

# HyperRESEARCH and Chapter 12 – Organizing Data for Interrogation

Chapter 12 discusses the variety of ways organisation of data can happen and the importance of particular organizing tools to enable different levels and complexity of interrogation. Chapter 6 discussed basic structures like folders which enable simple tidying up and filtering. This chapter takes the subject further and focuses on the need to assign multiple variables or attributes to each respondent or case, so that comparing within or across cases can happen via combinations of data and subset characteristics if required. *See all coloured illustrations (from the book) of software tasks and functions, numbered in chapter order.*

Sections included in the chapter:

- Illustrating the potential for interrogation

- Timing, when to put organisational structures in place

- Organising whole documents

- Organising parts of documents

- Auto coding structures in documents

## Chapter 12 Exercises: Organising data to known characteristics

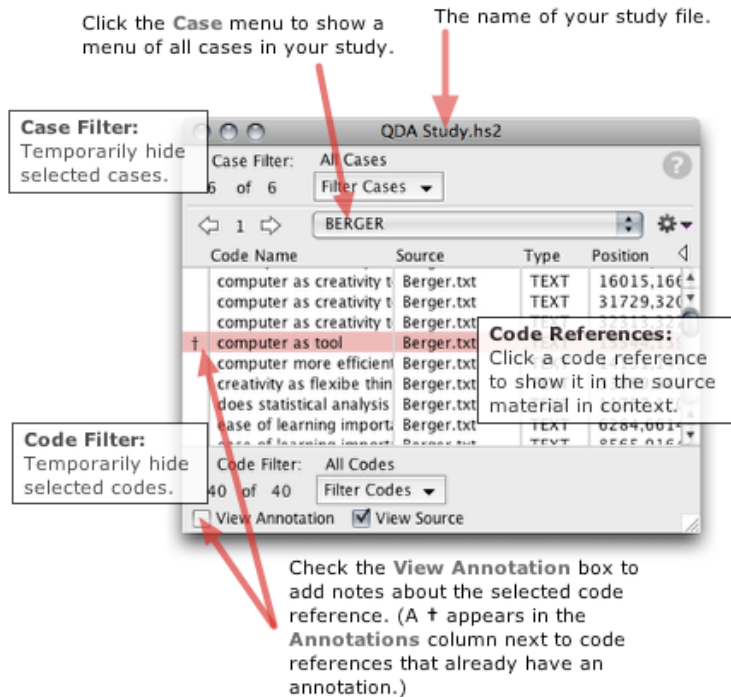

HyperRESEARCH's case-based structure makes it easy to organize your data in any way you wish.

### What's a case?

A case is the atomic unit of your study, the basic unit of analysis you are studying. How you define what a “case” is will depend on the nature of your study.

During the coding process, you will be selecting source material and applying codes (and possibly annotations or memos) to that source material. Those codes are stored in the case shown in the Study Window at the time of coding, linked to the original source material and to the annotation.

## The Study Window up close

(For more about the study window, see the **Study Window** topic in the Help system.)

## Sample Study Organization Schemes

Using the Case A, Case B, and Case C sample data sets, here are some examples of how a researcher might organize cases and source files:

### Case-study – Young People’s Perceptions

In this study, each case could represent an individual. There would thus be eight cases, named according to the conventions used in naming the source files. Each case would have at least three source files coded to it, according to the respondent:

001-ENG-M-16

- INV-001-ENG-M-16 (optimal).docx
- PHO-001-ENG-M-16.docx
- VIG-001-ENG-M-16.docx

...

008-NL-M-15

- INV-008-NL-F-16.docx
- PHO-008-NL-F-16.docx
- VIG-008-NL-M-16.docx

and so on.

In addition to the interview, response to photos, and vignette data files for each respondent, the image file of each of the three photos could also be coded to each case. (In HyperRESEARCH, you can use any number of sources in a single case, and share sources across cases.)

Reviewing, coding, and annotating the Case A Literature files could be done using additional cases in the Young People's Perceptions study, or in a separate study file focusing mainly on the selected literature. Two or more studies can be combined at a later date using the "Import Other Study...." command. Or reports from each study can be generated and then coded into a third study as source material.

When analyzing the data by cases, you can use case filtering to focus on subsets of your data. Those subsets might include:

- English respondents
- Dutch respondents
- Males
- Females

### Case-study B – The Financial Crisis

Case B is a mixed-methods study that includes survey data.

With a wide array of source material (survey results, focus group transcripts, documents containing text and graphics from media sources, etc.) it can be difficult to decide how best to organize them within cases in a single study file -- or across multiple HyperRESEARCH studies.

One question to ask is: how finely detailed do you wish your analysis to be?

With Case B as an example, here are suggestions in increasing fineness of granularity:

Three cases, each case representing one of the following:

- Focus Groups
- Survey Respondents
- News and Articles

Thirteen cases, each case representing one of the following:

- Focus Groups (1 case per focus group: Retired Professionals, Employed Urban, Redundant Short Time, Employed Rural, Mixed Employed Urban)
- Survey Respondents by Employment Status (Employed, Employed Part Time, Self Employed, Retired, Unemployed)
- News / media reports by source (print, television, blogs)

Many cases, each representing a person or entity (but be aware that the finer the granularity of your cases and codes, the more work it will be to codify, categorize, and analyze!):

- 191 survey respondents

- 29 focus group participants
- As many cases as there are news sources analyzed (BBC, CNN, Economix, Guardian, Mirror, New York Times, Sun, etc.)

There are many other ways to organize your source material using HyperRESEARCH's case structure and code and case filtering tools.

Just remember that if you wish to compare A to B, then A and B should each be coded to a separate case. While it is possible to change your decisions involving cases and codes as you progress in your coding and analysis, planning your approach in advance of creating your study will save you time and aggravation.

### Case-study C – Coca Cola commercials

As Case C is an example of a longitudinal study, each case would represent a time period. The relevant commercials would be coded to the case representing the appropriate period. The other source files (History, About Us, Mission) would be coded to each case in turn, focusing on the images and text passages relevant to the time period represented by that case.

For example:

1960s

- 1960s Coca Cola commercial.mp4
- 1965 Black + White Beach.mp4
- History of Coca-Cola.docx
- Coca-cola - About Us Main.jpg
- Coca-cola - Mission.jpg

1970s

- 1971 I'd Like to Buy the World a Coke Commercial.mp4

....

2010s

- 2011 Coca-Cola Commercial Reasons To Believe 2011 (HD) English Version (Whatever Oasis).mp4
- 2012 Move to the Beat of London 2012 Commercial - 2 minutes.mp4
- History of Coca-Cola.docx
- Coca-cola - About Us Main.jpg
- Coca-cola - Mission.jpg

For information on coding audio or video files in HyperRESEARCH, please see the "Movie and Audio Source Window" topic in the Windows topic in the HyperRESEARCH Reference section of the Help system.

## Automatically Mapping Survey Data to Cases and Variable Codes

For a detailed look at the survey results by respondent, you can use the Mixed Methods Importer (a HyperRESEARCH plug-in tool available from Researchware). The Mixed Methods Importer can create a study with the survey data mapped to cases and codes.

Here's what the Mixed Methods Importer will do:

- Automatically build a study from your survey data
- Create a case for each respondent (or whatever field in the survey data you choose to be used as "Casename")
- Create a text source file for each case, with the survey labels and responses for that case in the text file
- Add Code Groups to your code book (one Code Group for each survey data field you flag to be treated as a "Filter") (e.g. "EMP STAT")
- Add Codes containing the variable responses to your "Filter" data fields to your code book (e.g. "EMP STAT - EMPLYD") and to the relevant code group
- Apply codes linking to the relevant portion of the text sources

This document is designed to complement your reading of [Silver & Lewins 2014: Using Software in Qualitative Research: A Step-by-Step Guide, Sage Publications, London](#) rather than as a stand-alone resource. Thanks to Ann Dupuis and ResearchWare for contributing. Christina Silver & Ann Lewins © SAGE Publications.

Custom File Settings...

**Import Setup**

Select a unique column for the Casenames and Filter or Ignore setting for each:

Column	Header Name	Code Prefix	Filter	Ignore	Casename
1	RESPONDENTS	RESPONDENTS	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="radio"/>
2	EMP STAT	EMP STAT	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
3	FAM CH	FAM CH	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
4	MARITAL	MARITAL	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
5	AGE GRP	AGE GRP	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
6	REGION	REGION	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
7	Q.1. JOB-SECURE	Q.1. JOB-SECURE	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
8	Q.2. HOW-AFF	Q.2. HOW-AFF	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
9	Q.3. FAULT	Q.3. FAULT	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
10	Q.3A COMMENTS FAULT	Q.3A COMMENTS FAULT	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
11	Q.4. HOLDS	Q.4. HOLDS	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
12	Q.4A. HOLDS OTHER COMMENTS	Q.4A. HOLDS OTHER COMMENTS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
13	Q.5 PURCHASES	Q.5 PURCHASES	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>
14	Q.5. COMMENT PURCHASES	Q.5. COMMENT PURCHASES	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>

**Import Options**

☐ Create a broad code for each Filterable Code

☒ Place Filterable Codes in Groups

Separate code prefixes from values with a: Dash [-]

Empty Values: ☒ Do Not Code ☐ Replace with: N/A

Apply Codes To: ☒ Just the Value ☐ Label and Value

Case Name Prefix: Survey -

**Import to a Study**

☐ Save the Imported Data to a Study File

☐ Save the Imported Data to a Study and Open the Study's Folder

☐ Save the Imported Data to a Study and Merge with the Current Study

☒ Save the Imported Data to a Study and Open it in place of the Current Study

Close Import...

You can choose to use the study created from the spreadsheet/survey data as a separate study focusing on the survey results, or combine it with the focus group and/or media releases material provided with Case B.

## Filtering Cases by Variable Codes (indicating socio-demographic information or other characteristics)

Case filters let you choose to work with only a subset of your cases, hiding the others temporarily. In this way, you can analyze subgroups and compare them. Use them with variable codes to select cases based on demographics or other coded attributes or characteristics.

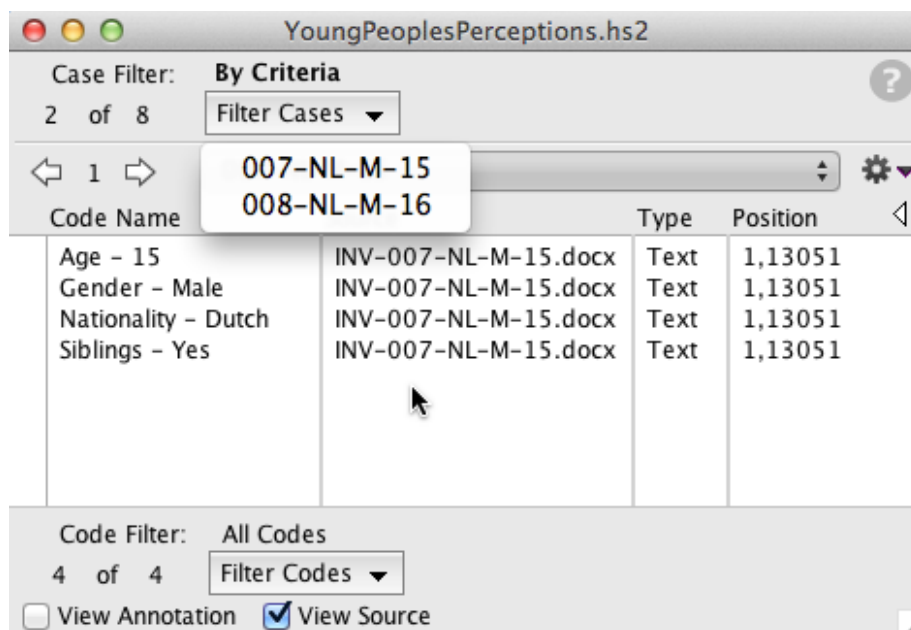

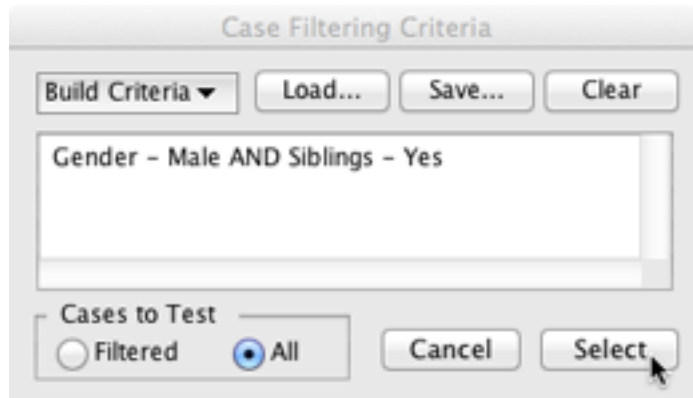

With case and code filters in place, you can browse your study and run reports (including code frequencies) containing only the subset of data you have filtered for.

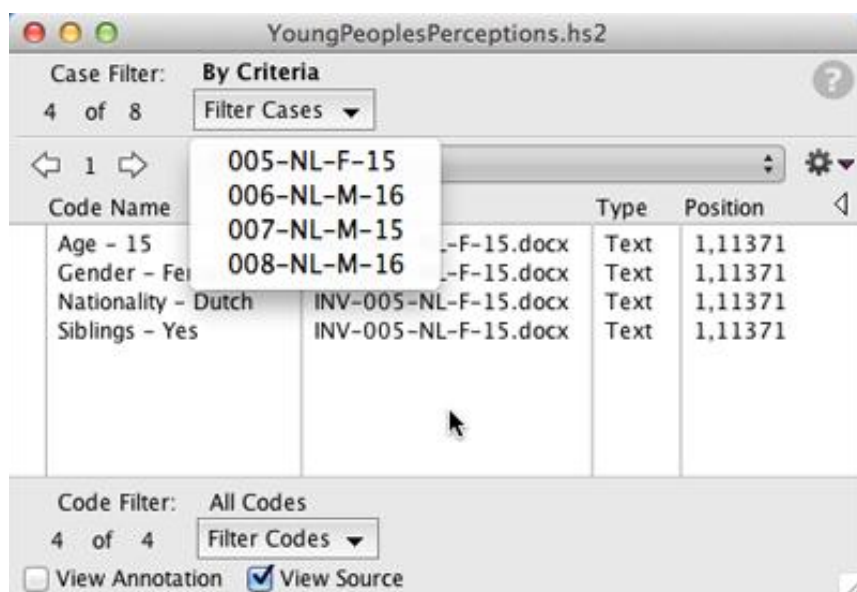

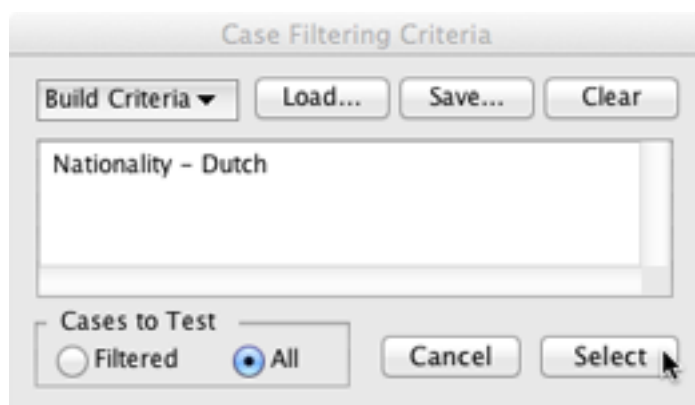

To filter cases, choose an option from the Cases Filter Cases submenu. You can filter cases by simply choosing their names, or by creating criteria based on your codes (so you can look at only cases that include a certain combination of

codes). There is no typing or syntax involved; you simply choose your codes from a list and then the appropriate Boolean operator (and, or, not) to build as complex an expression as necessary to filter a set of cases.

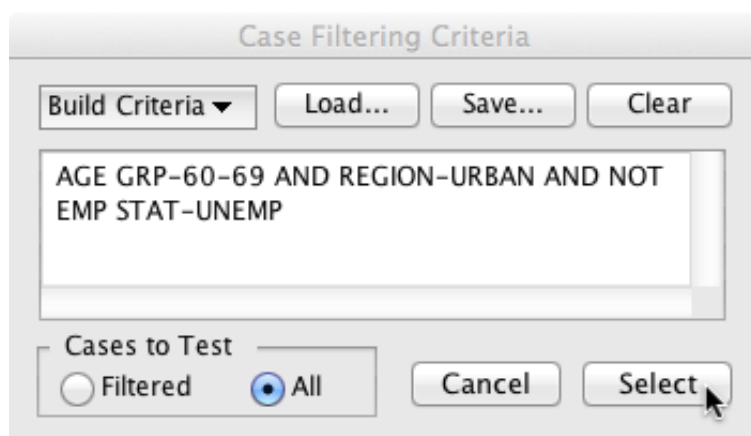

Examples of filtering criteria you can set up:

Case-study A – Young People's Perceptions

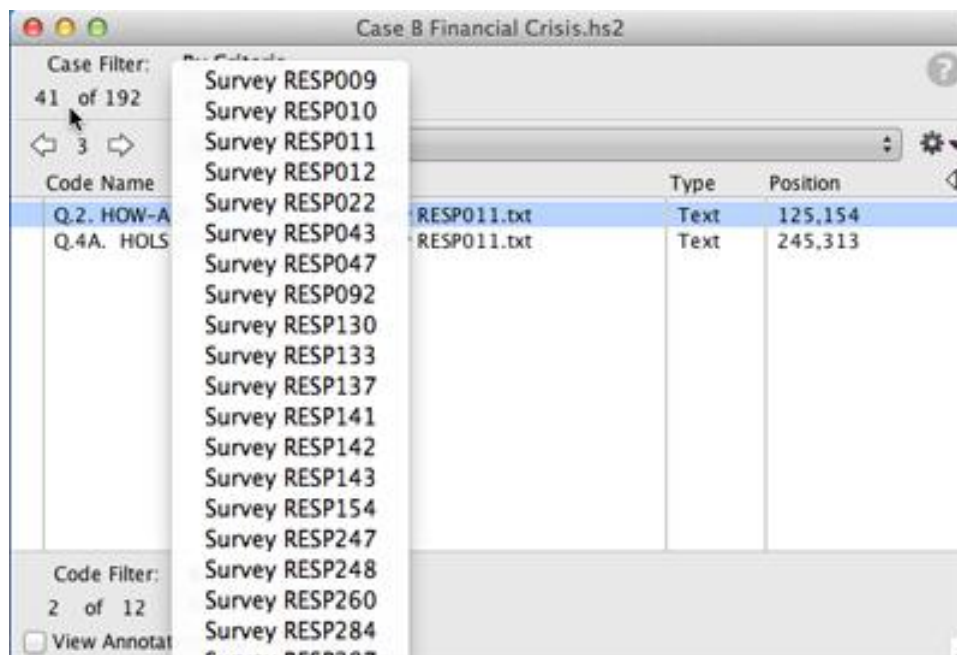

#### Case-study B – The Financial Crisis

## Filtering Codes

You can also filter codes. You can choose to work with only certain codes you select, or which match criteria you devise. Combine case and code filters to look at specific subsets of your cases and codes.

With case and code filters in place, you can build reports focusing on the specific data you are interested in. You can also browse the cases in the study window, examining only those cases and codes that pertain to your current focus within the data.

## Exercise 1: Organizing data where individual data files constitute units of analysis

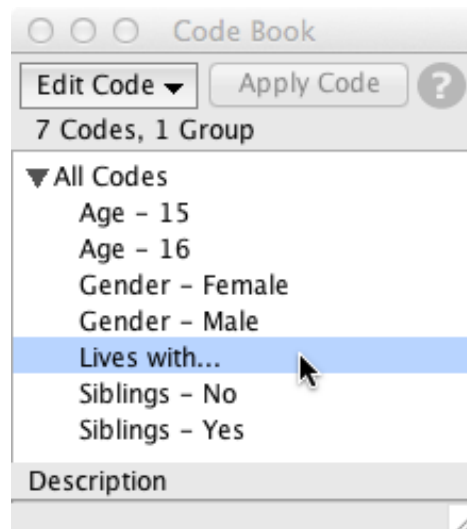

When creating a study where individual data files will each map to their own case (e.g. **Case-study A - Young People's Perceptions**), follow these steps:

1. Begin a new HyperRESEARCH study.
  - a. Launch HyperRESEARCH
  - b. Choose "Create New HyperRESEARCH Study" from the Welcome screen
  - c. Choose "Save As" from the File menu. Give the study file a meaningful name, (e.g. "Case-study A" or "Young People's Perceptions") and save it in a location you can find again easily)
2. Create cases
  - a. With the Untitled case showing in the Study Window, choose Cases --> Rename Case and change the name to the first respondent's name or identification code (e.g. "001-ENG-M-16")
  - b. Choose Cases --> New... and enter the name or id of the next respondent
  - c. Create additional cases as necessary:

001-ENG-M-16  
002-ENG-F-15  
003-ENG-M-16  
004-ENG-F-15  
005-NL-F-15  
006-NL-M-16  
007-NL-M-15  
008-NL-M-16

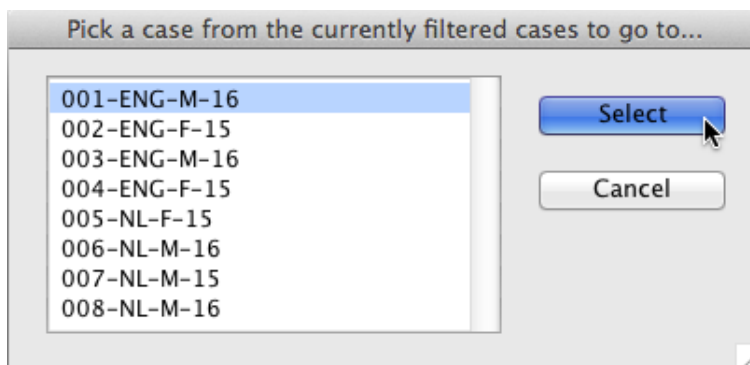

3. Create variable / demographic codes

- a. Click on the Code Book to make it the active window.
- b. Choose "New Code" from the drop-down menu at the top left of the code book
- c. Enter a variable code's name (e.g. "Gender - Male")
- d. Repeat until the variable / demographic codes you need are in your code book:

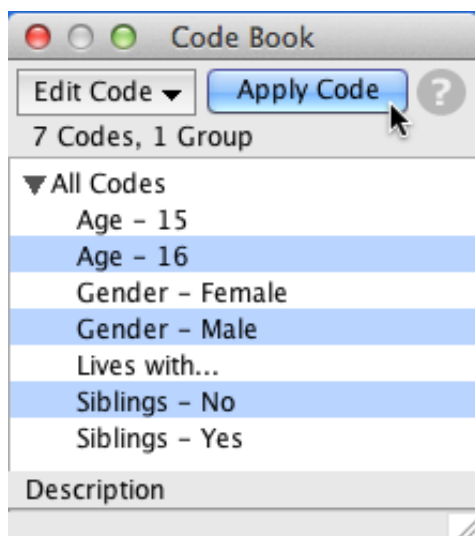

4. Add source files to Sources List

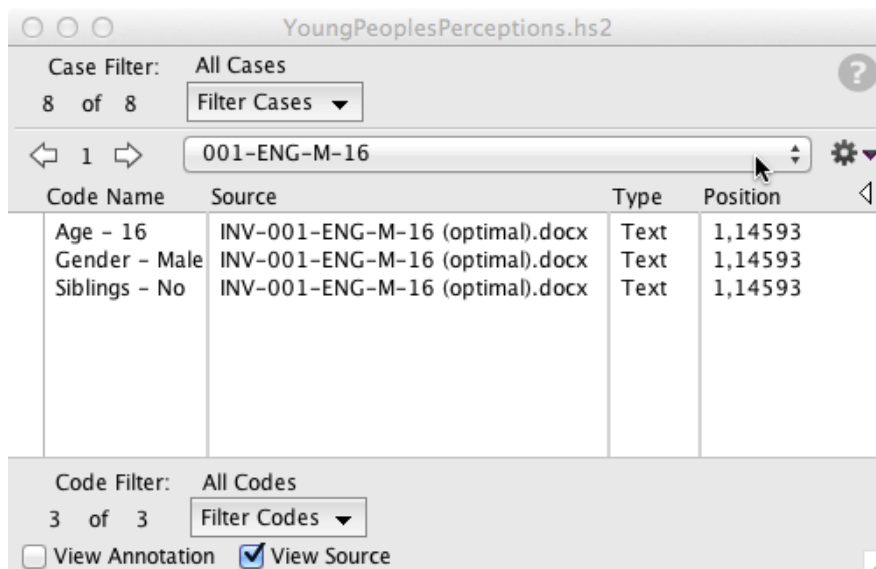

- a. Choose Sources List from the Sources menu
  - b. Use "Add New Source File...." to add the a source file, or "Add New Sources From Folder" if all of the relevant source files are in the same folder on your hard drive
5. Open a source file (double-click on the file name in the Sources List)
6. Navigate to relevant case (choose from the drop-down list of case at the top of the Study Window, or choose "Go to Case...." from the Cases menu)

7. With the correct source file open and the matching case showing in the Study Window, apply variable codes to source file as a whole
  - a. Click in the Source Window to make it the active window
  - b. Select the entire file: Edit --> Select All (keyboard shortcut: cmd-a for Mac, ctrl-a for Windows)
  - c. With the contents of the source file highlighted, select the relevant variable / demographic codes from the code book and click Apply Code (e.g. "Age - 16," "Gender - Male," "Siblings - No" for respondent 001-ENG-M-16)

HyperRESEARCH will apply the selected codes to the selected source material (e.g. the entire document). The codes will appear on the active case (e.g. 001-ENG-M-16) in the Study Window:

- d. Add annotations (memos) to the applied variable codes if you wish to record analytical insights related to the characteristics they represent.

**Note:** you don't necessarily need to do these steps in the order in which they're given. For example, you can create one case at a time, open its corresponding source file, and apply the appropriate variable codes (demographics, etc.) to the source file before moving on to repeat the process with the next case.

And of course you can begin coding the source files at any time with other codes (not just variable codes indicating demographics, etc.).

## Exercise 2: Where multiple data files combine to constitute a unit of analysis

To work with data files where you have multiple sources for a given unit of analysis (e.g. a respondent), simply open and code the additional data files to the relevant case.

If you will be using variable codes representing factual characteristics solely to select subsets of cases based on those characteristics, you can apply the variable codes (e.g. Gender, Age, and other demographic codes) to any of the source files you code to that particular case. Once the case is coded with "Gender - Male," for example, that case and all the codes applied to it can be included in any subset that includes "Gender - Male" as a characteristic.\*

If you wish to use variable codes to filter other codes using the proximity functions available in the Filter Codes by Criteria window (e.g. find all the codes where "Gender - Male" and "Attitudes/embarrassment" are applied to the same or overlapping source selections), then you should apply the variable codes to the full selection of each source file on the case (as in Exercise 1).

**\*Provided the case matches the other criteria in the Filter Cases By Criteria settings as well.**

### Exercise 3: Where changes over time need to be tracked

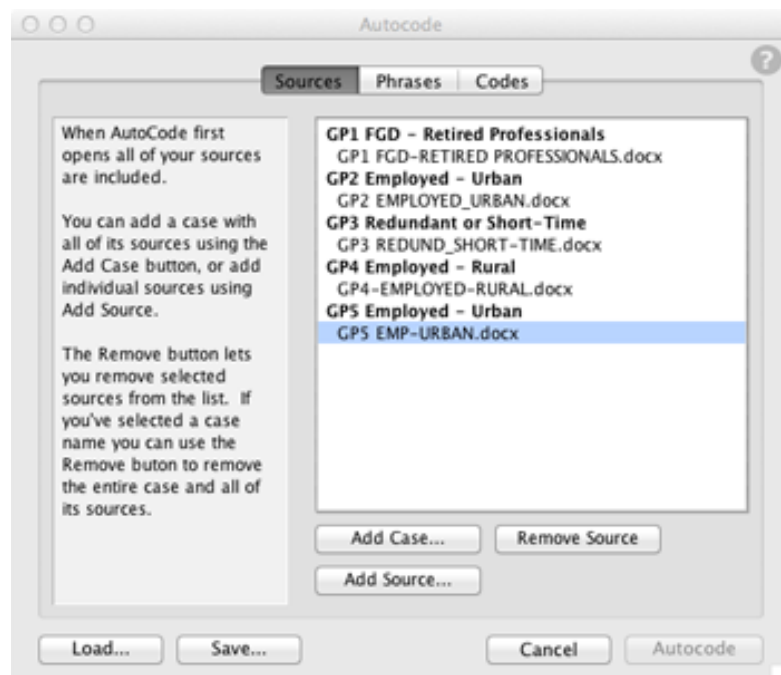

For longitudinal studies, organize cases and source files by time periods appropriate to your data and research question. If the source material in one document spans multiple time periods, simply code the relevant passages in each source file to the corresponding case (time period). You may apply variable codes (socio-demographic characteristics and the like) to the source material as in Exercises 1 and 2.

### Exercise 4: Organising parts of data files

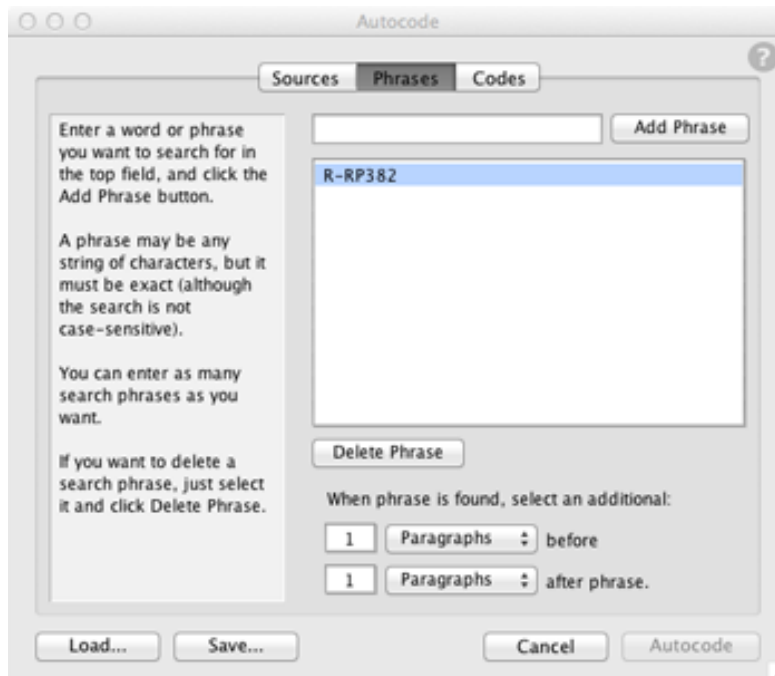

You can also use variable codes to differentiate source material within the same file by speaker or other characteristics. Select the passage corresponding to the speaker, and apply a code identifying the speaker. These identification codes will be especially useful when filtering codes based on code proximity functions (see "Code Relationship Functions" in the Analysis topic in the Help system). They will allow you to look at the intersection of the speaker id code and one other code (e.g. "Speaker: R-RP382" and "Security").

Use the Autocode feature to quickly apply identification codes to the passages of each speaker.

1. Choose "Autocode..." from the Codes menu.
2. Specify which source files will be coded to which cases.
  - a. Make sure all of the cases you wish to autocode are listed in the Sources tab of the Autocode window. (Use "Add Case" and "Remove Case" as needed to specify the cases you wish to include in the autocoding.)
  - b. Click on a case to select it, then use "Add Source...." to add a source file to that case." (If you have already coded some source files to your cases, those source files may already be assigned to the appropriate cases.) Continue adding source files to each case's Sources settings until you have assigned all the relevant source files for this autocoding session. (if you accidentally assign a source file to the wrong case, click on the source name and use Remove Source to remove it.)

3. Click on the "Phrases" tab to set up the Phrase you will be searching for (the exact phrase that identifies each speaker in the text). The first participant listed in the "GP1 FGD-RETIRED PROFESSIONALS.docx" file is identified as "R-RP382" in the text, so that is the phrase we will have Autocode search for.

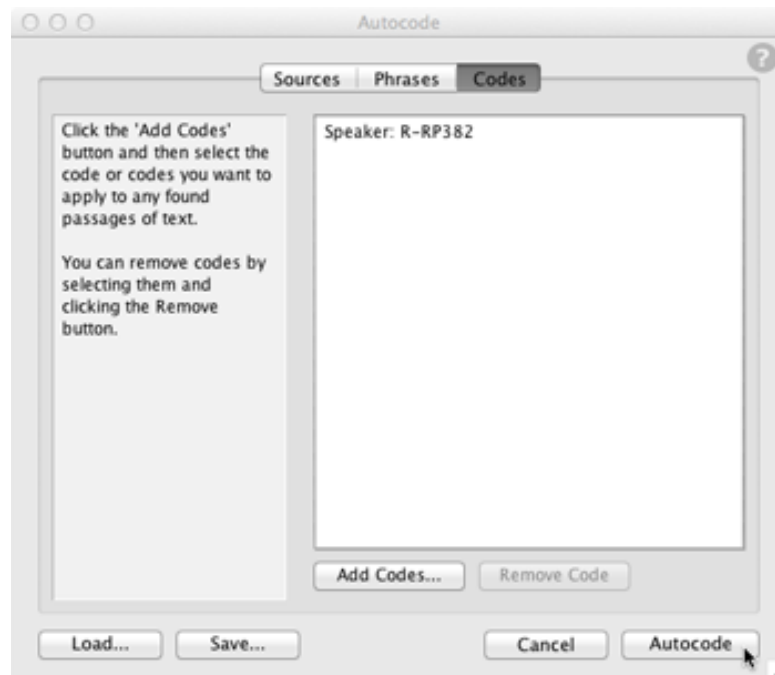

Since most of the responses from speakers in the focus groups are in the form of a single paragraph, set the "When phrase is found, select an additional:" option to one paragraph before and one paragraph after. This tells HyperRESEARCH to select the entire paragraph the searched-for phrase is found in.

**Note: A few of the participant responses appear in the text files as more than one paragraph. There are two ways to handle this situation:**

- a. Before beginning to code your source files, review and edit them to make sure that a respondent ID is associated with every paragraph; or
  - b. After Autocoding, review the results and manually add the appropriate ID code to any paragraphs that were missed due to the lack of the searched-for phrase present in that paragraph.
4. Click on the "Codes" tab to specify the code(s) to apply to the case. It's a good idea to prefix your ID codes with useful information (e.g. "Speaker: " or "Focus Group 1: ") followed by the actual identifying information (e.g. " R-RP382").
  - c. Use "Add Codes...." to call up the Code Selection dialog to select the code or codes you wish applied to the selected source material around every instance of the specified phrase. (Note: you can add additional variable codes such as "Gender: Male" in the same autocoding pass.)

If you haven't already created the appropriate ID codes in your code book, you can create the using the "New Code..." button in the Add Code dialog box.

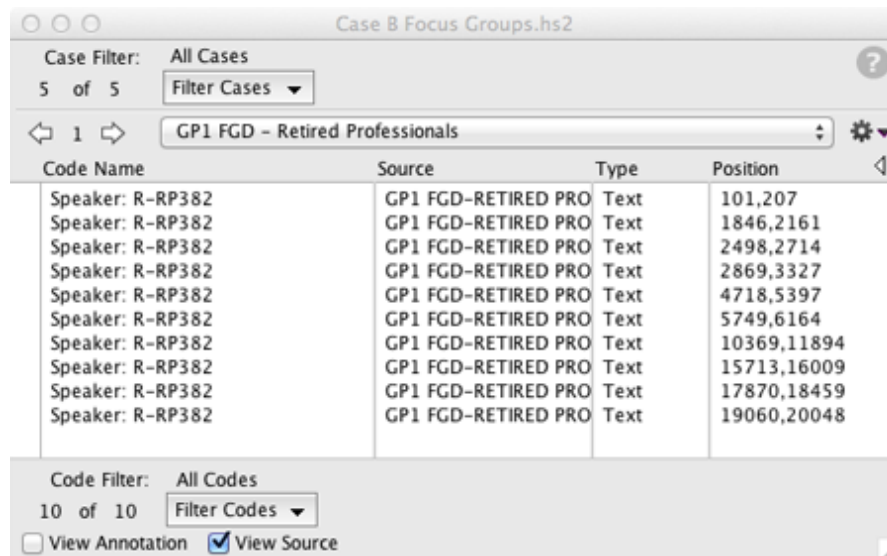

5. Once you have assigned the sources to your cases in the Sources tab, specified the phrase to search on, and added one or more codes to the Codes tab, click Autocode.

HyperRESEARCH will tell you how many codes have been automatically added to your study:

You can view the new references in the Study window:

The screenshot shows the HyperRESEARCH software interface. At the top, the window title is 'Case B Focus Groups.hs2'. Below the title bar, there is a 'Case Filter' section with 'All Cases' selected and '5 of 5' cases displayed. A 'Filter Cases' button is visible. Below this, a search bar contains 'GP1 FGD - Retired Professionals'. The main area is a table with four columns: 'Code Name', 'Source', 'Type', and 'Position'. The table lists 10 entries, all with 'Speaker: R-RP382' as the code name and 'GP1 FGD-RETIRED PRO' as the source. The positions range from 101,207 to 19060,20048. At the bottom, there is a 'Code Filter' section with 'All Codes' selected and '10 of 10' codes displayed. There are also checkboxes for 'View Annotation' (unchecked) and 'View Source' (checked).

Code Name	Source	Type	Position
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	101,207
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	1846,2161
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	2498,2714
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	2869,3327
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	4718,5397
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	5749,6164
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	10369,11894
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	15713,16009
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	17870,18459
Speaker: R-RP382	GP1 FGD-RETIRED PRO	Text	19060,20048

### Also See in HyperRESEARCH Help

These topics in the HyperRESEARCH Help and the User Guide may be helpful in completing the exercises for this chapter:

- Organization: Setting Up Your Study
- Coding: Coding Source Material
- Windows: Study window, Movie and Audio Source window, Autocode window
- Tools: Mixed Methods Importer (if installed)

To find a topic, choose Help > HyperRESEARCH Help and look through the list on the left side of the Help window.

Inevitably – data organization is all about enabling you to interrogate across or within cases or subsets.

See Chapter 13 to get an idea of the range of queries that are possible in HyperRESEARCH.

### Also See in HyperRESEARCH Help
