \quad + b \Rightarrow \left(\dfrac{d}{d}\right)_{(2,-8)} = 4a + b$

Since, the tangent is parallel to X-axis.

$\therefore \left(\dfrac{d}{d}\right)_{(2,-8)} = 0 \Rightarrow b = -4a$ ….(i)

Also, the point (2, –8) lies on the curve $= a \quad^2 + b$.

$\therefore -8 = 4a + 2b$ ….(ii)

From (i) and (ii), we get a = 2, b = –8

13. $= a \quad^2 - 6 \quad + b$

$\therefore \dfrac{d}{d} = 2a \quad - 6$

$\therefore \left(\dfrac{d}{d}\right)_{\left(= \frac{3}{2}\right)} = 3a - 6$

Since, the tangent is parallel to X-axis at $\quad = \dfrac{3}{2}$.

$\therefore \left(\dfrac{d}{d}\right)_{\left(= \frac{3}{2}\right)} = 0$

$\Rightarrow 3a - 6 = 0 \Rightarrow a = 2$

Now, the given curve passes through (0, 2).

$\therefore 2 = 0 - 0 + b$

$\Rightarrow b = 2$

14. At t = 2, $= \frac{1}{2}$

and $= 2 - \frac{1}{2} = \frac{3}{2}$

Now, $\frac{d}{d} = \frac{\frac{d}{dt}}{\frac{d}{dt}} = \frac{1+\frac{1}{t^2}}{\frac{-1}{t^2}} = \frac{t^2+1}{-1}$

∴ $\left(\frac{d}{d}\right)_{(t=2)} = -5$

∴ Equation of the normal at $\left(\frac{1}{2}, \frac{3}{2}\right)$ is

$- \frac{3}{2} = \frac{1}{5}\left(- \frac{1}{2}\right)$

∴ $- 5 + 7 = 0$

15. At $\theta = \frac{\pi}{6}$,

$= a \sec\frac{\pi}{6} = \frac{2a}{\sqrt{3}}$ and $= a \tan\frac{\pi}{6} = \frac{a}{\sqrt{3}}$

$\frac{d}{d} = \frac{\frac{d}{d\theta}}{\frac{d}{d\theta}} = \frac{a\sec^2\theta}{a\sec\theta\tan\theta} = \frac{1}{\sin\theta} = \operatorname{cosec}\theta$

∴ $\left(\frac{d}{d}\right)_{\theta=\frac{\pi}{6}} = \operatorname{cosec}\frac{\pi}{6} = 2$

∴ Equation of the tangent at $\left(\frac{2a}{\sqrt{3}}, \frac{a}{\sqrt{3}}\right)$ is

$- \frac{a}{\sqrt{3}} = 2\left(- \frac{2a}{\sqrt{3}}\right)$

$\Rightarrow 2 - = \sqrt{3}a$

16. $= ^3 + 2 ^2 - 4 - 43$

∴ $\frac{d}{d} = 3 ^2 + 4 - 4$

∴ $\left(\frac{d}{d}\right)_{(-2,5)} = 3(-2)^2 + 4(-2) - 4 = 0$

∴ equation of the tangent at (–2, 5) is

$- 5 = 0.(+ 2)$

i.e., $= 5$ (parallel to X-axis)

Normal is perpendicular to X-axis and passes through (–2,5).

∴ equation of the normal is

$- 2$, i.e., $+ 2 = 0$

17. $^2 = 5 - 1$

∴ $\frac{d}{d} = \frac{5}{2}$

∴ $\left(\frac{d}{d}\right)_{(1,-2)} = \frac{-5}{4}$

∴ Equation of the normal at (1, –2) is

$- (-2) = \frac{4}{5}(- 1)$

∴ $4 - 5 - 14 = 0$ ....(i)

As the normal is of the form a $- 5 + b = 0$, comparing this with (i), we get

a = 4 and b = –14

18. $^{\frac{2}{3}} + ^{\frac{2}{3}} = a^{\frac{2}{3}}$

Differentiating both sides w.r.t. , we get

$\frac{2}{3} ^{\frac{-1}{3}} + \frac{2}{3} ^{\frac{-1}{3}} \frac{d}{d} = 0$

$\Rightarrow \frac{d}{d} = \frac{- ^{\frac{1}{3}}}{^{\frac{1}{3}}}$

At $(a \sin^3\theta, a \cos^3\theta)$,

$\frac{d}{d} = -\frac{\cos\theta}{\sin\theta} = -\cot\theta$

∴ slope of the normal is $\tan\theta$.

∴ equation of the normal at $(a \sin^3\theta, a \cos^3\theta)$ is

$- a\cos^3\theta = \tan\theta(- a\sin^3\theta)$

$\Rightarrow \cos\theta - a\cos^4\theta = \sin\theta - a\sin^4\theta$

$\Rightarrow \sin\theta - \cos\theta = a\sin^4\theta - a\cos^4\theta$

19. Let $(_1, _1)$ be a point on the curve $= + \frac{4}{^2}$.

Since, the tangent is parallel to X-axis.

∴ $\left(\frac{d}{d}\right)_{(_1, _1)} = 0 \Rightarrow 1 - \frac{8}{_1^3} = 0 \Rightarrow _1 = 2$

Now, $_1 = _1 + \frac{4}{_1^2}$

$\Rightarrow _1 = 2 + \frac{4}{2^2}$

$\Rightarrow _1 = 3$

∴ equation of the tangent at (2, 3) is

$- 3 = 0 \Rightarrow = 3$

20. Since, the given curve crosses the X-axis, $= 0$

∴ $0 = 2 - \Rightarrow = 2$

∴ the given curve crosses the X-axis at (2, 0).

Now, $(1 + ^2) = 2 -$

Differentiating both sides w.r.t. , we get

$(1 + \;^{2})\frac{d}{d} + 2 \quad = -1$

∴ $\frac{d}{d} = \frac{-1-2}{1+\;^{2}}$

∴ $\left(\frac{d}{d}\right)_{(2,0)} = -\frac{1}{5}$

∴ equation of the tangent at (2, 0) is

$- 0 = -\frac{1}{5}(\;\; - 2)$

$\Rightarrow \;\; + 5 \;\; = 2$

21. Since, the given curve crosses the Y-axis, $= 0$

∴ $= be^{0} \Rightarrow \;\; = b$

∴ the given curve crosses the Y-axis at (0, b).

Now, $= be^{-\frac{}{a}}$

∴ $\frac{d}{d} = -\frac{b}{a}e^{-\frac{}{a}}$

∴ $\left(\frac{d}{d}\right)_{(0,b)} = -\frac{b}{a}$

∴ the equation of the tangent at (0, b) is

$- b = -\frac{b}{a}(\;\; - 0)$

$\Rightarrow \frac{}{a} + \frac{}{b} = 1$

22. $= e^{2}$

∴ $\frac{d}{d} = 2e^{2}$

∴ $\left(\frac{d}{d}\right)_{(0,1)} = 2$

∴ equation of the tangent at (0, 1) is

$- 1 = 2(\;\; - 0)$

$\Rightarrow \;\; = 2 \;\; + 1$

This tangent meets X-axis, ∴ $= 0$

∴ $0 = 2 \;\; + 1 \Rightarrow \;\; = -\frac{1}{2}$

∴ the required point is $\left(-\frac{1}{2}, 0\right)$.

23. Let the required point be $(\;_{1}, \;_{1})$.

∴ $_{1} = be^{-\frac{1}{a}}$ ….(i)

Now, $= be^{-\frac{}{a}}$

∴ $\frac{d}{d} = \frac{-b}{a}\cdot e^{-\frac{}{a}}$

∴ $\left(\frac{d}{d}\right)_{(\;_1,\;_1)} = \frac{-b}{a}\cdot e^{-\frac{1}{a}} = \frac{-\;_{1}}{a}$ ....[From (i)]

∴ equation of the tangent at $(\;_{1}, \;_{1})$ is

$- \;_{1} = \frac{-\;_{1}}{a}(\;\; - \;_{1})$

$\Rightarrow \frac{}{a} + \frac{}{_{1}} = \frac{_{1}}{a} + 1$

Comparing this equation with $\frac{}{a} + \frac{}{b} = 1$, we get

$_{1} = b$ and $1 + \frac{_{1}}{a} = 1 \Rightarrow \;_{1} = 0$

∴ the required point is (0, b).

24. When $= 0$,

$= (1 + 0) \;\; + \sin^{-1}(0) \Rightarrow \;\; = 1$

Now, $= (1 + \;\;) \;\; + \sin^{-1}(\sin^{2}\;\;)$

∴ $\frac{d}{d} = (1 + \;\;)\left\{\frac{d}{d}\log(1 + \;\;) + \frac{}{1+}\right\} + \frac{\sin 2}{\sqrt{1-\sin^{4}}}$

∴ $\left(\frac{d}{d}\right)_{(0,1)} = 1$

∴ the equation of the normal at (0, 1) is

$- 1 = -1(\;\; - 0) \Rightarrow \;\; + \;\; = 1$

25. Let $(\;_{1}, \;_{1})$ be the point on the curve $= 2\;^{2} + 7$, where the tangent is parallel to the line $4 \;\; - \;\; + 3 = 0$.

Then, $_{1} = 2\;_{1}^{2} + 7$ ....(i)

Now, $= 2\;^{2} + 7$

∴ $\frac{d}{d} = 4$

∴ $\left(\frac{d}{d}\right)_{(\;_1,\;_1)} = 4\;_{1}$

Slope of the given line is 4.

Since, the tangent is parallel to the given line.

∴ slope of the tangent = 4

$\Rightarrow 4\;_{1} = 4$

$\Rightarrow \;_{1} = 1$

From (i), $_{1} = 9$

∴ the coordinates of the point are (1, 9).

∴ Equation of the tangent at (1, 9) is

$- 9 = 4(\;\; - 1)$

$\Rightarrow 4 \;\; - \;\; + 5 = 0$

26. $8 \;\; = (\;\; - 2)^2$
Differentiating both sides w.r.t. , we get
$\frac{d}{d} = \frac{\; - 2}{4}$
∴ $\left(\frac{d}{d}\right)_{(-6,8)} = \frac{-6-2}{4} = -2$ ....(i)
$= \;\; + \frac{3}{\;}$
∴ $\frac{d}{d} = 1 - \frac{3}{\;^2}$
∴ $\left(\frac{d}{d}\right)_{(1,4)} = 1 - \frac{3}{1^2} = -2$ ....(ii)
From (i) and (ii),
T_1 is parallel to T_2

27. $= 1$
∴ $= \frac{1}{\;}$
∴ $' = \frac{-1}{\;^2}$
∴ Slope of the normal = $\;^2$
Slope of the line a + b + c = 0 is $\frac{-a}{b}$.
Since, the line a + b + c = 0 is a normal to the curve = 1.
∴ $\;^2 = -\frac{a}{b}$
For this condition to hold true, either a < 0, b > 0 or b < 0, a > 0

28. $\frac{d}{d} = 1 - 2 \;\; + 3 \;^2$
∴ $\frac{d}{d} = 3 \;^2 - 2 \;\; + 1 = 3\left(\;^2 - \frac{2}{3} \;\; + \frac{1}{3}\right)$
$= 3\left(\;^2 - \frac{2}{3} \;\; + \frac{1}{9} - \frac{1}{9} + \frac{1}{3}\right)$
$= 3\left[\left(\;\; - \frac{1}{3}\right)^2 + \frac{2}{9}\right]$
$= 3\left(\;\; - \frac{1}{3}\right)^2 + \frac{2}{3} > 0$
Slope of the given line is $-\frac{l}{m}$.
The slope will be positive only if l and m have opposite signs.
∴ option (D) is the correct answer.

29. $\left(\frac{\;}{a}\right)^n + \left(\frac{\;}{b}\right)^n = 2$
Differentiating both sides w.r.t. , we get
$\frac{1}{a^n} n \;^{n-1} + \frac{1}{b^n} n \;^{n-1} \; ' = 0$
∴ $' = \frac{-b^n}{a^n} \cdot \frac{\;^{n-1}}{\;^{n-1}}$
At (a, b),
$' = \frac{-b^n}{a^n} \cdot \frac{a^{n-1}}{b^{n-1}} = \frac{-b}{a}$, which is independent of n.

30. Since, ($_1$, $_1$) lies on the curve $= a^2$.
∴ $\;_1 \;_1 = a^2$ ....(i)
Now, $= a^2$
Differentiating w.r.t. , we get
$\frac{d}{d} + \;\; = 0$
⇒ $\frac{d}{d} = -\frac{\;}{\;}$
∴ $\left(\frac{d}{d}\right)_{(\;_1,\;_1)} = -\frac{\;_1}{\;_1}$
∴ equation of the tangent at ($_1$, $_1$) is
$- \;_1 = -\frac{\;_1}{\;_1}(\;\; - \;_1)$
⇒ $\;_1 + \;_1 = 2 \;_1 \;_1$
⇒ $\;_1 + \;_1 = 2a^2$ ....[From (i)]
This tangent meets the coordinate axes at
$\left(\frac{2a^2}{\;_1}, 0\right)$ and $\left(0, \frac{2a^2}{\;_1}\right)$.
∴ required area $= \frac{1}{2}\left(\frac{2a^2}{\;_1}\right)\left(\frac{2a^2}{\;_1}\right)$
$= \frac{2a^4}{\;_1 \;_1}$
$= 2a^2$ ....[From (i)]

31. $= \;^2 ⇒ \frac{d}{d} = 2 \;\; ⇒ \left(\frac{d}{d}\right)_{(1,1)} = 2 = m_1$(say)
$6 \;\; = 7 - \;^3 ⇒ 6.\frac{d}{d} = -3 \;^2$
⇒ $\left(\frac{d}{d}\right)_{(1,1)} = -\frac{1}{2} = m_2$(say)
Since, $m_1m_2 = -1$
∴ the angle of intersection is $\frac{\pi}{2}$.

32. $= {}^{2}$

$\therefore$ $\frac{d}{d} = 2$

$\therefore$ $\left(\frac{d}{d}\right)_{(1,1)} = 2 = m_1\,(\text{say})$

and $= {}^{2}$

$\therefore$ $1 = 2\ \frac{d}{d}$

$\Rightarrow \frac{d}{d} = \frac{1}{2}$

$\therefore$ $\left(\frac{d}{d}\right)_{(1,\,1)} = \frac{1}{2} = m_2\,(\text{say})$

$\therefore$ angle of intersection is $\tan\theta = \left|\frac{m_1 - m_2}{1 + m_1 m_2}\right|$

$$= \left|\frac{2 - \frac{1}{2}}{1 + 2\left(\frac{1}{2}\right)}\right| = \frac{3}{4}$$

$\therefore$ $\theta = \tan^{-1}\left(\frac{3}{4}\right)$

33. The point of intersection of the given curves is (0, 1).

Now, $= a$

$\therefore$ $\frac{d}{d} = a\ \ \log a$

$\therefore$ $\left(\frac{d}{d}\right)_{(0,1)} = \log a = m_1\,(\text{say})$

Also, $= b$

$\therefore$ $\frac{d}{d} = b\ \ \log b$

$\therefore$ $\left(\frac{d}{d}\right)_{(0,1)} = \log b = m_2\,(\text{say})$

$\therefore$ $\tan\alpha = \left|\frac{m_1 - m_2}{1 + m_1 m_2}\right| = \frac{\log a - \log b}{1 + \log a \log b}$

34. $s = ae^t + \frac{b}{e^t}$

$\therefore$ $\frac{ds}{dt} = \text{velocity} = ae^t - \frac{b}{e^t}$

$\therefore$ $\frac{d^2s}{dt^2} = \text{acceleration} = ae^t + \frac{b}{e^t} = s$

35. $\frac{dS}{dt} = \text{velocity} = 15 + 12t - 3t^2$

When particle comes to rest, v = 0

$\Rightarrow 3t^2 - 12t - 15 = 0$

$\Rightarrow t = 5$ sec

36. $s = \sqrt{t} \Rightarrow \frac{ds}{dt} = \frac{1}{2\sqrt{t}}$

and $\frac{d^2s}{dt^2} = -\frac{1}{4t^{\frac{3}{2}}}$

$$= -\frac{1}{4}\left(\frac{2ds}{dt}\right)^3 = -2\left(\frac{ds}{dt}\right)^3$$

Hence, acceleration $\propto$ (velocity)^3.

37. $s = \sqrt{at^2 + bt + c}$

$\therefore$ $v = \frac{ds}{dt} = \frac{1}{2}\frac{2at + b}{\sqrt{at^2 + bt + c}}$

$$= \frac{2at + b}{2s}$$

acceleration $= \frac{d^2s}{dt^2} = \frac{dv}{dt}$

$$= \frac{2s(2a) - (2at + b)\cdot 2\frac{ds}{dt}}{4s^2}$$

$$= \frac{4as - 2(2at + b)\frac{(2at + b)}{2s}}{4s^2}$$

$$= \frac{4as^2 - (2at + b)^2}{4s^3}$$

$$= \frac{4a(at^2 + bt + c) - (4a^2t^2 + 4abt + b^2)}{4s^3}$$

$$= \frac{4ac - b^2}{4s^3}$$

$\therefore$ acceleration varies as $\frac{1}{s^3}$

38. Area of a circle is $A = \pi R^2$ and $\frac{dR}{dt} = 0.2$

$\therefore$ $\frac{dA}{dt} = 2\pi R\ \frac{dR}{dt} = 1.2\pi\text{cm}^2$

39. Let a be each side and A be the area of the square at any time t. Then,

$A = a^2$

$\Rightarrow \frac{dA}{dt} = 2a\frac{da}{dt}$

$= 2(2)(4)$

$\ldots\left[\because \frac{da}{dt} = 4\,\text{cm/sec and } a = 2\,\text{cm(given)}\right]$

$= 16$ cm^2/sec

40. Radius of balloon = $r = \frac{3}{4}(2\ \ +3)$

$\Rightarrow \frac{dr}{d} = \frac{3}{2}$

$V = \frac{4}{3}\pi r^3$

$\therefore \quad \frac{dV}{d} = 4\pi\left(\frac{3}{4}\right)^2 (2\ \ +3)^2.\frac{3}{2}$

$= \frac{27\pi}{8}(2\ \ +3)^2$

41. Given, $\frac{dr}{dt} = 2$ cm/sec, where r be the radius of circle and t be the time.
Now, area of circle is given by $A = \pi r^2$

$\therefore \quad \frac{dA}{dt} = 2\pi r \frac{dr}{dt}$

$\Rightarrow \frac{dA}{dt} = 2\pi\ .\ 20\ .2$

$\therefore \quad \frac{dA}{dt} = 80\ \pi\ cm^2/sec$

$\therefore$ the rate of change of area of circle with respect to time is 80 π cm^2/sec.

42. Let r be the radius and V be the volume of the spherical balloon at any time t. Then,

$V = \frac{4}{3}\pi r^3$

$\Rightarrow \frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$

$\therefore \quad \left(\frac{dV}{dt}\right)_{(r=15)} = 4\pi \times (15)^2 \times \left(\frac{dr}{dt}\right)_{(r=15)}$

$\Rightarrow 30 = 900\pi\left(\frac{dr}{dt}\right)_{(r=15)}$

$\ldots\left[\because \frac{dV}{dt} = 30\,ft^3/min\,(given)\right]$

$\Rightarrow \left(\frac{dr}{dt}\right)_{(r=15)} = \frac{1}{30\pi} ft/min$

43. Let velocity V = 5 cm/sec
(Increasing the rate/sec is called the velocity)

$\frac{da}{dt} = 5$ ….(i)

But if a is edge of a cube, then $V = a^3$

$\therefore \quad \frac{dV}{dt} = 3a^2\frac{da}{dt} = 3a^2.\ 5$

$= 15a^2 = 15 \times (12)^2$ …[∵ edge a = 12 cm]

$= 2160\ cm^3/sec$

44. $\frac{da}{dt} = 60$cm/sec where a is edge and t is time.

$V = a^3$

$\therefore \quad \frac{dV}{dt} = 3a^2\frac{da}{dt}$

$= 3a^2 \times 60 = 180a^2$

$= 180 \times (90)^2$

$= 1458000\ cm^3/sec.$

45. $V = \frac{4}{3}\pi(\ \ +10)^3$, where   is thickness of ice.

$\therefore \quad \frac{dV}{dt} = 4\pi(10+\ \ )^2\frac{d}{dt}$

But, $\frac{dV}{dt} = 50$

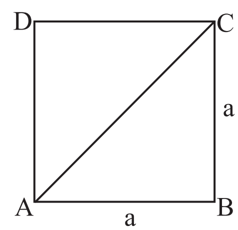
$\therefore \quad 50 = 4\pi\ (10+\ \ )^2\frac{d}{dt}$

At   = 5, $\frac{d}{dt} = \frac{50}{4\pi(10+5)^2}$

$= \frac{50}{4\pi(225)}$

$= \frac{1}{18\pi}$ cm/ min

46. $\frac{d}{dt} = 0.5$ cm/sec



$\therefore$ Area $= \frac{\ ^2}{2}$

$\therefore \quad \frac{dA}{dt} = \frac{2}{2}\cdot\frac{d}{dt}$

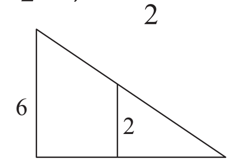
$\therefore \quad \left[\frac{dA}{dt}\right]_{A=400} = \frac{1}{2}\sqrt{800}$ $\ldots\left[\begin{array}{l}\because A = 400\,cm^2\\ \therefore \quad = \sqrt{800}\,cm\end{array}\right]$

$= 10\sqrt{2}\ cm^2/sec$

47. From the figure,

$\frac{\ }{2} = \frac{\ +\ }{6}$

$\Rightarrow 4\ \ = 2\ \ \Rightarrow\ \ = \frac{1}{2}$

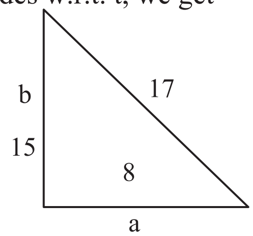


$\therefore \quad \frac{d}{dt} = \frac{1}{2}\frac{d}{dt} = \frac{5}{2}$ metre/hour

48. When a = 8, b = 15, $a^2 + b^2 = 17^2$

Differentiating both sides w.r.t. t, we get

$2a\frac{da}{dt} + 2b\frac{db}{dt} = 0$



∴ $8(1) + 15\frac{db}{dt} = 0$

∴ $\frac{db}{dt} = \frac{-8}{15}$ m/sec

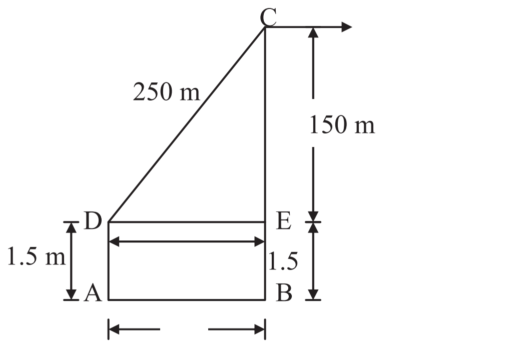
∴ the upper end is coming down at the rate of $\frac{8}{15}$ m /sec.

49. Let the position of the kite at time t be at C.

∴ BC = 151.5 m

Let AD be the boy who is flying the kite.

∴ CE = BC – BE = 151.5 – 1.5 = 150 m



In right angled Δ CDE,

$^2 = \ ^2 + (150)^2$

Differentiating both sides w.r.t. t, we get

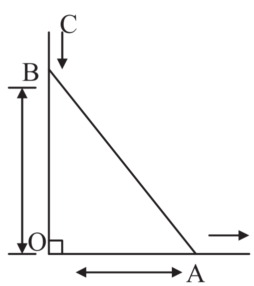
$2\ \frac{d}{dt} = 2\ \frac{d}{dt}$

$\Rightarrow \frac{dy}{dt} = -.(10)$ .... $\left[\because \frac{d}{dt} = 10\right]$

$= \frac{10\sqrt{\ ^2 - (150)^2}}{}$

$= \frac{10\sqrt{(250)^2 - (150)^2}}{250} = \frac{10 \times 200}{250} = 8$ m/s

50.



Let OC be the wall. Let AB be the position of the ladder at any time t such that OA = and OB = .

Length of the ladder AB = 20 ft.

In right angled Δ AOB,

$^2 + \ ^2 = (20)^2$

Differentiating both sides w.r.t. t, we get

$2\ \frac{d}{dt} + 2\ \frac{d}{dt} = 0$

∴ $\frac{d}{dt} = -\ \cdot \frac{d}{dt} = \frac{-}{\sqrt{400 - \ ^2}} \cdot \frac{d}{dt}$

∴ $\left(\frac{d}{dt}\right)_{=16} = -\frac{16}{\sqrt{400 - (16)^2}} \cdot \frac{d}{dt} = -\frac{4}{3} \cdot \frac{d}{dt}$

Negative sign indicates, that when increases with time, decreases.

Hence, the upper end is moving $\frac{4}{3}$ times as fast as the lower end.

51. f( ) = $^3 - 3\ + 5$

∴ f ′( ) = $3\ ^2 - 3$

Here, a = 2 and h = – 0.01

∴ f(a + h) ≈ f(a) + hf ′(a)

≈ 7 + (–0.01) (9)

∴ f (1.99) ≈ 7 – 0.09 ≈ 6.91

52. Let f( ) = $\frac{1}{\sqrt{\ }}$

∴ f ′( ) = $\frac{-1}{2}\ ^{\frac{-3}{2}} = \frac{-1}{2\ ^{\frac{3}{2}}}$

Here, a = 25 and h = 0.1

∴ f(a + h) ≈ f(a) + hf ′(a)

$\approx \frac{1}{5} - \frac{(0.1)}{2 \times 125} \approx \frac{1}{5} - \frac{0.1}{250}$

$\approx \frac{1}{5}\left(1 - \frac{1}{500}\right) \approx \frac{1}{5}\left(\frac{499}{500}\right) \approx \frac{1}{5}\left(\frac{998}{1000}\right)$

∴ $\frac{1}{\sqrt{25.1}} \approx \frac{1}{5} \times 0.998 \approx 0.1996$

53. Let f( ) = $\frac{1}{\ ^2}$

∴ f ′( ) = $-2\ ^{-3} = \frac{-2}{\ ^3}$

Here, a = 2 and h = 0.002

∴ f(a + h) ≈ f(a) + hf ′(a)

$\approx \frac{1}{4} + (0.002)\left(\frac{-2}{8}\right) \approx \frac{1}{4} - \frac{0.002}{4}$

∴ $\frac{1}{(2.002)^2} \approx \frac{0.998}{4} \approx 0.2495$

54. Let f( ) = $^{\frac{1}{4}}$

∴ $f'(\ ) = \frac{1}{4}\ ^{\frac{-3}{4}} = \frac{1}{4\ ^{\frac{3}{4}}}$

Here, a = 81 and h = –1

∴ f (a + h) ≈ f (a) + h f ′(a)

$$\approx (81)^{\frac{1}{4}} + (-1)\left[\frac{1}{4(81)^{\frac{3}{4}}}\right]$$

$$\approx 3 - \frac{1}{108}$$

$$\approx 3 - 0.009259$$

∴ $(80)^{\frac{1}{4}} \approx 2.9907$

55. Let f( ) = $\cot^{-1}$

∴ $f'(\ ) = \frac{-1}{1+\ ^2}$

Here, a = 1 and h = 0.001

∴ f(a + h) ≈ f(a) + hf ′(a)

$$\approx \frac{\pi}{4} + 0.001\left(\frac{-1}{2}\right)$$

$$\approx \frac{3.14}{4} - 0.0005$$

∴ $\cot^{-1}(1.001) \approx 0.785 - 0.0005 \approx 0.7845$

56. Let f( ) = $\tan^{-1}$

∴ $f'(\ ) = \frac{1}{1+\ ^2}$

Here, a = 1 and h = – 0.001

∴ f(a + h) ≈ f(a) + hf ′(a)

∴ $\tan^{-1}(0.999) \approx \frac{\pi}{4} + \frac{1}{1+1}(-0.001)$

$$\approx \frac{\pi}{4} - \frac{0.001}{2}$$

= 0.00875

f(a) = f(90°) = cos 90° = 0

f ′(a) = f ′(90°) = –sin90° = –1

∴ f(a + h) ≈ f(a) + h f ′(a)

∴ cos (90° 30′) ≈ 0 + (0.00875) × (–1) ≈ –0.00875

58. Let f( ) = sin

∴ f ′( ) = cos

Here, a = 30° and

h = 1° = 0.0175^c

∴ f(a + h) ≈ f(a) + h f ′(a)

$$\approx \frac{1}{2} + 0.0175 \times 0.8660$$

$$\approx 0.5 + 0.01515$$

∴ sin(31°) ≈ 0.51515

≈ 0.5152

59. Let f( ) = tan

∴ f ′( ) = $\sec^2$

Here, a = 45° = $\left(\frac{\pi}{4}\right)^c$ and h = 1° = 0.0175^c

61. Consider option (B),

f( ) = $\ ^2$ is a polynomial function.

∴ f( ) is continuous and differentiable in the given interval.

Also, f(1) = f(–1) = 1

So, Rolle's theorem is applicable to

f( ) = $\ ^2$ on [–1, 1].

62. $f(\ ) = |\ | = \begin{cases} \ , & \ge 0 \\ -\ , & < 0 \end{cases}$

$$f'(0^-) = \lim_{h\to 0}\frac{f(0-h)-f(0)}{-h}$$

$$= \lim_{h\to 0}\frac{|-h|}{-h} = \lim_{h\to 0}\frac{h}{-h} = -1$$

$$f'(0^+) = \lim_{h\to 0}\frac{f(0+h)-f(0)}{h}$$

$$= \lim_{h\to 0}\frac{|h|}{h} = \lim_{h\to 0}\frac{h}{h} = 1$$

∴ f( ) is not differentiable at = 0.

63. $f(\ ) = e^{-2}\ \sin 2$

$\Rightarrow f'(\ ) = 2e^{-2}\ (\cos 2\ - \sin 2\ )$

Now, $f'(c) = 0$

$\Rightarrow \cos 2c - \sin 2c = 0$

$\Rightarrow \tan 2c = 1 \Rightarrow 2c = \frac{\pi}{4} \Rightarrow c = \frac{\pi}{8}$

64. $f(\ ) = \ ^3 - 6\ ^2 + a\ + b$

$\Rightarrow f'(\ ) = 3\ ^2 - 12\ + a$

Now, $f'(c) = 0 \Rightarrow f'\left(2+\frac{1}{\sqrt{3}}\right) = 0$

$$\Rightarrow 3\left(2+\frac{1}{\sqrt{3}}\right)^2 - 12\left(2+\frac{1}{\sqrt{3}}\right) + a = 0$$

$$\Rightarrow 3\left(4+\frac{1}{3}+\frac{4}{\sqrt{3}}\right) - 12\left(2+\frac{1}{\sqrt{3}}\right) + a = 0$$

$\Rightarrow 12 + 1 + 4\sqrt{3} - 24 - 4\sqrt{3} + a = 0$

$\Rightarrow a = 11$

65. $f(\ ) = (\ +3)e^{-\left(\frac{1}{2}\right)}$

∴ $$f'(\ ) = (\ ^2+3\ )e^{-\left(\frac{1}{2}\right)}\cdot\left(-\frac{1}{2}\right) + (2\ +3)e^{-\left(\frac{1}{2}\right)}$$

$$= e^{-\left(\frac{1}{2}\right)}\left\{-\frac{1}{2}(\ ^2+3\ ) + 2\ + 3\right\}$$

$$= -\frac{1}{2}e^{-\left(\frac{}{2}\right)}(\ ^2 - \ - 6)$$

Since, f( ) satisfies all the conditions of Rolle's theorem. So, there exists c ∈ (–3, 0) such that

$f'(c) = 0$

$\Rightarrow c^2 - c - 6 = 0$

$\Rightarrow c = 3, -2$

But $c = -2 \in [-3, 0]$

∴ $c = -2$

66. Here, f( ) is continuous and differentiable on (0, 1) for α > 0

Also, f(0) = f(1) = 0

For f( ) to be continuous at = 0,

$$\lim_{\to 0^+} f(\ ) = f(0) \Rightarrow \lim_{\to 0^+}\ ^\alpha \log\ = 0$$

$$\Rightarrow \lim_{\to 0^+}\frac{\log\ }{\ ^{-\alpha}} = 0$$

Applying L'Hospital rule, we get

$$\lim_{\to 0^+}\frac{\frac{1}{\ }}{-\frac{\alpha}{\ ^{\alpha+1}}} = 0 \Rightarrow \lim_{\to 0^+} -\frac{\ ^\alpha}{\alpha} = 0,$$

which is possible only when α > 0

∴ option (D) is the correct answer.

68. $f(\ ) = \ + \frac{1}{\ }$

∴ $f(3) = \frac{10}{3}$, $f(1) = 2$ and $f'(\ ) = 1 - \frac{1}{\ ^2}$

By Lagrange's mean value theorem,

$$f'(c) = \frac{f(3)-f(1)}{3-1}$$

$$\Rightarrow 1 - \frac{1}{c^2} = \frac{\frac{10}{3}-2}{2} \Rightarrow 1 - \frac{1}{c^2} = \frac{2}{3}$$

$\Rightarrow c^2 = 3 \Rightarrow c = \sqrt{3}$

$$\Rightarrow 3c^2 - 6c + 2 = \frac{\frac{3}{8}-0}{\frac{1}{2}-0} = \frac{3}{4}$$

$$\Rightarrow 3c^2 - 6c + \frac{5}{4} = 0$$

$\therefore$ $c = \frac{6 \pm \sqrt{36-15}}{2 \times 3} = \frac{6 \pm \sqrt{21}}{6} = 1 \pm \frac{\sqrt{21}}{6}$

72. $f(\ ) = 1 - \ ^3 - \ ^5 \Rightarrow f'(\ ) = -3\ ^2 - 5\ ^4$

$\Rightarrow$ $f'(\ ) < 0$ for all values of .

73. $f(\ ) = 2\ ^3 + 3\ ^2 - 12\ + 5$

74. $f(\ ) = \frac{\ }{1+|\ |}$

$\therefore$ $f'(\ ) = \frac{1+|\ | - \frac{|\ |}{\ }}{(1+|\ |)^2} = \frac{1}{(1+|\ |)^2} > 0$

$\therefore$ the given function is increasing.

75. $f(\ ) = \frac{\log}{\ }$

$\therefore$ $f'(\ ) = \frac{1-\log}{\ ^2} < 0$

$\Rightarrow 1 - \log\ < 0$

$\Rightarrow 1 < \log$

$\Rightarrow \log\ > 1$

$\Rightarrow\ > e$

76. $\frac{d}{d}(f(\ )) = \frac{-2-}{(\ +1)^2}$

For $\ > 0$,

$\frac{d}{d}(f(\ )) < 0$

77. $f'(\ ) = 3\ ^2 + 3\ + 3 = 3(\ ^2 + \ + 1)$

$$= 3\left[\left(\ + \frac{1}{2}\right)^2 + \frac{3}{4}\right] \geq \frac{9}{4} > 0$$

$\therefore$ $f(\ )$ is an increasing function.

78. $f'(\ ) = 2\ e^{-} - \ ^2 e^{-} = \ e^{-}(2 - \ )$

Since, f is increasing, $f'(\ ) > 0$

$\Rightarrow\ e^{-}(2-\ ) > 0 \Rightarrow\ (2-\ ) > 0$

$\Rightarrow\ > 0, 2 - \ > 0$ or $\ < 0, 2 - \ < 0$

$\Rightarrow\ > 0, 2 > \$ or $\ < 0, 2 <$

$\Rightarrow 0 < \ < 2$ or $2 < \ < 0$ (Not possible)

$\Rightarrow 0 < \ < 2 \Rightarrow\ \in (0, 2)$

79. $f(\ ) = e^{a} + e^{-a}$

$\therefore$ $f'(\ ) = a(e^{a} - e^{-a}) < 0$

But, $a < 0$

$\therefore$ $e^{a} - e^{-a} > 0$

$\Rightarrow e^{a} > e^{-a}$

$\Rightarrow a\ > -a$

$\Rightarrow 2a\ > 0$

$\therefore$ $a\ > 0$, then $\ < 0$ ….[$\because a < 0$]

80. $f'(\ ) = 3k\ ^2 - 18\ + 9$

$= 3(k\ ^2 - 6\ + 3)$

Since, $f(\ )$ is increasing on R $\therefore f'(\ ) > 0$

$\therefore$ $k\ ^2 - 6\ + 3 > 0\ \forall\ \in R$

$\Rightarrow k > 0$ and $36 - 12k < 0$

$\Rightarrow k > 3$

….[$\because a\ ^2 + b\ + c > 0\ \forall\ \in R$

$\Rightarrow a > 0$ and $b^2 - 4ac < 0$]

Hence, $f(\ )$ is increasing on R if $k > 3$.

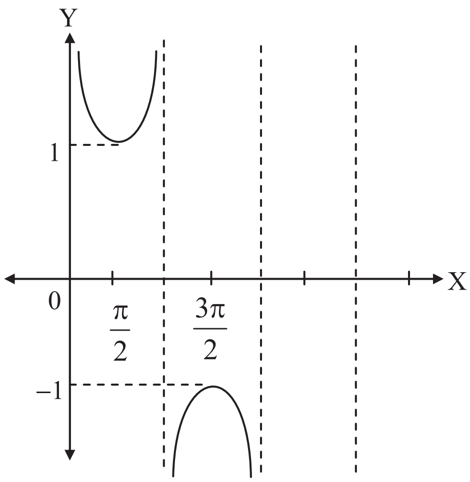
81. Since, f( ) is increasing for all .

$\therefore$ $f'( ) > 0$ for all

$\Rightarrow \dfrac{K-2}{(\sin \ + \cos \ )^2} > 0$ for all

$\Rightarrow K - 2 > 0 \Rightarrow K > 2$

82. The graph of cosec is opposite in interval $\left(\dfrac{\pi}{2}, \dfrac{3\pi}{2}\right)$



At the point $=\pi$, cosec is not defined and $\in \left(\dfrac{\pi}{2}, \dfrac{3\pi}{2}\right)$

$\therefore$ equation is neither increasing nor decreasing.

Also $\dfrac{d}{d}(\tan \ ) = \sec^2 \ > 0$ which is a increasing function.

Also $= {}^2$ is a parabola, which is increasing

Also $= |\ - 1|$ is a V-shaped upward curve, which is always increasing.

$\therefore$ option (A) is the correct answer.

83. Let $f( ) = \ + \dfrac{1}{\ }$

$\therefore$ $f'( ) = 1 - \dfrac{1}{\ ^2} \le 0 \Rightarrow 1 \le \dfrac{1}{\ ^2} \Rightarrow \ ^2 \le 1$

$\Rightarrow \ \in [-1, 1]$

84. Since $f'( ) = \dfrac{3}{(\ +1)^2}$ is greater than '0' in interval $(-\infty, \infty)$, therefore $f( ) = \dfrac{-2}{\ +1}$ is increasing in interval $(-\infty, \infty)$ or R.

85. Let $f( ) = \sin \ - b \ + c$

$\therefore$ $f'( ) = \cos \ - b > 0 \Rightarrow \cos \ > b \Rightarrow b < -1$

86. $f( ) = \ ^4 - \dfrac{\ ^3}{3} \Rightarrow f'( ) = 4\ ^3 - \ ^2$

For f( ) to be increasing, $4\ ^3 - \ ^2 > 0$

$\Rightarrow \ ^2(4\ - 1) > 0$

$\therefore$ the function is increasing for $\ > \dfrac{1}{4}$

Similarly, decreasing for $\ < \dfrac{1}{4}$

87. $f( ) = 2\ ^3 - 15\ ^2 + 36\ + 1$

$\therefore$ $f'( ) = 6\ ^2 - 30\ + 36 = 6(\ ^2 - 5\ + 6)$

$= 6(\ - 2)(\ - 3)$

To be monotonic decreasing, $f'( ) < 0$

$\Rightarrow (\ - 2)(\ - 3) < 0 \Rightarrow \ \in (2, 3)$

88. As $f( ) = \sin 2\ \Rightarrow f'( ) = 2\cos 2\ $

Here, $f'( ) > 0$ in $\left(0, \dfrac{\pi}{4}\right)$ and $f'( ) < 0$ in $\left(\dfrac{\pi}{4}, \dfrac{\pi}{2}\right)$

89. $f( ) = \ + \cos \ \Rightarrow f'( ) = 1 - \sin \ $

$f'( ) > 0$ for all values of .

$\therefore$ f( ) is always increasing.

90. $f( ) = \dfrac{\log \ }{\ }$

$\therefore$ $f'( ) = \dfrac{1}{\ ^2} - \dfrac{\log \ }{\ ^2} = \dfrac{1 - \log \ }{\ ^2}$

For f( ) to be increasing, $f'( ) > 0$

$\Rightarrow 1 - \log \ > 0 \Rightarrow 1 > \log \ \Rightarrow e > \ $

$\therefore$ f( ) is increasing in the interval (0, e).

91. $f( ) = 1 - e^{-\frac{\ ^2}{2}}$

$\Rightarrow f'( ) = -e^{-\frac{\ ^2}{2}}(-\ ) = \ e^{-\frac{\ ^2}{2}}$

For f( ) to be increasing, $f'( ) > 0$

$\Rightarrow \ e^{-\frac{\ ^2}{2}} > 0$

$\Rightarrow$ f( ) is decreasing for $\ < 0$ and increasing for $\ > 0$.

92. $f( ) = \dfrac{a\sin \ + b\cos \ }{c\sin \ + d\cos \ }$

f( ) will be decreasing, if $f'( ) < 0$

$\therefore$ $\dfrac{1}{(c\sin \ + d\cos \ )^2}[(c\sin \ + d\cos \ )(a\cos \ - b\sin \ )$

$-(a\sin \ + b\cos \ )(c\cos \ - d\sin \ )] < 0$

$\Rightarrow ac\sin \ \cos \ - bc\sin^2 \ + ad\cos^2 \ $

$- bd\sin \ \cos \ - ac\sin \ \cos \ + ad\sin^2 \ $

$- bc\cos^2 \ + bd\sin \ \cos \ < 0$

$\Rightarrow ad(\sin^2 \ + \cos^2 \ ) - bc(\sin^2 \ + \cos^2 \ ) < 0$

$\Rightarrow ad - bc < 0$

93. $f(\ ) = {}^4 - 62{}^2 + a\ + 9$ ….(i)

$\therefore$ $f'(\ ) = 4{}^3 - 124\ + a$

For ma imum or minimum, $f'(\ ) = 0$

$\Rightarrow 4{}^3 - 124\ + a = 0$

Since, $= 1$ is a root of (i).

$\therefore$ $f'(1) = 4 - 124 + a = 0 \therefore a = 120$

94. $f(\ ) = (\ - \alpha)(\ - \beta) = {}^2 - (\alpha + \beta)\ + \alpha\beta$

$\therefore$ $f'(\ ) = 2\ - (\alpha + \beta)$

For maximum or minimum, $f'(\ ) = 0$

$\Rightarrow\ = \frac{\alpha+\beta}{2}$

Now $f''(\ ) = 2 > 0$

$\therefore$ $f(\ ) = f\left(\frac{\alpha+\beta}{2}\right)$

$= \left(\frac{\alpha+\beta}{2} - \alpha\right)\left(\frac{\alpha+\beta}{2} - \beta\right)$

$= \left(\frac{\beta-\alpha}{2}\right)\left(\frac{\alpha-\beta}{2}\right) = -\frac{(\alpha-\beta)^2}{4}$

95. $= e$

$\therefore$ $' = \ e\ + e\ = e\ (\ + 1) = 0$

$\therefore$ $= -1$

$'' = \ e\ + e\ + e$

At $= -1$,

$'' = -e^{-1} + e^{-1} + e^{-1} = \frac{1}{e} > 0$

$\therefore$ Minimum at $= -1$.

96. $f(\ ) = {}^5 - 5{}^4 + 5{}^3 - 10$

$\therefore$ $f'(\ ) = 5{}^4 - 20{}^3 + 15{}^2$

For maximum or minimum, $f'(\ ) = 0$

$\Rightarrow 5{}^2(\ {}^2 - 4\ + 3) = 0$

$\Rightarrow {}^2(\ - 3)(\ - 1) = 0$

$\Rightarrow\ = 0,\ = 3,\ = 1$

$f''(\ ) = 20{}^3 - 60{}^2 + 30\ = 10\ (2{}^2 - 6\ + 3)$

$f''(0) = 0$

$f''(3)$ = Positive (Minima)

$f''(1)$ = Negative (Maxima)

$\therefore$ (p, q) = (1, 3)

97. $\frac{d}{d} = \frac{a}{} + 2b\ + 1 \Rightarrow \left(\frac{d}{d}\right)_{=1} = a + 2b + 1 = 0$

$\Rightarrow a = -2b - 1$ and $\left(\frac{d}{d}\right)_{=2} = \frac{a}{2} + 4b + 1 = 0$

$\Rightarrow \frac{-2b-1}{2} + 4b + 1 = 0$

$\Rightarrow -b + 4b + \frac{1}{2} = 0$

$\Rightarrow 3b = \frac{-1}{2} \Rightarrow b = \frac{-1}{6}$ and $a = \frac{1}{3} - 1 = \frac{-2}{3}$

98. $f(\ ) = 3{}^4 - 4{}^3$

$\therefore$ $f'(\ ) = 12{}^3 - 12{}^2$

$\therefore$ ${}^2(\ - 1) = 0 \Rightarrow\ = 1, 0$

Now $f''(\ ) = 36{}^2 - 24$

$f''(1) = 12 > 0$

$f''(0) = 0$

$f(1) = 3 - 4 = -1$

$f(-1) = 3 + 4 = 7$

$f(2) = 48 - 32 = 16$

$\therefore$ Maximum at 2 and Minimum at 1 and Maximum value is 16 and Minimum value is –1.

99. Let $f(\ ) = {}^3 - 12{}^2 + 36\ + 17$

$\therefore$ $f'(\ ) = 3{}^2 - 24\ + 36 = 0$ at $= 2, 6$

Again $f''(\ ) = 6\ - 24$ is –ve at $= 2$

So that $f(6) = 17$, $f(2) = 49$

At the end points, $f(1) = 42$, $f(10) = 177$

So that $f(\ )$ has its maximum value as 177

100. $+\ = 16 \Rightarrow\ = 16 -$

$\Rightarrow {}^2 + {}^2 = {}^2 + (16 -\ )^2$

Let $z = {}^2 + (16 -\ )^2$

$\Rightarrow z' = 4\ - 32$

To be minimum of z, $z'' > 0$,

Therefore $4\ - 32 = 0 \Rightarrow\ = 8,\ = 8$

101. $f(\ ) = (\ -1)^{\frac{1}{3}}(\ - 2)$

$\therefore$ $f'(\ ) = (\ - 1)^{\frac{1}{3}}.1 + (\ - 2).\frac{1}{3}(\ -1)^{\frac{-2}{3}}$

$= \frac{4\ -5}{3(\ -1)^{\frac{2}{3}}}$

For maxima or minima, $f'(\ ) = 0$

$\therefore$ $\frac{4\ -5}{3(\ -1)^{\frac{2}{3}}} = 0$

$\therefore$ $= \frac{5}{4}$

$\therefore$ $f(1) = (1-1)^{\frac{1}{3}}(1-2) = 0$

$f\left(\frac{5}{4}\right) = \left(\frac{5}{4} - 1\right)^{\frac{1}{3}}\left(\frac{5}{4} - 2\right) = \frac{-3}{4^{\frac{4}{3}}}$, $f(9) = 14$

$\therefore$ absolute minimum occurs at $= \frac{5}{4}$ and min. value $= \frac{-3}{4^{\frac{4}{3}}}$

Absolute maximum occurs at $= 9$ and max. value = 14.

102. Let f( ) = $\sqrt{1- \ ^2}$

$\Rightarrow f'(\ ) = \dfrac{1-2 \ ^2}{\sqrt{1- \ ^2}} = 0 \Rightarrow \ = \pm\dfrac{1}{\sqrt{2}}$

But as > 0, we have = $\dfrac{1}{\sqrt{2}}$

Now,

$$f''(\ ) = \dfrac{\sqrt{1- \ ^2}(-4 \ ) - (1-2 \ ^2)\dfrac{-}{\sqrt{1- \ ^2}}}{(1- \ ^2)}$$

$$= \dfrac{2 \ ^3 - 3}{(1- \ ^2)^{3/2}}$$

$\Rightarrow f''\left(\dfrac{1}{\sqrt{2}}\right) = -ve$

∴ f( ) is maximum at = $\dfrac{1}{\sqrt{2}}$

103. Let and be two natural numbers such that
 + = 10 and the product is .
 = (10 –) = 10 – ^{2} = f( )
∴ f ′( ) = 10 – 2
∴ f ″( ) = – 2
Roots of f ′( ) = 0,
i.e., 10 – 2 = 0 i.e., = 5
f ′(5) = 10 – 10 = 0
∴ f is maximum when = 5, = 5
∴ The product is maximum if = 5, = 5

104. 2 (+) = 24
∴ + =12
∴ = 12 –
f( ) = = (12 –) = 12 – ^{2}
∴ f ′( ) = 12 – 2 = 0
∴ = 6 At = 6, = 6
∴ max area is 36 m^2.

105. Let + = 3
According to the given condition,
f( ) = ^{2} × (3 –) = 3 ^{2} – ^{3} ….(i)
∴ f ′( ) = 6 – 3 ^{2} = 0
∴ 3 (– 2) = 0
∴ = 0 , = 2
Now f ″( ) is max at = 2
Its maximum value is 4 ....[From (i)]

106. Let one number be (100 –) and then another is Therefore f( ) = 2(100 –) + ^{2}
= ^{2} – 2 + 200
∴ f ′( ) = 0 ⇒ 2 – 2 = 0 ⇒ = 1
Here f ″( ) = 2 > 0
Therefore function is minimum at = 1.
So the numbers are 99 and 1.

107. According to the given condition,
2 + 2 = 100 ⇒ + = 50 ….(i)
Let the area of rectangle be A.
∴ A = ⇒ = $\dfrac{A}{\ }$

Put in (i), we have + $\dfrac{A}{\ }$ = 50 ⇒ A = 50 – ^{2}

$\Rightarrow \dfrac{dA}{d} = 50 - 2$

For maximum area, $\dfrac{dA}{d} = 0$

∴ 50 – 2 = 0 ⇒ = 25 and = 25
Hence, adjacent sides are 25 and 25 cm.

108. Let the number be , then the function

f( ) = $\dfrac{\ }{\ ^2+16}$

On differentiating with respect to , we get

$\Rightarrow f'(\ ) = \dfrac{(\ ^2+16).1 - \ (2 \ )}{(\ ^2+16)^2}$

$= \dfrac{\ ^2+16-2 \ ^2}{(\ ^2+16)^2}$

$= \dfrac{16- \ ^2}{(\ ^2+16)^2}$

Put f ′( ) = 0 for maxima or minima
f ′( ) = 0 ⇒ 16 – ^{2} = 0 ⇒ = 4, –4
Again differentiating

$f''(\ ) = \dfrac{(\ ^2+16)^2(-2 \ ) - (16- \ ^2)2(\ ^2+16)2}{(\ ^2+16)^4}$

At = 4, f ″( ) < 0 and at = –4, f ″( ) > 0

∴ Least value of f( ) = $\dfrac{-4}{16+16} = -\dfrac{1}{8}$

109. Let = ^{2} ⇒ log = 2 .log , (> 0)

Differentiating, $\dfrac{d}{d} = 2 \ ^2 \ (1 + \log \ )$;

∴ $\dfrac{d}{d} = 0$

$\Rightarrow \log \ = -1 \Rightarrow \ = e^{-1} = \dfrac{1}{e}$

∴ Stationary point is = $\dfrac{1}{e}$

110. + = 8 ∴ = 8 –
Now f( ) = = (8 –) = 8 – ^{2}
∴ f ′( ) = 8 – 2
For maximum value of f( ), f ′( ) = 0
∴ = 4 and = 4
So, maximum value of = 4 × 4 = 16

111. $f(\ ) = 2\ ^3 - 21\ ^2 + 36\ - 30$
$\Rightarrow f'(\ ) = 6\ ^2 - 42\ + 36$
$\therefore$ $f'(\ ) = 0 \Rightarrow\ = 6, 1$ and $f''(\ ) = 12\ - 42$
Here $f''(1) = -30 < 0$ and $f''(6) = 30 > 0$
$\therefore$ $f(\ )$ has maxima at $\ = 1$ and minima at $\ = 6$.

112. $f(\ ) = \cos\ + \cos(\sqrt{2}\ )$
$\therefore$ $f'(\ ) = -\sin\ - \sqrt{2}\sin(\sqrt{2}\ ) = 0$
$\therefore$ $\ = 0$ is the only solution.
$f''(\ ) = -\cos\ - 2\ \cos(\sqrt{2}\ ) < 0$ at $\ = 0$
Hence, maxima occurs at $\ = 0$.

113. Let $f(\ ) = \ ^3 - 18\ ^2 + 96$
$\therefore$ $f'(\ ) = 3\ ^2 - 36\ + 96$
For maximum or minimum, $f'(\ ) = 0$
$\Rightarrow\ ^2 - 12\ + 32 = 0 \Rightarrow (\ - 4)(\ - 8) = 0$
$\Rightarrow\ = 4, 8$
Now, $f''(\ ) = 6\ - 36$
At $\ = 4$, $f''(\ ) = 24 - 36 = -12 < 0$
At $\ = 4$, $f(\ )$ will be maximum
and $[f(4)]_{max.} = 64 - 288 + 384 = 160$
At $\ = 8$, $\frac{d^2}{d\ ^2} = 48 - 36 = 12 > 0$
At $\ = 8$, $f(\ )$ will be minimum and
$[f(8)]_{min.} = 128$

114. Let PQ = a and PR = b, then $\Delta = \frac{1}{2}ab\sin\theta$
$\because$ $-1 \le \sin\theta \le 1$
Since, area is maximum when $\sin\theta = 1$
$\Rightarrow \theta = \frac{\pi}{2}$

115. Here $f(\ ) = |\sin 4\ + 3|$
We know that minimum value of sin is -1 and maximum is 1.
Hence minimum $|\sin 4\ + 3| = |-1 + 3| = 2$ and maximum $|\sin 4\ + 3| = |1 + 3| = 4$

116. $f(\ ) = |p\ - 9| + r|\ |$, $\ \in (-\infty, \infty)$
Where $p > 0$, $q > 0$ and $r > 0$ can assume its minimum value only at one point, if $p = q = r$.

117. $f(\ ) = 3\ ^4 - 8\ ^3 + 12\ ^2 - 48\ + 25$
$\therefore$ $f'(\ ) = 12\ ^3 - 24\ ^2 + 24\ - 48$
$= 12(\ ^3 - 2\ ^2 + 2\ - 4) = 12[(\ - 2)(\ ^2 + 2)]$
For maximum or minimum of $f(\ )$, $f'(\ ) = 0$
$\Rightarrow 12[(\ - 2)(\ ^2 + 2)] = 0$
$\Rightarrow\ = 2$.
Now, $f''(\ ) = 12(3\ ^2 - 4\ + 2)$
$\therefore$ $f''(2) = 12(12 - 8 + 2) = 72 > 0$
$\therefore$ f has minimum at $\ = 2$ and the minimum value of f at $\ = 2$ is
$f(2) = 48 - 64 + 48 - 96 + 25 = -39$

118. $f(\ ) = (\ - \alpha)(\ - \beta) = \ ^2 - (\alpha + \beta)\ + \alpha\beta$
$\therefore$ $f'(\ ) = 2\ - (\alpha + \beta)$
For maximum or minimum of $f(\ )$, $f'(\ ) = 0$
$\Rightarrow 2\ - (\alpha + \beta) = 0$
Now, $f''(\ ) = 2 > 0$
$\therefore$ f has minimum at $\ = \frac{\alpha + \beta}{2}$
and the minimum value of f at $\ = \frac{\alpha + \beta}{2}$ is
$\left(\frac{\alpha + \beta}{2} - \alpha\right)\left(\frac{\alpha + \beta}{2} - \beta\right)$
$= \left(\frac{\beta - \alpha}{2}\right)\left(\frac{\alpha - \beta}{2}\right) = -\frac{(\alpha - \beta)^2}{4}$

119. Let $\ + \ = 20 \Rightarrow\ = 20 -\ $ ….(i)
and $\ ^3\ ^2 = z$
$\Rightarrow z = \ ^3(20 - \ )^2 \Rightarrow z = 400\ ^3 + \ ^5 - 40\ ^4$
$\therefore$ $\frac{dz}{d\ } = 1200\ ^2 + 5\ ^4 - 160\ ^3$
For maximum or minimum,
$\frac{dz}{d\ } = 0$
$\Rightarrow 1200\ ^2 + 5\ ^4 - 160\ ^3 = 0$
$\Rightarrow\ = 12, 20$
$\frac{d^2z}{d\ ^2} = 2400\ + 20\ ^3 - 480\ ^2$
$\therefore$ $\left(\frac{d^2z}{d\ ^2}\right)_{=12} = -5760 < 0$
$\therefore$ z is maximum at $\ = 12$.
From (i), $\ = 20 - 12 = 8$
$\therefore$ the parts of 20 are 12 and 8.

120. Let $\ = \sin^p\ .\cos^q\ $
$\therefore$ $\frac{d}{d} = p\sin^{p-1}\ .\cos\ .\cos^q\ + q\cos^{q-1}\ .(-\sin\ )\sin^p\ $
$\therefore$ $\frac{d}{d} = p\sin^{p-1}\ .\cos^{q+1}\ - q\cos^{q-1}\ .\sin^{p+1}\ $
For maximum or minimum,
$\frac{d}{d} = 0$
$\therefore$ $\tan^2\ = \frac{p}{q} \Rightarrow \tan\ = \pm\sqrt{\frac{p}{q}}$
$\therefore$ Point of maxima $\ = \tan^{-1}\sqrt{\frac{p}{q}}$

121. $4\ \ + 2\pi r = a$

$A = \ ^2 + \pi r^2 = \frac{1}{16}(a - 2\pi r)^2 + \pi r^2$

$\therefore$ $\frac{dA}{dr} = 0$ gives $r = \frac{a}{2(\pi + 4)}$, thus $\frac{d^2A}{dr^2} > 0$

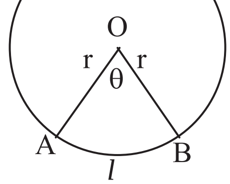
and hence minimum,

$\therefore$ $4\ \ = a - 2\pi r = a - \frac{a\pi}{\pi + 4} = \frac{4a}{\pi + 4}$

$\therefore$ $\ \ = \frac{a}{\pi + 4}$

$\therefore$ $A = \ ^2 + \pi r^2 = \frac{a^2}{4(\pi + 4)}$

122.



Let OAB be a given sector of a circle of a radius r cm such that arc AB = l cm, and $\angle AOB = \theta$ radians.

Then

$2r + l = 20$ ....(i)

$\frac{l}{r} = \theta$ ....(ii)

$A = \frac{1}{2}r^2\theta$ ....(iii)

From (i), (ii) ,(iii), we get

$A = \frac{1}{2}r^2 \times \frac{l}{r} = \frac{1}{2}r\,l = \frac{1}{2}r(20 - 2r)$

$\Rightarrow A = 10\,r - r^2$ ....(iv)

Now, $\frac{dA}{dr} = 10 - 2r = 0 \Rightarrow r = 5$

$\therefore$ $\frac{d^2A}{dr^2} = -2 < 0$

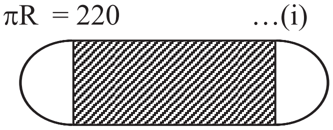
$\therefore$ A is maximum at r = 5

Hence the maximum area

$= 10 \times 5 - 25 = 25\ cm^2$ .... [From (iv)]

123. $2l + 2\pi R = 440$

$\therefore$ $l + \pi R = 220$ ...(i)



Now $f(\ ) = l\,(2R) = (220 - \pi R)(2R)$

$\therefore$ $f(\ ) = 440R - 2\pi R^2$

$\therefore$ $f'(\ ) = 440 - 4\pi R = 0$

$\therefore$ $0 = 110 - \pi R$

$\therefore$ $110 = \frac{22}{7}R$

$\therefore$ $R = 35$ $\therefore$ $2R = 70$

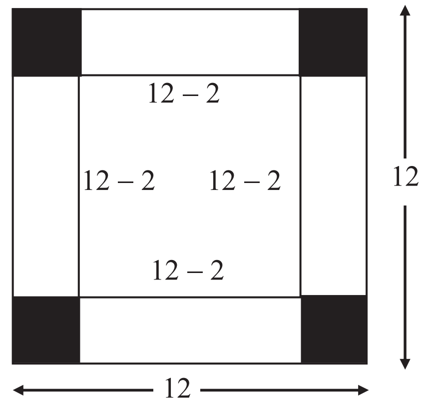
From (i),

$l + \frac{22}{7} \times 35 = 220$

$\therefore$ $l + 110 = 220$

$\therefore$ $l = 110$

124. Let the length of side of each square cut out be   sq cm. Then, each side of base of the box is $(12 - 2\ )$ cm and   cm will be height of box.



V = Volume of box

$= (12 - 2\ )^2\ \ = 4(36 + \ ^2 - 12\ )$

$= 4(\ ^3 - 12\ ^2 + 36\ )$

$\Rightarrow \frac{dV}{d\ } = 4(3\ ^2 - 24\ \ + 36)$

$= 12\,(\ ^2 - 8\ \ + 12)$

and $\frac{d^2V}{d\ ^2} = 4(6\ \ - 24)$

Now, $\frac{dV}{d\ } = 0 \Rightarrow \ ^2 - 8\ \ + 12 = 0$

$\Rightarrow (\ \ - 2)(\ \ - 6) = 0 \Rightarrow \ \ = 2$ or $\ \ = 6$

But $\ \ < 6$

$\therefore$ $\ \ = 2$

For $\ \ = 2$, $\frac{d^2V}{d\ ^2} = 4\,(12 - 24) = -48 < 0$

$\therefore$ Volume is maximum when each square of 2 cm length is cut out from each corner.

125. Given equation is $10s = 10ut - 49t^2$

$\Rightarrow s = ut - 4.9t^2$

$\Rightarrow \frac{ds}{dt} = u - 9.8t = v$

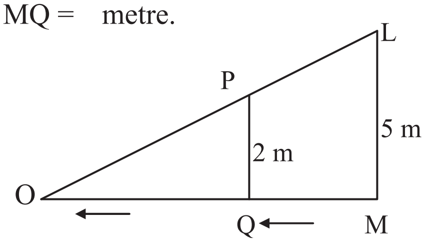
When stone reaches the maximum height, then v = 0

$\Rightarrow u - 9.8t = 0 \Rightarrow u = 9.8t$

But time t = 5 sec

So the value of $u = 9.8 \times 5 = 49.0$ m/sec

126. Let L be the lamp and PQ be the man and OQ = metre be his shadow and let MQ = metre.



$\frac{d}{dt}$ = speed of the man = 3 m/s (given)

Since, Δ OPQ and Δ OLM are similar.

∴ $\frac{OM}{OQ} = \frac{LM}{PQ} \Rightarrow \frac{+}{} = \frac{5}{2}$

$\Rightarrow \; = \frac{3}{2}$

∴ $\frac{d}{dt} = \frac{3}{2} \cdot \frac{d}{dt}$

$\Rightarrow 3 = \frac{3}{2} \cdot \frac{d}{dt}$

$\Rightarrow \frac{d}{dt}$ = 2m/s.

127. Let A, P and x be the area, perimeter and length of the side of the square respectively at time t seconds. Then, A = x2 and P = 4x

∴ $P = 4\sqrt{A}$

∴ $\frac{dP}{dt} = 4.\frac{1}{2\sqrt{A}}.\frac{dA}{dt}$

$= \frac{2}{}.\frac{dA}{dt} = \frac{2}{16}.2 = \frac{1}{4}\text{cm / sec}.$

128. Let

$f(A) = \cos A \cos B = \cos A \cos\left(\frac{\pi}{2} - A\right)$

$= \cos A \sin A$

∴ $f'(A) = \cos^2 A - \sin^2 A = \cos 2A$

For maximum or minimum,

$f'(A) = 0 \Rightarrow \cos 2A = 0$

$\Rightarrow 2A = \frac{\pi}{2} \Rightarrow A = \frac{\pi}{4}$

Now, $f''(A) = -2 \sin 2A$

$= -2 \sin \frac{\pi}{2} = -2 < 0$

∴ f(A) is maximum at $A = \frac{\pi}{4}$.

∴ Maximum value $= \cos\frac{\pi}{4} \sin\frac{\pi}{4} = \frac{1}{2}$

129. Since, f( ) satisfies all the conditions of Rolle's theorem.

∴ f(3) = f(5) = 0

⇒ = 3 and = 5 are the roots of f( ).

⇒ f( ) = (– 3) (– 5) = ^{2} – 8 + 15

∴ $\int_3^5 f(\;)d \; = \int_3^5 (\;^2 - 8\; + 15)d$

$= \left[\frac{^3}{3} - 4\;^2 + 15\right]_3^5$

$= \frac{1}{3}(125-27) - 4(25-9) + 15(5-3)$

$= -\frac{4}{3}$

Competitive Thinking

1. $= \;^2 - \frac{1}{^2}$

∴ $\frac{d}{d} = 2\; + \frac{2}{^3}$

∴ $\left(\frac{d}{d}\right)_{(-1,0)} = 2(-1) + \frac{2}{(-1)^3} = -4$

∴ Slope of normal at (–1, 0) $= -\frac{1}{\left(\frac{d}{d}\right)_{(-1,0)}} = \frac{1}{4}$

2. For the point (2, –1) on the curve

= $t^2 + 3t - 8$, = $2t^2 - 2t - 5$, we have

$t^2 + 3t - 8 = 2$ and $2t^2 - 2t - 5 = -1$

⇒ (t + 5) (t – 2) = 0 and (t –2) (t + 1) = 0

⇒ t = 2

Now, $\frac{d}{d} = \frac{\frac{d}{dt}}{\frac{d}{dt}} = \frac{4t-2}{2t+3}$

∴ $\left(\frac{d}{d}\right)_{(t=2)} = \frac{4(2)-2}{2(2)+3} = \frac{6}{7}$

3. Slope of the normal $= \frac{-1}{\frac{d}{d}}$

$\Rightarrow \tan\frac{3\pi}{4} = \frac{-1}{\left(\frac{d}{d}\right)_{(3,4)}}$

$\Rightarrow \left(\frac{d}{d}\right)_{(3,4)} = 1 \Rightarrow f'(3) = 1$

4. $= a\ ^3 + b\ \ + 4$

∴ $\frac{d}{d} = 3a\ ^2 + b$

Slope of tangent at (2, 14) = $\left(\frac{d}{d}\right)_{(2,\ 14)}$

$\Rightarrow 21 = 3a(2)^2 + b$

$\Rightarrow 21 = 12a + b$ ...(i)

$= a\ ^3 + b\ \ + 4$

∴ 14 = a (8) + b (2) + 4

$\Rightarrow 8a + 2b = 10$ ...(ii)

On solving (i) and (ii), we get

a = 2, b = –3

5. $= t^2 - 1,\ \ = t^2 - t$

∴ $\frac{d}{d} = \frac{\frac{d}{dt}}{\frac{d}{dt}} = \frac{2t-1}{2t}$

Since, the tangent is perpendicular to X-axis.

∴ $\frac{d}{d} = 0 \Rightarrow \frac{2t}{2t-1} = 0 \Rightarrow t = 0$

6. $= \ ^3 \Rightarrow \frac{d}{d} = 3\ ^2$

According to the given condition,

$3\ ^2 =$

$\Rightarrow 3\ ^2 = \ ^3$ ....[∵ $= \ ^3$]

$\Rightarrow \ = 0, 3$

Thus, the two points are (0, 0) and (3, 27).

7. $= \ ^2 - 3\ \ + 2 \Rightarrow \frac{d}{d} = 2\ \ - 3$

Slope of the given line = 1

Since, the tangent is perpendicular to the given line.

∴ $(2\ \ - 3)(1) = -1$

$\Rightarrow \ = 1$

At $\ = 1,\ \ = 0$

∴ the required point is (1, 0).

8. Given equation of curve is $= \sqrt{\ \ -1}$

Slope of tangent to the curve is

$\frac{d}{d} = \frac{1}{2\sqrt{\ \ -1}}$

Slope of line 2 + – 5 = 0 is –2

Since the tangent is perpendicular to the given line,

$\left(\frac{1}{2\sqrt{\ \ -1}}\right)(-2) = -1$

$\Rightarrow \sqrt{\ \ -1} = 1 \qquad \Rightarrow \ = 2$

$= \sqrt{\ \ -1} = \sqrt{2-1} = 1$

∴ (,) = (2, 1)

9. $\ ^2 = p\ ^3 + q$ .....(i)

Differentiating both sides w.r.t. , we get

$2\ .\frac{d}{d} = 3p\ ^2$

$\Rightarrow \frac{d}{d} = \frac{3p}{2}\left(\frac{\ ^2}{\ }\right)$

∴ $\left(\frac{d}{d}\right)_{(2,3)} = \frac{3p}{2} \times \frac{4}{3} = 2p$

Since the line touches the curve, their slopes are equal.

∴ $2p = 4 \Rightarrow p = 2$

Since, (2,3) lies on $\ ^2 = p\ ^3 + q$.

∴ $9 = 2 \times 8 + q \Rightarrow q = -7$

10. $\ ^2 = a\ ^3 + b$ .....(i)

Differentiating both sides w.r.t. , we get

$2\ .\frac{d}{d} = 3a\ ^2$

$\Rightarrow \frac{d}{d} = \frac{3a}{2}\left(\frac{\ ^2}{\ }\right)$

∴ $\left(\frac{d}{d}\right)_{(2,3)} = \frac{3a}{2} \times \frac{4}{3} = 2a$

Since, the line touches the curve, their slopes are equal.

∴ $2a = 4 \Rightarrow a = 2$

Since, (2,3) lies on $\ ^2 = a\ ^3 + b$.

∴ $9 = 2 \times 8 + b \Rightarrow b = -7$

Now, 7a + 2b = 7(2) + 2(–7) = 0

11. $= \frac{1}{\ }$ ....(i)

∴ $\frac{d}{d} = \frac{-1}{\ ^2}$

∴ Slope of tangent to the curve = $\frac{-1}{\ ^2}$

Slope of $\ = -4\ \ + b$ is –4.

∴ $\frac{-1}{\ ^2} = -4 \qquad \Rightarrow \ = \pm\frac{1}{2}$

From (i),

$= \pm 2$

Putting the values of and in

$= -4\ \ + b$, we get

b = ± 4

12. $^2 = 2(\; - 3)$ ....(i)

Differentiating w.r.t. , we get

$2 \frac{d}{d} = 2 \Rightarrow \frac{d}{d} = \frac{1}{}$

∴ Slope of the normal $= \frac{-1}{\frac{d}{d}} = -$

Slope of the given line = 2.

Since, the normal is parallel to the given line.

∴ $= -2$

From (i), $= 5$

∴ the required point is (5, –2).

13. Given equation of curve is

$^2 - 4\;^2 = 1$ ...(i)

Slope of tangent to the curve is

$\frac{d}{d} = \frac{}{4}$

Slope of line is $= 2$ is $\frac{1}{2}$

Since, the tangent is parallel to the given line,

$\frac{}{4} = \frac{1}{2}$

∴ $= 2$

Substituting $= 2$ in equation (i), we get

$(2\;)^2 - 4\;^2 = 1$

∴ tangent is parallel to curve at zero point.

14. $= a(1 + \cos\theta)$ and $= a \sin\theta$

∴ $\frac{d}{d\theta} = -a\sin\theta$ and $\frac{d}{d\theta} = a\cos\theta$

∴ $\frac{d}{d} = \frac{\frac{d}{d\theta}}{\frac{d}{d\theta}} = -\cot\theta$

∴ slope of the normal $= -\frac{1}{\frac{d}{d}} = \frac{-1}{-\cot\theta} = \tan\theta$

∴ equation of the normal at θ is

$- a\sin\theta = \tan\theta[\; - a(1 + \cos\theta)]$

Clearly, this line passes through (a, 0).

15. $^2 = 12$ ....(i)

Differentiating w.r.t. , we get

$2 \frac{d}{d} = 12 \Rightarrow \frac{d}{d} = \frac{6}{}$

∴ slope of the normal $= -\frac{1}{\frac{d}{d}} = -\frac{}{6}$

Slope of the line + = k is –1.

∴ $-\frac{}{6} = -1 \Rightarrow \; = 6$

From (i), $= 3$

Putting the values of and in + = k, we get k = 9

16. Slope of given line $= -\frac{a}{b}$

$= \frac{4}{} \Rightarrow \frac{d}{d} = -\frac{4}{^2}$

$\Rightarrow -\frac{a}{b} = -\frac{4}{^2}$

$\Rightarrow \frac{a}{b} = \frac{4}{^2} > 0$

$\Rightarrow a < 0, b < 0$

17. $^2 = 4a$

∴ $2 \frac{d}{d} = 4a$

$\Rightarrow \frac{d}{d} = \frac{2a}{}$

$\Rightarrow \left(\frac{d}{d}\right)_{(at^2,\, 2at)} = \frac{2a}{2at} = \frac{1}{t}$

∴ Slope of tangent $(m_1) = \frac{1}{t}$

$^2 - \;^2 = a^2$

$\Rightarrow 2 \; - 2 \; \frac{d}{d} = 0$

$\Rightarrow \frac{d}{d} = \frac{}{}$

$\Rightarrow \left(\frac{d}{d}\right)_{(a\sec\theta,\, a\tan\theta)} = \frac{a\sec\theta}{a\tan\theta}$

$= \operatorname{cosec}\theta$

∴ Slope of normal $(m_2) = \operatorname{cosec}\theta$

Now, $m_1 \cdot m_2 = -1$

$\Rightarrow \left(\frac{1}{t}\right)(\operatorname{cosec}\theta) = -1$

$\Rightarrow t = -\operatorname{cosec}\theta$

18. $9\;^2 = \;^3$ ....(i)

Differentiating w.r.t. , get

$18 \frac{d}{d} = 3\;^2$

$\Rightarrow \frac{d}{d} = \frac{^2}{6}$

∴ slope of the normal = $-\frac{6}{\ ^{2}}$

Since, the normal to the given curve makes equal intercepts with the axis.

∴ $-\frac{6}{\ ^{2}} = \pm 1$

$\Rightarrow \ = -\frac{\ ^{2}}{6}$ or $\frac{\ ^{2}}{6}$

Putting these values in (i), we get

$9\left(\frac{\ ^{4}}{36}\right) = \ ^{3} \Rightarrow \ = 0$ or $\ = 4$

∴ $\ = 0$ or $\ = -\frac{16}{6}$ or $\frac{16}{6}$ $\ = -\frac{8}{3}$ or $\frac{8}{3}$

∴ the required points are $\left(4, \frac{8}{3}\right)$ or $\left(4, -\frac{8}{3}\right)$.

19. $\ = \frac{2}{3}\ ^{3} + \frac{1}{2}\ ^{2}$ ....(i)

∴ $\frac{d}{d} = 2\ ^{2} +$

Since, the tangent makes equal angles with the axis.

∴ $\frac{d}{d} = \pm 1$

$\Rightarrow 2\ ^{2} + \ = \pm 1$

$\Rightarrow 2\ ^{2} + \ = 1$ (taking +ve sign)

$\Rightarrow 2\ ^{2} + \ - 1 = 0$

$\Rightarrow (2\ - 1)(\ + 1) = 0$

$\Rightarrow \ = \frac{1}{2}, -1$

From (i),

when $\ = \frac{1}{2}$, $\ = \frac{2}{3}\cdot\frac{1}{8} + \frac{1}{2}\cdot\frac{1}{4} = \frac{5}{24}$

and when $\ = -1$, $\ = \frac{2}{3}(-1) + \frac{1}{2}\cdot 1 = -\frac{1}{6}$

∴ the required points are $\left(\frac{1}{2}, \frac{5}{24}\right)$ and $\left(-1, -\frac{1}{6}\right)$.

20. At $\ = 4$,

$4^2 = 8\ \Rightarrow\ \ = 2$

Now, $\ ^{2} = 8$

Differentiating w.r.t. , we get

$2\ = 8\frac{d}{d} \Rightarrow \frac{d}{d} = \frac{\ }{4}$

∴ $\left(\frac{d}{d}\right)_{(4,2)} = 1$

∴ equation of the normal at (4, 2) is

$\ - 2 = -1(\ - 4) \Rightarrow \ + \ = 6$

21. At t = 1, $\ = (1)^2 = 1$ and $\ = 2(1) = 2$

$\frac{d}{d} = \frac{\frac{d}{dt}}{\frac{d}{dt}} = \frac{2}{2t} = \frac{1}{t}$

∴ $\left(\frac{d}{d}\right)_{t=1} = 1$

∴ Equation of the normal at (1, 2) is

$\ - 2 = -1(\ - 1) \Rightarrow \ + \ - 3 = 0$

22. Centre of circle is (1, –2) and point A(2,1) lie on circle.

∴ Equation of normal is $\ + 2 = \frac{1+2}{2-1}(\ - 1)$

$\Rightarrow \ + 2 = 3(\ - 1) \Rightarrow \ = 3\ - 5$

23. $\left(\frac{\ }{a}\right)^{n} + \left(\frac{\ }{b}\right)^{n} = 2$

Differentiating w.r.t , we get

$n\left(\frac{\ }{a}\right)^{n-1}\left(\frac{1}{a}\right) + n\left(\frac{\ }{b}\right)^{n-1}\left(\frac{1}{b}\right)\left(\frac{d}{d}\right) = 0$

$\Rightarrow \frac{n}{b}\left(\frac{\ }{b}\right)^{n-1}\frac{d}{d} = \frac{-n}{a}\left(\frac{\ }{a}\right)^{n-1}$

$\Rightarrow \frac{d}{d} = \frac{-b}{a}\left(\frac{\ }{a}\right)^{n-1}\left(\frac{b}{\ }\right)^{n-1}$

Slope of tangent at (a, b) = $\left(\frac{d}{d}\right)_{(a,\,b)}$

$= \frac{-b}{a}\left(\frac{a}{a}\right)^{n-1}\left(\frac{b}{b}\right)^{n-1}$

$= \frac{-b}{a}$

Equation of tangent is $\ - b = \frac{-b}{a}(\ - a)$

$\Rightarrow a\ - ab = -b\ + ab$

$\Rightarrow a\ + b\ = 2ab$

$\Rightarrow \frac{\ }{a} + \frac{\ }{b} = 2$

24. At $\theta = \frac{\pi}{4}$,

$\ = 2\cos^3\theta$ and $\ = 3\sin^3\theta$

∴ $\frac{d}{d\theta} = -6\cos^2\theta\sin\theta$ and $\frac{d}{d\theta} = 9\sin^2\theta\cos\theta$

$\therefore \quad \frac{d}{d} = \frac{\frac{d}{d\theta}}{\frac{d}{d\theta}} = -\frac{3}{2}\tan\theta$

$$\Rightarrow \frac{d}{d} = \frac{\ + \ }{3 \ - \ } \Rightarrow \left(\frac{d}{d}\right)_{(1,1)} = 1$$

∴ equation of the normal at (1, 1) is

$\Rightarrow \ = 2 -$

Putting $= 2 -$ in (i), we get

$^2 + 2 \ (2 - \ ) - 3(2 - \ )^2 = 0$

$\Rightarrow \ ^2 - 4 \ + 3 = 0$

$\Rightarrow \ = 1, 3$

∴ the points of intersection are (1,1) and (3,–1).

$$\left(\frac{d}{d}\right)_{=\pi/2} = \left[2 \ e^{\ 2}\right]_{=\frac{\pi}{2}} = \pi e^{\frac{\pi^2}{4}}$$

Slope of tangent to (ii) at $= \frac{\pi}{2}$ is given by

$$\left(\frac{d}{d}\right)_{=\pi/2} = \left[2 \ e^{\ 2} \sin \ + e^{\ 2} \cos \ \right]_{=\frac{\pi}{2}} = \pi e^{\frac{\pi^2}{4}}$$

Since both tangents have equal slopes, the angle between them is zero.

35. Let the given curves intersect each other at P($_1$, $_1$).

$^2 = 6$

Differentiating w.r.t. , we get

$$2 \ \frac{d}{d} = 6 \Rightarrow \left(\frac{d}{d}\right)_P = \frac{3}{\ _1}$$

$9 \ ^2 + b \ ^2 = 16$

Differentiating w.r.t. , we get

$$18 \ + 2b \ \frac{d}{d} = 0$$

$$\Rightarrow \left(\frac{d}{d}\right)_P = -\frac{9 \ _1}{b \ _1}$$

Since, the given curves intersect each other at right angles.

$$\Rightarrow \left(\frac{3}{\ _1}\right)\left(\frac{-9 \ _1}{b \ _1}\right) = -1$$

$$\Rightarrow \frac{27 \ _1}{b \ _1^2} = 1$$

$$\Rightarrow b = \frac{9}{2} \qquad \ldots\left[\ _1^2 = 6 \ _1\right]$$

36. Acceleration, $\frac{dv}{dt} = 2t$, then acceleration after 3 second $= 2 \times 3 = 6 \text{ cm / sec}^2$.

37. Motion of a particle $s = 15t - 2t^2$

$\therefore$ velocity $= \frac{ds}{dt} = 15 - 4t$

$$\Rightarrow \left(\frac{ds}{dt}\right)_{t=0} = 15 \text{ and } \left(\frac{ds}{dt}\right)_{t=3} = 3$$

$\therefore$ average velocity $= \frac{15+3}{2} = 9$ units

38. Velocity, $v^2 = 2 - 3$

Differentiating both sides w.r.t.t, we get

$$2v\frac{dv}{dt} = -3\frac{d}{dt}$$

$$\Rightarrow 2v\frac{dv}{dt} = -3v$$

$$\Rightarrow \frac{dv}{dt} = -\frac{3}{2}$$

Hence, the acceleration is uniform.

39. $= At^2 + Bt + C$

$\therefore$ $v = 2At + B \Rightarrow v^2 = 4A^2t^2 + 4ABt + B^2$

and $4A \ = 4A^2t^2 + 4ABt + 4AC$

$\Rightarrow v^2 - 4A \ = B^2 - 4AC$

$\Rightarrow 4A \ - v^2 = 4AC - B^2$

40. $t = \frac{v^2}{2} \Rightarrow v^2 = 2t$

Differentiating both sides w.r.t.t., we get

$$2v\frac{dv}{dt} = 2$$

$$\Rightarrow \frac{dv}{dt} = \frac{1}{v} = f$$

$$\Rightarrow \frac{df}{dt} = -\frac{1}{v^2}\cdot\frac{dv}{dt} = -\frac{1}{v^2} \times \frac{1}{v}$$

$$\Rightarrow -\frac{df}{dt} = \frac{1}{v^3} = f^3$$

41. $$\frac{d^2t}{d \ ^2} = \frac{d}{d}\left(\frac{dt}{d}\right) = \frac{d}{d}\left(\frac{1}{v}\right) = -\frac{1}{v^2}\cdot\frac{dv}{d}$$

Since, $v\frac{dv}{d} = f \Rightarrow \frac{dv}{d} = \frac{f}{v}$

$$\therefore \frac{d^2t}{d \ ^2} = -\frac{1}{v^2}\cdot\frac{f}{v} \Rightarrow -v^3 \ \frac{d^2t}{d \ ^2} = f$$

42. $s = \frac{1}{2}vt \Rightarrow 2s = vt \Rightarrow 2\frac{ds}{dt} = v + t.\frac{dv}{dt}$

$\Rightarrow 2\frac{d^2s}{dt^2} = \frac{dv}{dt} + t.\frac{d^2v}{dt^2} + \frac{dv}{dt}$

But $\frac{dv}{dt}$ = acceleration (a)

$\Rightarrow 2a = a + t.\frac{da}{dt} + a \Rightarrow \frac{da}{dt} = 0$ or $t = 0$

But t = 0 is impossible

$\therefore \quad \frac{da}{dt} = 0$ i.e., a is constant.

44. $s = 6 + 48t - t^3$

$\therefore \quad v = \frac{ds}{dt} = 0 + 48 - 3t^2$

When direction of motion reverses, v = 0

$\Rightarrow 48 - 3t^2 = 0 \Rightarrow t = -4, 4$

$\therefore \quad (s)_4 = 6 + 192 - 64 = 134$

45. $a + bv^2 = \ ^2$

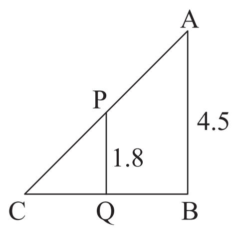
Differentiating both sides w.r.t.t, we get

$0 + b\left(2v.\frac{dv}{dt}\right) = 2 \ \frac{d}{dt}$

$\Rightarrow v.b\frac{dv}{dt} = \ .\frac{d}{dt} \Rightarrow \frac{dv}{dt} = \frac{}{b} \quad .... \left[\because \frac{d}{dt} = v\right]$

46. $\frac{d}{dt} = 1.2.$

From the figure,



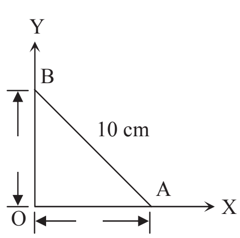
$= \frac{2}{3} \Rightarrow \frac{d}{dt} = \frac{2}{3}.\frac{d}{dt}$

$\therefore$ Required rate of length of shadow

$= \frac{d}{dt} = 0.8$ m/s

47. From the figure, $^2 + \ ^2 = 100$ .....(i)

$\Rightarrow 2 \ \frac{d}{dt} + 2 \ \frac{d}{dt} = 0$ .....(ii)



From (i) and (ii),

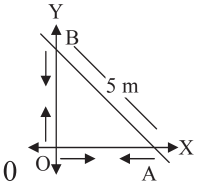
$\frac{d}{dt} = -\frac{16}{6} = -\frac{8}{3}$ cm / sec

The rate at which the end B is moving is $\frac{8}{3}$ cm / sec.

48. According to the figure, $^2 + \ ^2 = 25$ ….(i)

Differentiate (i) w.r.t. t, we get

$2 \ \frac{d}{dt} + 2 \ \frac{d}{dt} = 0$ ….(ii)



Here $= 4$ and $\frac{d}{dt} = 1.5$

From (i), $4^2 + \ ^2 = 25 \Rightarrow \ = 3$

From (ii), $2(4)(1.5) + 2(3)\frac{d}{dt} = 0$

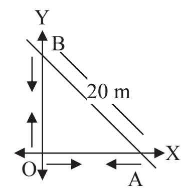
$\Rightarrow \frac{d}{dt} = -2$ m/sec

Hence, length of the highest point decreases at the rate of 2 m/sec.

49. According to the figure, $^2 + \ ^2 = 400$ ….(i)

Differentiate (i) w.r.t. t, we get

$2 \ \frac{d}{dt} + 2 \ \frac{d}{dt} = 0$ ….(ii)



Here $= 12$ and $\frac{d}{dt} = 2$

From (i), $12^2 + \ ^2 = 400$

$\Rightarrow \ = 16$

From (ii), $2(12)\frac{d}{dt} + 2(16)(2) = 0$

$\Rightarrow \frac{d}{dt} = -\frac{8}{3}$

50. Surface area, $S = 4\pi r^2$ and $\frac{dr}{dt} = 2$

$\therefore \quad \frac{dS}{dt} = 4\pi \times 2r\frac{dr}{dt} = 8\pi r \times 2 = 16\pi r$

$\Rightarrow \frac{dS}{dt} \propto r$

51. Given the rate of increasing the radius

$= \frac{dr}{dt} = 3.5$cm/sec and r = 10cm

Area of circle = $A = \pi r^2$

$\therefore \quad \frac{dA}{dt} = 2\pi r.\frac{dr}{dt}$

$\Rightarrow \frac{dA}{dt} = 2\pi \times 10 \times 3.5 \Rightarrow \frac{dA}{dt} = 220$ cm^2/sec

52. If is the length of each side of an equilateral triangle and A is its area, then

$A = \frac{\sqrt{3}}{4} \ ^2 \Rightarrow \frac{dA}{dt} = \frac{\sqrt{3}}{4}.2 \ \frac{d}{dt}$

Here, $= 10$ cm and $\frac{d}{dt} = 2$ cm / sec

$\therefore \quad A = 10\sqrt{3}$ sq. unit/sec

53. $A_1 = \ ^2$, and $A_2 = \ ^2$

$\Rightarrow \frac{dA_1}{dt} = 2 \ \frac{d}{dt}$, and $\frac{dA_2}{dt} = 2 \ \frac{d}{dt}$

$\therefore \frac{dA_2}{dA_1} = \frac{\frac{dA_2}{dt}}{\frac{dA_1}{dt}} = \frac{2 \ \frac{d}{dt}}{2 \ \frac{d}{dt}} = - \left(\frac{d}{d}\right)$

Given, $= \ + \ ^2$

$\therefore \frac{d}{d} = 1 + 2$

$\therefore \frac{dA_2}{dA_1} = - \ (1 + 2 \ )$

$= \frac{+ \ ^2}{} (1 + 2 \ )$

$= (1 + \ )(1 + 2 \ ) = 2 \ ^2 + 3 \ + 1$

54. $h = 6$ m, $r = 4$ m $= \frac{2}{3}h$

$V = \frac{1}{3}\pi r^2 h$

$\Rightarrow V = \frac{1}{3} \times \frac{4}{9} \times \pi h^3$

$\Rightarrow \frac{dV}{dt} = \frac{4}{9}\pi h^2 \frac{dh}{dt}$

But $\frac{dV}{dt} = 3$ m^3/min and $h = 3$ m

$\therefore 3 = \frac{4}{9}\pi \times 9 \times \frac{dh}{dt}$

$\Rightarrow \frac{dh}{dt} = \frac{3}{4\pi}$ m/min

55. $V = \frac{4}{3}\pi r^3$

$\therefore \frac{dV}{dt} = 4\pi r^2 . \frac{dr}{dt} \Rightarrow \frac{dr}{dt} = \frac{1}{4\pi r^2} . \frac{dV}{dt}$

$\Rightarrow \frac{dr}{dt} = \frac{1}{4 \times \pi \times 15 \times 15} \times 900$

$\Rightarrow \frac{dr}{dt} = \frac{1}{\pi} = \frac{7}{22}$

56. Here, $V = \frac{4}{3}\pi r^3$ and $S = 4\pi r^2$

$\Rightarrow \frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt} \Rightarrow \frac{dr}{dt} = \frac{40}{4\pi r^2} = \frac{5}{32\pi}$

$\therefore \frac{dS}{dt} = 8\pi r \frac{dr}{dt}$

$= 8\pi \times 8 \times \frac{5}{32\pi} = 10$ cm^2/min

57. $V = \frac{4}{3}\pi r^3$

$\Rightarrow 288\pi = \frac{4}{3}\pi r^3$

$\Rightarrow r = 6$ cm

$V = \frac{4}{3}\pi r^3$

$\therefore \frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$

$\Rightarrow 4\pi = 4\pi r^2 \frac{dr}{dt}$

$\Rightarrow \frac{dr}{dt} = \frac{1}{r^2}$

Now, $A = 4\pi r^2$

$\therefore \frac{dA}{dt} = 8\pi r \frac{dr}{dt}$

$= 8\pi r \times \frac{1}{r^2}$

$= \frac{8\pi}{r} = \frac{8\pi}{6} = \frac{4\pi}{3}$ cm^2/sec

58. Volume $= V = \frac{4}{3}\pi r^3$

$\Rightarrow \frac{dV}{dt} = 4\pi r^2 . \frac{dr}{dt}$, at $r = 7$ cm

$\Rightarrow 35 = 4\pi(7)^2 \frac{dr}{dt} \Rightarrow \frac{dr}{dt} = \frac{5}{28\pi}$

Surface area, $S = 4\pi r^2$

$\therefore \frac{dS}{dt} = 8\pi r \frac{dr}{dt} = 8\pi(7)\left(\frac{5}{28\pi}\right) = 10$ cm^2/min

59. $V = \frac{4}{3}\pi r^3$

$\therefore \frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$ ....(i)

After 49 min, $(4500 - 49 \times 72)\pi = 972\ \pi m^3$

$\therefore 972\pi = \frac{4}{3}\pi r^3$

$\therefore r^3 = 3 \times 243 = 3 \times 3^5$

$\therefore r = 9$

Given, $\frac{dV}{dt} = 72\pi$

$\therefore 72\pi = 4\pi \times 9 \times 9 \left(\frac{dr}{dt}\right)$ ....[From (i)]

$\therefore \frac{dr}{dt} = \frac{2}{9}$

60. Volume of sphere (V) = $\frac{4}{3}\pi r^3$

Surface area of sphere (A) = $4\pi r^2$

$\frac{dV}{dr} = 4\pi r^2$ and $\frac{dA}{dr} = 8\pi r$

$\therefore \left(\frac{dV}{dA}\right) = \frac{\left(\frac{dV}{dr}\right)}{\left(\frac{dA}{dr}\right)} = \frac{4\pi r^2}{8\pi r} = \frac{r}{2}$

$\therefore \left(\frac{dV}{dA}\right)_{r=4} = \frac{4}{2} = 2\ cm^3/cm^2$

61. W = nw, n = $2t^2 + 3$ and w = $t^2 - t + 2$

$\therefore \frac{dW}{dt} = w\frac{dn}{dt} + n\frac{dw}{dt}, \frac{dn}{dt} = 4t, \frac{dW}{dt} = 2t - 1$

At t = 1,

n = 5, w = 2, $\frac{dn}{dt} = 4, \frac{dW}{dt} = 1$

$\therefore \left(\frac{dW}{dt}\right)_{(t=1)} = 2(4) + 5(1) = 13$

62. According to the given condition,

$\frac{d\ }{dt} = 8\frac{d\ }{dt}$ ….(i)

Given, $6\ \ = \ ^3 + 2$ ….(ii)

$\Rightarrow 6\left(\frac{d\ }{d\ }\right) = 3\ ^2 \frac{d\ }{dt}$

$\Rightarrow 6\left(\frac{8d\ }{dt}\right) = 3\ ^2 \frac{d\ }{dt}$ ….[From (i)]

$\Rightarrow 3\ ^2 = 48 \Rightarrow\ ^2 = 16 \Rightarrow\ = \pm 4$

Putting = 4 in (ii), we get

$6\ = (4)^3 + 2 = 64 + 2$

$\therefore$ = 11

Putting = – 4 in (ii), we get

= – 64 + 2

$\therefore\ = \frac{-62}{6} = \frac{-31}{3}$

$\therefore$ the required points on the curve are (4, 11) and $\left(-4, \frac{-31}{3}\right)$.

$\therefore$ f ′ ( ) = $\frac{1}{5}\ ^{-4/5} = \frac{1}{5\ ^{4/5}}$

Here, a = 243 and h = –0.001

f(a + h) ≈ f(a) + h f ′(a)

$= (243)^{1/5} - 0.001 \times \frac{1}{5(243)^{4/5}}$

$= 3 - \frac{0.001}{5 \times 81}$

$= 3 - \frac{1}{405000}$

$\therefore$ f(242.999) = $\frac{1214999}{405000}$

66. Let f( ) = cos

$\therefore$ f ′( ) = –sin

Here, a = 30° and h = 1° = 0.0174

$\therefore$ f(a + h) ≈ f(a) + h f ′(a)

$\approx \frac{\sqrt{3}}{2} + 0.0174\left(\frac{-1}{2}\right)$

$\approx \frac{1.73}{2} - \frac{0.0174}{2}$

≈ 0.8563

67. f( ) = e (sin – cos)

$\therefore$ f ′( ) = e (sin –cos) + e (cos + sin)

$\therefore$ f ′( ) = 2e sin

Now, f ′(c) = 0

$\Rightarrow 2e^c \sin c = 0$

$\Rightarrow \sin c = 0 = \sin \pi$

$\Rightarrow c = \pi$

68. Here, $f\left(\frac{\pi}{2}\right) = e^0 = 1$ and $f\left(\frac{3\pi}{2}\right) = e^0 = 1$

$\therefore f\left(\frac{\pi}{2}\right) = f\left(\frac{3\pi}{2}\right)$

$\therefore$ Third condition of Rolle’s theorem is satisfied by option (A) only.

69. (A) f( ) = | | is not differentiable at = 0.

(B) f( ) = tan is discontinuous at $= \frac{\pi}{2}$.

(C) $f(\ ) = 1 + (\ - 2)^{\frac{2}{3}}$ is not differentiable at = 2.

(D) $f(\ ) = (\ - 2)^2$ is a polynomial function.

∴ f( ) is continuous on [0, 2] and differentiable on (0, 2).

Also, f (0) = f (2)

Hence, Rolle's theorem is applicable.

70. f( ) = e

∴ $f(0) = e^0 = 1$, f(1) = e and f ′( ) = e

By mean value theorem,

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

$$\Rightarrow f'(c) = \frac{e^b - e^a}{b - a}$$

$$\Rightarrow e^c = \frac{e - 1}{1 - 0}$$

$$\Rightarrow c = \log(e - 1)$$

71. $f(\ ) = \ ^2$

f (2) = 4, f (4) = 16

f ′( ) = 2

∴ By Lagrange's mean value theorem,

$$f'(c) = \frac{f(4) - f(2)}{4 - 2}$$

$$\Rightarrow 2c = \frac{16 - 4}{2}$$

$$\Rightarrow c = 3$$

72. $f(\ ) = \sqrt{\ }$

∴ $f(a) = f(4) = \sqrt{4} = 2$, $f(b) = f(9) = \sqrt{9} = 3$ and

$$f'(\ ) = \frac{1}{2\sqrt{\ }}$$

$$\text{Given, } f'(c) = \frac{f(b) - f(a)}{b - a} = \frac{3 - 2}{9 - 4} = \frac{1}{5}$$

∴ $\frac{1}{2\sqrt{c}} = \frac{1}{5} \Rightarrow c = \frac{25}{4} = 6.25$

$\Rightarrow f(\ ) = \ ^2 - 3\ + 2$

f (0) = 2

$$f\left(\frac{1}{2}\right) = \frac{3}{4}$$

f ′ ( ) = 2 – 3

By Lagrange's mean value theorem,

$$f'(c) = \frac{f\left(\frac{1}{2}\right) - f(0)}{\frac{1}{2} - 0}$$

$$\Rightarrow 2c - 3 = \frac{\frac{3}{4} - 2}{\frac{1}{2}}$$

$$\Rightarrow 2c = \frac{-5}{2} + 3 \Rightarrow c = \frac{1}{4}$$

74. $f(\ ) = \frac{2\ + 3}{4\ - 1}$

$f(1) = \frac{5}{3}$, f(2) = 1

$$f'(\ ) = \frac{(4\ - 1)(2) - (2\ + 3)(4)}{(4\ - 1)^2} = \frac{-14}{(4\ - 1)^2}$$

∴ By Lagrange's mean value theorem,

$$f'(c) = \frac{f(2) - f(1)}{2 - 1}$$

$$\Rightarrow \frac{-14}{(4c - 1)^2} = \frac{1 - \frac{5}{3}}{1}$$

$$\Rightarrow (4c - 1)^2 = \frac{-14}{\frac{-2}{3}}$$

$$\Rightarrow 16c^2 - 8c + 1 = 21$$

$$\Rightarrow 4c^2 - 2c - 5 = 0$$

$$\Rightarrow c = \frac{1 + \sqrt{21}}{4}$$

75. f( ) = cos

∴ $f(0) = 1, f\left(\frac{\pi}{2}\right) = 0$ and f ′( ) = –sin

By mean value theorem,

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

$$\Rightarrow -\sin c = \frac{f\left(\frac{\pi}{2}\right) - f(0)}{\frac{\pi}{2} - 0}$$

$$\Rightarrow -\sin c = \frac{0 - 1}{\frac{\pi}{2}} = -\frac{2}{\pi}$$

$$\Rightarrow \sin c = \frac{2}{\pi} \Rightarrow c = \sin^{-1}\left(\frac{2}{\pi}\right)$$

76. $g(\ ) = \dfrac{f(\ )}{\ +1}$

∴ $g(0) = \dfrac{f(0)}{0+1} = 12$ and $f(6) = \dfrac{f(6)}{6+1} = \dfrac{-4}{7}$

By mean value theorem,

$g'(c) = \dfrac{g(6)-g(0)}{6-0}$

$= \dfrac{\frac{-4}{7}-12}{6}$

$= \dfrac{-4-84}{7\times 6} = -\dfrac{44}{21}$

77. Consider option (A),

$Lf'\left(\dfrac{1}{2}\right) = -1$ and $Rf'\left(\dfrac{1}{2}\right) = 0$

So, it is not differentiable at $\ = \dfrac{1}{2} \in (0, 1)$.

Hence, Lagrange's mean value theorem is not applicable.

78. $\ = \ ^3 = f(\ )$

∴ $f(2) = 8$, $f(-2) = -8$ and $f'(\ ) = 3\ ^2$

By mean value theorem,

$f'(\ ) = \dfrac{f(2)-f(-2)}{2-(-2)}$

$\Rightarrow 3\ ^2 = \dfrac{8-(-8)}{4}$

$\Rightarrow \ ^2 = \dfrac{4}{3}$

$\Rightarrow \ = \pm\dfrac{2}{\sqrt{3}}$

79. $f(b) = f(2) = 8 - 24a + 10 = 18 - 24a$

$f(a) = f(1) = 1 - 6a + 5 = 6 - 6a$

$f'(\ ) = 3\ ^2 - 12a\ + 5$

By Lagrange's mean value theorem,

$f'(\ ) = \dfrac{f(b)-f(a)}{b-a} = \dfrac{18-24a-6+6a}{2-1}$

∴ $f'(\ ) = 12 - 18a$

∴ $3\ ^2 - 12a\ + 5 = 12 - 18a$

At $\ = \dfrac{7}{4}$,

$3\left(\dfrac{49}{16}\right) - 12a\left(\dfrac{7}{4}\right) + 5 = 12 - 18a$

$\Rightarrow 3a = \dfrac{147}{16} - 7 \Rightarrow 3a = \dfrac{35}{16} \Rightarrow a = \dfrac{35}{48}$

80. Since, $f(\ ) = \ ^3 \Rightarrow f'(\ ) = 3\ ^2$, which is non-negative for all real values of .

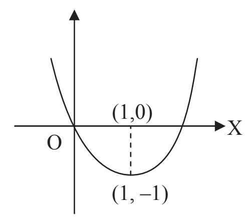
∴ Option (C) is the correct answer.

81. $f(\ ) = a\ + b \Rightarrow f'(\ ) = a$

∴ For strictly increasing, $f'(\ ) > 0$

$\Rightarrow a > 0$ for all real .

82. $f(\ ) = (\ -1)^2 - 1$. Hence decreasing in $\ < 1$.



Alternate Method:

$f'(\ ) = 2\ - 2 = 2(\ -1)$

To be decreasing, $2(\ -1) < 0 \Rightarrow (\ -1) < 0$

$\Rightarrow \ < 1$

83. $\ = \tan\ - \ \Rightarrow \dfrac{d}{d} = \sec^2\ - 1 = \tan^2\ \geq 0$

84. $f(\ ) = \begin{cases} 0 & , \ = 0 \\ \ -3 & , \ > 0 \end{cases}$

∴ $f'(\ ) = \begin{cases} 0 & , \ = 0 \\ 1 & , \ > 0 \end{cases}$

∴ It is strictly increasing when $\ > 0$.

85. $f(\ )$ will be monotonically decreasing, if $f'(\ ) < 0$.

$\Rightarrow \ \in (-\infty, -2) \cup (4, \infty)$

89. $f(\ ) = -2\ ^3 - 9\ ^2 - 12\ + 1$
$\Rightarrow f'(\ ) = -6\ ^2 - 18\ - 12$
For $f(\ )$ to be decreasing, $f'(\ ) < 0$
$\Rightarrow -6\ ^2 - 18\ - 12 < 0$
$\Rightarrow \ ^2 + 3\ + 2 > 0 \Rightarrow (\ + 2)(\ + 1) > 0$

$\Rightarrow \dfrac{(2n+1)\pi}{4} < \ < \dfrac{(n+1)\pi}{2}$
For $n = 0, \dfrac{\pi}{4} < \ < \dfrac{\pi}{2}$
Now, $\dfrac{\pi}{2} = \dfrac{4\pi}{8} > \dfrac{3\pi}{8}$

$= \dfrac{\sqrt{2}\cos\left(\ + \frac{\pi}{4}\right)}{1 + (\sin\ + \cos\ )^2}$

For f( ) to be increasing, $f'(\ ) > 0$

$\Rightarrow \sqrt{2}\cos\left(\ + \frac{\pi}{4}\right) > 0$

$\Rightarrow f'(\ ) = \dfrac{\cos\ - \sin\ }{\sin\ + \cos\ } = \dfrac{1 - \tan\ }{1 + \tan\ } = \tan\left(\frac{\pi}{4} - \ \right)$

For f( ) to be increasing,

$\Rightarrow \tan\left(\frac{\pi}{4} - \ \right) > 0$

$\Rightarrow 0 < \frac{\pi}{4} - \ < \frac{\pi}{2}$

$\Rightarrow -\frac{\pi}{4} < -\ < \frac{\pi}{4}$

$\Rightarrow -\frac{\pi}{4} < \ < \frac{\pi}{4}$

For f( ) to be decreasing, $f'(\ ) < 0$

$\Rightarrow e\ (\ - 1)(\ - 2) < 0$

$\Rightarrow (\ - 1)(\ - 2) < 0$

$\Rightarrow\ \in (1, 2)$

103. $f(\ ) = \dfrac{\ }{\sin\ }$

$\Rightarrow f'(\ ) = \dfrac{\sin\ - \ \cos\ }{\sin^2\ } = \dfrac{\cos\ (\tan\ - \ )}{\sin^2\ }$

$\therefore\quad f'(\ ) > 0$ for $0 < \ \leq 1$

$\Rightarrow$ f( ) is an increasing function.

Now, $g(\ ) = \dfrac{\ }{\sin\ }$

$= \dfrac{\sin 2\ - 2\ }{2\sin^2\ }$

$\therefore\quad g'(\ ) < 0$ for $0 < \ \leq 1$.

$\Rightarrow$ g( ) is a decreasing function.

104. f( ) = sin – cos

$\Rightarrow$ f ′( ) = cos + sin = $\sqrt{2}\left[\cos\left(\ \ -\frac{\pi}{4}\right)\right]$

For f( ) to be decreasing, f ′( ) < 0

$\Rightarrow \sqrt{2}\cos\left(\ \ -\frac{\pi}{4}\right) < 0$

$\Rightarrow \cos\left(\ \ -\frac{\pi}{4}\right) < 0$

$\Rightarrow \frac{\pi}{2} < \ \ -\frac{\pi}{4} < \frac{3\pi}{2} \Rightarrow \frac{3\pi}{4} < \ \ \ \frac{7\pi}{4}$

105. h( ) = f( ) – (f( ))^2 + (f( ))^3

∴ h′( ) = f ′( ) – 2f( ) f ′( ) + 3(f( ))^2 f ′( )
= f ′( ) [1 – 2 f( ) + 3 (f( ))^2]

Here, 1 – 2 f( ) + 3(f( ))^2 > 0 for all f( )

$\Rightarrow$ h′( ) > 0, if f ′( ) > 0 and h′( ) < 0, if f ′( )<0

$\Rightarrow$ h is increasing whenever f is increasing and h is decreasing whenever f is decreasing.

106. f( ) = [(– 2)]^2

$\Rightarrow$ f( ) = ^{2}(– 2)^2

$\Rightarrow$f ′( ) = ^{2}{2(– 2)} + (– 2)^2 (2)
= 2 (– 2) { + (–2)}
= 4 (– 2)(– 1)

For f( ) to be increasing, f ′( ) > 0

$\Rightarrow$ 4 (– 1)(– 2) > 0

$\Rightarrow$ (– 1)(– 2) > 0 $\Rightarrow$ $\in$ (0, 1) $\cup$ (2, ∞)

107. = { (– 3)}^{2}

$\Rightarrow$ = ^{2}(– 3)^2

∴ $\frac{d}{d}$ = 2 (– 3)^2 + 2(– 3) ^{2}

= 2 (– 3)[– 3 +]

= 2 (– 3)(2 – 3)

For to be increasing, $\frac{d}{d}$ > 0

$\Rightarrow$ 2 (– 3) (2 – 3) > 0

$\Rightarrow$ (– 3)(2 – 3) > 0 $\Rightarrow$ $\in\left(0, \frac{3}{2}\right)$

108. f(a) = 2a^2 – 3a + 10

$\Rightarrow$f ′(a) = 4a – 3 $\Rightarrow$ f ″(a) = 4 > 0

For minimum value of f (a),

f ′(a) = 0 $\Rightarrow$ a = $\frac{3}{4}$

∴ f(a) is minimum at a = $\frac{3}{4}$.

∴ $[f(a)]_{min} = f\left(\frac{3}{4}\right) = 2\left(\frac{3}{4}\right)^2 - 3\left(\frac{3}{4}\right) + 10 = \frac{71}{8}$

109. f( ) = a sin + $\frac{1}{3}$sin 3

$\Rightarrow$ f ′( ) = a cos + $\frac{1}{3}$·3 cos 3

$\Rightarrow$ f ′( ) = a cos + cos 3

Now, f ′$\left(\frac{\pi}{3}\right)$ = 0

$\Rightarrow$ a cos $\frac{\pi}{3}$ + cosπ = $\frac{a}{2}$ – 1 = 0

$\Rightarrow$ a = 2

110. Clearly, it has a maximum at = 1.

f ( ) = ^{3} – 3 ^{2} + 5

f ′( ) = 3 ^{2} – 6

f ″( ) = 6 – 6

f ′( ) = 0 at = 0, = 2

f″ (0) < 0, f ″(2) > 0

∴ f ( ) is maximum at = 0

113. Let f( ) = 2 ^{3} – 15 ^{2} + 36 + 4

∴ f′ ( ) = 6 ^{2} – 30 + 36 = 0 at = 3, 2

∴ f″ ( ) = 12 – 30 is –ve at = 2

∴ maximum value of f( ) attained at = 2

114. f ′( ) = 6 ^{2} – 6 – 12

f ′( ) = 0 $\Rightarrow$ (– 2)(+ 1) = 0 $\Rightarrow$ = –1, 2

Here f(4) = 128 – 48 – 48 + 5 = 37

f(–1) = –2 – 3 + 12 + 5 = 12

f(2) = 16 – 12 – 24 + 5 = –15

f(–2) = –16 – 12 + 24 + 5 = 1

∴ the maximum value of function is 37 at = 4.

115. Given f( ) = (1–)^2, f( ) = ^{3} – 2 ^{2} +

∴ f ′( ) = 3 ^{2} – 4 + 1

Put f ′( ) = 0 i.e 3 ^{2} – 4 + 1 = 0

$\Rightarrow$ 3 ^{2} – 3 – + 1 = 0 $\Rightarrow$ = 1, 1/3

f ″( ) = 6 – 4

∴ f ″(1) = 2 > 0 and f ″(1/3) = –2 < 0

∴ f( ) is maximum at = $\frac{1}{3}$.

∴ Maximum value = f $\left(\frac{1}{3}\right) = \frac{4}{27}$

116. Let f( ) = ^{2} + $\frac{250}{\ }$

$\Rightarrow$ f ′( ) = 2 – $\frac{250}{\ ^2}$

$\Rightarrow$ f ″( ) = 2 + $\frac{500}{\ ^3}$

For maximum or minimum of f( ),

$f'(\ ) = 0 \Rightarrow 2\ ^3 - 250 = 0$

$\Rightarrow\ ^3 = 125 \Rightarrow\ = 5$

∴ $f''(5) = 2 + \frac{500}{125} = 6 > 0$

∴ f has minimum at = 5 and minimum value of f at = 5 is f(5) = 25 + 50 = 75

117. f( ) = log

f′( ) = 1 + log

for minimum, $f'(\ ) = 0 \Rightarrow \log\ = -1 \Rightarrow\ = \frac{1}{e}$

$f''(\ ) = \frac{1}{\ }$ $f''(e) = \frac{1}{e} > 0$

∴ f( ) is minimum at $= \frac{1}{e}$

∴ $f\left(\frac{1}{e}\right) = \frac{1}{e}\log\left(\frac{1}{e}\right) = -\frac{1}{e}$

118. Let $f(\ ) = \frac{\log}{\ } \Rightarrow f'(\ ) = \frac{1}{\ ^2} - \frac{\log}{\ ^2}$

For maximum or minimum value of f( ),

$f'(\ ) = 0$

$\Rightarrow \frac{1-\log_e}{\ ^2} = 0$

∴ $\log_e\ = 1$ or $= e$, which lie in (0, ∞).

For $= e$, $\frac{d^2}{d\ ^2} = -\frac{1}{e^3}$, which is –ve.

∴ is maximum at = e

and its maximum value $= \frac{\log e}{e} = \frac{1}{e}$.

119. + = 32 ⇒ = 32 –

$\Rightarrow\ ^2 + \ ^2 = \ ^2 + (32 - \ )^2$

Let $z = \ ^2 + (32 - \ )^2$

$\Rightarrow z' = 2\ + 2(32 - \ )(-1) = 4\ - 64$

Now, $z'' = 4 > 0$

∴ at = 16 and = 32 – = 32 – 16 = 16

$\ ^2 + \ ^2 = 32$ have minimum value

∴ minimum value $= \ ^2 + \ ^2 = (16)^2 + (16)^2 = 512$

120. Let $f(\ ) = \ ^{25}(1 - \ )^{75}$

∴ $f'(\ ) = \ ^{25}(75)(1 - \ )^{74}(-1) + 25\ ^{24}(1 - \ )^{75}$

For maximum value of f( ), f′( ) = 0

$\Rightarrow -75\ ^{25}(1 - \ )^{74} + 25\ ^{24}(1 - \ )^{75} = 0$

$\Rightarrow 25\ ^{24}(1 - \ )^{74}(1 - 4\ ) = 0$

$\Rightarrow\ = 0$ or $= 1$ or $= \frac{1}{4}$

At $= \frac{1}{4}, f'\left(\frac{1}{4} - h\right) > 0$ and $f'\left(\frac{1}{4} + h\right) < 0$

∴ f( ) has maximum value at $= \frac{1}{4}$.

121. $h(\ ) = \frac{\ ^2 + \frac{1}{\ ^2}}{\ - \frac{1}{\ }}$

When $\ - \frac{1}{\ } < 0$, $\left(\ - \frac{1}{\ }\right) + \frac{2}{\left(\ - \frac{1}{\ }\right)} \le -2\sqrt{2}$

When $\ - \frac{1}{\ } > 0$, $\left(\ - \frac{1}{\ }\right) + \frac{2}{\left(\ - \frac{1}{\ }\right)} \ge 2\sqrt{2}$

The local minimum value of h( ) is $2\sqrt{2}$.

122. $f(\ ) = 2\ ^3 - 9a\ ^2 + 12a^2\ + 1$

$\Rightarrow f'(\ ) = 6\ ^2 - 18a\ + 12a^2$

$\Rightarrow f''(\ ) = 12\ - 18a$

For maximum or minimum of f( ), f′( ) = 0

$\Rightarrow 6\ ^2 - 18a\ + 12a^2 = 0$

$\Rightarrow\ ^2 - 3a\ + 2a^2 = 0$

⇒ = a or = 2a

At = a, f has maximum $(5a^3 + 1)$

and at = 2a, f has minimum $(4a^3 + 1)$

Since, $p^3 = q$

∴ $a^3 = 2a \Rightarrow a = \sqrt{2}$ or a = 0

But a > 0

∴ $a = \sqrt{2}$

123. $f(\ ) = \ ^2 + 2b\ + 2c^2$

$f'(\ ) = 2\ + 2b = 0$, at $= -b$

$f''(\ ) = 2 > 0$

∴ f( ) is minimum at = –b

∴ $f(-b) = b^2 - 2b^2 + 2c^2 = 2c^2 - b^2$

$g(\ ) = -\ ^2 - 2c\ + b^2$

$g'(\ ) = -2\ - 2c = 0$ at $= -c$

$g''(\ ) = -2 < 0$

∴ g( ) is maximum at = – c

∴ $g(-c) = -c^2 + 2c^2 + b^2 = b^2 + c^2$

Given, minimum value of f( ) > maximum of g( )

$\Rightarrow 2c^2 - b^2 > b^2 + c^2$

$\Rightarrow c^2 > 2b^2$

124. $f(\ ) = \ ^2 + e$
$f'(\ ) = 2\ + e$

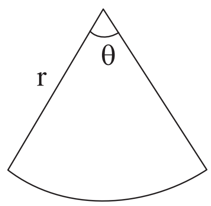
$\Rightarrow\ +\ = 18 \Rightarrow\ = 18 -$ ….(i)
Area of rectangle,
$A = \ = \ (18 - \ ) = 18\ - \ ^2$
$\therefore \frac{dA}{d} = 18 - 2$
For maximum or minimum,
$\frac{dA}{d} = 0 \Rightarrow 18 - 2\ = 0 \Rightarrow\ = 9$
From (i), $= 18 - 9 = 9$

126. Total length of wire = r + r + rθ
$\Rightarrow 20 = 2r + r\theta$
$\Rightarrow \theta = \frac{20-2r}{r}$



$A = \frac{1}{2}r^2\theta$
$= \frac{1}{2}r^2\left(\frac{20-2r}{r}\right) = 10r - r^2$
$\therefore \frac{dA}{dr} = 10 - 2r$
For maximum area, $\frac{dA}{dr} = 0$
$\Rightarrow 0 = 10 - 2r \Rightarrow 10 = 2r \Rightarrow r = 5$ m
$\therefore$ Area $= \frac{1}{2}r(20 - 2r)$
$= \frac{1}{2} \times 5 \times (20 - 10) = 25$ sq.m.

127. Let $+\ = 4 \Rightarrow\ = 4 -$
$\frac{1}{\ } + \frac{1}{\ } = \frac{\ +\ }{\ }$
$f(\ ) = \frac{4}{\ } = \frac{4}{(4 - \ )} = \frac{4}{4\ - \ ^2}$
$\therefore f'(\ ) = \frac{-4}{(4\ - \ ^2)^2}.(4 - 2\ )$
For maximum or minimum of f( ),
$f'(\ ) = 0 \Rightarrow 4 - 2\ = 0$
$\therefore\ = 2$ and $= 2$
$\therefore \min\left(\frac{1}{\ } + \frac{1}{\ }\right) = \frac{1}{2} + \frac{1}{2} = 1$

128. Let and be the lengths of two adjacent sides of the rectangle.
Then, its perimeter is $P = 2(\ +\ )$ ….(i)
$\Rightarrow\ = \frac{P-2}{2}$
Area of rectangle, A =
$= \ \left(\frac{P-2}{2}\right) = \frac{P\ - 2\ ^2}{2}$
$\therefore \frac{dA}{d} = \frac{P-4}{2}$ and $\frac{d^2A}{d\ ^2} = -2$
For maximum or minimum,
$\frac{dA}{d} = 0$
$\Rightarrow \frac{P-4}{2} = 0$
$\Rightarrow P = 4$
$\Rightarrow 2\ + 2\ = 4$ ….[From (i)]
$\Rightarrow\ =$
$\therefore \left(\frac{d^2A}{d\ ^2}\right)_{=} = -2 < 0$
Hence, the area of a rectangle will be maximum when rectangle is a square.

129. $p(t) = 1000 + \frac{1000t}{100 + t^2}$
$\therefore \frac{dp}{dt} = \frac{(100+t^2)1000 - 1000t.2t}{(100+t^2)^2}$
$= \frac{1000(100-t^2)}{(100+t^2)^2}$
For extremum,
$\frac{dp}{dt} = 0 \Rightarrow t = 10$
Now $\left.\frac{dp}{dt}\right|_{t<10} > 0$ and $\left.\frac{dp}{dt}\right|_{t>10} < 0$
$\therefore$ At t = 10, $\frac{dp}{dt}$ change from positive to negative.
It is a critical point.
$\therefore$ p is maximum at t = 10.
$\therefore p_{max} = p(10)$
$= 1000 + \frac{1000.10}{100 + 10^2} = 1050$

130. $f(\ ) = \ + \frac{1}{\ } \Rightarrow f'(\ ) = 1 - \frac{1}{\ ^2}$
$\Rightarrow f'(\ ) = 0 \Rightarrow \ ^2 - 1 = 0 \Rightarrow\ = 1, -1$
But it is given that is positive
$\therefore$ at $= 1$, $f(\ ) = 1 + \frac{1}{1} = 2$

131. $f(\ ) = \ + \sin \ \Rightarrow f'(\ ) = 1 + \cos$

Now, $f'(\ ) = 0 \Rightarrow 1 + \cos \ = 0 \Rightarrow \cos \ = -1$

$\Rightarrow \ = \pi$

Now, $f''(\ ) = -\sin \ , f''(\pi) = 0$

$f'''(\ ) = -\cos$

$\therefore$ $f'''(\pi) = 1 \neq 0$

$\therefore$ Neither maximum nor minimum.

132. Let α, β be the roots of the equation

$^2 - (a-2) \ - a + 1 = 0,$

then $\alpha + \beta = a - 2, \alpha\beta = -a + 1$

$\therefore$ $z = \alpha^2 + \beta^2 = (\alpha+\beta)^2 - 2\alpha\beta$

$= (a-2)^2 + 2(a-1) = a^2 - 2a + 2$

$\therefore$ $\frac{dz}{da} = 2a - 2 = 0 \Rightarrow a = 1$

$\frac{d^2z}{da^2} = 2 > 0$, so z has minima at a = 1

So $\alpha^2 + \beta^2$ has least value for a = 1. This is because we have only one stationary value at which we have minima. Hence a = 1.

133. $f(\ ) = \frac{^2 - 1}{^2 + 1} = \frac{^2 + 1 - 2}{^2 + 1} = 1 - \frac{2}{^2 + 1}$

$\therefore$ $f(\ ) < 1 \ \forall$ and $f(\ ) \geq -1$ as $\frac{2}{^2+1} \leq 2$

$\therefore$ $-1 \leq f(\ ) < 1$

$\therefore$ $f(\ )$ has minimum value -1.

134. Let $\ = \frac{^2 - \ + 1}{^2 + \ + 1}$

$\Rightarrow \frac{d}{d} = \frac{(\ ^2 + \ + 1)(2 \ - 1) - (\ ^2 - \ + 1)(2 \ + 1)}{(\ ^2 + \ + 1)^2}$

$\Rightarrow \frac{d}{d} = \frac{2 \ ^2 - 2}{(\ ^2 + \ + 1)^2} = 0$

$\Rightarrow 2 \ ^2 - 2 = 0 \Rightarrow \ = -1, +1$

$\frac{d^2}{d \ ^2} = \frac{4(- \ ^3 + 3 \ + 1)}{^2 + \ + 1}$

At $\ = -1$, $\frac{d^2}{d \ ^2} < 0$ the function will occupy maximum value,

$\therefore$ $f(-1) = 3$ and at $\ = 1$, $\frac{d^2}{d \ ^2} > 0$ the function will occupy minimum value.

$\therefore$ $f(1) = \frac{1}{3}$

135. Let $f(\ ) = \exp(2 + \sqrt{3} \cos \ + \sin \ )$

$\Rightarrow f'(\ ) = \exp(2 + \sqrt{3} \cos \ + \sin \ )$

$\times (-\sqrt{3} \sin \ + \cos \ )$

For maximum or minimum of $f(\ ), f'(\ ) = 0$

$\Rightarrow \exp(2 + \sqrt{3}\cos \ + \sin \ )(-\sqrt{3}\sin \ + \cos \ ) = 0$

$\Rightarrow -\sqrt{3}\sin \ + \cos \ = 0$

$\Rightarrow \frac{\sqrt{3}}{2}\sin \ - \frac{1}{2}\cos \ = 0$

$\Rightarrow \sin\left(\ - \frac{\pi}{6}\right) = 0$

$\Rightarrow \ = \frac{\pi}{6}$

At $\ = \frac{\pi}{6}$, $f''(\ )$ is negative

$\therefore$ f has maximum at $\ = \frac{\pi}{6}$ and maximum value of f at $\ = \frac{\pi}{6}$ is

$f\left(\frac{\pi}{6}\right) = \exp\left(2 + \sqrt{3}\left(\frac{\sqrt{3}}{2}\right) + \frac{1}{2}\right) = \exp(4)$

136. Let $\ = \ \Rightarrow \log \ = \ .\log \ , (\ > 0)$

Differentiating, $\frac{d}{d} = \ (1 + \log \ );$

$\therefore$ $\frac{d}{d} = 0$

$\Rightarrow \log \ = -1 \Rightarrow \ = e^{-1} = \frac{1}{e}$

$\therefore$ Stationary point is $\ = \frac{1}{e}$

137. Let $f(\ ) = \left(\frac{1}{\ }\right)$

$\Rightarrow f(\ ) = \ ^{-}$

$\Rightarrow f'(\ ) = - \ ^{-} (1 + \log \ )$

$\Rightarrow f''(\ ) = \ ^{-} (1 + \log \ )^2 - \ ^{- \ -1}$

For maximum or minimum of $f(\ ), f'(\ ) = 0$

$\Rightarrow - \ ^{-} (1 + \log \ ) = 0$

$\Rightarrow 1 + \log \ = 0$

$\Rightarrow \log \ = -1 = \log \frac{1}{e}$

$\Rightarrow \ = \frac{1}{e}$

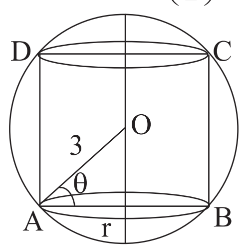
$\therefore$ $f''\left(\frac{1}{e}\right) = \left(\frac{1}{e}\right)^{\frac{-1}{e}}\left(1 + \log\frac{1}{e}\right)^2 - \left(\frac{1}{e}\right)^{-\frac{1}{e}-1}$

$= e^{\frac{1}{e}}(1-1)^2 - e^{\frac{1}{e}+1}$

$= -e^{\frac{1}{e}+1} < 0$

∴ f has maximum at $= \frac{1}{e}$ and maximum value of f at $= \frac{1}{e}$ is $f\left(\frac{1}{e}\right) = (e)^{1/e}$

138. Let r be the radius and h be the height, then from the figure, $r^2 + \left(\frac{h}{2}\right)^2 = 3^2$



∴ $h^2 = 4(9 - r^2)$

$\Rightarrow r^2 = 36 - h^2$

Now, $V = \pi r^2 h$

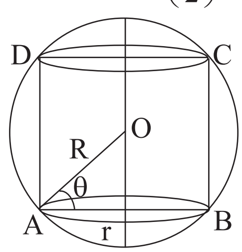
$\Rightarrow V = \pi(36 - h^2)h$

∴ $\frac{dV}{dh} = \pi(36 - 3h^2)$

for max or min, $\frac{dV}{dh} = 0$

$\Rightarrow \pi(36 - 3h^2) = 0 \Rightarrow h^2 = 12 \Rightarrow h = 2\sqrt{3}$

139. Let r be the radius and h be the height, then from the figure, $r^2 + \left(\frac{h}{2}\right)^2 = R^2$



∴ $h^2 = 4(R^2 - r^2)$

Now, $V = \pi r^2 h = 2\pi r^2 \sqrt{R^2 - r^2}$

∴ $\frac{dV}{dr} = 4\pi r\sqrt{R^2 - r^2} + 2\pi r^2 . \frac{(-2r)}{2\sqrt{R^2 - r^2}}$

For max. or min., $\frac{dV}{dr} = 0$

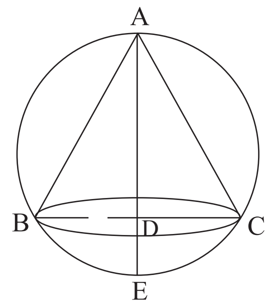
$\Rightarrow 4\pi r\sqrt{R^2 - r^2} = \frac{2\pi r^3}{\sqrt{R^2 - r^2}} \Rightarrow 2(R^2 - r^2) = r^2$

$\Rightarrow 2R^2 = 3r^2 \Rightarrow r = \sqrt{\frac{2}{3}}R \Rightarrow \frac{d^2V}{dr^2} .= -ve$

∴ V is max., when $r = \sqrt{\frac{2}{3}}R$.

140. Let diameter of sphere be AE = 2r

Let radius of cone be and height be .



∴ AD =

Since, $BD^2 = AD.DE$

$\Rightarrow \ ^2 = \ (2r - \ )$

Volume of cone $V = \frac{1}{3}\pi \ ^2 \ = \frac{1}{3}\pi \ (2r - \ )$

$= \frac{1}{3}\pi(2r \ ^2 - \ ^3)$

$\Rightarrow \frac{dV}{d} = \frac{1}{3}\pi(4r \ - 3 \ ^2)$

Now $\frac{dV}{d} = 0$

$\Rightarrow \frac{1}{3}\pi(4r \ - 3 \ ^2) = 0 \Rightarrow \ (4r - 3 \ ) = 0$

$\Rightarrow \ = \frac{4}{3}r, 0$

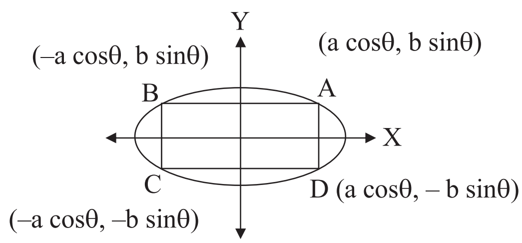
Now $\frac{d^2V}{d \ ^2} = \frac{1}{3}\pi(4r - 6 \ )$

$\Rightarrow \left(\frac{d^2V}{d \ ^2}\right)_{=\frac{4}{3}r} = \frac{1}{3}\pi\left(4r - 6 \times \frac{4}{3}r\right) < 0$

So, volume of cone is maximum at $= \frac{4}{3}r$.

∴ $\frac{\text{Height of Cone}}{\text{Diameter of Sphere}} = \frac{}{2r} = \frac{2}{3}$

141.

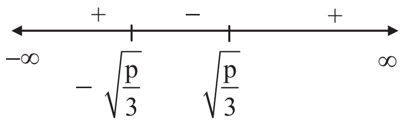


Area of rectangle ABCD

= (2a cos θ) (2b sin θ) = 2ab sin 2θ

Hence, area of greatest rectangle is equal to 2ab, when sin 2θ = 1.

142. Let f( ) = ^{3} – p + q. Then,
f ′( ) = 3 ^{2} – p
$= 3\left(\; - \sqrt{\frac{p}{3}}\right)\left(\; + \sqrt{\frac{p}{3}}\right)$
The signs of f ′( ) for different values of are as shown below:



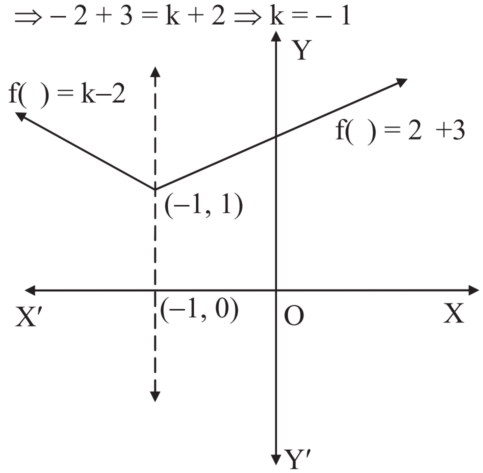
Since, f ′( ) changes its sign form positive to negative in the neighbourhood of $-\sqrt{\frac{p}{3}}$.

So, $-\sqrt{\frac{p}{3}}$ is a point of local maximum.

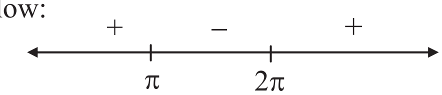
Similarly, $= \sqrt{\frac{p}{3}}$ is a point of local minimum.

143. For any ∈ [0, 1], we have
$^2 \le \; \le 1$
⇒ $^2 e^{\,2} \le \; e^{\,2} \le e^{\,2}$
⇒ $e^{-\,2} + \;^2 e^{\,2} \le e^{-\,2} + \; e^{\,2} \le e^{\,2} + e^{\,2}$
⇒ h( ) ≤ g( ) ≤ f( )
Now, f( ) = $e^{\,2} + e^{-\,2}$
⇒ f ′( ) = 2 $\left(e^{\,2} - e^{-\,2}\right)$ > 0 for all ∈ (0, 1]
⇒ f( ) is increasing on (0, 1]
⇒ f(1) is the maximum value of f( ) on [0, 1]
⇒ a = e + e^{-1}
Also, f(1) = g(1) = h(1) = e + e^{-1}
∴ a = b = c = e + e^{-1}

144. If f( ) has a local minimum at = –1, then
$\lim_{\to -1^+} f( ) = \lim_{\to -1^-} f( )$
⇒ $\lim_{\to -1^+} (2 \; + 3) = \lim_{\to -1^-} (k - 2 \;)$
⇒ – 2 + 3 = k + 2 ⇒ k = – 1



145. f( ) = $\int_0 \sqrt{t}\sin t\,dt \Rightarrow f'( ) = \sqrt{\;}\ \sin$
For local maximum or minimum of f( ),
f ′( ) = 0 ⇒ $\sqrt{\;}$ sin = 0
⇒ = π, 2π .... $\left[\because \; \in \left(0, \frac{5\pi}{2}\right)\right]$
The changes in signs of f ′( ) in the neighbourhoods of π and 2π are as shown below:

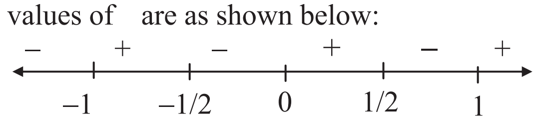


Clearly, f ′( ) changes its sign from positive to negative in the neighbourhood of = π and negative to positive in the neighbourhood of = 2π. Thus, f( ) has a local maximum at = π and a local minimum at = 2π.

146. f( ) = | | + | ^{2} – 1| = $\begin{cases} - \; + \;^2 - 1, & \le -1 \\ - \; - \;^2 + 1, & -1 \le \; < 0 \\ \; - \;^2 + 1, & 0 \le \; < 1 \\ \; + \;^2 - 1, & \ge 1 \end{cases}$

∴ f ′( ) = $\begin{cases} 2 \; - 1, & < -1 \\ -2 \; - 1, & -1 < \; < 0 \\ -2 \; + 1, & 0 < \; < 1 \\ 2 \; + 1, & > 1 \end{cases}$

Here, f( ) is not differentiable at = –1, 0, 1.
The changes in signs of f ′( ) for different values of are as shown below:



So, f ′( ) changes its sign at 5 points.
Hence, total number of points of local maximum or local minimum of f( ) is 5.

147. f( ) = $\begin{cases} e & , \; 0 \le \; \le 1 \\ 2 - e^{\;-1} & , \; 1 < \; \le 2 \\ \; - e & , \; 2 < \; \le 3 \end{cases}$

and g( ) = $\int_0 f(t)dt$, ∈ [1, 3]

∴ g′( ) = f( ) = $\begin{cases} 2 - e^{\;-1} & 1 < \; \le 2 \\ \; - e & 2 < \; \le 3 \end{cases}$

Now, g′( ) = 0 ⇒ = 1 + $\log_e$ 2 and = e
Also, g′( ) > 0 for ∈ (1, 1 + $\log_e$ 2)
and g′( ) < 0 for ∈ (1 + $\log_e$ 2, 2).

So, g( ) attains a local maximum at
  = 1 + $\log_e 2$.
Similarly,
g′( ) < 0 for 2 <   < e
and g′( ) > 0 for e <   < 3
So, g( ) attains a local minimum at   = e.
We have,

$$f'(\ ) = \begin{cases} e & , 0 < \quad 1 \\ -e^{\ -1} & , 1 < \ < 2 \\ 1 & , 2 < \quad 3 \end{cases}$$

Clearly, f ′( ) > 0 for ∈ (0, 1)
f ′( ) < 0 for ∈ (1, 2)
f ′( ) > 0 for ∈ (2, 3)
So, f( ) attains local maximum at   = 1 and local minimum at   = 2.
Hence, option (C) is incorrect.

148. $f(\ ) = \begin{cases} (2+\ )^3 & , -3 < \ \le -1 \\ \ ^{2/3} & , -1 < \quad 2 \end{cases}$

$$\Rightarrow f'(\ ) = \begin{cases} 3(2+\ )^2 & , -3 < \quad -1 \\ \frac{2}{3}\ ^{-1/3} & , -1 < \quad 2 \end{cases}$$

Clearly, f ′( ) changes its sign from positive to negative as   passes through   = –1 from left to right.
So, f( ) attains a local maximum at   = –1.
Here, f ′( ) > 0 for all ∈ (–3, –1) and
f ′( ) < 0 for ∈ (–1, 0).
Also, f ′( ) > 0 for ∈ (0, 2).
But, f ′(0) does not exist.
So, f( ) attains a local minimum at   = 0
Hence, the total number of local maxima and local minima is 2.

149. f( ) = $(1 + b^2)\ ^2$ + 2b + 1
⇒ f ′( ) = $2(1 + b^2)$ + 2b
⇒ f ″( ) = $2(1 + b^2) > 0$
For minimum value of f( ),
f ′( ) = 0
⇒ $2(1 + b^2)$ + 2b = 0
⇒   = $-\frac{b}{1+b^2}$
∴ f( ) is minimum at   = $-\frac{b}{1+b^2}$
∴ Minimum value of f( ) = $\frac{1}{1+b^2}$
∴ m(b) = $\frac{1}{1+b^2}$

Since, $\frac{1}{1+b^2} \le 1$ and $\frac{1}{1+b^2} > 0 \ \forall\ b \in R$
∴ 0 < m(b) ≤ 1
∴ range of m (b) is (0, 1].

150. P( ) = $\ ^4 + a\ ^3 + b\ ^2 + c\ + d$
⇒ P ′( ) = $4\ ^3 + 3a\ ^2 + 2b\ + c$ ....(i)
Since,   = 0 is the only real root of P ′( ) = 0.
∴ P′(0) = 0 ⇒ c = 0
Putting c = 0 in (i), we get
P′( ) = $(4\ ^2 + 3a\ + 2b)$
Since,   = 0 is the only real root of P ′( ) = 0.
∴ $4\ ^2 + 3a\ + 2b = 0$ has no real root.
⇒ $9a^2 - 32b < 0$
Given, P(–1) < P(1)
⇒ 1 – a + b – c + d < 1 + a + b + c + d
⇒ a > 0
But, $9a^2 - 32b < 0$. Therefore, b > 0
∴ P ′( ) = $(4\ ^2 + 3a\ + 2b) > 0$ for all ∈ (0, 1]
⇒ P( ) is increasing in (0, 1]
⇒ P(1) is the maximum value of P( ).
Also, P ′( ) = $(4\ ^2 + 3a\ + 2b) < 0$ for all ∈ [–1, 0)
....[∵ $4\ ^2 + 3a\ + 2b > 0$ for all]
⇒ P( ) is decreasing in [– 1, 0).
⇒ P(– 1) is not the minimum value of P.

151. f( ) = ln{g( )}
⇒ g( ) = $e^{f(\ )}$
⇒ g ′( ) = $e^{f(\ )}$ f ′( )
For local maximum of g( ),
g ′( ) = 0
⇒ $e^{f(\ )}$ f ′( ) = 0
⇒ f ′( ) = 0
⇒ $2010(\ - 2009)(\ - 2010)^2(\ - 2011)^3 \times (\ - 2012)^4 = 0$
⇒   = 2009, 2010, 2011, 2012
∴ f ′( ) changes its sign from positive to negative in the neighbourhood of   = 2009.
∴ g( ) has a local maximum at   = 2009 only.

152. According to the given condition,
$\frac{d}{d} = 0$
⇒ $12 - 3\ ^2 = 0$
⇒   = ± 2
When   = 2,   = 16
When   = –2,   = –16
∴ the required points are (2, 16) and (–2, –16).

153. $v = \frac{d}{dt} = 4t^3 - 3kt^2$

$\therefore \quad \frac{dv}{dt} = 12t^2 - 6kt$

At t = 2, $\frac{dv}{dt} = 0$

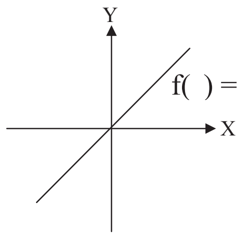
$\Rightarrow 48 - 12k = 0 \Rightarrow k = 4$

154. Since, f( ) satisfies the conditions of Rolle's theorem.

$\therefore \quad f(2) = f(1)$

Now, $\int_1^2 f'(\ )d\ = [f(\ )]_1^2 = f(2) - f(1) = 0$

155. It is always increasing.



156. $f(\ ) = \ ^3 + b\ ^2 + c\ + d$

$\therefore \quad f'(\ ) = 3\ ^2 + 2b\ + c$

Now its discriminant = $4(b^2 - 3c)$

$\Rightarrow 4(b^2 - c) - 8c < 0$, as $b^2 < c$ and $c > 0$

$\Rightarrow f'(\ ) > 0$ for all $\ \in R$

$\Rightarrow$ f is strictly increasing on R.

157. Since = 1 and = 3 are extreme points of p( ).

$\therefore \quad p'(1) = 0$ and $p'(3) = 0$

$\therefore \quad (\ -1)$ and $(\ -3)$ are the factors of $p'(\ )$.

$\therefore \quad p'(\ ) = k(\ -1)(\ -3) = k(\ ^2 - 4\ + 3)$

$\Rightarrow p(\ ) = k\left(\frac{\ ^3}{3} - 2\ ^2 + 3\ \right) + c$

Given, p(1) = 6 and p(3) = 2

$\Rightarrow 6 = k\left(\frac{1}{3} - 2 + 3\right) + c$ and 2

$= k(9-18+9) + c$

$\Rightarrow 6 = \frac{4k}{3} + c$ and $c = 2 \Rightarrow k = 3$

$\therefore \quad p'(\ ) = 3(\ ^2 - 4\ + 3)$

$\therefore \quad p'(0) = 9$

158. Let $f(\ ) = a_0 + a_1\ + a_2\ ^2 + a_3\ ^3 + a_4\ ^4$

Given, $\lim_{\ \to 0}\left[1 + \frac{f(\ )}{\ ^2}\right] = 3$

$\Rightarrow \lim_{\ \to 0}\frac{f(\ )}{\ ^2} = 3 - 1 = 2$

$\Rightarrow \lim_{\ \to 0}\frac{a_0 + a_1\ + a_2\ ^2 + a_3\ ^3 + a_4\ ^4}{\ ^2} = 2$

$\therefore \quad a_0 = 0, a_1 = 0, a_2 = 2$

$\therefore \quad f(\ ) = 2\ ^2 + a_3\ ^3 + a_4\ ^4$

$\therefore \quad f'(\ ) = 4\ + 3a_3\ ^2 + 4a_4\ ^3 = \ (4 + 3a_3\ + 4a_4\ ^2)$

Given, f ′(1) = 0 and f ′(2) = 0

$\Rightarrow 4 + 3a_3 + 4a_4 = 0$ ….(i)

and $4 + 6a_3 + 16a_4 = 0$ ….(ii)

Solving (i) and (ii), we get

$a_4 = \frac{1}{2}, a_3 = -2$

$\therefore \quad f(\ ) = 2\ ^2 - 2\ ^3 + \frac{\ ^4}{2}$

$\therefore \quad f(2) = 8 - 16 + 8 = 0$

159. tan A. tan B is maximum if $A = B = \frac{\pi}{6}$

$\therefore$ Maximum of tanA.tanB = $\frac{1}{3}$

160. According to the given condition,

$4\ + 2\pi r = 2$

$\Rightarrow 2\ + \pi r = 1$ ....(i)

$A = \ ^2 + \pi r^2 = \left(\frac{1 - \pi r}{2}\right)^2 + \pi r^2$

$\therefore \quad \frac{dA}{dr} = 2\left(\frac{1 - \pi r}{2}\right)\left(-\frac{\pi}{2}\right) + 2\pi r$

For maximum or minimum, $\frac{dA}{dr} = 0$

$\Rightarrow \pi(1 - \pi r) = 4\pi r$

$\Rightarrow 1 = 4r + \pi r$ ...(ii)

From (i) and (ii), we get

$2\ + \pi r = 4r + \pi r$

$\Rightarrow \ = 2r$

161. $f(\ ) = \tan^{-1}\sqrt{\frac{1 + \sin\ }{1 - \sin\ }}$

$= \tan^{-1}\sqrt{\frac{\left(\cos\frac{\ }{2} + \sin\frac{\ }{2}\right)^2}{\left(\cos\frac{\ }{2} - \sin\frac{\ }{2}\right)^2}}$

$= \tan^{-1}\left(\tan\left(\frac{\pi}{4} + \frac{\ }{2}\right)\right) = \frac{\pi}{4} + \frac{\ }{2}$

$\Rightarrow f'(\ ) = \frac{1}{2}$ and at $\ = \frac{\pi}{6}, f(\ ) = \frac{\pi}{3}$

$\therefore$ equation of the normal at $\left(\frac{\pi}{6}, \frac{\pi}{3}\right)$ is

$\ - \frac{\pi}{3} = -2\left(\ - \frac{\pi}{6}\right) \Rightarrow \ + 2\ = \frac{2\pi}{3}$

Only option (A) satisfies this equation.

Evaluation Test

1. Let f( ) = a ^{4} + b ^{3} + c ^{2} + d

∴ f(0) = 0

and f(3) $= a.3^4 + b.3^3 + c.3^2 + d.3$
$= 81a + 27b + 9c + 3d$
$= 3(27a + 9b + 3c + d)$
$= 3 \times 0$

∴ f(0) = f(3) = 0

f( ) is a polynomial function, it is continuous and differentiable.

Now, f ′( ) = 4a ^{3} + 3b ^{2} + 2c + d

By Rolle's theorem, there exist at least 1 root of the equation f ′( ) = 0 in between 0 and 3.

2. The equation of the curve is = ^{2} + b + c.

∴ $\frac{d}{d}$ = 2 + b ….(i)

Since, the curve touches the line = at (1,1).

∴ $[2 + b]_{(1, 1)} = 1$

∴ 2(1) + b = 1

⇒ b = –1

Substituting the value of b in equation (i), we get

$\frac{d}{d}$ = 2 – 1

Since, gradient is negative.

∴ $\frac{d}{d} < 0$

⇒ 2 – 1 < 0

⇒ 2 < 1

⇒ $< \frac{1}{2}$

3. The equation of the parabola is ^{2} = 8 .

∴ 2 $\frac{d}{d}$ = 8

∴ $\frac{d}{d} = \frac{8}{2} = \frac{4}{\ } = m_1$

Slope of given line, $m_2 = 3$

Since, $\tan\theta = \left|\frac{m_1 - m_2}{1 + m_1 m_2}\right|$

∴ $\tan\frac{\pi}{4} = \left|\frac{\frac{4}{\ } - 3}{1 + \frac{4}{\ }\cdot 3}\right|$

⇒ $1 = \left|\frac{4 - 3}{\ + 12}\right|$

∴ = –2 or = 8

Putting = –2 in the equation of the curve, we get

$= \frac{1}{2}$

∴ the point of contact is $\left(\frac{1}{2}, -2\right)$.

4. f( ) = $\tan^{-1}$ $- \frac{1}{2}\log$

∴ $f'( ) = \frac{1}{1 + \ ^2} - \frac{1}{2} = -\frac{(\ -1)^2}{2\ (1 + \ ^2)}$

Now, f ′( ) = 0 ⇒ = 1

$f(1) = \tan^{-1} 1 - \frac{1}{2}\log 1 = \frac{\pi}{4} = \frac{3.14}{4} = 0.785$

Since, we are finding maxima on an interval $\left(\frac{1}{\sqrt{3}}, \sqrt{3}\right)$. We have to find the value of f( ) at $\left(\frac{1}{\sqrt{3}}\right)$ and $\left(\sqrt{3}\right)$

$f\left(\frac{1}{\sqrt{3}}\right) = \tan^{-1}\frac{1}{\sqrt{3}} + \frac{1}{4}\log 3 = \frac{\pi}{6} + \frac{1}{4}\log 3$

$= \frac{3.14}{6} + \frac{1}{4}\log 3 = 0.52 + \frac{1}{4} \times 1.0986$

$= 0.52 + 0.2746 = 0.7946$

$f(\sqrt{3}) = \tan^{-1}\left(\sqrt{3}\right) - \frac{1}{4}\log 3 = \frac{\pi}{3} - \frac{1}{4}\log 3$

$= \frac{3.14}{3} - 0.2746$

$= 1.04 - 0.2746$

$= 0.7654$

∴ the greatest value of f( ) is $\frac{\pi}{6} + \frac{1}{4}\log 3$.

5. $\alpha + \beta = \frac{\pi}{2}$

∴ $\cos\beta = \cos\left(\frac{\pi}{2} - \alpha\right) = \sin\alpha$

Let = cos α cos β = cos α sin α = $\frac{1}{2}$sin2α

∴ $\frac{d}{d\alpha} = \frac{1}{2}\cos 2\alpha.2 = \cos 2\alpha$

Now, $\frac{d}{d\alpha} = 0 \Rightarrow \cos 2\alpha = 0 \Rightarrow 2\alpha = \frac{\pi}{2}$

$\Rightarrow \alpha = \frac{\pi}{4}$

Also, $\frac{d^2}{d\alpha^2} = -2 \sin 2\alpha = -2 < 0$

$\therefore$ is maximum when $\alpha = \frac{\pi}{4}$

$\therefore$ it is maximum at $\beta = \frac{\pi}{4}$

6. Let P($_1$, $_1$) be the point on the curve at which tangent is drawn.
The equation of the curve is $= c^2$.

$\therefore$ $\frac{d}{d} + (1) = 0$

$\therefore$ $_1 - \ _1 \ _1 = - \ _1 + \ _1 \ _1$

$\therefore$ $_1 + \ _1 = 2 \ _1 \ _1$

$\therefore$ $\frac{}{2\ _1} + \frac{}{2\ _1} = 1$

$\therefore$ The tangent meets the X-axis in the point A(2 $_1$, 0) and the Y-axis in the point B(0, 2 $_1$)

$\therefore$ P is the mid point of AB

$\therefore$ The ratio is 1 : 1

7. Let f( ) $= \frac{a\ ^3}{3} + \frac{b\ ^2}{2} + c\ + d$

$\therefore$ f ′( ) = a ^{2} + b + c

Now, $f(1) = \frac{a}{3} + \frac{b}{2} + c + d = \frac{2a + 3b + 6c + 6d}{6}$

$\Rightarrow f(1) = \frac{0 + 6d}{6} = d$ ….[$\because$ 2a + 3b + 6c = 0]

Also, f(0) = d

$\therefore$ f(0) = f(1)

f( ) is a polynomial function, it is continuous and differentiable.

$\therefore$ There exists at least one value of in (0, 1) at which f ′( ) = a ^{2} + b + c = 0

$\therefore$ one root of the equation a ^{2} + b + c = 0 has value between 0 and 1.

8. f( ) = sin (1 + cos)
= sin + sin cos

$\therefore$ f( ) = sin + $\frac{1}{2}$ sin 2

$\therefore$ f ′( ) = cos + cos 2 = 2 cos $\frac{}{2}$ cos $\frac{3}{2}$

$\therefore$ f ′( ) = 0 $\Rightarrow$ cos $\frac{}{2}$ = 0 or cos $\frac{3}{2}$ = 0

$\therefore$ $\frac{}{2} = \frac{\pi}{2}$ or $\frac{3}{2} = \frac{\pi}{2}$

$\therefore$ = π or = $\frac{\pi}{3}$

f ″( ) = − sin − 2 sin 2 < 0, only when = $\frac{\pi}{3}$

$\therefore$ The maximum value of function is at $\frac{\pi}{3}$

$\therefore$ $f\left(\frac{\pi}{3}\right) = \frac{\sqrt{3}}{2}\left(1 + \frac{1}{2}\right) = \frac{\sqrt{3}}{2} \times \frac{3}{2} = \frac{3\sqrt{3}}{4}$

9. f( ) = sin^4 + cos^4
= (sin^2 + cos^2)^2 − 2 sin^2 cos^2

$\therefore$ f( ) = 1 − $\frac{1}{2}$ sin^{2}2

$\therefore$ f ′( ) = − $\frac{1}{2}$(2 sin 2 cos 2) × 2

f ′( ) = − 2 sin 2 cos 2

Now, f ′( ) = 0

$\Rightarrow$ sin 2 = 0 or cos 2 = 0

$\Rightarrow$ = 0 or = $\frac{\pi}{4}$

Since, f ′( ) = −2 sin 2 cos 2

$\Rightarrow$ f ′( ) = − sin 4

$\therefore$ f″( ) = − 4 cos 4

For = 0, f″( ) = − 4 < 0

For = $\frac{\pi}{4}$ f″( ) = 4 > 0

$\therefore$ At = $\frac{\pi}{4}$, f( ) is minimum

$\therefore$ Minimum value of f( ) = $1 - \frac{1}{2}(1) = 1 - \frac{1}{2} = \frac{1}{2}$

10. $2^{(\ ^2-3)^3+27}$ is minimum when $(\ ^2-3)^3+27$ is minimum.

Since, (^{2} − 3)^3 + 27
= ^{6} − 9 ^{4} + 27 ^{2}
= ^{2}(^{4} − 9 ^{2} + 27)
= $^2\left[\left(\ ^2 - \frac{9}{2}\right)^2 + \frac{27}{4}\right] \geq 0$, for all

$\therefore$ Minimum value of (^{2} − 3)^3 + 27 is 0.

$\therefore$ Minimum value of $2^{(\ ^2-3)^3+27} = 2^0 = 1$

11. $f(\ ) = 3\cos|\ | - 6a\ + b$
$= 3\cos\ - 6a\ + b$
....[∵ cos (–) = cos]

∴ $f'(\ ) = -3\sin\ - 6a$
The function f( ) is increasing for all ∈ R.
∴ $f'(\ ) > 0$
∴ $-3\sin\ - 6a > 0$
$\Rightarrow 6a < -3\sin$
$\Rightarrow a < -\frac{1}{2}\sin$
$\Rightarrow a < -\frac{1}{2}$

12. Let $f(\ ) = a^2\sec^2\ + b^2\mathrm{cosec}^2$
∴ $f'(\ ) = a^2.2\sec\ \sec\ \tan$
$+ b^2.2\,\mathrm{cosec}\ (-\mathrm{cosec}\ \cot\ )$
$= 2a^2\sec^2\ \tan\ - 2b^2\mathrm{cosec}^2\ \cot$
Now, $f'(\ ) = 0$
$\Rightarrow 2a^2\sec^2\ \tan\ - 2b^2\mathrm{cosec}^2\ \cot\ = 0$
$2a^2.\frac{1}{\cos^2}\cdot\frac{\sin}{\cos} = 2b^2\frac{1}{\sin^2}\cdot\frac{\cos}{\sin}$
∴ $\frac{\sin^4}{\cos^4} = \frac{b^2}{a^2}$
∴ $\tan^4\ = \frac{b^2}{a^2}$
∴ $\tan^2\ = \frac{b}{a}$ and $\cot^2\ = \frac{a}{b}$
Also,
$f''(\ ) = 2a^2\left[\sec^2\ .\sec^2\ + \tan\ .2\sec\ \sec\ \tan\ \right]$
$-2b^2\left[\begin{array}{l}\mathrm{cosec}^2\ (-\mathrm{cosec}^2\ ) \\ \quad + \cot\ .2\mathrm{cosec}\ (-\mathrm{cosec}\ \cot\ )\end{array}\right]$
$= 2a^2\left[\sec^4\ + 2\sec^2\ \tan^2\ \right]$
$+ 2b^2\left[\mathrm{cosec}^4\ + 2\mathrm{cosec}^2\ \cot^2\ \right]$
∴ $f''(\ ) > 0$ for all .
∴ f( ) is minimum when $\tan^2\ = \frac{b}{a}$
∴ Minimum value of $f(\ ) = a^2(1 + \tan^2\ )$
$+ b^2(1 + \cot^2\ )$
$= a^2\left(1 + \frac{b}{a}\right) + b^2\left(1 + \frac{a}{b}\right)$
$= a^2\left(\frac{a+b}{a}\right) + b^2\left(\frac{a+b}{b}\right)$
$= a(a + b) + b(a + b) = (a + b)^2$

13. $= \frac{a\ + b}{(\ -4)(\ -1)} = \frac{a\ + b}{\ ^2 - 5\ + 4}$
∴ $\frac{d}{d} = \frac{(\ ^2 - 5\ + 4)a - (a\ + b)(2\ - 5)}{(\ ^2 - 5\ + 4)^2}$
For extreme (i.e., maximum or minimum)
$\frac{d}{d} = 0$
∴ $a(\ ^2 - 5\ + 4) - (a\ + b)(2\ - 5) = 0$
Since, has an extreme at P(2, –1)
∴ = 2 satisfies above equation
$a(4 - 10 + 4) - (2a + b)(-1) = 0$
$\Rightarrow -2a + 2a + b = 0$
$\Rightarrow b = 0$
= 2, = –1 satisfies the equation of the curve
∴ $-1 = \frac{a(2) + b}{4 - 10 + 4}$
∴ $-1 = \frac{2a + 0}{-2} = -a$
∴ a = 1 ∴ a = 1, b = 0

14. Let $f(\ ) = \ \tan$
∴ $f'(\ ) = \ \sec^2\ + \tan$
∴ $f'(\ ) > 0$ for $\in \left(0, \frac{\pi}{2}\right)$
∴ f( ) is increasing in the interval $\left(0, \frac{\pi}{2}\right)$
Since, $0 < \alpha < \beta < \frac{\pi}{2}$
∴ $f(\alpha) < f(\beta)$
∴ $\alpha\tan\alpha < \beta\tan\beta$
$\Rightarrow \frac{\alpha}{\beta} < \frac{\tan\beta}{\tan\alpha}$

15. The point of intersection of the given curves is (0, 1).
Now, = 3
∴ $\frac{d}{d} = 3\ \log 3$
∴ $\left(\frac{d}{d}\right)_{(0,1)} = \log 3 = m_1$ (say)
Also, = 5
∴ $\frac{d}{d} = 5\ \log 5$
∴ $\left(\frac{d}{d}\right)_{(0,1)} = \log 5 = m_2$ (say)
∴ $\tan\alpha = \left|\frac{m_1 - m_2}{1 + m_1m_2}\right| = \frac{\log 3 - \log 5}{1 + \log 3 \log 5}$

16. Let f( ) = a ^{2} + b + c

∴ f ′( ) = 2a + b

since, α and β are roots of the equation a ^{2} + b + c = 0

∴ f(α) = f(β) = 0

∴ f( ) being a polynomial function in , it is continuous and differentiable.

∴ There exists k in (α, β) such that f ′(k) = 0

∴ 2ak + b = 0, ∴ $k = -\frac{b}{2a}$

But k ∈ [α, β]

∴ α < k < β

∴ $\alpha < -\frac{b}{2a} < \beta$

17. f( ) = tan^{-1} (sin + cos)

∴ $f'( ) = \frac{1}{1+(\sin\ +\cos\ )^2}\times(\cos\ -\sin\ )$

$= \frac{\sqrt{2}\cos\left(\ +\frac{\pi}{4}\right)}{1+(\sin\ +\cos\ )^2}$

For f( ) to be increasing, f ′( ) > 0

$\Rightarrow \sqrt{2}\cos\left(\ +\frac{\pi}{4}\right) > 0$

$\Rightarrow \cos\left(\ +\frac{\pi}{4}\right) > 0$

$\Rightarrow -\frac{\pi}{2} < \ +\frac{\pi}{4} < \frac{\pi}{2} \Rightarrow -\frac{3\pi}{4} < \ < \frac{\pi}{4}$

∴ f( ) is an increasing function in $\left(-\frac{\pi}{2}, \frac{\pi}{4}\right)$.

18. f( ) = ^{3} – 12a ^{2} + 36a^2 – 4

Diff. w.r.t. , we get

f ′( ) = 3 ^{2} – 12a(2) + 36a^2(1)

= 3 ^{2} – 24a + 36a^2

Now, f ′( ) = 0 ⇒ 3 ^{2} – 24a + 36a^2 = 0

∴ ^{2} – 8a + 12a^2 = 0

∴ (– 2a) (– 6a) = 0

∴ = 2a or = 6a

Also, f ″( ) = 6 – 24a

[f ″( )]$_{=2a}$ = 12a – 24a = – 12a < 0

[f ″( )]$_{=6a}$ = 36a – 24a = 12a > 0

∴ Maxima at p = 2a and minima at q = 6a

3p = q^2 ….(given)

∴ 3 × 2a = (6a)^2

∴ 6a = 36a^2

∴ $a = \frac{1}{6}$

19. The functions e$^-$, sin , cos are continuous and differentiable in their respective domains.

∴ f( ) is continuous and differentiable

Also $f\left(\frac{\pi}{4}\right) = 0 = f\left(\frac{5\pi}{4}\right)$

Now,

f ′( )= – e$^-$ (sin – cos) + e$^-$ (cos + sin)

= e$^-$ (– sin + cos + cos + sin)

= 2e$^-$ cos

Also, f ′( ) = 0 ⇒ cos = 0

∴ $= \frac{\pi}{2} \in \left[\frac{\pi}{4}, \frac{5\pi}{4}\right]$

20. a ^{2} = ^{3} ….(i)

Diff. w.r.t. , we get

$2a\ \frac{d}{d} = 3\ ^2$

$\Rightarrow \frac{d}{d} = \frac{3\ ^2}{2a}$

∴ slope of the normal = $-\frac{2a}{3\ ^2}$

Since, the normal to the given curve makes equal intercepts with the axis.

∴ $-\frac{2a}{3\ ^2} = -1$

$\Rightarrow\ = \frac{3\ ^2}{2a}$

Substituting $= \frac{3\ ^2}{2a}$ in (i) and solving, we get the point $\left(\frac{4a}{9}, \frac{8a}{27}\right)$.

$= \ \log(1-\sqrt{\ }) + \frac{1}{2}\int \frac{\sqrt{\ }}{1-\sqrt{\ }} d$

$= \ \log(1-\sqrt{\ }) + \frac{1}{2} I_1$ ….(i)

Now, $I_1 = \int \frac{\sqrt{\ }}{1-\sqrt{\ }} d$

Put $\ = t^2$,

∴ $d \ = 2t\, dt$

∴ $I_1 = \int \frac{\sqrt{t^2}}{1-\sqrt{t^2}} .2t\, dt = 2\int \frac{t^2}{1-t} dt$

$= -2\int \frac{1-t^2-1}{1-t} dt$

Putting $\ = 0$ in (ii), $C = -1$

Putting $\ = 1$ in (ii), $A = 2$

Putting $\ = -1$ in (ii), $B = -1$

∴ $I = \int \left(\frac{2}{-1}-\frac{1}{}-\frac{1}{^2}\right) d$

∴ From (i),

$P(\ ) + Q(\ ) = \ + 2\log|\ -1| - \log|\ | + \frac{1}{} + c$

∴ $(P + Q)(2) = P(2) + Q(2)$

∴ $\frac{5}{2} = \frac{5}{2} - \log 2 + c$ ….$\left[\because (P+Q)(2) = \frac{5}{2}\right]$

∴ $c = \log 2$

∴ $P(\ ) + Q(\ ) = \ + 2\log|\ -1| - \log|\ |$

Put $\ e^{\sin\ } = t$

∴ $e^{\sin\ }(1+\ \cos\ )\,d\ \ = dt$

∴ $I = \int \frac{1}{t(1-t^2)}dt = \int \frac{1}{t(1-t)(1+t)}dt$

Put $\frac{1}{t(1-t)(1+t)} = \frac{A}{t}+\frac{B}{1-t}+\frac{C}{1+t}$

∴ $1 = A(1-t)(1+t) + Bt(1+t) + Ct(1-t)$ ….(i)

When $\ \ = \alpha$, $\alpha = \alpha \sin^2 t + \beta(1-\sin^2 t)$

$\alpha = \beta + (\alpha-\beta)\sin^2 t$

When $\ \ = \beta$,

$\beta = \alpha(1-\cos^2 t) + \beta \cos^2 t$

The positive integer values of a satisfying the above inequality are 1, 2, 3, 4.

$\therefore$ There are 4 such values.

27. Since, $-1 \le \sin\ \ \le 1 \Rightarrow -2 \le 2\sin\ \ \le 2$

$$\int_{\frac{\pi}{2}}^{\frac{3\pi}{2}}[2\sin\ \ ]d\ \ = \int_{\frac{\pi}{2}}^{\frac{5\pi}{6}}[2\sin\ \ ]d\ \ + \int_{\frac{5\pi}{6}}^{\pi}[2\sin\ \ ]d\ \ + \int_{\pi}^{\frac{7\pi}{6}}[2\sin\ \ ]d\ \ + \int_{\frac{7\pi}{6}}^{\frac{3\pi}{2}}[2\sin\ \ ]d$$

$\therefore a+\sqrt{a}-2<4$

$\therefore a+\sqrt{a}-6<0$

$\therefore \left(\sqrt{a}+3\right)\left(\sqrt{a}-2\right)<0$

$\therefore -3<\sqrt{a}<2$

$= \frac{3}{2}[\ \ ^2]_3^5 - 5[\ \ ]_3^5 = \frac{3}{2}(25 - 9) - 5(5 - 3)$

= 24 – 10 = 14 sq. units

2. According to the given condition,

$\int_1^2 m \ \ d \ \ = 6 \Rightarrow m\left[\frac{\ ^2}{2}\right]_1^2 = 6$

$\Rightarrow m\left(\frac{3}{2}\right) = 6 \Rightarrow m = 4$

3.

$= 2\left[1 - \frac{1}{2}\right] = 1$ sq. unit.

Alternate method:

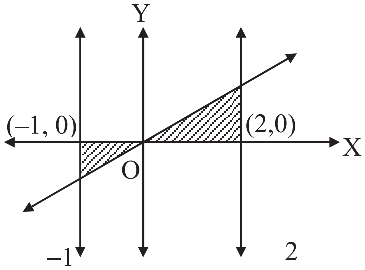
5.



Required area = $\left|\int_{-1}^{0} \ d\ \right| + \int_{0}^{2} \ d$

$= \left|\int_{-1}^{0} \ d\ \right| + \int_{0}^{2} \ d\ = \left|\frac{-1}{2}\right| + 2$

$= 2 + \frac{1}{2} = \frac{5}{2}$ sq. units

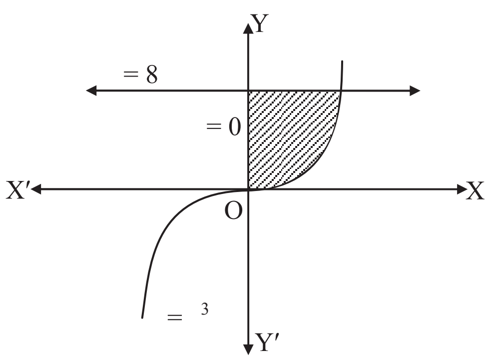
Alternate method:

Required area $= \frac{1}{2} \times 1 \times 1 + \frac{1}{2} \times 2 \times 2$

$= \frac{1}{2} + 2$

$= \frac{5}{2}$ sq. units.

6.



Required area = $\int_{0}^{8} \ d\ = \int_{0}^{8} \ ^{1/3} d$

$= \frac{3}{4}\left[\ ^{4/3}\right]_0^8 = \frac{3}{4}(8^{4/3} - 0)$

$= 12$

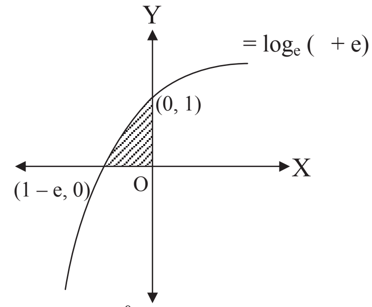
7. Required area = $\int_{1}^{3} |\ - 2|\, d$

$= \int_{1}^{2} (2 - \ )\, d\ + \int_{2}^{3} (\ - 2)\, d$

$= \left[2\ - \frac{\ ^2}{2}\right]_1^2 + \left[\frac{\ ^2}{2} - 2\ \right]_2^3$

$= \frac{1}{2} + \frac{1}{2} = 1$

8.



Required area = $\int_{1-e}^{0} \log_e(\ + e)\, d$

$= \int_{1}^{e} \log t\, dt$ ….[Put $\ + e = t$]

$= [t \log t - t]_1^e = 1$ sq. unit

9. For X-axis, $\ = 0$

∴ $2\ - \ ^2 = 0$

$\Rightarrow\ (2 - \ ) = 0 \Rightarrow\ = 0, 2$

Required area = $\int_{0}^{2} (2\ - \ ^2)\, d$

$= \left[\ ^2 - \frac{\ ^3}{3}\right]_0^2$

$= 4 - \frac{8}{3}$

$= \frac{4}{3}$ sq.units

10. For X-axis, $\ = 0$

∴ $1 - \ - 6\ ^2 = 0$

$\Rightarrow (2\ + 1)(3\ - 1) = 0$

$\Rightarrow\ = \frac{-1}{2}$ or $\ = \frac{1}{3}$

∴ Required area $= \int_{\frac{-1}{2}}^{\frac{1}{3}} (1 - \ - 6\ ^2)\, d$

$= \left[\ - \frac{\ ^2}{2} - 2\ ^3\right]_{\frac{-1}{2}}^{\frac{1}{3}}$

$= \left[\frac{1}{3} - \frac{1}{18} - \frac{2}{27}\right] - \left[\frac{-1}{2} - \frac{1}{8} + \frac{1}{4}\right]$

$= \frac{11}{54} + \frac{3}{8}$

$= \frac{125}{216}$ sq. units.

11. 
Area of the required region = $2\int_0^{\sqrt{3}}\left(- \,^2+3\right) d$

$= 2\left[\frac{-\;^3}{3} + 3\;\right]_0^{\sqrt{3}}$

$= 4\sqrt{3}$ sq. Units

12. In both cases area will be same.

∴ A : B = 1 : 1

13. According to the given condition,

$\int_1^b f(\;)d\; = \sqrt{b^2+1} - \sqrt{2}$

$= \sqrt{b^2+1} - \sqrt{1+1} = [\sqrt{\;^2+1}]_1^b$

∴ $f(\;) = \frac{d}{d}\left(\sqrt{\;^2+1}\right) = \frac{2}{2\sqrt{\;^2+1}} = \frac{}{\sqrt{\;^2+1}}$

14. According to the given condition,

$\int_{\frac{\pi}{4}}^{\beta} f(\;)d\; = \beta\sin\beta + \frac{\pi}{4}\cos\beta + \sqrt{2}\beta$

Differentiating w.r.t. β, we get

$f(\beta) = \sin\beta + \beta\cos\beta - \frac{\pi}{4}\sin\beta + \sqrt{2}$

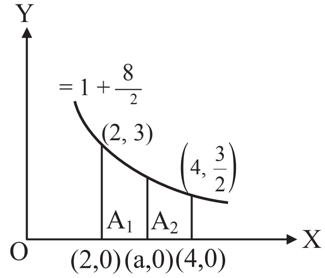
∴ $f\left(\frac{\pi}{2}\right) = \sin\frac{\pi}{2} + \frac{\pi}{2}\cos\frac{\pi}{2} - \frac{\pi}{4}\sin\frac{\pi}{2} + \sqrt{2}$

$= 1 - \frac{\pi}{4} + \sqrt{2}$

15. $A_1 = \int_2^a \left(1+\frac{8}{\;^2}\right) d$

$= \left[\;-\frac{8}{}\right]_2^a$

$= a - \frac{8}{a} + 2$



$A_2 = \int_a^4 \left(1+\frac{8}{\;^2}\right) d = \left[\;-\frac{8}{}\right]_a^4 = 2 - a + \frac{8}{a}$

According to the given condition,

$a - \frac{8}{a} + 2 = 2 - a + \frac{8}{a}$

$\Rightarrow 2a = \frac{16}{a} \Rightarrow a^2 = 8$

$\Rightarrow a = 2\sqrt{2}$ ….[∵ a > 0]

16. The given curve passes through (1, 2).

∴ 2 = a + b …..(i)

According to the given condition,

$\int_0^4 (a\sqrt{\;} + b\;)\,d\; = 8$

$\Rightarrow \frac{2a}{3}[\;^{3/2}]_0^4 + \frac{b}{2}[\;^2]_0^4 = 8 \Rightarrow \frac{2a}{3}.8 + 8b = 8$

⇒ 2a + 3b = 3 ….(ii)

From (i) and (ii), we get

a = 3, b = –1

17. $R_1 = \int_{-1}^{2} f(\;)\,d$

$= \int_{-1}^{2} (1-\;)f(1-\;)\,d$ ….$\left[\because \int_a^b f(\;)d\; = \int_a^b f(a+b-\;)d\;\right]$

$= \int_{-1}^{2} (1-\;)f(\;)\,d$ ….[∵ f( ) = f(1 –) (given)]

∴ $R_1 = \int_{-1}^{2} f(\;)d\; - R_1 \Rightarrow 2R_1 = \int_{-1}^{2} f(\;)d$

According to the given condition,

$R_2 = \int_{-1}^{2} f(\;)\,d$

∴ $R_2 = 2R_1$

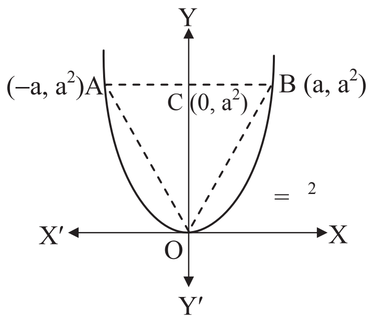
$$\text{Required area} = \int_{\frac{\pi}{2}}^{\pi} \sin^2 \quad d \;=\; \int_{\frac{\pi}{2}}^{\pi} \frac{1-\cos 2}{2} d$$

$$= \left[\frac{1}{2} \quad - \frac{\sin 2}{4}\right]_{\frac{\pi}{2}}^{\pi}$$

$$= \frac{\pi}{2} - \frac{\pi}{4} \;=\; \frac{\pi}{4} \text{ sq. units}$$

20.



Area of the region AOB

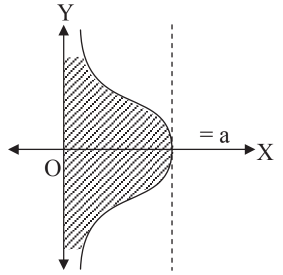
Now, area of ΔAOB = $\frac{1}{2}$ × AB × OC

$$= \frac{1}{2} \times 2a \times a^2 = a^3$$

∴ $\dfrac{\text{Area of } \Delta\text{AOB}}{\text{Area of the region AOB}} = \dfrac{a^3}{\frac{4}{3}a^3} = \dfrac{3}{4}$

21.



Since the curve is symmetrical about X-axis.

Put $\quad = a\sin^2\theta$

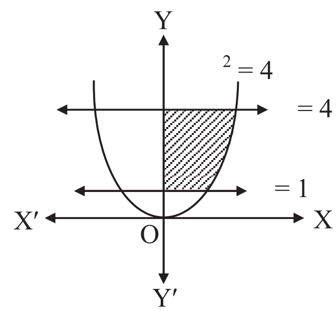
$\Rightarrow d \quad = 2a \sin\theta.\cos\theta\, d\theta$

∴ $A = 2\int_0^{\pi/2} a\sqrt{\dfrac{a\cos^2\theta}{a\sin^2\theta}}\;.\;2a\sin\theta\cos\theta\, d\theta$

$$= 4a^2 \int_0^{\pi/2} \frac{\cos\theta}{\sin\theta} \sin\theta\cos\theta\, d\theta$$

$$= 4a^2 \int_0^{\pi/2} \cos^2\theta\, d\theta = 4a^2 . \frac{1}{2} . \frac{\pi}{2} = \pi a^2$$

22.



$$\text{Required area} = \int_1^4 \quad d$$

$$= \frac{28}{3} \text{ sq. units.}$$

23.

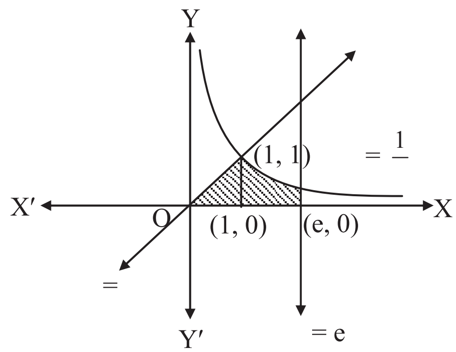
24.



Required area = $\int_0^1 \ d \ + \int_1^e \frac{1}{} d$

$= \left[\frac{^2}{2}\right]_0^1 + [\log \ ]_1^e$

$= \frac{1}{2} + 1$

$= \frac{3}{2}$ sq.units

25.

$= \left[\frac{2 \ ^{\frac{3}{2}}}{3} - \frac{^3}{3}\right]_0^1 = \frac{2}{3} - \frac{1}{3} = \frac{1}{3}$

29.

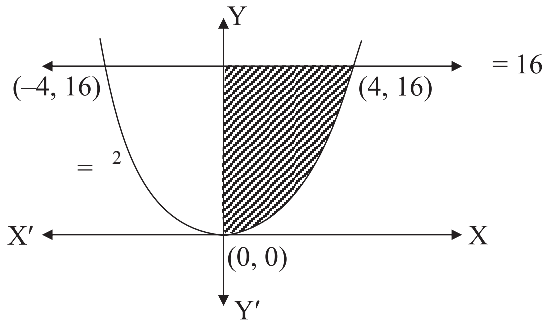
$= 2\left(1-\frac{1}{3}\right) = \frac{4}{3}$ sq. units

30.



Area bounded by $= \ ^2$ and line $= 16$ is

$2\int_0^4 \left(\ ^2 - 16\right) d$

$= 2\left[\frac{^3}{3} - 16 \ \right]_0^4 = \frac{-256}{3}$

But area cannot be negative

∴ Required area $= \frac{256}{3}$ sq. units

31. The points of intersection of

$(2a \ )^2 = 4a$

$\Rightarrow 4a \ (a \ - 1) = 0$

$\Rightarrow \ = 0$ or $= \frac{1}{a}$

When $= 0$, $= 0$ and when $= \frac{1}{a}$, $= 2$

∴ the points of intersection are (0, 0) and $\left(\frac{1}{a}, 2\right)$.

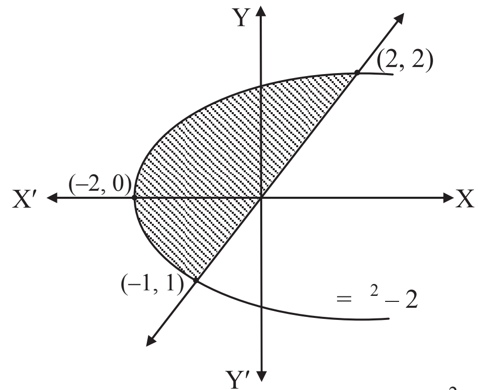
Here, $a = \frac{1}{2}$ and $m = 1$

∴ Required area $= \frac{8\left(\frac{1}{2}\right)^2}{3(1)^3} = \frac{2}{3}$ sq. units.

33.



The points of intersection of $= \ ^2 - 2$ and $=$ are (–1, –1) and (2, 2)

∴ Required area $= \int_{-1}^{2} \left(\ ^2 - 2 - \ \right) d$

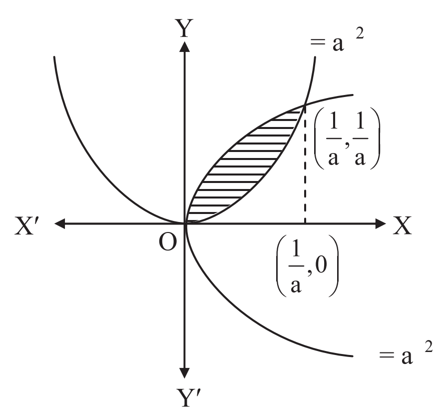
$= \left[\frac{8}{3} - 4 - \frac{4}{2}\right] - \left[-\frac{1}{3} + 2 - \frac{1}{2}\right]$

$= \frac{-9}{2}$

But area cannot be negative.

∴ Required area $= \frac{9}{2}$ sq. Units

34.



The two curves intersect at (0, 0) and $\left(\frac{1}{a}, \frac{1}{a}\right)$.

Required area = $\int_0^{\frac{1}{a}} \frac{\sqrt{\ }}{\sqrt{a}} d \ - \int_0^{\frac{1}{a}} a \ ^2 d$

$= \frac{2}{3\sqrt{a}}\left(\frac{1}{a}\right)^{\frac{3}{2}} - \frac{a}{3}\left(\frac{1}{a}\right)^3 = \frac{2}{3a^2} - \frac{1}{3a^2}$

$\Rightarrow \frac{1}{3a^2} = 1 \Rightarrow a = \frac{1}{\sqrt{3}}$

$\therefore$ $S_2 + S_3 = \frac{32}{3}$ ....(i)

$\therefore$ $S_2 = \frac{32}{3} - \frac{16}{3} = \frac{16}{3}$

Since, $S_1 + S_2 + S_3$ = Area of square OAPB

The equation $\ {}^2 + 4\ {}^2 = 4$ is of ellipse with centre at origin and the equation $4\ {}^2 = 3\ \ $ is of a parabola with vertex at origin.

Solving the equations, we get $\ {}^2 + 3\ \ - 4 = 0$

$\therefore \quad (\ \ + 4)(\ \ - 1) = 0$

But $\ = -4$ is not possible, since both points of intersection lie on the right hand side of Y-axis.

Slope of tangent = $\frac{d}{d}$ = 2 + 1

∴ = $\int(2 \quad +1)d$ = $^2 + \quad + c$

The curve passes through the point (1, 2).

∴ $2 = 1^2 + 1 + c$ ∴ c = 0

∴ The equation of the curve is = ^{2} + , which is a parabola as shown in the figure.

∴ Required area = $\int_0^1 (\ ^2 + \ )d = \left[\frac{^3}{3}+\frac{^2}{2}\right]_0^1$

The equation of the parabola is

$(\ -2)^2 = \ -1$

Diff. w.r.t. , we get

$2(\ -2)\frac{d}{d} = 1$

∴ $\frac{d}{d} = \frac{1}{2(\ -2)}$

∴ $\left(\frac{d}{d}\right)_{(2,3)} = \frac{1}{2(3-2)} = \frac{1}{2}$

∴ Equation of tangent is $\ -3 = \frac{1}{2}(\ -2)$

∴ $2 \ -6 = \ -2$

96. Let P be the population at time t years.

Then, $\frac{dP}{dt} = kP$

$\Rightarrow \frac{dP}{P} = kdt$

Integrating on both sides, we get

log P = kt + c

When t = 0, P = 40000

$\therefore$ log 40000 = 0 + c $\Rightarrow$ c = log 40000

$\therefore$ log P = kt + log 40000

When t = 0, $P = P_0$

$\therefore$ $\log P_0 = 0 + c \Rightarrow c = \log P_0$

When t = 0, θ = 100° C

$\therefore$ $\log(100 - 20) = k(0) + c \Rightarrow c = \log 80$

$\therefore$ $\log(\theta - 20) = kt + \log 80$ ….(i)

When t = 20, θ = 60° C

When θ = 30° C, we have

$\log(30 - 20) = t\left(\frac{1}{20}\right)\log\left(\frac{1}{2}\right) + \log 80$

$\Rightarrow \log 10 - \log 80 = \frac{t}{20}\log\left(\frac{1}{2}\right)$

$\Rightarrow \log\left(\frac{1}{8}\right) = \frac{t}{20}\log\left(\frac{1}{2}\right)$

$\Rightarrow 3\log\left(\frac{1}{2}\right) = \frac{t}{20}\log\left(\frac{1}{2}\right)$

$\Rightarrow c = \log(1000)$

$\therefore$ log = kt + log (1000) ....(i)

When t = 1, = 2000

$\therefore$ $\log(2000) = k(1) + \log(1000)$

$\Rightarrow k = \log\left(\frac{2000}{1000}\right) = \log 2$

$\therefore$ log = t log 2 + log (1000) ….[From (i)]

When $t = 2\frac{1}{2} = \frac{5}{2}$, we have

log = $\left(\frac{5}{2}\right)\log 2 + \log(1000)$

$= \log\left(2^{\frac{5}{2}}\right) + \log(1000)$

$= \log\left(4\sqrt{2}\right) + \log(1000)$

$= \log(4000\sqrt{2})$

$= \log(4000 \times 1.414)$

$\Rightarrow \frac{dp}{p} = \frac{3}{100}dt$

Integrating on both sides, we get

$\int \frac{dp}{p} = \frac{3}{100}\int dt$

$\Rightarrow \log p = \frac{3}{100}t + c_1$

$\Rightarrow p = e^{\frac{3}{100}t + c_1} \Rightarrow p = e^{\frac{3}{100}t}e^{c_1}$

Integrating on both sides, we get

$\int \frac{d(p(t))}{\frac{1}{2}p(t) - 200} = \int dt + c_1$

$\Rightarrow 2\log\left(\frac{p(t)}{2} - 200\right) = t + c_1$

$\Rightarrow \frac{p(t)}{2} - 200 = e^{\frac{t}{2}}.c, \left(\text{where } c = e^{\frac{c_1}{2}}\right)$ ....(i)

Putting t = 0, we get

$\frac{p(0)}{2} - 200 = e^0.c$

Evaluation Test

1. The given equation is

$\sqrt{1-\ ^4} + \sqrt{1-\ ^4} = a(\ ^2 - \ ^2)$

Put $\ ^2 = \sin\alpha,\ \ ^2 = \sin\beta$

The equation becomes

$\cos\alpha + \cos\beta = a(\sin\alpha - \sin\beta)$

$2\cos\left(\frac{\alpha+\beta}{2}\right)\cos\left(\frac{\alpha-\beta}{2}\right) = 2a\sin\left(\frac{\alpha-\beta}{2}\right)\cos\left(\frac{\alpha+\beta}{2}\right)$

$\therefore \quad \cot\left(\frac{\alpha-\beta}{2}\right) = a$

$\therefore \quad \alpha - \beta = 2\cot^{-1} a$

$\therefore \quad \sin^{-1}\ ^2 - \sin^{-1}\ ^2 = 2\cot^{-1} a$

Differentiating w.r.t. , we get

$\frac{1}{\sqrt{1-\ ^4}}\cdot 2\ \ - \frac{1}{\sqrt{1-\ ^4}}\cdot 2\ \ \frac{d}{d} = 0$

$\therefore \quad \frac{d}{d} = -\sqrt{\frac{1-\ ^4}{1-\ ^4}}$

$\therefore$ Degree and order are both 1.

2. Since, the given differential equation cannot be expressed as a polynomial in differential coefficients, so its degree is not defined.

3. The equation of tangent at any point P(,) is

$Y - \ = \frac{d}{d}(X - \ )$

This meets the X-axis at $A\left(\ - \ \frac{d}{d}, 0\right)$.

Similarly, it meets the Y-axis at $B\left(0,\ \ - \ \frac{d}{d}\right)$.

According to the given condition,

P is the mid-point of AB.

$\therefore \quad 2 \;=\; -\dfrac{d}{d}$ and $2 \;=\; -\dfrac{d}{d}$

$\therefore \quad + \dfrac{d}{d} = 0$ and $+ \dfrac{d}{d} = 0$

Both of these equations reduce to

$\dfrac{1}{}d \; + \dfrac{1}{}d \; = 0$

Integrating both sides, we get

log + log = log c

$\therefore$ log ( ) = log c

$\therefore$ = c, which is the equation of rectangular hyperbola.

4. $\sqrt{1+\ ^2} + \sqrt{1+\ ^2} = A\left(\ \sqrt{1+\ ^2} - \ \sqrt{1+\ ^2}\right)$

Put = tan α, = tan β

The equation becomes

sec α + sec β = A (tan α sec β – tan β sec α)

$\therefore \quad \dfrac{1}{\cos\alpha} + \dfrac{1}{\cos\beta} = A\left(\dfrac{\sin\alpha}{\cos\alpha}\cdot\dfrac{1}{\cos\beta} - \dfrac{\sin\beta}{\cos\beta}\cdot\dfrac{1}{\cos\alpha}\right)$

$\therefore \quad \dfrac{\cos\alpha + \cos\beta}{\cos\alpha\,\cos\beta} = A\left(\dfrac{\sin\alpha - \sin\beta}{\cos\alpha\,\cos\beta}\right)$

$\therefore$ cos α + cos β = A (sin α – sin β)

$\therefore \quad 2\cos\left(\dfrac{\alpha+\beta}{2}\right)\cos\left(\dfrac{\alpha-\beta}{2}\right)$

$= A.2\sin\left(\dfrac{\alpha-\beta}{2}\right)\cos\left(\dfrac{\alpha+\beta}{2}\right)$

$\therefore \quad \cot\left(\dfrac{\alpha-\beta}{2}\right) = A$

$\therefore \quad \alpha - \beta = 2\cot^{-1} A$

$\therefore \quad \tan^{-1} \; - \tan^{-1} \; = 2\cot^{-1} A$

Differentiating w.r.t. , we get

$\dfrac{1}{1+\ ^2} - \dfrac{1}{1+\ ^2}\cdot\dfrac{d}{d} = 0$

$\therefore \quad \dfrac{d}{d} = \dfrac{1+\ ^2}{1+\ ^2}$

$\therefore$ Degree and order of the differential equation are both 1.

$\therefore \quad \dfrac{d}{d} = v + \dfrac{dv}{d}$

$\therefore$ The given equation becomes,

$v + \dfrac{dv}{d} = v + \dfrac{f(v)}{f'(v)}$

$\therefore \quad \dfrac{1}{}d \; = \dfrac{f'(v)}{f(v)}dv$

Integrating on both sides, we get

log = log f(v) + log K

$\Rightarrow$ = f(v)K

$\Rightarrow \quad = Kf\left(-\right)$

$\therefore \quad f\left(-\right) = \dfrac{1}{K}\cdot \; = c$, where $c = \dfrac{1}{K}$

$\therefore \quad = f(\ ) = \left(\dfrac{6\ +5}{\ +1}\right)e^{\ ^2}$

8. $\frac{d}{d} = \frac{^2 + \ ^2 + 1}{2}$

$\therefore$ $2 \ d \ = (\ ^2 + 1)\, d \ + \ ^2 d$

$\therefore$ $2 \ d \ - \ ^2 d \ = (\ ^2 + 1)\, d$

Dividing by ^{2}, we get

$\frac{2 \ d \ - \ ^2 d}{^2} = \left(\frac{^2 + 1}{^2}\right) d$

$\therefore$ $d\left(\frac{^2}{}\right) = \left(1 + \frac{1}{^2}\right) d$

Integrating both sides, we get

$\frac{^2}{} = \ - \frac{1}{} + c$

$\therefore$ $^2 = \ ^2 - 1 + c$

$\therefore$ $\frac{1}{2} d(\ ^2 + \ ^2) + d\left(\tan^{-1} \frac{}{}\right) = 0$

Integrating both sides, we get

$\frac{1}{2}(\ ^2 + \ ^2) + \tan^{-1}\left(\frac{}{}\right) = \frac{c}{2}$

$\therefore$ $^2 + \ ^2 + 2\tan^{-1}\left(\frac{}{}\right) = c$

$\therefore$ $2\tan^{-1}\left(\frac{}{}\right) = c - \ ^2 - \ ^2$

$\therefore$ $\tan^{-1}\left(\frac{}{}\right) = \frac{c - \ ^2 - \ ^2}{2}$

$\therefore$ $\frac{d}{d}(\ ^2 \ ^2) = \tan(\ ^2 \ ^2)$

$\therefore$ $\frac{dz}{d} = \tan z$, where $z = \ ^2 \ ^2$

$\therefore$ $d \ = \cot z dz$

$\therefore$ $\cos \ \frac{d}{d} + (4 \sin \ ). \frac{1}{} = \frac{e}{^3}$

Put $\sin \ = t, \therefore \cos \ \frac{d}{d} = \frac{dt}{d}$

$\therefore$ the equation becomes,

$\frac{dt}{d} + \left(\frac{4}{}\right) t = \frac{e}{^3}$, which is a linear equation

$\therefore$ I.F. $= e^{\int \frac{4}{} d} = e^{4 \log} = e^{\log \ ^4} = \ ^4$

Put $\frac{1}{} = t, \ \therefore -\frac{1}{^2} \cdot \frac{d}{d} = \frac{dt}{d}$

$\therefore$ The equation becomes,

$\therefore \quad \sqrt{\cot} = \sqrt{\tan} + c$

The curve passes through $\left(1, \frac{\pi}{4}\right)$.

$\therefore \quad 1 = 1 + c, \quad \therefore c = 0$

$\therefore$ the equation of the curve is

19. The equation of hyperbola is $= 2$

∴ $= \frac{2}{}$

∴ $m_1 = \frac{d}{d} = -\frac{2}{^2}$ (slope of tangent to the hyperbola)

$m_2 = \frac{d}{d} =$ slope of tangent to the required family of curves.

The curves are intersecting orthogonally,

$m_1m_2 = -1$

∴ $\frac{d}{d} \times \left(-\frac{2}{^2}\right) = -1$

∴ $\frac{d}{d} = \frac{^2}{2}$

Integrating both sides, we get $= \frac{^3}{6} + c$, which is the equation of required family of curves.

20. The given equation is

$\frac{d}{d} = -\frac{(+ ^3)}{1 + + ^2} = \frac{-(+ ^3)}{1 + (1 + ^2)}$

∴ $\frac{d}{d} = -\frac{1 + (1 + ^2)}{(1 + ^2)}$

$= -\frac{1}{(1 + ^2)} - -$

∴ $\frac{d}{d} + \frac{1}{} \cdot \quad -\frac{1}{(1 + ^2)}$, which is a linear equation

∴ I.F. $= e^{\int \frac{1}{} d} = e^{\log} =$

∴ the required solution is

$= -\int \frac{1}{1 + ^2} d + c$

∴ $= -\tan^{-1} + c$

The curve passes through (0, 1) ∴ $c = \frac{\pi}{4}$

∴ the required equation of the curve is

$+ \tan^{-1} = \frac{\pi}{4}$

21. Slope of tangent $= \frac{d}{d}$

∴ slope of normal $= -\frac{1}{\frac{d}{d}}$

The equation of the normal is

$Y - = -\frac{1}{\frac{d}{d}}(X -)$

∴ $(Y -)\frac{d}{d} + (X -) = 0$

The normal passes through the point (3, 0).

∴ $(0 -)\frac{d}{d} + (3 -) = 0$

∴ $\frac{d}{d} = 3 -$

∴ $d = (3 -)\, d$

Integrating both sides, we get $\frac{^2}{2} = 3 - \frac{^2}{2} + c$

The curve passes through (3 , 4), ∴ $c = \frac{7}{2}$

∴ the equation of the curve is $\frac{^2}{2} = 3 - \frac{^2}{2} + \frac{7}{2}$

∴ $^2 + ^2 - 6 - 7 = 0$

22. The given equation can be written as

$d - d = ^3(1 + \log)\, d$

∴ $-\left(\frac{d - d}{^2}\right) = (1 + \log)\, d$

∴ $-d\left(\frac{}{}\right) = (1 + \log)\, d$

∴ $-\frac{}{}d\left(\frac{}{}\right) = ^2(1 + \log)\, d$

Integrating both sides, we get

$-\frac{\left(\frac{}{}\right)^2}{2} = (1 + \log)\int ^2 d$

$-\int\left\{\frac{d}{d}(1 + \log)\int ^2 d\right\}d + \frac{c}{2}$

∴ $-\frac{^2}{2\,^2} = (1 + \log)\,.\,\frac{^3}{3} - \int \frac{1}{} \cdot \frac{^3}{3} d + \frac{c}{2}$

∴ $-\frac{^2}{2\,^2} = (1 + \log)\,.\frac{^3}{3} - \frac{^3}{9} + \frac{c}{2}$

∴ $-\frac{^2}{^2} = \frac{2\,^3}{3}(1 + \log) - \frac{2\,^3}{9} + c$

$= \frac{2\,^3}{3}\left(1 + \log - \frac{1}{3}\right) + c$

∴ $-\frac{^2}{^2} = \frac{2\,^3}{3}\left(\frac{2}{3} + \log\right) + c$

$$\Rightarrow \frac{\text{d}}{\text{d}} + \left(-\frac{1}{\ }\right) \ = - \ ^2$$

∴ I.F. $= \text{e}^{\int -\frac{1}{\ }\text{d}} = \text{e}^{-\log} \ = \frac{1}{\ }$

$$\Rightarrow \ - = -\frac{^2}{2} + \text{c} \Rightarrow \ = -\frac{^3}{2} + \text{c}$$

∴ $\text{f}(\ ) = -\frac{^3}{2} + \text{c}$ ....(i)

∴ $\text{f}(1) = -\frac{1}{2} + \text{c}$

$$\Rightarrow 1 = -\frac{1}{2} + \text{c} \Rightarrow \text{c} = \frac{3}{2}$$

∴ $\text{f}(\ ) = -\frac{^3}{2} + \frac{3}{2}$ ....[From (i)]

∴ $\text{f}(-3) = \frac{27}{2} - \frac{9}{2} = 9$

24. $\frac{\text{dV}}{\text{dt}} = -\text{k}(\text{T} - \text{t})$

$\Rightarrow \text{dV} = -\text{k}(\text{T} - \text{t})\text{dt}$

Integrating on both sides, we get

$$\int \text{dV} = -\text{k}\int(\text{T} - \text{t})\,\text{dt} + \text{c}$$

$$\Rightarrow \text{V}(\text{t}) = \frac{\text{k}(\text{T} - \text{t})^2}{2} + \text{c} \quad \text{....(i)}$$

Initially i.e., when t = 0, V(t) = I

∴ $\text{I} = \frac{\text{kT}^2}{2} + \text{c} \Rightarrow \text{c} = \text{I} - \frac{\text{kT}^2}{2}$

∴ $\text{V}(\text{t}) = \frac{\text{k}(\text{T} - \text{t})^2}{2} + \text{I} - \frac{\text{kT}^2}{2}$ ....[From (i)]

When t = T,

$$\text{V}(\text{T}) = \text{I} - \frac{\text{kT}^2}{2}$$

25. $\frac{\text{d}}{\text{d}} = - \ - \cos^2 -$ ….(i)

Put $\ = \text{v}$ ….(ii)

$\Rightarrow \frac{\text{d}}{\text{d}} = \text{v} + \ \frac{\text{dv}}{\text{d}}$ ….(iii)

Substituting (ii) and (iii) in (i), we get

$$\text{v} + \ \frac{\text{dv}}{\text{d}} = \text{v} - \cos^2\text{v} \quad \Rightarrow \quad \frac{\text{dv}}{\text{d}} = -\cos^2 \text{v}$$

Integrating on both sides, we get

$$\int \sec^2 \text{v}\,\text{dv} = -\int \frac{\text{d}}{\ } + \text{c}$$

$\Rightarrow \tan \text{v} = -\log \ + \text{c}$

$\Rightarrow \tan - \ = -\log \ + \text{c}$ ….(iv)

Since, the required curve passes through $\left(1, \frac{\pi}{4}\right)$.

∴ $\tan\frac{\pi}{4} = -\log 1 + \text{c} \Rightarrow \text{c} = 1$

∴ $\tan - = -\log \ + 1$ ….[From (iv)]

$\Rightarrow \tan - \ = -\log \ + \log \text{e}$

$$\Rightarrow \ = \ \tan^{-1}\left[\log\left(\frac{\text{e}}{\ }\right)\right]$$

Classical Thinking

1. The sum of all the probabilites in a probability distribution is always unity.

$\therefore$ $0.1 + k + 0.2 + 2k + 0.3 + k = 1$

$\Rightarrow 4k + 0.6 = 1 \Rightarrow 4k = 0.4 \Rightarrow k = 0.1$

2. Since, $\sum_{=1}^{4} P(X = \ ) = 1$

$\therefore$ $\frac{1}{8} + \frac{1}{2} + \frac{1}{4} + k = 1$

$\Rightarrow k + \frac{1+4+2}{8} = 1$

$\Rightarrow k = 1 - \frac{7}{8} = \frac{1}{8}$

3. Since, $\sum_{=0}^{4} P(X = \ ) = 1$

$\therefore$ $k + 2k + 3k + 2k + k = 1$

$\Rightarrow 9k = 1 \Rightarrow k = \frac{1}{9}$

4. The probability distribution of X is

X	0	1	2
P (X)	k	2k	3k

Since, $\sum_{=0}^{2} P(X = \ ) = 1$

$\therefore$ $k + 2k + 3k = 1$

$\Rightarrow 6k = 1 \Rightarrow k = \frac{1}{6}$

5. $P(X \le 2) = P(X = 0) + P(X = 1) + P(X = 2)$

$= \frac{^5C_0}{2^5} + \frac{^5C_1}{2^5} + \frac{^5C_2}{2^5}$

$= \frac{1+5+10}{2^5} = \frac{16}{32}$

6. $F(-1) = 0.2 + 0.3 = 0.5$

7. $F(\ _1) = p_1 = 0.05$

$F(\ _2) = p_1 + p_2 = 0.05 + 0.2 = 0.25$

$F(\ _3) = p_1 + p_2 + p_3 = 0.25 + 0.15 = 0.4$

$F(\ _4) = p_1 + p_2 + p_3 + p_4 = 0.4 + 0.25 = 0.65$

$F(\ _5) = p_1 + p_2 + p_3 + p_4 + p_5 = 0.65 + 0.35 = 1$

8. $E(X) = \sum \ _i . P(\ _i)$

$= 0\left(\frac{1}{8}\right) + 1\left(\frac{3}{8}\right) + 2\left(\frac{3}{8}\right) + 3\left(\frac{1}{8}\right)$

$= \frac{3}{8} + \frac{6}{8} + \frac{3}{8} = \frac{3}{2}$

9. $E(X) = \sum \ _i \cdot P(\ _i)$

$= 0\,(0.2) + 1\,(0.5) + 3\,(0.2) + 5\,(0.1)$

$= 0 + 0.5 + 0.6 + 0.5$

$= 1.6$

$= (0)^2\,(0.2) + (1)^2\,(0.5) + (3)^2\,(0.2) + (5)^2\,(0.1) - (1.6)^2$

$= 4.8 - 2.56 = 2.24$

10. Since, $Var(X) = E(X^2) - [E(X)]^2$

$\therefore$ $4 = 13 - [E(X)]^2$

$\therefore$ $[E(X)]^2 = 13 - 4 = 9$

$\therefore$ $E(X) = 3$

11. Since, $Var(X) = E(X^2) - [E(X)]^2$

$\therefore$ $6 = E(X^2) - (5)^2$

$\therefore$ $E(X^2) = 25 + 6 = 31$

12. Mean $= E(X) = \sum \ _i \cdot P(\ _i)$

$= \frac{1}{6}(1) + \frac{1}{3}(2) + \frac{1}{3}(3) + \frac{1}{6}(4)$

$= \frac{1}{6} + \frac{2}{3} + 1 + \frac{4}{6} = \frac{1+4+6+4}{6}$

$= \frac{2+16+36+32-75}{12}$

$= \frac{86-75}{12} = \frac{11}{12}$

13. $E(X) = 1\left(\frac{1}{7}\right) + 2\left(\frac{2}{7}\right) + 3\left(\frac{3}{7}\right) + 4\left(\frac{1}{7}\right) = \frac{18}{7}$

$E(X^2) = (1^2)\left(\frac{1}{7}\right) + (2^2)\left(\frac{2}{7}\right) + (3^2)\left(\frac{3}{7}\right) + (4^2)\left(\frac{1}{7}\right)$

$= \frac{1}{7} + \frac{8}{7} + \frac{27}{7} + \frac{16}{7} = \frac{52}{7}$

∴ $Var(X) = E(X^2) - [E(X)]^2$

$= \frac{52}{7} - \left(\frac{18}{7}\right)^2 = \frac{40}{49}$

14. $P(1 < X < 3) = \int_1^3 f(\ )d$

$= \int_3^4 \frac{}{8} d \ = \frac{1}{8}\left[\frac{^2}{2}\right]_3^4 = \frac{7}{16}$

18. Since, f( ) is the p.d.f. of X.

∴ $\int_{-\infty}^{\infty} f(\ )\ d \ = 1$

$\Rightarrow \int_0^2 k\ ^2 d \ = 1 \Rightarrow k\left[\frac{^3}{3}\right]_0^2 = 1$

$\Rightarrow k\left[\frac{8}{3}\right] = 1 \Rightarrow k = \frac{3}{8}$

19. The c.d.f. of X is

$F(\ ) = \int_{-1} \frac{^2}{3} d \ = \frac{1}{3}\left[\frac{^3}{3}\right]_{-1}$

$= \frac{1}{3}\left(\frac{^3}{3} + \frac{1}{3}\right) = \frac{^3}{9} + \frac{1}{9}$

Critical Thinking

1. The sum of all the probabilities in a probability distribution is always unity.
In option (A), we have 0.3 + 0.2 + 0.4 + 0.1 = 1

2. Since, $\sum_{=1}^{4} P(X = \ ) = 1$

∴ k + 2k + 3k + 4k = 1

$\Rightarrow$ 10k = 1 $\Rightarrow k = \frac{1}{10}$

Now, P (X < 3) = P (X = 1) + P (X = 2)
= k + 2k

$= 3k = 3\left(\frac{1}{10}\right) = 0.3$

3. Since, $\sum_{=0}^{4} P(X = \ ) = 1$

∴ k + 3k + 5k + 2k + k = 1

$\Rightarrow$ 12 k = 1 $\Rightarrow k = \frac{1}{12}$

Now, P (X ≥ 2) = P (X=2) + P (X=3) + P (X=4)
= 5k + 2k + k

$= 8k = 8\left(\frac{1}{12}\right) = \frac{2}{3}$

4. Since, $\sum_{=0}^{6} P(X = \ ) = 1$

∴ k + 3k + 5k + 7k + 9k + 11k + 13k = 1

$\Rightarrow 49k = 1 \Rightarrow k = \frac{1}{49}$

∴ P(0 < X < 4)
= P(X = 1) + P(X = 2) + P(X = 3)

$= 3k + 5k + 7k = 15k = \frac{15}{49}$

5. P(X is odd)
= P(X = –3) + P(X = –1) + P(X = 1)+ P(X = 3)
= 0.05 + 0.15 + 0.25 + 0.10 = 0.55

6.

X =	0	1	2	3	4
P(X =)	k	4k	6k	4k	k

Since, $\sum_{=0}^{4} P(X = \ ) = 1$

∴ k + 4k + 6k + 4k + k = 1

$\Rightarrow$ 16k = 1

$\Rightarrow k = \frac{1}{16}$

7. Since, $\sum_{=0}^{7} P(X = \ ) = 1$

$\therefore$ $0 + P + 2P + 2P + 3P + P^2 + 2P^2 + 7P^2 + P = 1$

$\therefore$ $10P^2 + 9P - 1 = 0$

$\therefore$ $(P + 1)(10P - 1) = 0$

$\therefore$ $P = \frac{1}{10}$ ....[$\because$ $P \geq 0$, $\therefore$ $P + 1 \neq 0$]

8. Since, $\sum_{=0}^{2} P(X = \ ) = 1$

$\therefore$ $3k^3 + 4k - 10k^2 + 5k - 1 = 1$

$\Rightarrow 3k^3 - 10k^2 + 9k - 2 = 0$

$\Rightarrow (k - 1)(k - 2)(3k - 1) = 0$

$\Rightarrow k = 1$ or $k = 2$ or $k = \frac{1}{3}$

For k = 1 or k = 2, P (X = 1) < 0, which is not possible.

$\therefore$ $k = \frac{1}{3}$

9. Since, $\sum_{=1}^{5} P(X = \ ) = 1$

$\therefore$ $\frac{1}{20} + \frac{3}{20} + a + b + \frac{1}{20} = 1$

$\Rightarrow a + b = 1 - \frac{5}{20}$

$\Rightarrow a + 2a = 1 - \frac{1}{4}$ ....[$\because$ b = 2a (given)]

$\Rightarrow 3a = \frac{3}{4}$

$\Rightarrow a = \frac{1}{4}$ and $b = 2\left(\frac{1}{4}\right) = \frac{1}{2}$

10. The probability distribution of X is

X	0	1	2	3	4
P(X)	0.1	k	2k	2k	k

Since, $\sum_{=0}^{4} P(X = \ ) = 1$

$\Rightarrow 0.1 + k + 2k + 2k + k = 1$

$\Rightarrow 6k = 0.9$ $\Rightarrow k = 0.15$

11. Let $P(X = {}_3) = k$. Then $P(X = {}_1) = \frac{k}{2}$,

$P(X = {}_2) = \frac{k}{3}$, $P(X = {}_4) = \frac{k}{5}$

Since, $P(X = {}_1) + P(X = {}_2) + P(X = {}_3) + P(X = {}_4) = 1$

$\therefore$ $\frac{k}{2} + \frac{k}{3} + k + \frac{k}{5} = 1$ $\Rightarrow k = \frac{30}{61}$

$\therefore$ option (A) is the correct answer.

12. Let X denotes the number of heads.

Thus, the possible values of X are 0, 1, 2 and 3.

$P(X = 0)$ = P(getting no head)

= P(TTT) = $\frac{1}{8}$

$P(X = 1)$ = P(getting one head)

= P(HTT, THT, TTH) = $\frac{3}{8}$

$P(X = 2)$ = P(getting two heads)

= P(HHT, THH, HTH) = $\frac{3}{8}$

$P(X = 3)$ = P(getting three heads)

= P(HHH) = $\frac{1}{8}$

$\therefore$ Option (D) is the correct answer.

13. Let X denote the number of red balls drawn from the bag. There are 4 red balls and X can take values 0, 1, 2 and 3.

P(X = 0) = Probability of getting no red ball

$= \frac{{}^{6}C_3}{{}^{10}C_3} = \frac{1}{6}$

P(X = 1) = Probability of getting one red ball

$= \frac{{}^{4}C_1 \times {}^{6}C_2}{{}^{10}C_3} = \frac{1}{2}$

P(X = 2) = Probability of getting two red balls

$= \frac{{}^{4}C_2 \times {}^{6}C_1}{{}^{10}C_3} = \frac{3}{10}$

P(X = 3) = Probability of getting three red balls

$= \frac{{}^{4}C_3}{{}^{10}C_3} = \frac{1}{30}$

14. Let X denote the number of defective mangoes from the bag. X can take values 0, 1, 2, 3 and 4.

P(X = 0) = Probability of getting no defective

mango $= \frac{{}^{15}C_4}{{}^{20}C_4} = \frac{91}{323}$

P(X = 1) = Probability of getting one defective

mango $= \frac{{}^{5}C_1 \times {}^{15}C_3}{{}^{20}C_4} = \frac{455}{969}$

P(X = 2) = Probability of getting two defective mangoes = $\frac{{}^{5}C_2 \times {}^{15}C_2}{{}^{20}C_4} = \frac{70}{323}$

P(X = 3) = Probability of getting three defective mangoes $= \frac{{}^{5}C_3 \times {}^{15}C_1}{{}^{20}C_4} = \frac{10}{323}$

P(X = 4) = Probability of getting four defective mangoes = $\frac{{}^{5}C_4}{{}^{20}C_4} = \frac{1}{969}$

15. P(= 2) = F(2) – F(1) = 0.43 – 0.18 = 0.25
P(= 3) = F(3) – F(2) = 0.54 – 0.43 = 0.11
P(= 4) = F(4) – F(3) = 0.68 – 0.54 = 0.14
∴ P(1 < < 5) = P(= 2) + P(= 3) + P(= 4)
= 0.25 + 0.11 + 0.14 = 0.50

16. P(X = 1) = F(1) – F(0) = 0.65 – 0.5 = 0.15
P(X = 3) = F(3) – F(1) = 0.75 – 0.65 = 0.10
P(X = 5) = 0.85 – 0.75 = 0.10
P(X = 7) = 0.90 – 0.85 = 0.05
P(X = 9) = 1 – 0.90 = 0.10
∴ P (X ≤ 3|X > 0)

$$= \frac{P(X=1)+P(X=3)}{P(X=1)+P(X=3)+P(X=5)+P(X=7)+P(X=9)}$$

$$= \frac{0.15+0.1}{0.15+0.1+0.1+0.05+0.1}$$

$$= \frac{0.25}{0.50} = \frac{1}{2}$$

17. The sum of all the probabilities in a probability distribution is always unity.

18. The sum of all the probabilities in a probability distribution is always unity.
∴ 0.2 + 0.1 + 0.3 + k = 1
∴ k = 1 – 0.6 = 0.4
E(X) = $\sum {}_{i} \cdot P({}_{i})$
= 1(0.2) + 2(0.1) + 3(0.3) + 4(0.4)
= 0.2 + 0.2 + 0.9 + 1.6 = 2.9
Var(X) = E(X^2) – [E (X)]^2
= $(1)^2$ (0.2) + $(2)^2$ (0.1) + $(3)^2$ (0.3)
+ $(4)^2$ (0.4) – $(2.9)^2$
= 0.2 + 0.4 + 2.7 + 6.4 – 8.41
= 9.7 – 8.41 = 1.29

19. The sum of all the probabilities in a probability distribution is always unity.
∴ k + 3k + 3k + k = 1

20. Mean = E(X) = $\sum {}_{i}.P({}_{i})$

∴ S.D. = 1

21. The p.m.f. of the r.v. X is as follows:

X =	–1	0	1	2
P(X =)	$\frac{2}{5}$	$\frac{3}{10}$	$\frac{1}{5}$	$\frac{1}{10}$

22.

$P(F) = P(X < 4)$

$= P(X = 1) + P(X = 2) + P(X = 3)$

$= 0.15 + 0.23 + 0.12 = 0.50$

$P(E \cap F) = P(X \text{ is a prime number less than } 4)$

$= P(X = 2) + P(X = 3)$

$= 0.23 + 0.12 = 0.35$

$\therefore$ $P(E \cup F) = P(E) + P(F) - P(E \cap F)$

$= 0.62 + 0.50 - 0.35 = 0.77$

4. Here, $\frac{1+3p}{4}$, $\frac{1-p}{4}$, $\frac{1+2p}{4}$ and $\frac{1-4p}{4}$ are probabilities when X takes values –1, 0, 1 and 2 respectively. Therefore, each is greater than or equal to 0 and less than or equal to 1.

i.e., $0 \leq \frac{1+3p}{4} \leq 1$, $0 \leq \frac{1-p}{4} \leq 1$,

$0 \leq \frac{1+2p}{4} \leq 1$ and $0 \leq \frac{1-4p}{4} \leq 1$

$\Rightarrow -\frac{1}{3} \leq p \leq \frac{1}{4}$

$\text{Mean}(X) = -1 \times \frac{1+3p}{4} + 0 \times \frac{1-p}{4} + 1 \times \frac{1+2p}{4} + 2 \times \frac{1-4p}{4}$

$= \frac{2-9p}{4}$

Now, $-\frac{1}{3} \leq p \leq \frac{1}{4}$

$\Rightarrow 3 \geq -9p \geq -\frac{9}{4}$

$\Rightarrow -\frac{1}{4} \leq 2 - 9p \leq 5$

$\Rightarrow -\frac{1}{16} \leq \frac{2-9p}{4} \leq \frac{5}{4}$

5. $P(X > 1.5) = \int_{1.5}^{2} \frac{\ }{2} d\ = \left[\frac{\ ^2}{4}\right]_{1.5}^{2} = 0.4375$

and $P(X > 1) = \int_{1}^{2} \frac{\ }{2} d\ = \left[\frac{\ ^2}{4}\right]_{1}^{2} = 0.75$

$\therefore$ $P\left(\frac{X>1.5}{X>1}\right) = \frac{P(X>1.5)}{P(X>1)} = \frac{0.4375}{0.75} = \frac{7}{12}$

6. $P(X = \ _i) = ki$, where $1 \leq i \leq 10$

$\therefore$ $\sum P(X = \ _i) = 1$

$\Rightarrow (1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 + 10)k = 1$

$\Rightarrow k = \frac{1}{55}$

7. We have, $\sum_{\ =0}^{\infty} P(X = \ ) = 1$

$\Rightarrow k \sum_{\ =0}^{\infty} (\ +1)\left(\frac{1}{5}\right)^{\ } = 1$

$\Rightarrow k\left[1 + 2\left(\frac{1}{5}\right) + 3\left(\frac{1}{5}\right)^2 + 4\left(\frac{1}{5}\right)^3 + ...\right] = 1$

$\Rightarrow k\left[\frac{1}{1-\frac{1}{5}} + \frac{1 \times \frac{1}{5}}{\left(1-\frac{1}{5}\right)^2}\right] = 1$

....$\left[\because\ a + (a+d)r + (a+2d)r^2 + ... = \frac{a}{1-r} + \frac{dr}{(1-r)^2}\right]$

$\Rightarrow k\left(\frac{5}{4} + \frac{5}{16}\right) = 1$

$\Rightarrow \frac{25k}{16} = 1$

$\Rightarrow k = \frac{16}{25}$

$\therefore$ $P(X = 2) = {}^8C_2\left(\frac{1}{2}\right)^2\left(\frac{1}{2}\right)^6$

$= 28.\frac{1}{2^8} = \frac{28}{256}$

28. E(X) = 5 and Var (X) = 2.5

$\Rightarrow np = 5$ and $npq = 2.5$

$\Rightarrow p = \frac{1}{2}, q = \frac{1}{2}$ and $n = 10$

$\therefore$ $P(X < 1) = P(X = 0)$

$= {}^{10}C_0\left(\frac{1}{2}\right)^0\left(\frac{1}{2}\right)^{10} = \left(\frac{1}{2}\right)^{10}$

29. E(X) = 6 and V(X) = 2

$\Rightarrow np = 6$ and $npq = 2$

$\Rightarrow q = \frac{1}{3}, p = \frac{2}{3}$ and $n = 9$

$P(5 \le X \le 7) = P(X = 5) + P(X = 6) + P(X = 7)$

$= {}^9C_5\left(\frac{2}{3}\right)^5\left(\frac{1}{3}\right)^4 + {}^9C_6\left(\frac{2}{3}\right)^6\left(\frac{1}{3}\right)^3 + {}^9C_7\left(\frac{2}{3}\right)^7\left(\frac{1}{3}\right)^2$

$= \frac{2^5}{3^9}[126 + 168 + 144]$

$= \frac{2^5 \times 438}{3^9} = \frac{2^5 \times 146}{3^9} = \frac{4672}{6561}$

30. Probability of getting a success, $p = \frac{1}{4}$

Probability of not getting success, $q = \frac{3}{4}$

Standard deviation = $\sqrt{\text{Variance}}$

$\Rightarrow$ Variance = 9

$\Rightarrow npq = 9 \Rightarrow n.\frac{1}{4}.\frac{3}{4} = 9 \Rightarrow n = 48$

Mean = $np = \frac{1}{4} \times 48 = 12$

31. Let X = Number of heads appear in n tosses

$X \sim B\left(n, \frac{1}{2}\right)$

Now, $P(X \ge 1) = 1 - P(X = 0) = 1 - \frac{1}{2^n}$

Since, $P(X \ge 1) \ge 0.9$

$\therefore$ $1 - \frac{1}{2^n} \ge 0.9$

$\Rightarrow \frac{1}{2^n} \le \frac{1}{10} \Rightarrow 2^n \ge 10 \Rightarrow n \ge 4$

$\therefore$ minimum number of tosses = 4

Evaluation Test

1. We have, $p = \frac{10}{100} = \frac{1}{10}$

$\therefore$ $q = 1 - \frac{1}{10} = \frac{9}{10}$

According to the given condition,

$P(X \ge 1) \ge \frac{50}{100}$

$\Rightarrow 1 - P(X = 0) \ge \frac{1}{2}$

$\Rightarrow P(X = 0) \le \frac{1}{2}$

$\Rightarrow \left(\frac{9}{10}\right)^n \le \frac{1}{2}$,

which is possible if n is at least 7.

$\therefore$ n = 7

2. $P(X = 1) = 8 . P(X = 3)$, if $n = 5$

$\Rightarrow {}^5C_1 q^4 p^1 = 8. {}^5C_3 q^2 p^3$

$\Rightarrow \frac{5q^2}{p^2} = 8(10) \Rightarrow \frac{q^2}{p^2} = 16$

$\Rightarrow q = 4p$

$\Rightarrow 1 - p = 4p$

$\Rightarrow 5p = 1 \Rightarrow p = \frac{1}{5}$

3. $P(X = 0) = \frac{16}{81}$

$\Rightarrow {}^4C_0 p^0 q^4 = \frac{16}{81} \Rightarrow q^4 = \left(\frac{2}{3}\right)^4$

$\Rightarrow q = \frac{2}{3} \Rightarrow p = \frac{1}{3}$

$\therefore$ $P(X = 4) = {}^4C_4 p^4 q^0 = p^4 = \left(\frac{1}{3}\right)^4 = \frac{1}{81}$

4. Here $p = \frac{3}{6} = \frac{1}{2}$

and $q = 1 - p = 1 - \frac{1}{2} = \frac{1}{2}$

$n = 100$

$\therefore$ variance $= npq = 100 \times \frac{1}{2} \times \frac{1}{2} = 25$

5. Here $n = 8$,

p = Probability of getting 1 or 3 $= \frac{2}{6} = \frac{1}{3}$

$\therefore$ $q = 1 - \frac{1}{3} = \frac{2}{3}$

$\therefore$ S.D. $= \sqrt{npq} = \sqrt{8 \times \frac{1}{3} \times \frac{2}{3}} = \sqrt{\frac{16}{9}} = \frac{4}{3}$

6. Let X denote the number of failures in 5 trials.
Then, $P(X = r) = {}^5C_r (1 - p)^r p^{5-r}$; $r = 0,1,2,...., 5$

$\therefore$ $P(X \geq 1) \geq \frac{31}{32}$

$\Rightarrow 1 - P(X = 0) \geq \frac{31}{32}$

$\Rightarrow 1 - p^5 \geq \frac{31}{32}$

$\Rightarrow \frac{1}{32} \geq p^5$

$\Rightarrow p \leq \frac{1}{2} \Rightarrow p \in \left[0, \frac{1}{2}\right]$

7. Required probability

$= {}^3C_0\left(\frac{1}{2}\right)^3 \times {}^3C_0\left(\frac{1}{2}\right)^3 + {}^3C_1\left(\frac{1}{2}\right)^3 \times {}^3C_1\left(\frac{1}{2}\right)^3$

$+ {}^3C_2\left(\frac{1}{2}\right)^3 \times {}^3C_2\left(\frac{1}{2}\right)^3 + {}^3C_3\left(\frac{1}{2}\right)^3 \times {}^3C_3\left(\frac{1}{2}\right)^3$

$= (1 + 9 + 9 + 1) \times \frac{1}{8} \times \frac{1}{8} = \frac{5}{16}$

8. P(at least one success) $\geq \frac{9}{10}$

$\Rightarrow P(X \geq 1) \geq \frac{9}{10}$

$\Rightarrow 1 - P(X = 0) \geq \frac{9}{10}$

$\Rightarrow P(X = 0) \leq \frac{1}{10}$

$\Rightarrow {}^nC_0\left(\frac{1}{4}\right)^0\left(\frac{3}{4}\right)^n \leq \frac{1}{10}$

$\Rightarrow \left(\frac{3}{4}\right)^n \leq \frac{1}{10}$

$\Rightarrow \left(\frac{4}{3}\right)^n \geq 10$

$\Rightarrow n\log_{10}\left(\frac{4}{3}\right) \geq \log_{10} 10$

$\Rightarrow n(\log_{10} 4 - \log_{10} 3) \geq 1$

$\Rightarrow n \geq \frac{1}{\log_{10} 4 - \log_{10} 3}$

9. According to the given condition,
$np + npq = 15$ and $(np)^2 + (npq)^2 = 117$

$\therefore$ $\frac{n^2p^2(1+q^2)}{(np+npq)^2} = \frac{117}{15^2}$

$\Rightarrow \frac{1+q^2}{(1+q)^2} = \frac{117}{225}$

$\Rightarrow 6q^2 - 13q + 6 = 0 \Rightarrow q = \frac{2}{3}$

$\therefore$ $p = 1 - \frac{2}{3} = \frac{1}{3}$

Since, $np + npq = 15$

$\Rightarrow n \times \frac{1}{3} + n \times \frac{2}{9} = 15$

$\Rightarrow n = 27$

$\therefore$ mean $= np = 27 \times \frac{1}{3} = 9$

10. P(getting head) = p = $\frac{1}{2}$

∴ $q = 1 - \frac{1}{2} = \frac{1}{2}$

Here, $P(X = r) = {}^nC_r p^r q^{n-r} = {}^nC_r \left(\frac{1}{2}\right)^r \left(\frac{1}{2}\right)^{n-r}$

$= {}^nC_r \left(\frac{1}{2}\right)^n$

Since, P(X= 4), P(X= 5) and P(X= 6) are in A.P.

$\Rightarrow 2P(X = 5) = P(X = 4) + P(X = 6)$

$\Rightarrow 2\,{}^nC_5 \left(\frac{1}{2}\right)^n = {}^nC_4 \left(\frac{1}{2}\right)^n + {}^nC_6 \left(\frac{1}{2}\right)^n$

$\Rightarrow 2\,{}^nC_5 = {}^nC_4 + {}^nC_6$

$\Rightarrow 2\frac{n!}{5!(n-5)!} = \frac{n!}{4!(n-4)!} + \frac{n!}{6!(n-6)!}$

$\Rightarrow \frac{2}{5(n-5)} = \frac{1}{(n-4)(n-5)} + \frac{1}{6 \times 5}$

$\Rightarrow n^2 - 21n + 98 = 0$

$\Rightarrow (n - 7)(n - 14) = 0$

$\Rightarrow n = 7$ or 14

11. Let the probability of success and failure be p and q respectively.

∴ p = 2q

Since, p + q = 1

∴ $3q = 1 \Rightarrow q = \frac{1}{3}$

∴ $p = 1 - \frac{1}{3} = \frac{2}{3}$

∴ required probability

$= {}^6C_4 \left(\frac{2}{3}\right)^4 \left(\frac{1}{3}\right)^2 + {}^6C_5 \left(\frac{2}{3}\right)^5 \left(\frac{1}{3}\right) + {}^6C_6 \left(\frac{2}{3}\right)^6 \left(\frac{1}{3}\right)^0$

$= \frac{240}{729} + \frac{192}{729} + \frac{64}{729} = \frac{496}{729}$

12. Mean = np and variance = npq

∴ np = 20 and npq = 16

∴ $20q = 16 \Rightarrow q = \frac{4}{5}$

∴ $p = 1 - \frac{4}{5} = \frac{1}{5}$

Since, np = 20

∴ $n \times \frac{1}{5} = 20 \Rightarrow n = 100$
