## PRICE GUARANTEE

Since 1981, we have led the industry by continuing to offer the lowest national prices while providing quality service. Many companies have come and gone trying to imitate our quality and service. If by some oversight we do not have the lowest prices advertised on the products you desire, then we would appreciate the opportunity to rectify this oversight.

- Your card is not charged until we ship

## 800 4 PIECE BOARD SET

Includes Main Board, Power Supply Assembly, CPU Module and 10K Revision B Operating System Module. All boards are new, tested and complete with all components.

**\$2850**

## 1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor etc. Just plug in, no difficult alignments or adjustments required.

**\$4750**

## SUPRA

### 2400 BAUD MODEM

Fully Hayes Compatible. High quality. Works with all Atari's. 8 bit requires interface.

**\$15795**

## POWER PACKS

Exact replacement transformer for 800/400, 1050, 810, 1200XL, 850 and 1020 units. Replaces older "weaker" units. Atari part #CO17945.

**\$1450**

## 400 3 PIECE BOARD SET

Includes Main Board, Power Supply Assembly and CPU Module. All boards are new, tested and complete with all components.

**\$1950**

400 Membrane Keyboard \$12.50

## 810 DISK DRIVE PARTS

Sideboard with Data Sep. .... \$44.95  
Analog Board ..... \$19.50  
Rear Power Board (New Style) ... \$35.00  
Rear/Analog Set (Upgrade) .... \$47.50  
Complete Set (New Style) ..... \$67.50  
Board set includes instructions for using a Tandon TM-100-1 or MPI B-5 mechanics to build your own disk drive. (Mechanics NOT included or avail. from us)

## ATARIWRITER CARTRIDGE

Popular cartridge version turns any 8 bit Atari into a powerful word processor. Written by Atari. Disk drive supported but not required.

For all Atari's except ST **\$2995**

## 600XL 64K UPGRADE

Easy to install internal modification allows you to hook up a disk drive and run all 800XL software. Kit includes all parts and detailed instructions. Soldering required to install 3 jumpers.

**\$2995**

## 800 10K "B" O.S. Module

Older 800 units need the revision "B" Operating system to run newer software. Type the following peek in BASIC to see which revision you have. PRINT PEEK(58383).

**\$950**

If the result is 56 order now!

## PILOT PROGRAMMING LANGUAGE PACKAGE

Includes PILOT cart. with "Turtle Graphics", Pilot Primer and Student Pilot manuals. PILOT is an excellent learning or teaching tool.

Works with all Atari's except ST. **\$1750**

## PADDLE CONTROLLERS

(Pair). Required for numerous 8 bit programs and applications. Use these to add two changeable variables to your BASIC or machine language programs.

**\$650**

## SERIAL I/O CABLE

High quality 13 pin cable used to connect 8 bit Atari's to disk drives, interfaces, etc.

**\$595**

New low price

## 800/400 MODULES

NEW PARTS COMPLETE WITH IC'S

**\$950** EACH

- 800 Main Board
- 800/400 CPU with GTIA
- 800 10K "B" O.S. Module
- 400 Main Board
- 400 Power Supply Board

## \$99.95 "SUPER ARCHIVER II"!

(for ATARI 1050 drives)

NOW! COPS all ENHANCED DENSITY programs plus retains all of the features of our World Famous SUPER ARCHIVER! (see below). Allows you to COPY or CREATE single or ENHANCED density protection schemes (including PHANTOM SECTORS!). Completely automatic; compatible with the BIT-WRITER; the ULTIMATE BACKUP/PROGRAMMING device! Only \$99.95 plus \$4 S/H/I.

NOTICE! If you already own a SUPER ARCHIVER, you can upgrade to a SUPER ARCHIVER II for only \$29.95 plus \$4 S/H/I (disk only - no additional hardware required!).

THE

## \$69.95 "SUPER ARCHIVER"!® \$69.95

(for ATARI 1050 drives)

The new SUPER ARCHIVER, obsoletes all copying devices currently available for the ATARI 1050! It eliminates the need for Patches, PDB files, Computer Hardware, etc. Copies are exact duplicates of originals and will run on any drive; without exaggeration, the SUPER ARCHIVER is the most powerful PROGRAMMING/COPYING device available for the 1050! Installation consists of a plug-in chip and 6 simple solder connections. Softwares included. Features are:

- TRUE DOUBLE DENSITY
- ULTRA-SPEED read/write
- FULLY AUTOMATIC COPYING
- SUPPORTS EXTRA MEMORY
- SCREEN DUMP to printer
- TOGGLE HEX/DEC DISPLAY
- SECTOR or TRACK TRACING
- AUTOMATIC DIAGNOSTICS
- DISPLAYS HIDDEN PROTECTION
- ADJUSTABLE/CUSTOM SKEWING
- AUTOMATIC SPEED COMPENSATION
- AUTOMATIC/PROGRAMMABLE PHANTOM SECTOR MAKER
- ARCHIVER/HAPPY ARCHIVER COMPATIBLE
- BUILT-IN EDITOR-reads, writes, displays upto 35 sectors/track (short)
- BUILT-IN CUSTOM FORMATTER - upto 40 sectors/track
- BUILT-IN DISASSEMBLER
- BUILT-IN MAPPER - upto 42 sectors/track
- DISPLAYS/COPIES Double Density HEADERS
- AUTOMATIC FORMAT LENGTH CORRECTION
- SIMPLE INSTALLATION

The SUPER ARCHIVER is so POWERFUL that the only programs we know that can't be copied are the newer ELECTRONIC ARTS and SYNFILE/SYNCALC (34 FULL sectors/track). If you want it ALL... buy the "BIT-WRITER" also... then you'll be able to copy even these programs! Only \$69.95 plus \$4 S/H/I.

## \$39.95 THE "QUINTOPUS!" \$39.95

The "QUINTOPUS!" is an inexpensive device that provides a tremendous amount of convenience while eliminating the problems associated with the endless "daisy-chaining" of peripherals (eg: drives, interfaces, printers, modems, cassettes, etc.). The "QUINTOPUS!" is an I/O port expander that converts a single I/O output/input into five additional outputs/inputs. Instead of daisy-chaining all of your peripherals (which often times results in passing a signal through 30 feet or more of cable!), the "QUINTOPUS!" allows each device to be connected directly to the computers through only three or four feet of cable. This is particularly useful when attempting to use ULTRASPEED or WARPSPED data transfer rates. The "QUINTOPUS!" also provides the "extra" I/O ports often needed to connect devices not having daisy-chaining capabilities. Cable resistance and capacitance are greatly reduced thereby significantly improving the opportunity of accurate data transfers! Only \$39.95 plus \$4 S/H/I.

## \$59.95 THE "QUINTOPUS!" \$59.95 WITH SWITCHABLE PORTS

This Deluxe version of the "QUINTOPUS!" has all of the above features with the additional benefits of two SWITCHABLE PORTS! This means you can connect two computers to one printer or two printers to one computer; you can switch in a computer/printer combination and while your printing out a long document, switch in a second computer to access a modem, disk drive, cassette deck, etc! Switch multiple combinations of peripherals at computers without the hassle of re-arranging I/O cables... simply flip a switch! Only \$59.95 plus \$4 S/H/I.

DEALER/DISTRIBUTOR/USER GROUP Discounts available call for info. PHONE Orders - MASTER CARD, VISA MAIL - Money Orders, Checks.

## \$79.95 THE SUPER ARCHIVER "BIT-WRITER"! \$79.95

The Super Archiver "BIT-WRITER" is capable of duplicating even the "uncopyable" EA and SYN series which employ 34 FULL sectors/tracks. "BIT-WRITER" is capable of reproducing these and FUTURE protection schemes of non physically damaged disks. PLUG-IN circuit boards and 4 simple solder connections. The SUPER ARCHIVER with "BIT-WRITER" is the ultimate PROGRAMMING/COPYING device for Atari 1050's EXACT DUPLICATES of originals are made! Copies run on ANY drive. Must be used with Super Archiver. Only \$79.95 plus \$4 S/H/I.

## \$69.95 "ULTRA SPEED PLUS" \$69.95

Imagine a universal XL/XE Operating System so easy to use that anyone can operate it instantly, yet so versatile and powerful that every Hacker, Programmer and Ramdisk owner will wonder how they ever got along without it! Ultra Speed Plus puts unbelievable speed and convenience at your fingertips. Use ANY DOS to place an ULTRA SPEED format on your disks, boot any drive (1-9) upon power-up, format your RAMDISK in Double Density, activate a built-in 400/800 OS for software compatibility, plus dozens of other features to numerous to mention! Below are just a FEW features you'll find in the amazing OS:

- ULTRA Speed \$10 for most modified drives
- ULTRA Speed is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 or 2 Meg upgrades
- Background colors adjustable
- Reverse use of OPTION key
- Cold-start without memory loss
- Built in floppy disk configuration editor (1-9)
- Built in RAMDISK configuration editor (1-9)
- RAMDISK exactly duplicates floppy drive so sector copying and sector editing are now possible
- Built in MINI Sector Copier
- Toggle SCREEN OFF for up to 40% increase of processing speed
- Toggle internal BASIC
- Rom resident disk loader program (MACH 40 menu)
- DOUBLE DENSITY RAMDISK capable
- Entire MEMORY test that pinpoints defective RAM chip
- Boot any drive (1-9) upon power-up or cold-start
- Supports memory upgrades up to TWO MEGABYTES
- THREE Operating Systems in one (XL/XE, 400/800, ULTRA SPEED PLUS)

## \$29.95 "XF551 ENHANCER!" \$29.95

The XF551 Atari drive is a fine product with one major flaw... it writes to side TWO of your floppy disks BACKWARDS. This causes read/write incompatibility problems with all other single sided drives made for Atari such as Indus, Trak, Rana, Percom, Astra, Atari 1050, Atari 810, etc. Add the XF551 ENHANCER to the new XF551 drive and your problems are over! This device will restore 100% compatibility while retaining original design qualities of Atari's super new drive. The XF551 ENHANCER is a MUST for all XF551 Owners. Installation is simple. Only \$29.95 plus \$4 S/H/I.

## FIRE SALE!

Recently, one of the adjoining stores to our offices/warehouse had a fire which forced us to re-locate. A large quantity of our software/hardware/documentation suffered heat/smoke/water damage. We salvaged as much as possible and are offering these items to you at ridiculously LOW PRICES. All items are fully warrantied. NO COD's - Cash, Bank Checks, Money Orders, VISA or MASTER CARD. ## I/O Board

### XL/XE-ONLY CARTRIDGES

The June 1988 *Antic* review of *Atari's 12 New Entertainment Cartridges* erred in claiming that all new cartridges work on any Atari 8-bit computer. Some current releases require XL/XE models—or a previous Atari upgraded to at least 64K memory.

So far, the new generation of Atari game cartridges that need a minimum of 64K memory are: *Flight Simulator II*, *Lode Runner*, *Hardball*, *One on One*, *Fight Night*, *David's Midnight Magic* and the upcoming *Food Fight*.

### WORDPERFECT HANGS IN

Despite any recent rumors, WordPerfect Corp. has not announced that we are withdrawing from the Atari market and have no current plans to do so. We *do* have some concerns about piracy, but they are not limited exclusively to the Atari market.

We have long held the philosophy that copy protection is an unacceptable solution to piracy problems. We believe that most people are honest and we feel that it is inappropriate to penalize them for the actions of the smaller group of dishonest people. I too have felt the frustration of having a copy-protected disk become "unreadable," not to mention the inconvenience to hard disk owners. The decision to make this a corporate policy was made several years ago when we were contemplating what to do about the IBM PC market.

Dan Lunt

Vice President, Marketing

WordPerfect Corporation

### XMM801 V-GRAPH FIX

I recently subscribed to your magazine and just received your *Best of Antic* disk as a bonus—and I found a program I could use right away. *V-Graph* was just what I needed to complete a report.

The program isn't compatible with the Atari XMM801 printer, but the fix is easy. Change line 690 to:

```
690 FOR U=0 TO 39: ? #3;  
CHR$(27);"V";CHR$(128);CHR$(1);
```

David Schoch

Scotia, NY

### WRITE-IN WORKED

Thanks to *Antic's* "Write a letter to Springboard" campaign, I now own the *Newsroom* program and have made my first newsletter with it. *Newsroom* works fine with my Atari 130XE and the documentation is great. The program is very easy to use.

I certainly hope that Atari XL/XE owners will support this fine product. The entire package with the three *Clip Art* disks costs only \$74.99 including shipping. It's well worth the money and will work with almost any dot-matrix printer.

Thanks to *Antic*, another fine software product is now available for the Atari 8-bit computer. Keep up the good work.

Frank Carey

Troy, MI

### 64K NEEDED

In the May 1988 *Antic*, the review of *Guild of Thieves* says that it requires 48K and a disk drive. This isn't true—it requires not only 64K, but an *Atari 1050* disk drive or equivalent. Many titles from *Mindscape* and *Datasoft* also require 64K memory.

David Patnychuk

Greencastle, PA

### AUTOTYPO UPGRADE

When typing in *Antic* programs, I use *AutoTYPO* (*Antic*, November 1986) so I don't have to look back and forth at the monitor to see if the TYPO codes match. It significantly reduces typing time. However, there is one minor flaw.

If, after entering the TYPO code, you type in a program line but forget the line number, no warning occurs, and you might finish typing in the program without ever realizing your mistake. This can be corrected if you add the following line:

```
32115 IF LINE$(1,1)<CHR$(49)  
OR LINE$(1,1)>CHR$(57) THEN  
SOUND 0,95,10,8:FOR X=1 TO  
75:NEXT X:SOUND 0,0,0,0:B=0
```

The TYPO code for that line is WV. Now, when you forget the line number, a pleasant tone alerts you to re-enter the line properly.

Gary Coppola

Budd Lake, NJ

## PADDLE PRAISE

Recently I became acquainted with Baudville's Blazing Paddles (reviewed in *Antic*, January 1987) and Shapes and Fonts. They're truly amazing. With the help of Baudville employee Faye Vanden Berge, I've discovered so many things Blazing Paddles can do. I can't begin to give Blazing Paddles all the praise it deserves.

Faye Hanners  
Linden, MI

## RIBBON REVIVAL

Computer users sometimes find that their printers are no longer supported or the ribbons are either hard to find or too expensive to replace. Here's a quick and easy fix:

You can find inexpensive ink rollers at stores that sell calculators and typewriters. Purchase one that's the approximate width of your printer ribbon. Apply a little glue to the side of the ribbon cartridge where

the ribbon passes through *after* passing the print head. Position the ink roller so that it just touches the ribbon as it returns to the cartridge. As the printer works, the ribbon runs over the ink roller and enters the cartridge where the ink soaks into it. By the time the ribbon leaves the other end of the cartridge, it has a fresh new covering of ink that continues to renew itself as long as the ink roller remains inked. On overused, dried-out ribbons, this works better if you run the printer's self-test for one or two pages.

William Culver  
Shickshinny, PA

## RAM ON

When I bought AtariWriter Plus over a year ago, I was dismayed that I couldn't run it from a RAMdisk because the program always wanted the Mail Merge and Proofreader programs on drive 1. However, I booted MYDOS, and though my

disk was already configured for a D8: RAMdisk, I set the RAMdisk to drive 1 with the Omniview 256K "Install 1" RAMdisk handler.

To my surprise, my physical D1: and D2: were kicked up to D2: and D3:—I still don't know if this was done by Omniview or MYDOS. Then I copied all the AtariWriter Plus files (except DOS.SYS and DUP.SYS) onto the RAMdisk and placed the AtariWriter Plus disk into my physical drive 1—now D2:. Then I ran AUTO-RUN.SYS from the RAMdisk. The program booted at lightning speed and made a quick check of the physical drive to verify the copy protection. Then it was ready to use.

Even more suprisingly, I found that while under the control of AtariWriter Plus, the two physical drives were treated as D1: and D2:, but when I selected Proofreader or Mail Merge, they loaded instantly from the RAMdisk, and returned

# Lycocomputer Marketing & Consultants

Air Orders Processed Within 24 Hours

## Lycocomputer Means Total Service.

Mark "Mac" Bowser, Sales Manager

I would personally like to thank all of our past customers for helping to make Lycocomputer one of the largest mail order companies and a leader in the industry. Also, I would like to extend my personal invitation to all computer enthusiasts who have not experienced the services that we provide. Please call our trained sales staff at our toll-free number to inquire about our diverse product line and weekly specials.

First and foremost our philosophy is to keep abreast of the changing market so that we can provide you with not only factory-fresh merchandise but also the newest models offered by the manufacturers at the absolute best possible prices. We offer the widest selection of computer hardware, software and accessories.

Feel free to call Lycocomputer if you want to know more about a particular item. I can't stress enough that our toll-free number is not just for orders. Many companies have a toll-free number for ordering, but if you just want to ask a question about a product, you have to make a toll call. Not at Lycocomputer. Our trained sales staff is knowledgeable about all the products we stock and is happy to answer any questions you may have. We will do our best to make sure that the product you select will fit your application. We also have Saturday hours — one more reason to call us for all your computer needs.

Once you've placed your order with Lycocomputer, we don't forget about you. Our friendly, professional customer service representatives will find answers to your questions about the status of an order, warranties, product availability, or prices.

Lycocomputer stocks a multimillion dollar inventory of factory-fresh merchandise. Chances are we have exactly what you want right in our warehouse. And that means you'll get it fast. In fact, orders are normally shipped within 24 hours. Free shipping on prepaid orders over \$50, and there is no deposit required on C.O.D. orders. Air freight or UPS Blue/Red Label shipping is available, too. And all products carry the full manufacturers' warranties.

I can't see why anyone would shop anywhere else. Selection from our huge in-stock inventory, best price, service that can't be beat—we've got it all here at Lycocomputer.

**PRICE GUARANTEE**  
Since 1981, we have led the industry by continuing to offer the lowest national prices while providing quality service. Many companies have come and gone trying to imitate our quality and service. If by some oversight we do not have the lowest prices advertised on the products you desire, then we would appreciate the opportunity to rectify this oversight.

instantly when I selected the return option.

The Proofreader needs to have the dictionary disk in the physical drive, so I would appreciate it if anyone could tell me how to use MYDOS (or any other DOS) to partition my Newell 256K XL into two RAMdisks so I can run the dictionary disk from RAM too.

John Kolak  
Fort Polk, LA

## BIO A+

I used *MegAnimator* (Antic, February 1988), *Mr. Snootby* and *Big Letters!* (March 1988) and *UltraFont* (August 1986) to create a project for my biology class. Using the VCR hookup instructions in *Big Letters!*, I brought in a videotaped show and got an A+, for which I think Antic deserves some credit.

Tim Kirby  
Pittsburgh, PA

## SOLAR ATARI

Our home is in a secluded National Wildlife Refuge area and we electrify it—including our 8-bit Atari system—with solar panels on a freon tracker. Two canisters hold freon that travels from one to the other through a small tube. The sun's heat converts the freon from liquid to gas which rises to the higher canister. Thus the tracker follows the sun across the sky, giving us the maximum power from our panels.

Our Heart Interface I200X Inverter converts our 12 VDC to 110 VAC. This allows us to use our computer system as well as other 110VAC appliances. As long as the wattage of the appliance does not exceed the limit of the inverter and it is not something that must run for long periods of time, like a freezer, you can use anything you'd usually use in the home.

The big problem of this system is that we have to be very careful about what we use after sunset. Our battery bank holds about 840 amp hours of power. The less

you drain them, the longer the batteries last, so we try to be careful and not use many 110VAC things in the evening, including our 130XE, Indus disk drive and Panasonic printer.

The meter box on one of our doors is our control center for all our power. It controls the changing of our batteries so they don't get overcharged (which can ruin them real fast!). It also serves as our fuse box, just like the one in an average house. Every line that runs to different parts of our house is fused as it goes to the box. The batteries are connected to the box also as our "power line." We can shut the whole system down or just shut off the house power, or the solar panels, or whatever.

Ron and Mary Kearns  
Arizona

## WEFAX OVERSEAS

I live in West Germany. Regarding *Weather Maps from Space* (Antic, September 1986), is it possible for me to receive WEFAX signals overseas?

Brandon Zanone  
APO NY

*Yes! Here are some books to help you find the signals.* The New Weather Satellite Handbook by Dr. Ralph Taggart is the definitive text on WEFAX. It's available from the author for \$12.50 (add \$2 for orders outside the U.S. Write: Dr. Ralph Taggart, 602 S. Jefferson, Mason, MI 48854. The Shortwave Facsimile Frequency Guide is available for \$14.95 from: University Electronics, Inc., 4555 Groves Road, Suite 13, Columbus, OH 43232.

The Weather Fax Guide is a free catalog from: Atlantic Surplus Sales, 3730 Nautilus Avenue, Brooklyn, NY 11224. But a free leaflet called the Weather Satellite Fact Sheet is a "must-have": Radio Nederlands, P.O. Box 222, Hilversum, The Netherlands.—ANTIC ED

## PRAISE I.C.

I recently installed a 128K upgrade from Innovative Concepts for my 65XE. I read about it in an ad in Antic, December 1987.

SpartaDOS Construction Set

All entries MUST be received by August 1, 1988. Send to: Contest '88, Antic Magazine, 544 Second Street, San Francisco, CA 94107.  
**See Complete Contest Rules in June 1988 Antic or send self-addressed, stamped envelope to above address for Contest Rules Sheet.**

## Super Disk Bonus

Program By RAYMOND CITAK

# Keyed-Up!

*Musical ear training. . . plus laughs!*

Antic's August 1988 Super Disk Bonus is a music education program disguised as a goofy game. Keyed-Up! gives you practice at hearing the difference between scales in major and minor keys. As you try to keep a bird from getting zapped on an electrified wire fence, you're actually learning the relationship between sounds and key signatures—those sharps or flats at the start of a musical composition.

Your joystick controls a bird flying above a roadside fence that consists of five wire strands representing the five lines of the treble staff. Between each fencepost is a key signature. There are 15 scrolling fence sections—seven with one to seven sharps, seven with one to seven flats, and one blank section with no sharps or flats.

As the bird starts flying, a letter indicating the first note of the scale appears at the lower center of the screen. Using the joystick, land the bird on the section of fence that shows the correct key signature for the scale and note indicated.

If you land correctly, you gain points and a new scale will be played. If you land on the wrong section of fence, watch the birdie—the fence is electrified! Play continues for three minutes.

You must listen carefully to the scale being played and try to tell the difference between the major and natural minor scales. There are three levels of difficulty and an online help screen that can be accessed anytime. Beginners should first play the major option, then the minor, to accustom their ears to the difference. The third note of the scale is the most important one to listen for.

The Keyed-Up! program consists of more than 100 sectors of assembly language code, which would be a mind-numbing chal-

lenge to type correctly. Author Raymond Citak is a piano instructor at the University of Wyoming in Laramie. He is a longtime Atari programmer making his first appearance in Antic.

Your August 1988 Antic Disk—featuring Keyed-Up! as well as every type-in program from this issue plus other special bonuses—will be shipped to you within 24 hours after receiving your order. Just phone Toll-Free to the Antic Disk Desk at (800) 234-7001. The monthly disk is only \$5.95 (plus \$2 for shipping and handling) on your Visa or MasterCard. Or mail a \$5.95 check (plus \$2 shipping and handling) to Antic Disk Desk, 544 Second Street, San Francisco, CA 94107.

Programmers: Antic wants to see your most ambitious programs, even those too large or complex for printing as a type-in listing. High-quality programs in any language that has a runtime version are now eligible for consideration as a Super Disk Bonus. ■

***This Month's Disk is FREE***  
*when you phone the Disk Desk to order your Antic*  
*12-issue subscription for only \$59.95.*

continued from page 8

I'm totally satisfied with the upgrade and IC's customer service. For the nominal price of \$29.95 I received all the parts I needed as well as easy-to-follow instructions. My thanks to a company which backs up Atari products with quality upgrades.

Alex Taristcheff  
APO NY

## JUNGLE RULES!

My personal net worth at forced retirement from *Entrepreneur Jungle* (Antic, March 1988) was \$110,322,048,793. I made my first \$1 billion at year 32, my first \$10 billion at year 34 and my first \$50 billion at year 39. Only twice was I convicted of racketeering—all other times, I was acquitted. Maybe I'll try the real stock exchange. Imagine the Wall Street Journal headline, "Kid Stock Whiz Sweeps Market—Credits it all to Antic Magazine!"

Fred Beondo

## STICK WRITER

We have two people here who are almost completely paralyzed after accidents, with minimal head and arm movement and no speech. Do you know of any Atari products that will help them communicate with other people? What we have in mind is a keyboard accessed by the joystick, allowing them to build sentences and activate a voice synthesizer or printer.

J.E. Lawton  
Invercargill  
Southland, New Zealand

Stick Writer (*Antic*, March 1986) is a joystick-driven word processor for the handicapped. It works with S.A.M. Handler (*Antic*, February 1985) to activate the S.A.M. software speech synthesizer which was widely sold several years ago. In order to save time in this emergency situation, we have sent a disk with the two Antic programs to you in New Zealand.—ANTIC ED

## QUICK B

Is there a way to use CompuServe "Quick B" protocol when downloading from ANTIC ONLINE?

Bob Loconto  
CompuServe ID  
73147,613

Not yet, we're still working on it.—ANTIC ED

*Antic welcomes your feedback, but we regret that the large volume of mail makes it impossible for the Editors to reply to everyone. Although we do respond to as much reader correspondence as time permits, our highest priority must be to publish I/O answers to questions that are meaningful to a substantial number of readers.*

*Send letters to: Antic I/O Board, 544 Second Street, San Francisco, CA 94107.*

### N.E.R.D.S. BIOLOGY DISKS

(printing software)

N.E.R.D.S. Software

18 Wendy Drive

Farmingville, NY 11738

Requires Print Shop

\$9.95 (\$16 for both), 48K disk

(516) 698-0445

The first **N.E.R.D.S. Biology Disk** contains about 115 graphics relating to human and animal circulatory, digestive, endocrine, respiration and reproductive systems. The second disk has another 115 icons dealing with microbiology, insects, basic biochemistry and plants. These graphics can be printed out in different sizes and positions. Broderbund's Print Shop software is required.

### AMYGDALA

(newsletter)

Amygdala

P.O. Box 219

San Cristobal, NM 87564

\$15 for 10 issues (\$25 overseas)

**Amygdala** is a newsletter devoted exclusively to fractals and the Mandelbrot set. Each issue contains black and white illustrations of fractals, an extensive bibliography and reviews of fractal-generating computer programs. The optional \$15 slide supplement (\$25 overseas) consists of finely detailed color slides of fractals.

### GATO

(entertainment software)

Atari Corp.

1196 Borregas Avenue

Sunnyvale, CA 94088-3427

(408) 745-2000

\$22.95, 64K cartridge

You're the captain on a World War II GATO-class submarine, patrolling the South Pacific theatre. You've under-

taken classified search, destroy and rescue missions in Atari's new cartridge conversion of **GATO** by Spectrum Holobyte. Positions, courses and maneuvers of your ship and others are calculated in real-time simulation. GATO also features 3-D perspective.

### CROSS TOWN CRAZY 8

XLent Software

P.O. Box 5228

Springfield, VA 22150

(703) 569-8881

\$19.95, 48K disk

**Cross Town Crazy 8** is the classic card game with a new twist. You can play against as many as three computer opponents—or challenge your friends on line via modems. Cross Town Crazy 8 was written for both 8-bit and ST by longtime **Antic** contributor Patrick Dell'Era, author of *Diskio Plus* (December 1985).

### NO THRILLS

(disk drive interface)

Irata Verlag USA

1272B Potter Drive

Colorado Springs, CO 80909

(303) 596-0135

\$130

With a **No Thrills Interface**, you can hook up either an IBM-compatible or ST disk drive to your Atari 8-bit, gaining vastly increased capacity and speed at less expense. The No Thrills Interface is roughly the size of a printer interface.

### ASTRONAUTS

(entertainment software)

Bensley Consulting

P.O. Box 301

217 West Walnut

Westfield, IL 62474

(217) 967-5465

\$19.95, 48K disk

**Astronauts** is a kind of space travel trivia quiz compiled with Turbo BASIC. In this unprotected program, you can choose questions on the Mercury, Gemini, Apollo and Shuttle missions. For example: You're given an astronaut's name—which missions was he involved in?

### HYPERDRIVE

(disk drive)

Wuztek

4521 Campus Drive, Suite 400

Irvine, CA 92715

(714) 733-0189

\$229, Atari XL/XE

**HyperDrive** stores 720K on a 3.5-inch disk and includes a printer interface with an 8K RAM buffer. Store more than eight times as much information on one XL/XE disk—running MYDOS, SpartaDOS or any DOS that can recognize and use the extra storage space. (Unfortunately, this doesn't include Atari DOS 2.0 and 2.5.) With the optional \$100 Hyperspeed cartridge, transfer speed increases to 150,000 baud.

### ADLINE BBS MARKETING

(online service)

Reamer-Williams and Associates

4131 S.W. Viewpoint Terrace, Suite 1

Portland, OR 97201

(503) 224-5494

\$25 registration

**Adline** offers computer-related products and services exclusively through local bulletin boards. Now you can shop online through your local BBS. And if you're a sysop, you can earn money—just post the Adline Marketing packages online and receive a percentage of sales. And you don't have to worry about handling orders.

If you're interested send in your one-time \$25 registration fee along with: type of BBS hardware and software; number of weekly callers; number of BBS phone lines; BBS name, phone number and address; and voice number of the sysop.

*Return the favor. When you call a manufacturer or supplier about a product you've seen advertised or otherwise mentioned in ANTIC, please tell them so. This will help us to continue to bring you the latest information about products that will make your Atari computer an even more valuable investment in the future.*

—ANTIC ED

# Black Box

*Rays that probe the unknown!*

Probe the mysterious black box with your joystick rays and deduce the location of hidden particles by cleverly analyzing graphic clues. This BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.

**B**lack Box is an computer upgrade of an enjoyable board game that doesn't seem to be still manufactured. You're exploring a "black box" containing up to eight "particles" in unknown locations randomly selected by the computer. The object is to discover those locations by probing the box as few times as possible.

Type in Listing 1, BLACKBOX.BAS, check it with TYPO II and SAVE a copy before you RUN it. If you have trouble typing the special characters in line 1090, don't type them in. Instead, type Listing 2, check it with TYPO II and SAVE a copy to disk. When RUN, Listing 2 creates this hard-to-type line and stores it in a file called LINES.LST.

To merge the two programs, disk users LOAD "D:BLACKBOX.BAS" and then ENTER "D:LINES.LST". Cassette users should CLOAD Listing 1, then insert the separate cassette used for Listing 2 and ENTER "C:". Remember to SAVE the completed program before you RUN it.

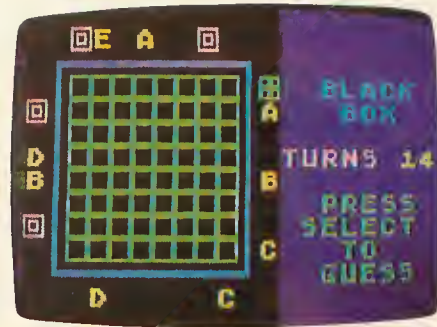

## PROBE & GUESS

You probe the box by sending a "ray" into it from one of the sides. The ray would normally travel in a straight line. The hidden particles interfere with the ray, changing (or halting) its path through the box.

Use these effects as clues to determine the position of each particle. Here are the possible effects:

1. If a particle is directly in front of a ray, the ray is absorbed. This is represented by a red square.
2. If one particle is on the left of the area directly in front of a ray and *another* is on the right, the ray is reflected back along its path to the starting point. This is represented by a purple circle.
3. If a *single* particle is on the left or right of the area directly in front of a ray, the ray will bounce off its corner. This means that two markers (letters) are placed where the ray *enters* and *exits* the box.
- 4: A ray that is neither reflected nor absorbed has two markers placed and counts as two turns.

You start the game by probing the box with rays sent from outside the box (The black box is actually displayed

here as a grid.) Move the cursor, a green square, with your joystick and send a ray through the box by pressing the joystick button.

Press [SELECT] when you're ready to guess where the particles are. Your cursor will turn yellow. Move the cursor over the box grid and press the joystick button to mark (or erase) your guesses.

After you think you know where all the particles are hidden, press the [SPACEBAR] to see their actual locations. Particles are represented as red boxes. Then you can start a new game by pressing the joystick button. ■

## GOT A MERCEDES THAT WON'T TURN LEFT?

... or a great database with a killer limitation or bug? Now there's an 8-BIT program that works, and does all those things required in a small business... WINNER —ANTIC Awards '88

## Turbobase™ \$179.

"IBM power without the price... I really can't think of any feature associated with running a business that has been left out—except for the huge prices charged for comparable software on MS-DOS computers." —ANTIC, Dec. '87  
 "... the most time consuming review I have ever done, due to the number of features... Turbobase finally gives what 8-bit owners have been clamoring for for years; true, powerful business software... set up a fully capable business system for less than \$1,000... customer support is superb... Practicality-excellent. Documentation-excellent." —COMPUTER SHOPPER, Aug. '87

Why settle for mere IBM performance when you can get that on an 8-bit with Turbobase? Designed by the author of Turbobase to maximize ST database performance, we present...

## Ultrabase™ ST \$99. Introductory Price

The ultimate in power/flexibility without learning a programming language!  
 Requires B/W monitor—full use of the superior definition of the B/W screen provides features not available with color: WYSIWYG report generator/high-res illustrations make complex formats easy!  
 Preset integrated applications for mailing/GL/PS/AR/AP/statements/COGS/aging/estimating/order entry/UPS tables/ordering/inventory/valuations/WIP/scheduling/teacher's grades w s.d./patient regist./recall/graphs/calendars/others. Review/modify these with overwrite. Easy to set up church/library/clubs/routing/home budget/taxes/any general database. Use your invoices/any other forms. Standard file transfers from other programs/remote stations.  
 This is the simplest program on the market to set up serious integrated applications from scratch with complete business capability! Expertise/programming not required! Full instructions in less than 100 pages.

- Pull any info from anywhere, including tables such as UPS tables, during entry/Secondary entry if not found/Secondary update/Double entry in one step, immediate customizable print
- Use full names, acct numbers, or any labels
- All conveniences such as review with overwrite, repeating entries in one record, lookup lists, mouse where useful, etc., etc
- Logic/math during entry or output
- "WYSIWYG" Output formatter for spread sheets, account/PU/balance/commission statements, labels, form letters, all reports. Continuous printing of these from lists of up to 15,000 names/numbers/labels
- Flexible use of dates/labels/strings/bracket search/etc in searching and sorting on any field

# THE INCREDIBLE BACK ISSUE SALE!

## ANTIC Back Issues

### HOW TO ORDER

Ordering individual magazines or disks is easy! AMS stands for Antic Magazine. ADS stands for Antic Disk. Follow these product codes with the month and year you want. For example, to order the March 1987 disk and magazine, write:

AMS0387  
For Antic Magazine  
March 1987

ADS0387  
For Antic Magazine  
March 1987

### WHAT IS AVAILABLE

Individual back issue disks and magazines are available for July 1983 through the current issue. September 1984 magazine is sold out.

Individual Antic disks are \$5.95 each, Antic magazines are \$4.00 each. Remember to include shipping and handling charges (see below)

## 6 month back packs only \$20.00 each

Get a complete set — order both magazines and disks in our special BACK PACK SALE

## Pre-Schoolers' New Software Guide

Rating 37 Atari 8-bit educational programs

If you're searching for just the right software for children aged 3 to 6, you might want to look into the 1988 Survey of Early Childhood Software.

Hundreds of educational programs, including 37 for the 8-bit Atari, are rated for ease of use, educational value, instructional design, computer compatibility, skills required and amount of adult supervision needed.

For the 8-bit Atari, the 10 top-rated programs are:

SCORE	TITLE	PUBLISHER
78	First Shapes	First Byte
76	Kid's Stuff	Stone & Associates
75	Make a Match	Springboard
74	First Letters	First Byte
73	Music Maestro	Springboard
73	Stickybear Opposites	Weekly Reader
70	Stickybear Shapes	Weekly Reader
69	Story Machine	Spinnaker
68	Learning With Leeper	Sierra On-Line
68	Grandma's House	Spinnaker

\$20. High/Scope Educational Research Foundation, 600 N. River Street, Ypsilanti, MI 48198. (313) 485-2000.

### NEW HACK BACK Special OFFER

The Alpha Systems HACK BACK contains all our finest products for making Back-up copies. Analyzing, Understanding and Protecting your Atari programs. It comes complete with Atari Protection Techniques (Book and Disk I), Advanced Protection Techniques (Book and Disk II), The Chipmunk, The Scanalyzer, The Impersonator and Disk Pack 1000. Worth over \$150! Get them all for the special price of **Just \$99.95**

### Atari Software Protection Techniques Vol I & II

These Book and Disk packages detail the most advanced copy protection methods in use today. They guide you through the methods used to create the protection as well as the copying techniques to get around them. They include information on Phreaking • Hacking • On-line security • Block boxes • Self-destructing programs • Pirate bulletin board systems • Logic bombs • New piracy laws • Hardware data keys • Weak sectoring (Phantom, Fuzzy and unstable sectors) • Overfilled tracks • CRC errors • Bank Select cartridges and MUCH, MUCH MORE. The disks include automatic program protectors, Protection Scanners, directory hiding and more.

**BOOK I and DISK I \$24.95**  
**BOOK II (Advanced protection) and DISK II \$24.95**  
**Special Offer, Order both sets for Only \$39.95**

### CHIPMUNK

Automatic Disk Back-Up System. Make perfectly running unprotected back-up copies of hundreds of the most popular Atari programs. Chipmunk's sophisticated programming Automatically finds and **REMOVES copy protection** from most Atari programs. Back-up even heavily protected programs with ease. Finally, a back-up system that needs no special hardware or skills.

(If you need a full list of what Chipmunk copies, call or write for our free catalog) **\$34.95**

**Scanalyzer** Automatically scan & analyze commercial programs. Unlock programming secrets and learn from the masters **\$29.95**

**Impersonator** Cartridge to Disk back up system. Create running back-up copies of any cartridge (up to 16K) **\$29.95**

### NEW CHEAT

Get more from your games with CHEAT. Tired of spending days trying to beat a game? Tired of getting stuck just when you need another life? Cheat is an innovative new product that gives you the chance you need to beat your favorite games. Cheat works with hundreds of Atari games to give you unlimited lives or power. End the frustration and get hours more enjoyment from your games. (Call or write Alpha Systems for our free catalog with a full list of the programs that work with Cheat) **ONLY \$24.95**

### BASIC TURBOCHARGER

NOW for the first time a BASIC programmer can get the power, flexibility and incredible speed of machine language. BASIC TURBOCHARGER is a **book and disk package** that contains over 150 ready to use machine language routines. Complete instructions show how to add them to your own BASIC programs to get these features and more: • Smooth Scrolling • Player/Missile control • Load & Save Picture files • Sorting and Searching • Special Effects Graphics • Incredible Speed • Much, Much More • Over 150 programs. You've heard of the power of Assembler, now harness it for your own needs **\$24.95**

## ATARI 8-BIT POWER

ALPHA SYSTEMS is constantly innovating to provide more power for your 8-bit Atari's

### NEW PARROT II

An All New Parrot sound digitizer for your Atari. Parrot II is a sophisticated new hardware device that plugs into your joystick port. Parrot II has two inputs, one for a microphone and one for a powered source such as a tape player, radio or Compact Disk.

The Powerful Parrot II software lets you record sounds into your computer and play them back on any Atari. Parrot II turns your computers keyboard into a musical instrument with nine different sounds covering three octaves each. The sounds can be anything, a dogs bark, a piano, a complete drum set, a symphony or your own voice.

Parrot II lets you modify the sounds on a graphic display to create brand new sounds and special effects. Best of all, the sounds and voices can be put into your own programs that can be used on any standard Atari. Explore the world of digital sound and music. **ONLY \$59.95**

**Pre-Recorded Sound Disk** More pre-recorded sounds for Parrot **\$4.95**  
**PARROT II Demo Disk** (Does not require Parrot II run) **\$5.00**

### NEW POP-N-ROCKER

a fast paced, multi-player trivia game that mixes questions with real songs (digitized with Parrot). Be the first to identify the songs and answer the music trivia questions. *Pop-N-Rocker* comes with three data disks and lets you add new questions so it will never get old. You can use a Parrot Sound digitizer to add new songs too! Use any kind of music from Rock to Classical to Nursery Rhymes. A new concept in entertainment and a perfect add-on for Parrot **\$24.95**

### COMPUTEREYES & MAGNIPRINT II+

Turn your computer into a digital portrait studio. This complete package lets you **capture, save & print** digital images from your **Video Camera, VCR or TV**. **COMPUTEREYES** hardware plugs directly into your joystick ports for easy use. Print your picture on a 6' foot poster. **\$119.95**

**ComputerEyes camera system** Comes complete with everything above, plus a black and white video camera and connecting cable. **\$329.95**

**Graphics 9 Software** - Add a new dimension to your **COMPUTEREYES** pictures - captures images in 16 shades of grey. **\$12.00**

### Magniprint II+

Easily the most powerful print program available today. Print graphics from almost any format in hundreds of shapes, sizes, and shades. Supports **color printing** and lets you create **giant posters**. Magniprint II+ lets you stretch and squeeze, invert, add text, adjust shading and much more.

Works with EPSON, NEC, Citoh, Panasonic, Gemini, Stor, XMM801, and compatible printers. (850 interface or equivalent required). **\$24.95**

### Graphics Transformer

Now you can combine the most powerful features of all your graphics programs. Create print shop icons from a Kodak pad picture, from a photo digitized with ComputerEyes, or any picture file. Graphics Transformer lets you **Shrink, Enlarge and Merge** pictures for unequalled flexibility. **\$22.95**

### YOUR ATARI COMES ALIVE

**SAVE MONEY!** Finally an alternative to buying expensive computer add-ons. Your Atari Comes Alive shows you how to **build them yourself!** This "How-To" **book and disk package** gives you complete step by step instructions and programs needed to build and control these exciting devices and MORE: • Light Pen • Light & Motor Controllers • Alarm Systems • Voice Recognition • Environmental Sensors • Data Decoders • More than 150 pages **Your Atari Comes Alive \$24.95**

GIGANT WALL SIZED POSTERS.

# BSR

***BSRk delivers the main features of the commercial PowerManager home controller software reviewed in this issue. Use your Atari to program a series of timed sequences on the X-10 Powerhouse Computer Interface for BSR on/off units. The BASIC program works with all Atari 8-bit computers with at least 48K. It requires an Atari 850 or P:R: Connection interface, a disk drive, the model CP290 Powerhouse interface and X-10 BSR modules. An ST version of BSRk is also published in this issue. It will work in high or medium resolution.***

By Walter Lazear

# BSRk

## Type-in home control software

Mary Rhomberg Pelogian

*X-10 wall-plug module and Powerhouse RS-232 serial controller let your Atari (8-bit or ST) automatically brew your first morning coffee—or any other on/off electrical operation.*

Type-In Software 

**BSR** modules such as the popular X-10 products plug into electrical outlets and use the household wiring to transmit programmed signals for switching any standard electrical equipment on and off. Full details about the X-10 system are explained in this issue's review of Terrific Corp.'s PowerManager software.

*Walt Lazear describes himself as a Chesapeake Bay sailor who finances his cruising by working as a systems analyst specializing in networks and communication protocols. He has enjoyed his Atari 800 for over five years.*

BSRk (BSR controller) is essentially a simple, menu-driven disk database manager that sends its data to the X-10 PowerHouse, which has its own memory and microprocessor. BSRk does much of the same job as PowerManager—but on a smaller scale and with fewer features. The key differences are:

1. BSRk requires an interface with a serial port, such as the Atari 850 or ICD's P:R: Connection. PowerManager plugs directly into the Atari's joystick port 2 with a special cable that comes with the package.
2. BSRk can control 16 devices and 24 on-off events. PowerManager handles 256 devices and 128 on-off events.
3. PowerManager can load previously saved libraries of scheduled activities. Only a single library can be saved as part of the BSRk program.

## GETTING STARTED

You need to use the IBM PC version of the X-10 Powerhouse CP290 interface, which comes with a generic RS-232 cable. This cable connects to your Atari 850 via your own modem cable (an RS-232C cable with a female DB25 connector on one end and a male DB13 connector on the other).

Plug one end of this cable into the R1: port on the 850. Plug the other end into the cable that came with your X-10. Finally, plug the other end of your X-10 cable into the back of your X-10, and plug your X-10 into a wall socket.

You must keep all your BSRk files together on a separate disk that has been formatted with DOS 2 or DOS 2.5. Type in Listing 1, BSRK.BAS, check it with TYPO II and SAVE a copy to your BSRk disk. This is the main program.

Next, type in Listing 2, BSRHAND.BAS, check it with TYPO II and SAVE a copy to your BSRk disk. When RUN, Listing 2 creates a file called BSRHAND.OBJ, a machine language program which first sets-up the RS-232 serial handler program, then RUNs BSRK.BAS. Antic Disk Subscribers will find a copy of BSRHAND.OBJ on the monthly disk.

Finally, copy BSRHAND.OBJ to your BSRk disk and rename it AUTORUN.SYS. At this point you should have just

Figure 1

### BSRK DATABASE FIELDS

<u>FIELD</u>	<u>LEGAL VALUES</u>
Status	I = inactive, A = active.
Device ID	BSR module number 1-8.
Location	Any text.
Days	Selected from a menu.
Time On	24-hour time.
Time Off	24-hour time.
Level	0 = brightest, 8 = dimmest.
Mode	N = normal (exact time), S = security (within an hour).

# ST BSRk

*GEM home control in GFA BASIC*

*By Charles Jackson, Antic Technical Editor*

The ST Version, BSRK.BAS, is written in GFA BASIC, and works the same way as its 8-bit cousin. Antic Disk owners will find BSRK.PRG, a runtime version of BSRK, on this month's disk. This version can be used even if you don't own GFA BASIC.

When RUN, BSRK.PRG clears your desktop, then displays a menu bar with three choices—Desk, Records and Files. Use the Desk menu to access your desk accessories.

The Options menu contains choices to initialize your BSRk database, set the interface's time, load the database into the interface, and to quit the program.

Use the Records menu to update your BSRk database, show all of the records in the database, and to show only the active records.

Start by pulling down the Options menu and clicking on "Initialize". You need to initialize the database file only once. Be Careful! This function erases any previous database from your disk and creates a blank, new one.

Next, pull down the Records menu, click on "Update" and specify record 1. Select each field and type the proper data, as shown in Figure 1. When you have entered the entire record, choose menu item 9 to return to the main screen.

For a quick summary of records, pull down the Records menu. From here you can click on Show Active to conveniently display only the active records, or Show All to display all of the records in the database.

Now, pull down the Options menu and click on Load BSR Interface to send your records to the X-10 Powerhouse's memory.

Finally, click on Set Time to set the current date and time. Now you may turn off your ST and let your X-10 Powerhouse control your house.

four files on your BSRk disk: DOS.SYS, DUP.SYS, AUTORUN.SYS and BSRK.BAS.

## GOING BSRk

Start by choosing item 1, Init Database, from the BSRk menu. You need to initialize a disk database and index

*continued on page 23*

# NumberPrint

*Dollars and cents  
where you want them*

**NumberPrint is a clever, handy subroutine that correctly lines up numbers for neat printouts. It automatically sets right justification for proper column alignment, floating dollar signs and commas, and filler characters for check printing. This BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.**

**W**ant to spruce up your program's reports? How about printing numbers using floating dollar signs, commas, and fill characters? No more checking numbers to see if you need to precede them with blanks, so that your amounts print out correctly in columns. No more converting numbers into string format and struggling to right-justify them so that the cents don't end up where dollars should be.

NumberPrint knows where to place numbers for correct printouts. All you have to do is create an edit pattern and call the NumberPrint subroutine from your main program.

## GETTING STARTED

Type in Listing 1, NUMPRINT.BAS, check it with TYPO II and SAVE a copy before you RUN it. (Antic Disk owners will also find a bonus file this month, NUMPRINT.M65, the MAC/65 assembly language source code for NumberPrint.)

•  
*By MARC ESCOLA*

If you have trouble typing the special characters in lines 1010-1040, don't type them in. Instead, type in Listing 2, check it with TYPO II and SAVE a copy. When you RUN Listing 2, it creates these hard-to-type lines and stores them in a file called LINES.LST.

To merge the two programs, disk users LOAD "D:NUM-PRINT.BAS" and then ENTER "D:LINES.LST." Cassette users: CLOAD Listing 1, then insert the separate cassette used for Listing 2 and ENTER "C:". Remember to SAVE the completed program before you RUN it.

The table below shows how NumberPrint translates the proper edit pattern into the printed result you want.

Number	Edit Pattern	Result
10	"XX,XXX.XX"	" 10.00"
22.5	"X\$,XXX.XX"	" \$22.50"
5	"*,XXX.XX"	"*****5.00"

You must first place the subroutine's data into a string. Now you will need a string where your edited number will be placed. Fill this string with the desired pattern. You will also need a temporary variable for the subroutine to use. Place the number you wish to edit into the temporary variable and then call the USR function. Your number is now in the string and ready to print.

Setting up your own edit pattern is easy. Use the X character for each spot where you wish a digit to be placed. Use as many Xs as the largest number you will use. If your number will contain fractions (decimal places) you can use the optional period [.] character. Place the period at the left of the digits that will represent it. The subroutine will fill these positions with zeros if your number has no fractions.

Fractions will be dropped if no period is in the string. Note that no rounding-off is performed. Commas or any other characters (except for optional and inverse) can be placed anywhere in the string to separate digits.

NumberPrint has two other optional characters which you can include—the dollar sign [\$] and the asterisk [\*]. These characters, if placed in the second position in the string, will automatically float up to the most significant digit. This is very useful if your program is printing checks.

Another handy way to use NumberPrint is for placing filler characters. The default character is a blank. Place the desired character in the first position of the string and if the number is smaller than the digits in the string, the spaces will be replaced with this character. Note that use of either the float position or the fill position takes the place of one of your X's. This means that if your number is too large, it will cut off these options. If you always wish to have these options in effect you should have enough Xs to fill in the string completely. ■

*Marc Escola of Portland, Oregon is senior application programmer for a major retail company. A member of the Portland Atari Club, he has been programming Atari 8-bit computers since 1983. This is his first publication in Antic.*

Listing on page 35

## BSRk

continued from page 21

files only once. This Init function erases any previous database from your disk and creates blank, new ones.

Next, choose item 3 to Update Records. Specify record 1, select each field and enter your data choices, as explained in *Figure 1*. Exit that Update, then *again* select Update Records from the main menu, but this time specify record 2. Repeat for as many BSR modules and on/off times as needed.

At any time you can use choice 4, Show Active, to conveniently display all of the active records, or choice 5 to Show All of the records in the database.

Next, choose item 6, Load BSR Interface, to actually send your records to the X-10 Powerhouse's memory.

Finally, set the current date and time with choice 2. Now you can unplug your 850 or P:R: Connection from the Powerhouse—which will remember the events you sent it and activate them when appropriate. Now, it's time to sit back and enjoy your house gone BSRk.

## PROGRAM TAKE-APART

BSRk is very modular and subroutine-oriented. This aids in debugging the initial code and extending the functionality later.

50 Initializes the 810 interface to 600 baud and even parity.

100 Writes characters from MSG\$ to the X-10 with inter-character delay.

150 Reads a character from the X-10.

200 Reads sync and status characters.

250 Computes the checksum across the START to FINISH portion of MSG\$.

300 Display column headers for record listings.

350 Displays a record in columns.

400 Set up constants, arrays, and labels.

450 Overwrites a record on disk.

500 Reads a record from disk.

550 Reads index file from disk and fills CHAR() and SECT() arrays.

600 Breaks 24-hour time into hours and minutes.

650 Sends the default housecode (A) to the X-10 to clear its memory.

700 Main loop. Display menu, get user choice, call appropriate routine.

1000 Initializes disk database by writing blank records and initializing the index.

2000 Prompts for hours and minutes and sends that time to the X-10.

3000 Retrieves record from disk, displays it, prompts for individual field changes, rewrites record to disk.

4000 Displays records that will be downloaded to the X-10 (status = active).

5000 Displays all records in the database.

6000 Clears the X-10, composes messages from active records, and sends them to the X-10.

7000-Exit BSRk to BASIC. ■

*Donkey Kong Jr.*

*Pac-Man*

## Cartridges II

*Ms. Pac-Man*

*Dig Dug*

*Qix*

### Ms. Pac Man, Donkey Kong Jr., Dig Dug and more . . . BY MATTHEW RATCLIFF

Here are some more of the classic Atari game cartridges that are still available for your new Atari XE Game System—or for any other Atari 8-bit computer. Just like the other 10 popular cartridge classics we reviewed in the July 1988 *Antic*, these games are rated on a four-star system.

Classic Atari game cartridges have become easier to find at retail outlets since the release of the XEGS computer last Christmas. You can also order cartridges directly from the Atari Corp. Atari's warehouse stock has been repackaged in uniformly designed boxes and is now priced from \$19.95 to \$22.95 each. Meanwhile, many dealers are still selling out their old packages at prices below the current list.

#### DONKEY KONG

★ ★ ★ ½

A very large simian creature has run amok and stolen the hero's sweetheart in this superb port from the original coin-op **Donkey Kong**. Kong doesn't look anything like a Donkey—this game originated in Japan, loosely translating as "Crazy Kong" in English.

You'll make Mario the construction worker climb the girders to retrieve his true love. On the first level you must jump barrels and fireballs and climb ladders toward the fierce Kong and Mario's bewildered darling. Along the

way Mario can jump up and grab some hammers to bash a few barrels, although the longer it takes to get to the top, the smaller bonus score you'll earn and the faster Kong tosses barrels at you. Once you've reached the top, it's true love again—until Kong becomes furious and snatches the lady off to the next level.

Higher yet on the girders, Kong and Mario's girlfriend await. Kong sends down fireballs as you help Mario climb up and across the grid of beams. For bonus points along the way, Mario can pick up personal effects dropped by his kidnapped cutie. When Mario jumps over the pins in the girder, he deftly pulls them out. Once all six pins are removed, the structure falls, taking Kong with it and giving him a serious bonk on the head.

But Kong has one tough noodle, and he moves on to another level, similar to the first screen, but he's much more aggressive with the barrel tossing. If Mario survives this level, he and Kong duke it out on yet another portion of the superstructure where moving elevators, bouncing girders and other hazards continue to challenge Mario.

Donkey Kong is a notably chivalrous game scenario among all too many shoot-em-ups. Eventually Kong defeats Mario, but there's always the [START] key to try again for more points.

## DONKEY KONG JR.

★★★

Donkey Kong was a smash hit in the arcades, so Nintendo, the original maker of the Donkey Kong and Mario Brothers video game series, followed up with **Donkey Kong Jr.** In this scenario, Donkey Kong Senior is under lock and key, guarded by the victorious Mario.

In this game you assume the role of poor Kong Junior, desperately trying to save Papa Kong from the vengeful Mario. There are four challenging levels—the vine, chain, jump board and hideout scenes.

On a scale of 1 to 10, I would rate the difficulty level of Donkey Kong at 5, whereas Donkey Kong Jr. is easily an 8 or 9. Only a few times have I gotten past the first screen, in which Junior must jump up onto vines and climb them, knocking down fruits, which can clobber the snapjaws—vine-climbing piranhas. He must jump across platforms and climb until he finally reaches Mario's platform at the top. Here Junior must jump quickly, grab the key and release Papa—briefly. Mario always manages to recapture Donkey Kong Senior, taking you to the next level of game play.

At the chains level Junior must insert six keys into six locks, pushing them up the chains while avoiding birds and more snapjaws. All six keys are needed to unlock Papa Kong, but Mario doesn't waste any time in recapturing him.

At the jump board and hideout levels things get even hairier, with more and stronger foes for poor Junior to conquer along the way.

I recommend this game for master arcade gamers with lightning reflexes. Both Donkey Kong games are superb conversions of the original coin-arcade hits.

## PAC-MAN

★★★½

Not every video game has a breakfast cereal, a kids' noodle snack and a Saturday morning cartoon named after it, but **Pac-Man** does. Mr. Pac is into eating dots, and the ghosts are out to eat him. Along the way Pac-Man can eat the flashing power pills for bonus points, briefly turning the tables on the nasty ghosts.

This is a perfect conversion of the Arcade classic, much better than the "flicker-matic" version done for the Atari 2600. It can get boring once you've mastered the lower levels, but you can always speed it up at the options screen before starting.

The maze screen remains the same at every level. The arcade original was quite susceptible to "pattern playing." Once you had the basic actions of the ghosts down pat, you could play a certain "pattern" at each level and really rack up the points. However, in the home computer version, these patterns don't seem to show up, and the game is more challenging.

## MS. PAC-MAN

★★★½

The art of video gaming traditionally had been a young man's fancy, but Pac-Man attracted a lot of ladies. Bally (originators of the Pac-Man family) noticed this too, and built a new, more sophisticated, feminine version of a great game.

In **Ms. Pac-Man** that cute little muncher, complete with lipstick and a bow, gobbles dots and power pills, just like her male counterpart, as ghosts chase her about. Unlike Pac-Man, where fruit bonuses are in fixed locations, Ms. Pac-Man must chase them around on the screen. Also, the screens in this rendition differ between levels, making it harder to master all the escape routes from the ghosts.

Ms. Pac-Man is more sophisticated than Pac-Man, maybe a bit more playable and not quite as monotonous. *One* of these games is a must for any complete gamer's cartridge library, but I don't think they're dissimilar enough to purchase both. Maybe Atari could release them both in one super cartridge.

## DIG DUG

★★★

Digging for gold isn't a simple job anymore. The hills are infested with all sorts of nasty little creatures, and you're just the high-tech exterminator to do the job.

The introductory music and sound effects of this game are captivating. Your job is to dig through the ground and zap all the little bugs and fire-breathing creatures before they zap *you*. The **Dig Dug** game screen is like looking into Pee Wee Herman's ant farm. If you dig into a cavity occupied by a bug, the critter attacks. You must fire first, zapping it with your lightning-bolt stun-gun. Three zaps are always needed to kill one of these baddies. Wait too long between zaps and the bugs will recover and grab you. Dig under what looks like a buried eggplant, with the bad guys in hot pursuit, and they'll get it in the chops.

You can't wait around too long, or the bugs, in ghost

# Power Manager

## X-10

By Charles Cherry

*Atari  
home  
controller  
connection*

One interesting application that was never previously available for any Atari is computer control of the X-10 PowerHouse home controller system. X-10 provides its own software for the Apple II, Commodore 64 and IBM, but left out the Atari. This unfortunate lack has now been corrected by Terrific Corp., whose **PowerManager** provides all the features available on other computers.

## MEET THE X-10

For those Atarians not familiar with the X-10 home control system, here's a brief overview:

A master controller turns lights and appliances (or anything else with an electric switch) on and off. A separate slave module is used for each item to be controlled, whether it's a lamp, appliance, wall socket, wall switch or thermostat. The lamp and wall switch modules also provide 16 levels of dimming.

The signals that control the slave modules travel through the normal house wiring. That's the real magic of the X-10 system—no additional wiring is needed. Just plug in the modules and you have remote control. I once worked with a small traveling theater company which used the X-10 system for stage lighting. We just plugged everything into the wall and were ready to go. No need to run cables everywhere. It was great.

X-10 PowerHouse hardware is reasonably priced and widely available from all kinds of stores that sell household electronic supplies. The controllers and modules are sometimes on sale for next to nothing. Even if you pay full price, the system's "power without the price" is an unbeatable value. The X-10 could be called the Atari of remote control systems.

Several different X-10 controllers are made, from simple manual ones to complex timers, wireless transmitters and even a telephone operated controller. The controller we're concerned with is the model CP290, PowerHouse RS-232 Computer Interface. With this controller—and the proper software and cable—your computer controls the PowerHouse system. The PowerManager provides the proper software and a cable that connects your Atari to the CP290.

## THE POWERMANAGER

The PowerManager cable plugs into joystick port 2. This saves you the cost of an RS-232 interface (such as an Atari 850 or a P:R: Connection). But it means you must be careful with the cable. Don't leave it plugged in when you run other software. Likewise, don't leave things like your PaperClip key plugged in when you run PowerManager.

The software is very similar to what's available for the other computers, except that X-10 software uses graphics—pictures of rooms into which you put icons of your lamps and appliances. PowerManager, however, identifies the devices numerically. Personally, I think PowerManager got it right. The X-10 pictures are cute, but they don't look like my house and there's no logical way to indicate devices that aren't in a room, like the porch lamp, the garage light or the automatic sprinkler system.

The X-10 interface is limited to 16 devices. Eight can be manually controlled by switches on the interface and all 16 can be controlled by the computer. Actually, many more than 16 can be controlled by the computer. It seems that since the signals travel on the house wiring, there's a chance that you will also control your neighbor's X-10 system, if you are connected to the same local transformer (those big boxes on top of utility poles, usually serving

about half a block).

To prevent this, each device can be set for a "house code." You and your neighbors decide who gets what code: "You're A, I'm B and the Murdocks are C." There are 16 house codes. If more families on your block get X-10 systems, you're out of luck. However, it's unlikely that many of your neighbors are using the PowerHouse system. This means all those house codes are available for you—16 house codes with 16 devices each, adds up to 256 devices. Now *that's* a respectable remote control system.

You can use the PowerManager software in two different ways. First, you could control your house directly from the keyboard or joystick. More likely, you will choose to program the interface to run from its internal timer. You can schedule as many as 128 different events. Each event can control one, several, or all of the 16 devices in one house code. You schedule each event for a specific time and have it automatically repeat on one or more days of the week. Or you can program events to occur on each scheduled day within an hour of the set time. This makes your home looked more lived-in while you are on vacation.

When your schedule is complete, you can save it to disk. You can build a library of schedules for various situations, such as summer, winter, vacations, etc. Once you select a schedule and upload it to the X-10 interface, the interface runs on its own. So you can use your computer for other things. The interface even has a 10-hour battery backup in case of power failure.

## A FEW COMPLAINTS

I found the logic structure of the menus inconvenient. You can only set the time and the default house code upon first booting. The arrow keys and [RETURN] are inconsistent and you cannot exit from a menu when you want to.

Another problem is the clock. It changes from a.m. to p.m. and back at 1 o'clock, not 12, so 12:30 in the afternoon must be entered as 12:30 AM, and 12:30 at night must be entered as 12:30 PM.

Also, I kept getting the following cryptic message: "\*Error: Interface was powered down.\*" I couldn't understand this, since the interface was plugged in and seemed to be working fine. In fact, everything worked just as it should have. Later when I read the X-10 programming guide, I realized the PowerManager was saying that the memory of the interface had been erased—it had been unplugged and "forgot" its previous programming. I don't think that qualifies as an error.

## PUTTING THE SYSTEM TO WORK

The PowerMaster X-10 was designed for home control and it works well there. I particularly enjoy waking to the glorious sound of my monster stereo instead of my tinny little clock radio. The system makes coffee and toast in the morning and it warms up the electric blanket before

*continued on next page*

## POWER MANAGER X-10

continued from previous page

bedtime. It has eliminated the need for a \$75 programmable set-back thermostat, and it remembers to turn on the porch light before my wife gets home and turn it off when we go to bed. When I get some relays and solenoids, I'll build an automatic cat feeder.

Home control is sort of a game. It's fun to plan your 21st-century house. This programmable system can replace many expensive dedicated systems to control sprinklers, solar heating, fans, security systems, etc. And it's all done with little or no rewiring. However, the X-10 is not limited to the home. (Remember, we used it for a theater.)

## BEYOND THE HOUSE

Any application requiring remote control is a candidate for the X-10. And if that remote control needs to be programmed, an Atari with the PowerManager is a cost-effective solution. The individual modules are limited to switching 15 amps or dimming 300 watts, but they can drive relays to control larger loads like floodlights and electric signs.

Of course, the system is a natural for science fair projects and other experimental control systems. You should be warned, however, that in the scheduled mode, it's only accurate to within one minute. In the direct mode, you can get about 10-second accuracy, but that brings up another problem. There's no information on using this sys-

tem in your own programming. The X-10 software for other computers includes a utility program to help you write BASIC applications. We could use the same for the PowerManger.

Writing custom software using the Atari's joystick and paddle inputs can create a simple data acquisition and process control system. A moisture sensor can trigger a pump, a phototransistor can turn off the lights, the vast array of security detectors (motion sensors, magnetic field detectors, infrared sensors) can be used to set off the appropriate responses.

*(Antic would be interested in publishing software/hardware articles about interesting, original X-10 PowerManager uses.—ANTIC ED)*

## FORMS GENERATOR

for the Atari 800, 800XL, 65XE, 130XE

Designed by Jeff Brenner, columnist for *Computer Shopper* magazine, of "Applying The Atari" fame, and author of book and magazine articles in *COMPUTE!*, *ANALOG* and others.

**LOOK WHAT YOU CAN DO WITH FORMS GENERATOR:** Purchase merchandise by mail? Next time, send a customized purchase order form! Does your home or business ever need statements, invoices, proposals, job work orders, gift certificates, etc.? No problem! Use *FORMS GENERATOR's* scrolling spreadsheet-style screen to design almost any form to suit your exact needs. What you see on-screen is what you get on paper! Use the text mode with any 80-column printer, or the high-res graphics mode with the Epson, Gemini/Star, Okidata, Panasonic or Prowriter for remarkably realistic forms. BUT THAT'S JUST THE BEGINNING: Once you've designed a form, you can program *FORMS GENERATOR* to make all calculations automatically! Imagine: after you enter quantities, descriptions and prices, *FORMS GENERATOR* moves about the form calculating extended prices, subtotals, and even the sales tax! Like magic! (Sample invoices included). You can also use *FORMS GENERATOR* for record keeping, since you can save filled forms to disk!

Read what our customers have written: "Excellent... easy to use and ran perfect (ly)..." T.W. Wethersfield, Connecticut; "I was most impressed with your *FORMS GENERATOR* program..." J.E. King, South Carolina; "Love it!" C.R. Cortland, Ohio. Our "down to planet Earth" price: Only \$23.95 (product #ATA611).

## CLASSIC CARTRIDGES II

continued from page 25

fashion, will fly through walls after you. The last bug at each level always high-tails it for the exits—zap him for bonus points.

Each level has more bugs to bonk. They're more vicious and they move faster. Eventually the mines and bugs are the death of you.

All too many games are simply an exercise in wrist wrenching in pursuit of a higher score. Dig Dug is a bit too cutesy, but it's a faithful conversion of the popular original coin-op game.

## QIX

★★

In *Qix*, you must protect your land from the invading grid bugs. On a large, mostly blank display you begin drawing boxes. If you're brave, holding the fire button during the draw slows you down for more points. Each time your drawing line reaches a previously drawn edge, the land is filled and reclaimed as yours. Land reclaimed slowly, in red, is more valuable than that gained quickly.

This game is an accurate conversion of the coin op, but seems just too slow. If you liked the arcade original, then this classic deserves a place in your cartridge library. If Atari ever re-releases *Qix*, they should consider speeding it up.

\$19.95 to \$22.95 each. Atari Corp., 1196 Borregas Avenue, Sunnyvale, CA 94086. (415) 745-2000.

# TYPING SPECIAL ATARI CHARACTERS

**Antic** printed program listings leave a small space between each Atari Special Character for easier reading. Immediately below you will see the way **Antic** prints all the standard Atari letters and numbers, in upper and lower case, in normal and inverse video.

```

ABCDEF GHI JKLMNOPQRSTU VWXYZ
abcde fgh i jklmno pqrstu vwxyz
0123456789          0123456789
  
```

The Atari Special Characters and the keys you must type in order to get them are shown in the two boxes below.

NORMAL VIDEO				INVERSE VIDEO			
FOR THIS	TYPE THIS	FOR THIS	TYPE THIS	FOR THIS	TYPE THIS	FOR THIS	TYPE THIS
	CTRL ,		CTRL S		CTRL ,		CTRL X
	CTRL A		CTRL T		CTRL A		CTRL Y
	CTRL B		CTRL U		CTRL B		CTRL Z
	CTRL C		CTRL V		CTRL C		ESC
	CTRL D		CTRL W		CTRL D		SHIFT DELETE
	CTRL E		CTRL X		CTRL E		ESC DELETE
	CTRL F		CTRL Y		CTRL F		ESC SHIFT INSERT
	CTRL G		CTRL Z		CTRL G		ESC CTRL CTRL TAB
	CTRL H		ESC ESC		CTRL H		ESC SHIFT TAB
	CTRL I		ESC CTRL -		CTRL I		CTRL .
	CTRL J		ESC CTRL =		CTRL J		CTRL ;
	CTRL K		ESC CTRL +		CTRL K		SHIFT =
	CTRL L		ESC CTRL *		CTRL L		ESC CTRL 2
	CTRL M		CTRL .		CTRL M		ESC CTRL DELETE
	CTRL N		CTRL ;		CTRL N		ESC CTRL INSERT
	CTRL O		SHIFT =		CTRL O		
	CTRL P		ESC SHIFT CLEAR		CTRL P		
	CTRL Q		ESC DELETE		CTRL Q		
	CTRL R		ESC TAB		CTRL R		
					CTRL S		
					CTRL T		
					CTRL U		
					CTRL V		
					CTRL W		

Whenever the CONTROL key (CTRL on the 400/800) or SHIFT key is used, *bold it down* while you press the next key. Whenever the ESC key is pressed, *release* it before you type the next key.

Turn on inverse video by pressing the Reverse Video Mode Key . Turn it off by pressing it a second time. (On the 400/800, use the Atari Logo Key instead.)

Among the most common program typing mistakes are switching certain capital letters with their lower-case counterparts—you need to look especially carefully at P, X, O and 0 (zero).

Some of Atari Special Characters are not easy to tell apart from standard alpha-numeric characters. Usually the Special Characters will be boxed. Compare the two sets of characters below:

SPECIAL		STANDARD	
	CTRL F		/
	CTRL G		SHIFT +
	CTRL N		SHIFT -
	CTRL R		-
	CTRL S		+

# HOW TO USE TYPO II (8-BIT)

TYPO II automatically proofreads Antic's type-in BASIC listings for 8-bit Atari computers. It finds the exact line where you made a program typing mistake.

Type in TYPO II and SAVE a copy to disk or cassette. Now type GOTO 32000. When you see the instruction on the screen, type in a single program line **without the two-letter TYPO II code** at the left of the line number. Press the [RETURN] key.

Your line will reappear at the bottom of the screen with a two-letter TYPO II code on the left. If this code is not exactly the same as the line code printed in the magazine, you mistyped something in that line.

To call back any line previously typed, type an asterisk [\*] followed (without in-between spaces) by the line number, then press [RETURN]. When the complete line appears at the top of the screen, press [RETURN] again. This is also the way you use TYPO II to proofread itself.

To LIST your program, press [BREAK] and type LIST. To return to TYPO II, type GOTO 32000.

To remove TYPO II from your program, type LIST "D:FILENAME",0,31999 [RETURN] (Cassette owners LIST "C:"). Type NEW, then ENTER "D:FILENAME"[RETURN](Cassette—ENTER "C:"). Your program is now in memory without TYPO II and you can SAVE or LIST it to disk or cassette.

Don't type the  
TYPO II Codes!

```

## SILICON DREAMS, SIX-SYSTEM BOX

### 6 SYSTEM BOX

The **6 System Box** is a switchbox for six different operating systems. It works on XL and XE computers. I don't personally know anyone with six OS chips, but I suppose it could happen. These days we have quite a variety to choose from, including Omnimon, Expander, Supermon, Omniview 80, plus the do-it-yourself chips. I myself use the standard Atari OS and UltraSpeed from CSS (reviewed in *Antic*, October 1987), which are controlled by a built-in switch. (See *Antic*, March 1988, for instructions.)

The box is a 5 1/2 X 3 X 1 inch aluminum project box with a rotary switch and six LEDs on top. Inside is a circuit board with sockets for the OS chips and the jumper cable. The construction is not polished, but it worked without any problems.

Installation is not difficult if the OS chip in your computer is socketed. Otherwise, it should be left to an experienced technician. The instructions included with the **6 System Box** are rudimentary and somewhat confusing. They suggest drilling a 1/4-inch hole, but they don't say why. They orient the chips in the box by referring to the "writing on the board." Since the board has writing on both edges, that's not much help. It would have been clearer to refer to the two small chips and the wires which are on the edge they mean.

The only other problem is the shortness of the jumper cable—a 6-inch flat ribbon cable that just barely reaches outside the computer box, where it interferes with cartridges (at least on the 130XE). I realize that there are strict length limits before the data gets scrambled, but this is something to consider.

Overall, the **6 System Box** works just fine. If you want to use several OS

chips, it's the only game in town.—  
CHARLES CHERRY

### SILICON DREAMS

In a departure from Rainbird's high-quality graphic adventures, *Pawn* and *Guild of Thieves*, **Silicon Dreams** is a trio of connected adventures with graphics such as you might have expected five years ago. But that's okay because these adventures can stand on their own without hi-res pictures and still be entertaining.

The adventures are called *Snowball*, *Return to Eden* and *Worm In Paradise*, and you can play them in any order you want. However, playing them in correct order lets you carry your score from one adventure to the next and gives you a higher final score as well as a shot at the title of Supreme Adventurer.

In *Snowball*, you're secret agent Kim Kimberley and you've awakened prematurely from your freezer-coffin on the good ship *Snowball*, which is on a collision course with the planet Eden. You must get to the main control room and avert disaster. In *Return*

to Eden, you have landed on the planet and must somehow enter the city of Enoch. *Worm in Paradise* is set 100 years later. You are now Kim Kimberley III, and your goal is to gain power and influence and to save Eden.

None of the adventures is easy. There are robots aboard *Snowball* that make life very difficult for Kim. On Eden there are native life-forms to deal with. However, I had a good deal of fun playing the role of Kim Kimberley, avoiding robots and "Star Wars" lightning bolts.

The commands in *Silicon Dreams* are pretty standard. The Help command was not very helpful, and I found myself wishing for the Hint command from *The Pawn*. *Silicon Dreams* came with a clear, interesting, humorous instruction manual, as well as a novella called "Eden Song" which really helped set the scene for the adventure.

*Silicon Dreams* has some things in common with *Pawn* and *Guild of Thieves*, both good and bad. The game understands long command sentences, which is handy when you must enter similar commands over and over. Games can be saved to disk, and the RAM SAVE feature lets you save your current position, then reload it later with the RAM RESTORE command.

What I didn't like about *Silicon Dreams* was the copy-protection. When you load a saved game, you're asked to type a word from a line in "Eden Song" and this really interferes with game play. Also, *Silicon Dreams* might not work with your drive if you don't have an Atari 1050.—JOHN MANOR

\$24.95, 64K disk. 1050 disk drive recommended. Rainbird, P.O. Box 2227, Menlo Park, CA 94026. (415) 940-6087. ■

# First Look

## Inside the XE Game System

**Hardware surprises revealed!**

**This look inside the Atari XE Game System includes two programs. XEGS Manager is a utility for convenient control of all the Game System's built-in features, but many of its options can also be used on the other Atari XL/XE computers. The second BASIC program is a short "spray-painting" routine for testing light guns.**

**A**tari executives asked the heads of several major toy store chains which product they'd rather sell—the powerful 65XE home computer for about \$80, or a fancy new game system for about \$150. The answer was, "You can keep the computer, give us that game machine!"

This "game machine" is what we now know as the Atari XEGS, the XL-compatible Extended memory Game System. It's simply an enhanced 65XE in a game machine package. It's also a brilliant idea. The XEGS has been selling out almost as fast as toy stores can get them in.

The XEGS may not seem like such a hot idea to serious Atari computer users. But just think about it. If you were afraid of computers or don't have the foggiest idea what to do with one, you'd have absolutely no interest in an Atari 65XE—even if it *could* play great games. However, you'd probably have no compunction about buying a great video game system, the XEGS, as a new addition to the family entertainment center.

Now we'll take a close technical look at the Atari XEGS. I'll explain how some of its changes in physical design have affected the operating system software. I'll also present the XEGS Manager, a utility for controlling all the built-in features of the XEGS.

**B Y M A T T H E W R A T C L I F F**

## KEYBOARD

The keyboard of the XEGS is detachable. When not connected, the XEGS console looks (and acts) like just a tame little game console. In fact, Missile Command is turned on automatically.

Plug in the keyboard and turn on the machine without an external cartridge, and you're running Atari BASIC, Revision C. The keyboard is virtually identical to the one found on the 130XE. It's mushy, but you can get used to it.

The cable on the XEGS keyboard is quite short. There are two brackets at the top of the keyboard case which lock neatly under the front of the console. The keyboard connector is a standard DB15 female. My first XEGS project was to construct an extension cable for the keyboard. I find it far more comfortable to type for a long time with the keyboard on my lap than on a desk.

Inside the XEGS keyboard case is a small circuit board. On it you will find some resistors, capacitors and two CD4051 chips, which decode the keypresses and send an internal keycode back to the POKEY chip in the XEGS. I already made an adapter cable to connect the XEGS keyboard to the 800XL joystick ports.

So far my efforts at "scanning" the external keyboard manually have failed—the POKEY chip does this automatically in the XEGS—but I hope to bring you a laptop keyboard utility program that lets you use the XEGS keyboard on any other Atari computer with minimal hardware hacking—just a cable.

## MEMORY

There are only two RAM chips in the XEGS, which deliver a full 64K of RAM. They're Texas Instruments TMS4464-12 64K-by-4-bit chips. In the XL/XE computers, eight 64K-by-1-bit chips are used. Fewer chips improves reliability and generally reduces the cost of producing the machine. In fact, the XEGS contains a total of only 17 chips.

ICD has indicated that it is working on a RAM upgrade kit for the XEGS similar to the RAMBO XL for the Atari 800XL. I've already received a 128K RAM upgrade kit from Innovative Concepts for my XEGS, making it fully 130XE-compatible. See review on this page.

Using higher-density ROM chips, the updated XEGS operating system had 8K of spare ROM. Atari decided to use that extra ROM for the Missile Command game, which is bank-switched in and out much like how Atari BASIC is toggled on and off. Missile Command can be enabled by holding the [SELECT] key during power-up when a keyboard is connected. When in BASIC, you can enter BYE to get to the Self Test. From there, pressing [RESET] while holding the [SELECT] sends control to Missile Command. Press [RESET] in Missile Command, while holding [OPTION], to return to the Self Test. Press [RESET] by itself to return to BASIC. (Reboot if a disk drive is connected.)

## LIGHT GUN

The XEGS comes with a light gun called the XG-1. The

*continued on next page*

# XE-GM1 UPGRADE

The **RAMdrive + XE-GM1** from Innovative Concepts is a RAM upgrade kit for the Atari XE Game System which converts this "game machine" into a powerful 128K computer that's 100% compatible with the Atari 130XE. Having 128K memory gives you access to such goodies as the RAM-resident spelling checker of Paper Clip 2.0, BASIC XE, RAMdisk support and any other software that can use the 130XE's extended RAM.

The XE-GM1 kit comes with a pair of 41464 RAM chips for a full 64K, a custom IC chip, two sockets for the RAM chips, wire and a few resistors. Five pages of instructions are included as well as a useful hand-drawn schematic.

Installation requires 26 steps. They're well-documented, and I had no trouble making the upgrade—the entire installation and checkout process took about three hours.

But before you run out to buy this nifty upgrade, I must warn you that this project requires some *real* hardware hacking experience. Although this upgrade has only three chips, it is still a delicate process. And of course, like any hardware modification, it will void whatever Atari warranty you may have left.

The most critical step in the XE-GM1 upgrade is the removal of the original RAM chips. These must be desoldered and removed without any heat damage to the chips or circuit board. I've burned chips to death while removing them, so I was very patient during this process and I never let the chips become uncomfortably warm to the touch. After the chips were out, I carefully cleaned out and inspected the pads.

After soldering in the new RAM sockets, I did *not* plunge into the next process, piggybacking RAM chips. I put the original RAMs back in the computer and hooked it up, making sure not to short out anything or zap myself. I ran the self test and the original RAMs checked out. Then I shut off the XE Game System and repeated the test process on the new RAMs from the kit. They too checked out. I *highly* recommend these steps, in order to prevent performing an upgrade with bad RAMs.

Next the RAMs must be stacked, with pin 16 of the top chips bent out, and soldered together. Here a light, quick touch of the solder iron is recommended. Patience and plenty of cooling

*continued on next page*

time between each pin are important.

Next came the custom IC, a 16-pin chip. All its legs were bent out except 8 and 16 (ground and +5 volts, respectively). This chip is soldered piggyback to U13 on the XE Game System. It looks like a squashed bug there—not pretty, but functional.

Some resistors had to be wired to some pins on the Atari's PIA chip. Another resistor had to be wired between pin 16 of the RAM chips and one pin of the custom IC. After that, it was simply a matter of stringing wire from the custom IC to the proper pins on the PIA, ANTIC, RAM and FREDDIE chips. Two pins of the FREDDIE also had to be desoldered and pulled up. I took my time, double-checking all connections and counting pin numbers three or four times before making a connection. You want this installation to work the *first* time.

Each time I piggybacked chips, I did something not mentioned in the instructions. I separated the upper and lower chips very slightly—1/32 to 1/16 of an inch. This helps the chips run cooler and last longer.

Also, it took me only a couple of connections with the wire included with the kit to realize it wasn't suited for the job. The insulation had a very low melting point and it tended to shrink back or melt off the wire completely during the soldering process. To prevent the risk of shorting, I switched to my own Kynar wire from Radio Shack which has a teflon insulation that withstands soldering heat.

Before putting the computer back together, I hooked up the motherboard and ran some preliminary checks. The upgrade ran just fine, so I buttoned up the system and ran memory tests for over 24 hours without a glitch.

The package includes Atari DOS 2.5 on disk, complete with utilities and RAMdisk software. On the flip side is a complete RAM test by Glenn Smith of Radon Software, which detects all available RAM banks (including the 256K in my upgraded 800XL) and tests them.

If you want the classy package of the XE Game System and all the RAM power of a 130XE, then I highly recommend the XE-GM1 from Innovative Concepts. If you aren't a hardware hacking veteran, I suggest that you seek the assistance of a guru in your users group or have an Atari service center install it for you. The installation fee will be significantly less than repair charges for burnt etch and fiberglass.—MATT RATCLIFF ■

\$34.95. Innovative Concepts, 31172 Shawn Drive, Warren, MI 48093. (313) 293-0730

This is the small printed circuit board inside the XEGS detachable keyboard. It is sitting on a schematic of the old Atari 800, adjacent to virtually identical keyboard circuitry.

There's room at the top of this keyboard for the START, SELECT, OPTION and RESET keys. But they are in the console. A dead giveaway that this keyboard is identical to that of the 65XE.

Nintendo light gun is more accurate—if something is lined up in its sights, that's exactly what you hit. Not so with the XG-1. You'll find that it often shoots to the left or right, depending on the software you're running.

The XG-1 is simply a specialized light pen. Light pen support was built into the earliest Atari computers, but it never really caught on. In the shape of a gun, the light pen has brought a whole new dimension to video games applications. The light pen horizontal position, LPENH, can be PEEKed at memory location 564, and the vertical position, LPENV, is found at location 565.

Light gun values range from 0 to 227. You will notice that your horizontal readings are quite odd. Try the sample program below, and notice how the GUN-X readings vary as you sweep the gun across the screen, left to right.

```
10 LPENH=564
20 LPENV=565
30 GRAPHICS 0:POKE 752,1:POKE 712,15
40 POS. 0,0:FOR I=1 TO 4:? "0123456789";:NEXT I
50 ? "GUN-X=";PEEK(LPENH); " "
60 ? "GUN-Y=";PEEK(LPENV); " "
70 ? "TRIGR=";STICK(0)
80 GOTO 50
```

Point the gun to the far left of the display and GUN-X will read about 88. Moving from left to right, the reading will reach 227 at about column 34. Then suddenly it drops to 0 and increases again to about 30 at column 39. This offset is due to the delay between when a pixel is actually

Mary Khomberg, Pelogain

lit on the display and when the information is relayed from the light gun sensor to the POKEY chip, which latches an internal scan counter for the pen reading.

The old Atari 400/800 Hardware Technical Reference recommends a “calibration procedure” each time the light pen is used, so that the software can compensate for this offset. A calibration procedure would improve the accuracy of the light gun. But Atari’s Bug Hunt and Barnyard Blaster games both have “hard-coded” values—different ones in fact. While Bug Hunt appears to shoot slightly to the left, Barnyard Blaster seems to shoot a tad to the right. The Y readings for the gun are more predictable, equal to half the number of the currently displayed scan line. You’ll notice with your test program that GUN-Y only varies from about 17 to 115. Note that you get much better performance out of the light gun near the screen edges, when you use a light colored border achieved with the POKE 712,15 above.

You’ll need to perform some computations to adjust for these unusual readings, to convert gun coordinates to screen coordinates. Different conversion factors are required for each graphics mode (and P/M graphics).

The gun won’t return reliable readings at all if the intensity of the display is too low. That’s why the screens for Atari light gun games may be brighter than usual. The game screen will momentarily flash white whenever you press the trigger in either Bug Hunt or Barnyard Blaster. While the screen is all white, the software reads the gun position and provides the most accurate values.

Listing 1, DRAWGUN.BAS, presents a Graphics “spray-painting” program for testing the XG-1. Dots are drawn

whenever the fire button is pressed. Try holding the gun very steady to see how much jitter you get in the readings. These inaccuracies are reflected in your games as well. I feel that, at the higher levels of play, Bug Hunt and Barnyard Blaster both require more accuracy for continued play than the XG-1 can deliver.

Atari has informed me, however, that the XG-1 and a revised Bug Hunt will be released as a separate package. If you’re tired of waiting, you may wish to pick up the Sega light gun, for about \$25 (when on sale) and modify it for the Atari.

To modify the Sega gun for the Atari, you’ll have to cut off the incompatible connector. The wires must be stripped back and soldered into an Atari joystick connector as follows:

SEGA GUN	ATARI JOYSTICK PORT
Blue wire	Pin 1 stick FWD
Gray wire	Pin 6 trigger
Green wire	Pin 7 +5 volts
Black wire	Pin 8 Ground

Because of the close-fitting connections for the XEGS ports, don’t wire in a DB9 female connector that has “ears.” Most joysticks don’t have wires for unused signals, so cutting up an old joystick cable may not work. Specifically, an Atari joystick does not need the +5 volts, so there isn’t likely to be a wire connected to Pin 7. However, you can find joystick extension cables at Radio Shack, which have all nine pins wired from male to female. **Antic** disclaims responsibility for any damages that might occur during improper implementaton of this, or any, hardware

modification project we publish.

Once it's all hooked up, you'll notice that gun fires when you *release* the trigger, which is annoying. The Sega trigger wiring is the opposite of what the Atari light gun uses. To rewire the trigger switch, remove the five screws (one is under the Sega logo on the side). Find the trigger micro switch with three connections. Wire to the normally *closed* contacts instead of normally open.

## XEGS MANAGER

Listing 2, XEGSMGR.BAS, is a BASIC loader that lets you create a machine language file on disk. Type it in, check it with TYPO II and SAVE a copy before you RUN it. The file XEGSMGR.EXE can then be loaded from DOS or renamed AUTORUN.SYS. Many of the program's features also can be applied to Atari XL/XE computers.

Antic Disk owners will also find the MAC/65 assembly language source code for Listing 2 on this month's disk, under the filenames XEGSMGR.M65 and RAMOS-DAT.M65. If you wish to recompile this code, you'll need the MAC/65 files IOMAC.LIB and SYSEQU.M65.

Normally you must press the [OPTION] key at boot time to disable BASIC and go directly to DOS. And once BASIC is off, the only way to get it back on is rebooting. Option 1 of XEGS Manager is to turn internal BASIC on, and option 2 turns it off.

Disabling BASIC while in DOS provides an additional 8K buffer for file copying. This is an important feature for owners of a single drive. Quite often, BASIC must be off before certain machine language files can be loaded and run. The XEGS Manager eliminates the need of re-

booting every time that BASIC must be re-enabled.

## SELF TEST

The XEGS Self Test lets you test the computer's sound registers, keyboard, and memory. However, BASIC is not turned off automatically when Self Test is run from the BYE command. This means that the 8K of RAM under BASIC isn't tested. Option 3 from the XEGS Manager lets you run the Self Test with BASIC off, so that the maximum amount of RAM is tested.

## RAM OS

All of the operating system of the XEGS (and 64K or more XL/XE machines) is "shadowed" by RAM. Some disk operating systems, such as DOS XL and SpartaDOS, use hidden RAM for many of their own functions. However, if you're using Atari DOS 2.0 or 2.5, then there is a lot of RAM going to waste in your machine.

Option 4 of the XEGS Manager lets you enable a RAM-based operating system so you can do some real "hacking"—disassembling and adjusting parts of the XEGS operating system to suit your needs. Even if you're not a hacker, there are other practical features of a RAM OS.

Once the RAM operating system is enabled, you are prompted for a disk drive number, 1-8 or 0 to exit. A custom font can be loaded in place of the standard one in the OS ROMs: enter the drive number to display a directory of all .FNT files. Then enter the name of the font file to load, or simply press [RETURN] to change drives or disks.

You needn't enter the drive specifier or extender—the

XEGS Manager will take care of that for you. The font file is loaded into memory at \$E000 (57344). Then you're prompted to (1) repeat the process and try a different font, or (2) exit. (You will find some font files on this month's disk as a bonus.)

Your RAM OS and font are reset-proof, too. Pressing the [RESET] key causes the XEGS to re-enable the ROM-based operating system, but a special handler in Page 6 of memory takes control after that. The handler converts the ROM back to RAM, recopying all the essential parts of the ROM OS, in case part of this RAM area got clobbered while you were hacking about. The handler does *not* recopy the ROM OS font, however, leaving yours intact. Should your RAM font get garbled somehow, press [RESET] while holding the [START] console key to return to the ROM font. Each time that [RESET] is pressed, a RAM OS prompt is displayed at the top of the screen as a reminder.

If you enable a RAM OS while running SpartaDOS, the XEGS Manager detects it and prevents the installation and subsequent system crash. The Manager does *not* automatically detect any other DOS, such as DOS XL, which may crash when a RAM OS is enabled.

## MISSILE COMMAND

Again, if you turn on your XEGS without the keyboard connected (or hold down the [SELECT] key at power-up), Missile Command fires up automatically. Option 6 of the XEGS Manager will get you into Missile Command with-

out having to mess with any console keys or power switches.

## CONCLUSIONS

The XEGS is a superb little computer. It's still a hacker's system too. I've found that the PBI ROM routines are intact, which means that you should be able to hack in your own custom PBI connector and use the XEGS with ICD's MIO board, if you're a real solder jockey.

The XEGS has brought along a lot of new software too, something Atari was counting on. Much of it includes repackaged classics or cartridge conversions from disk-based software, but there are a few new titles such as Battle Zone. Atari's new 256K bank-switch cartridges are not likely to be pirated. This means that the piracy threat for 8-bit Atari software should be minimal, thus attracting more new software vendors from the traditional Apple and Commodore markets.

If Atari can provide a responsive cartridge production service for third party software vendors (something the old Atari *never* would have done), then we're likely to see the software base for the 8-bit Ataris grow with the popularity of the game industry, which is definitely on the rise again. ■

## *ST Educational Software*

*ABZoo*

*Preschool KidProgs*

*Invasion*

*Reviewed by Jim Pierson-Perry*

*ABZoo* and

*PreSchool*

*KidProgs* are for

children aged 3 to 6.

*Invasion* provides

typing practice for

ages 6 to adult.

Fortunately I was

able to get evaluation

help from my four

daughters, aged 3 to

8. These three

Michigan programs

cost \$29.95 apiece,

require a color

monitor and are not

copy protected.

*continued on next page*

## ABZOO

ABZoo is aimed at introducing children to the computer keyboard and developing letter recognition skills. Three levels of work are provided, each increasingly harder. For the beginner, the letters of the keyboard are displayed onscreen. Pressing a key displays a picture of an animal whose name begins with that letter.

At the next level, the computer randomly picks a picture and displays it with the animal's name. The picture disappears, and the child must type the letters of the name as it was displayed on the screen. At each correct keypress, pieces of the picture appear—it's like doing a jigsaw puzzle. The highest level briefly shows the picture and name, then the child must correctly type the name from memory. The [HELP] key will redisplay the picture as a memory jogger.

Levels 1 and 2 are fine for preschool children. Some will use it just to look at the pictures, while others can begin to learn the keyboard. Level 3 is more demanding of memorization skills and not necessarily appropriate for children at this age level. A nice touch is the musical cues that reinforce correct responses.

Two different sets of pictures are provided—realistic and cartoon-style. There are some differences between the picture sets, which were all done with DEGAS Elite. The program and both picture sets can be installed on a double-sided disk.

One minor complaint is that the only way to exit the program is by pressing [SHIFT] [UNDO]—difficult for little ones to remember. But ABZoo is a fun introduction to learning the keyboard. Even my 3 year old was able to use it without supervision.

## PRESCHOOL KIDPROGS

PreSchool KidProgs is actually three programs in one—graphics, music and puzzle-solving activities. You can exit an activity whenever you want and return to the master menu.

The menu items are KidGrid+, KidKeys and KidBlocks. All program operations require the mouse. But my youngest children, ages 3 and 5, had a hard time coordinating mouse movement, although they understood exactly what they were trying to do with the program. With time they improved, but I think a joystick option would have been better for small hands.

KidGrid+ displays a drawing area containing 192 small triangles. The object is to create pictures by filling the triangles with any of 12 colors from a predefined palette. The program provides a starter set of 12 sample pictures. This is a good format for young artists, because it's much easier to fill in than draw freehand. Unfortunately, the pictures cannot be saved to disk. A way around this is to use a public domain program, such as SCRNRD.TOS from CompuServe, that redefines the [ALT] [HELP] printer-dump sequence to saving the screen as a DEGAS-format picture file.

Making music is the object of KidKeys. A keyboard is

displayed on screen, and notes are played through the internal speaker as they are selected with the mouse. Two different types of sounds, piano and organ, are available. There are 20 pre-recorded nursery rhymes, selected from a pictorial menu, and sing-along lyrics are provided in the manual.

The final activity is a 16-piece jigsaw puzzle in KidBlocks. Each piece can show one of six different faces, a different face for each of six possible puzzles. Pointing at a piece and clicking changes the face. The child goes through each piece, changing them as necessary, until an entire puzzle is completed, which is then rewarded by a short piece of music or animation.

KidProgs was rated far and away the best of the three by my panel of experts. Aside from the mouse-handling difficulties, they were all able to use the program without supervision and kept coming back for more.

## INVASION

Invasion is designed as a typing drill instructor *a la* Space Invaders. Words from a list appear and drop down from the sky, imperiling the city below. The only defense is to type each word accurately and blow it up before it hits ground. There are three rounds of increasing difficulty and three different speed levels.

Word lists are easily created and edited with an auxiliary program. They can be tailored to use with spelling lessons or typing instruction word lists (of increasing difficulty). You can't change word lists during a game without returning to the desktop and restarting. A list can contain 20 entries of 29 characters each.

Numeric keypad typing skills are developed by typing math problems. These use math lists, similar to word lists, where simple equations are entered. Two math play modes are used—training, where the answers are shown, and testing, where the answers are hidden by question marks. To win, the entire equation must be typed. The [Enter] key is used as a substitute for the [=] key, a questionable practice for teaching accuracy.

This program has several problems. One is a delay caused by type-ahead: you can easily type faster than the letters are "exploded." This makes it hard to see and correct typing errors. Also, the program is simply too fast, even at a novice setting, for many beginners. My 7- and 8-year-olds really had to work to get even simple three- and four-letter words. For math problems, it's hard enough to type part of the equation—let alone have time to solve it.

As a typing instructor, Invasion suffers from a lack of graded word lists. While you can create your own, there should have been a set of lists ranging from single letters through words of increasing difficulty. The program also provides no rating indicators of typing speed and accuracy. When you finish with a list, the program always tries to access the disk. If it's protected, you get two bombs and its restart time. ■

\$29.95 each. Color monitor required. MichTron Inc., 576 South Telegraph, Pontiac, MI 48053. (313) 334-5700.

## ST New Products

By GREGG PEARLMAN, *Antic Assistant Editor*

### PRODIGY

**Prodigy**, which **Antic** saw demonstrated at the West Coast Computer Faire in April, 1988, may well revolutionize online information gathering—and especially online shopping. Trintex, along with IBM and Sears, Roebuck and Co., offers a truly interactive service featuring colorful graphics screens and easy menus—all for \$9.95. No, not \$9.95 per hour, \$9.95 per *month*. How? That's where the "shopping" part comes in. Across the bottom of each screen is a text "commercial" from which you can buy merchandise directly.

The main drawback to Prodigy is that it's not available for the ST—yet. **Antic** has run Prodigy's IBM demonstration software on an ST using PC-Ditto, but it's mighty slow.

Prodigy *might* develop an ST-specific version of the software needed to access the service. With its graphics capabilities, the ST should be a natural for Prodigy. If you agree, you might give Trintex a gentle nudge via a tastefully written letter.

Trintex, 445 Hamilton Avenue, White Plains, NY 10601. (914) 993-8800.

### AUTOGRAPHS, ANYONE?

At Spectrum Holobyte's booth at the West Coast Computer Faire, **Dondra's** heroine, Terna, the Polythene Pam of the graphics-adventure game set, posed for pictures and signed autographs. At home in futuristic Dondra, she's the last of the Tëllasien race. Dondra is full of colorful cartoon-style graphics. As Terna, you'll fight Mutoids and encounter a strangely attractive lioness, but you'll have to keep an eye out for a wildebeest with a grudge.

\$39.95. Spectrum Holobyte, 2061 Challenger Drive, Alameda, CA 94501. (415) 522-0107.

### SQL

The **SQL Database Add-On** for LDW BASIC is a relational system for the ST. It extends the instruction set of LDW BASIC by adding commands to store, retrieve and modify information saved in a set of databases. No special knowledge of database programming is needed—anyway, the 36-page manual includes a large tutorial.

\$30. Regent Software, 7131 Owensmouth #45A, Canoga Park, CA 91303. (818) 882-2800.

### BECKEMEYER PAIR

**SDS** (Software Development System) lets you develop sophisticated applications that take advantage of the multitasking features of Beckemeyer's MT C-Shell. Written in Mark Williams C, SDS includes several Unix-compatible routines to help in porting Unix applications to MT C-Shell, and the package also provides sample programs. SDS costs \$59.95, but registered MT C-Shell owners can get it for \$49.95.

**MT C-Shell UUCP** (Unix to Unix Copy) is a file and electronic mail facility that can talk to any Unix or UUCP-compatible system. Once you've set it up, you can send and receive electronic mail, telexes, news and data files of all kinds. UUCP costs \$49.95, but registered MT C-Shell owners can get it for \$35.

Beckemeyer Development Tools, 478 Santa Clara Avenue, Oakland, CA 94610. (415) 452-1129.

### PLATOON

Based on the Oscar-winning film, **Platoon** is a realistic simulation of the war in Vietnam—and here, just as in the movie, there's no winner.

In Platoon, you'll find yourself leading your five cohorts through six increasingly hazardous situations. First you traverse a jungle to blow up a bridge, keeping an eye out for booby traps and snipers. Searching a village for a hidden trap door is the next challenge. Then you must navigate through underground tunnels, shooting the guerrilla fighters on sight.

You'll also find yourself in a bunker night-fight, surrounded by the enemy. Your platoon must find a safe jungle fox-hole before a napalm airstrike. Finally, the platoon must use grenades to take out a sergeant who betrayed them.

The factors of your condition include morale, hits (the number of "strikes" you can sustain before you become "retired in action"), ammunition and score.

\$44.95. Data East USA, Inc., 470 Needles Drive, San Jose, CA 95112. (408) 286-7074.

### QUIZMASTER ST

EZuse has ported its popular and inexpensive 8-bit Quiz Master Construction Set over to the Atari ST. The new **Quiz Mas-**

**ter Construction Set ST** combines all of the standalone 8-bit programs into one ST program that allows multiple choice answers, prints a score at the end of the game and has four ways to print the quiz.

\$11.50. EZuse Software, 2850 Enea Way, Antioch, CA 94509. (415) 754-6026.

### JUGGLER REDUX

**Juggler II** partitions the memory of your ST into two, four or eight equal sections, each of which acts as if it were the only one in the computer. Pushing [SHIFT] [ALTERNATE] suspends operations in the active partition before moving to the next one, so you can load and swap programs between partitions—you could even juggle, say, seven GEM programs and one non-GEM program. Owners of the original Juggler can receive free upgrades.

\$49.95. MichTron, 576 S. Telegraph, Pontiac, MI 48053. (313) 334-5700.

### CUIDADO! LLAMAS!

Artworx' **Spanish Verb Tutor** helps both the beginning student and the fluent Spanish speaker handle all Spanish verbs, including all modes, tenses and persons of all regular verbs and some irregular verbs. Each lesson is followed by a practice quiz. Spanish Verb Tutor furnishes the exact forms of over 12,000 verbs—giving you more than a million Spanish words.

\$39.95. Artworx Software, 1844 Penfield Road, Penfield, NY 14526. (800) 828-6573, (716)385-6120.

### QUESTRON II

You have the dubious fortune of being in possession of the Evil Book of Magic, which you stole from Mantor the nut in Questron, and which is SO evil that it can't be destroyed in the way you might normally destroy books. Now in **Questron II** you must go back in time to Landor to ensure that the book is never created. You must use weapons and spells (such as sonic whine and time sap) to defeat the various creatures you'll encounter.

\$49.95. Strategic Simulations Inc., 1046 N. Rengstorff Avenue, Mountain View, CA 94043. (415) 964-1353.

*continued on page 54*

# ST Games Gallery

*Gunship, Gone Fishin', GFL Football, Alien Fires*

## GFL CHAMPIONSHIP FOOTBALL

**GFL Championship Football** is exciting and adds a few new tricks. Your viewpoint is from the receiver's or runner's position on the field. This gets you involved in ways that a view from above the field can't. You hear your footsteps as you run and you almost feel the impact when you get tackled.

To start playing GFL, you and another player select your teams from four divisions—North, South, East and West. In a one-player game, you select the computer's team too. Each position is rated from 1 to 3. Use the joystick to call plays from an offensive or defensive play list. You also control your movements with the joystick.

Passing and running take practice. On offense you can pass short or long, or run up the middle or down the sidelines. On defense you can blitz or look for a passing play. Guess wrong and your opponent will gain big. Guess correctly, and you could throw him for a loss.

On passing plays, you move the receiver downfield after the snap. You must take the exact number of steps in the right directions to catch the ball. This is as hard as it sounds, but I managed to get the hang of it after a couple of games.

Special teams are important. You can block field goals by maneuvering a defensive player in front of the kicker and jiggling the joystick. During field goal attempts, if you kick too soon, the ball will go wide—too late, and it'll be blocked. When running the ball back after a punt, you can outrun or stiff-arm tacklers. My team got creamed a few times because the computer is pretty good at running back punts.

GFL comes with clear instructions,

helpful play diagrams and a glossary of football terms. It lacks interesting sound effects, however, and some of the graphics could be better.

But it's fun, especially for football fans who are also computer enthusiasts. It's not a game for statistics freaks. GFL just gives you a grunting, sweaty, nitty-gritty real-life football game. Learning the plays is a little hard, but the fun of breaking tackles or crushing an opponent's offensive drive makes it all worthwhile.—JOHN MANOR

\$39.95, color and joystick required. Activision, 3885 Bohannon Drive, Menlo Park, CA 94025. (415) 329-0880.

## GONE FISH'N

**Gone Fish'n** mimics every nuance of bass fishing. In your quest to catch the most and the biggest fish, your first decision is when to try your luck. Do you wait until Saturday, when weather conditions might not be prime, or do you skip work and set

sail on Friday, a perfect day? Unfortunately, you're not on salary so a skipped workday will cost you. And you'll need plenty of cash to afford all the state-of-the-art fishing paraphernalia on your wish list. Start with a simple lure, then choose the lake. Navigate to a prime location, attach your lure and let loose your line.

And wait.

Unfortunately, just like real fishing, I find this expedition boring. I just lack the patience to wait for a hungry fish to make a mistake. I want to pursue my adversary actively, not to outwait him. But the game really does simulate every aspect of fishing, so I'm sure some fishing enthusiasts will love it. Capable graphics heighten the realism of the experience. You'll actually see the stupid, starving bass dash toward your lure and you'll actually jerk back on the rod to set the hook (although I felt that the control interface left a lot to be desired). The jerky, mouse-controlled rod quickly became annoying, and a good read through the lengthy manual will also be necessary to master this non-intuitive game.

All in all, *Gone Fish'n* does just what it sets out to do—except lie about the size of your catch. But don't despair, as there's still latitude to fib about the one that got away.—STEVE PANAK

\$44.95, color. Electronic Arts (Interstell), 1820 Gateway Drive, San Mateo, CA 94404. (415) 571-7991.

## GUNSHIP

The AH-64A Apache is the hottest helicopter in the sky—with a top speed of 224 mph, a maximum climbing rate of 2,880 feet per minute and a ceiling of 20,500 feet. In **Gunship** your goal is to maneuver the Apache through a series of military operations, usually seeking to take out the primary target, an enemy installation or base. You select mission parameters, weapons, weather conditions, day or night and difficulty level. After successful missions you'll be promoted and receive medals and commendations.

The Apache is controlled with the keyboard and either a mouse or joystick. I recommend a joystick. A keyboard overlay noting each key's functions is included with the package.

What I like about Gunship is that you can fly the Apache in Easy or Realistic mode. In Easy mode, movements such as pitch, roll and altitude changes don't effect lift, but in Realistic mode, they do. So if you move from a hover to forward flight, keep

on your toes, or else you'll lose altitude.

Once you've mastered flight, the next goal is avoid getting shot down. The Apache uses a TADS (Target Acquisition & Designation System). The pilot and gunner wear special helmets that track their viewpoints in three dimensions—when a crewman looks at a target, the TADS "knows" where he's looking. When it locks onto a target, it will stay locked until the target is neutralized or a new one is selected.

When a target is located, its image appears on a video monitor showing distance, zoom factor and the display functions in daylight and darkness. In combat, you just *look* at a target, select a weapon and fire.

Of the four offensive weapons, the chain gun works best against ground troops and slow-flying aircraft. The Hellfire missile is for knocking out enemy tanks, using a laser to locate its target and firing a beam that "breaks up" when it bumps into a tank—the Hellfire "sees" that breakup and homes in. The unguided FEAR rocket works best against ground troops and installations, and the sole purpose of the AIM-9L Sidewinder missile, an infrared-homing air-to-air missile, is to take down enemy

aircraft.

If an incoming missile is radar-homing, the "R" light above your Apache's radar screen will flash. If it's a heat-seeker, the "I" light will flash. You'll want to choose either the radar or infrared jammers and change course. If you still can't lose the missile, then chaff or a flare should be deployed.

The tougher the mission, the better the enemy's skill and weapons. Sometimes deploying a decoy or jamming still won't shake a missile, so you have to take evasive action. This isn't easy in a helicopter.

The Gunship manual is the best game manual I've read—a piece of art. It includes detailed gameplay information, general helicopter information, weapons and tactics, Apache stats and complete mission briefings. It's clearly organized, and the learning process is a joy.

Gunship is the hottest helicopter simulation, period. Flying the Apache takes a bit if getting used to, but with practice you will be able to strafe those enemy fortifications with the best of them.—SCOT TUMLIN

\$49.95, color. MicroProse Simulation Software, 120 Lakefront Drive, Hunt Valley, MD 21030. (301) 771-1151.

## ALIEN FIRES—2199 A.D.

The superb cover art of *Alien Fires—2199 A.D.* sparked my imagination. And my expectation was fueled by the sight of not one, not two, but *three* disks holding worlds beyond my imagination. Unfortunately, the fire was extinguished soon after I booted up.

Your goal in *Alien Fires* is to travel to a planet called Galaxy's End and

destroy a time machine created by Dr. Kurtz, a benevolent genius driven insane by his own intellect. Skill points are assigned to each of seven attributes to determine your Time Lord's overall ability. As in most games of the *Dungeon & Dragons* genre, these values increase and decrease based on your performance.

Probably my biggest disappointment resulted from the lackluster graphics. The *ST* is the premier graphics-oriented personal computer,

but no one seems to have mentioned this to Paragon. The vector graphic corridors quickly become boring, and the creatures you meet, while colorful and interesting at times, become a dull gray when superimposed on the corridor.

The screen photos on the rear of the box are quite different from what you'll see at home. Movement through the corridors is annoyingly jerky and few options are open to you. While I'm sure that the three disks contained tons of data for generating limitless worlds and creatures, I felt little compulsion to explore. It's too bad.—STEVE PANAK

\$39.95. Electronic Arts (Paragon), 1820 Gateway Drive, San Mateo, CA 94404. (415) 571-7991.

**This month's ST Resource type-in software is BSRk, a flashy GFA BASIC version of our X-10 home controller program. You'll find the ST instructions in a special section of the 8-bit BSRk article in this issue.**

By PATRICK MCSHANE, PCS School

## Prolong the Life of Your ST Mouse

*One school's maintenance method.*

Mary Rbomberg Deloquin

The most vulnerable piece of hardware on the ST is the mouse. At PCS computer school we have kept ours alive for over a year—through heavy use by 152 kids—by performing the following maintenance procedures:

1. Always use a mouse pad. This keeps the ball from picking up deposits of oil and dirt that stick to furniture surfaces. Vacuum the mouse pad at least once a week.

2. Once a week:

a. Remove the mouse ball and wipe it off with a clean, soft cloth.

b. Unscrew the top plate, exposing the inside of the mouse.

c. Using cotton swabs and a light solution of isopropyl alcohol, clean the deposits on the thick surfaces of the sensor wheels—the three surfaces that come in direct contact with the mouse ball—to assure smooth and even wear of the mouse ball. You may need a small, plastic-tipped tool to scrape away the deposits if the cotton swabs don't work.

d. Gently blow out any dust that may have settled into the cavity. Replace the top and secure the screws.

*Since the article Maverick Atari School appeared in the October, 1987 issue of Antic, Patrick McShane's PCS School of Advanced Learning in Nampa, Idaho has grown from 85 to 152 students. This summer, for the first time, PCS hosts students from other parts of the U.S. in a National Summer Camp, August 8-19. Cost for the session is only \$100, because visiting campers will stay with PCS student families. In addition to the daily classes a raft trip down the "River of No Return" is planned.—ANTIC ED* ■

## ST New Products

*continued from page 51*

### VROOM VROOM

Zoom from Florida to California in your Mercedes 560 SEC—or one of three other **Crazy Cars**: a Porsche 911 Turbo, a Lamborghini Countach 500 S and a Ferrari GTO. Crazy Cars features 72 skill levels and 3-D action as you do your best to beat not only the clock but every other car you see.

\$39.95. Titus Software Corp., 20432 Corisco Street, Chatsworth, CA 91311. (818) 709-3692.

### FOUNDATION'S WASTE

Escape a hostile planet in a stolen spaceship and defeat your captors in **Foundation's Waste**, Scorpion's new arcade game featuring colorful graphics and the planet's scrolling background.

\$39.95. Scorpion, 19 Harbor Drive, Lake Hopatcong, NJ 07849. (201) 663-0202.

### MINI-LEDGER

Rascom's GEM-oriented **Mini-Ledger** for small businesses features an integrated expense sheet, income sheet and final profit/loss summary sheet to document your activities. Control the data with search, sort and update functions. Other features include built-in help screens, an integrated spreadsheet and report capability.

\$30. Rascom, 22128 Newkirk Ave., Carson, CA 90745.

### ST VIDEOS

Video SIG has produced three instructional video tapes for the Atari ST: "Dr. T's Music Software," "MidiSoft Studio" and "The Amazing Atari ST." The first two demonstrate and explain those ST music packages, and the third gives an overview of the ST and explains various software packages that can be used with it.

\$14.99 (\$39 for all three). Video Software Interest Group, 1030 E. Duane Avenue, Suite C, Sunnyvale, CA 94086. (408) 730-9291.

### M

**M** is an interactive composing and performing system that lets you specify basic musical material as notes and chords, then determine ways to transform that basic material and perform the music via screen controls and a MIDI keyboard. You can also "conduct" with the mouse in a multidirectional grid.

\$200. Intelligent Computer Music Systems, P.O. Box 8748, Albany, NY 12208. (518) 434-4110.

*New ST product notices are compiled from information provided by the products' manufacturers. Antic assumes no responsibility for the accuracy of these notices or the performance of the product.*

# Hard-Disk Backups

*Weighing the advantages of contrasting styles*

*Reviewed By* MARTIN BROWN

When I purchased an Atari 20Mb hard disk for my ST, my reasons for buying were *not* to obtain massive storage, but to gain fast access to my different programs and to speed up saves and retrieves of files. However, I soon realized that the best thing about a hard drive is never having to read "Disk Full" again.

But along with the large storage comes the necessity of backing up all that data. Failing to do so is foolish.

So now every morning I immediately copy my most important work files onto floppies and I use a different floppy for each work day. If I really foul up, I have at least four successively older backups. While copying a few critical daily-use files is easily accomplished using a "point-click-and drag" technique, faster methods are available for copying entire partitions of hard disk drives.

As the ST software marketplace matured, tools available for the Mac and IBM made their way into our arena—including software that considerably speeds up the backup process from a hard disk drive to a floppy, catalogs your backups more accurately, and selectively backs up changed files but skips files you haven't touched since the last backup.

Among the most noteworthy of these ST hard disk backup utilities are Beckemeyer's **Hard Disk Toolkit** and **Backup!** by Michifron. Interestingly, these two products take quite different approaches to the backup process, so they both have comparative advantages and disadvantages.

## HARD DISK TOOLKIT

Beckemeyer's Hard Disk Toolkit is amazingly fast, copying about 1Mb per minute. Operation is also much easier than the documentation would have you believe. You can designate

the partition to back up, decide whether you want automatic formatting of the floppies and away you go.

The program scans the drive partition being copied, tells you how many floppies are required and then backs up that partition at your command. At the end of the process, Toolkit marks each file on your hard disk partition that was copied so that next time you can simply back up changed files. Sound simple? It is. Even if you put an unformatted disk in the drive during the backup, Hard Disk Toolkit will recognize the problem and automatically format it.

However, Toolkit is not without problems. First, illegal file names that non-GEM programs can use stopped my first backup cold. I used file names starting with non-alphabetic characters, which Beckemeyer apparently never thought would happen. Toolkit simply locked up—and only after three reboots did I determine that the file name was the culprit.

Second, Toolkit's manual is a relic from other days—its style reminds me of a fire insurance policy I once canceled. The Beckemeyer seven-page manual, if followed step by step, does not explain the options very well at all. Toolkit's Update, which allegedly lets you copy only certain directories, simply does not work for me, even if I follow the sparse directions as closely as possible.

More serious a flaw is the method Toolkit uses to copy data. A floppy disk used by Toolkit is not readable by GEM. The information is packed onto the disk in a way that can't be read by your system without restoring the entire partition.

One of the options in the backup process is "verify," which allows you to turn off the write-verify process. The manual indicates this speeds up

the backup slightly, but at the sacrifice of some reliability. I could live with a minor sacrifice here, but I discovered that the chain is only as good as its Toolkit's weakest link. I once found it necessary to restore the partition of my hard drive with all my word processing files.

Knowing that what I was doing was serious, I backed up right before formatting that partition. My default method for backup was without write verify, and unknown to me, the next-to-last floppy disk had a bad sector. Toolkit gave no warning—I had verify turned off. When I went to restore, the first six disks seemed fine, but number seven gave me a "bad disk—re-enter" message. Nothing worked, and consequently Toolkit couldn't restore *any* of my files, not even those on the six good disks.

Toolkit's restore procedure calls for the floppies to be loaded in the proper order, making it hard to scramble files by restoring them in an incorrect order. This prevented my completing the restore with a bad disk. Without disk number seven, Toolkit refused to budge—no quitting and salvaging the first six disks, then rebooting and trying again. And since the floppies are not readable from the GEM desktop, I had nothing left to use.

So, when I really needed this program to help, its strengths became its major weakness. I suggest that if you want to use Hard Disk Toolkit—don't turn off write-verify and don't settle for less than the best floppies you can afford.

# Power Add-Ons for GFA BASIC

*3-D graphics plus a treasury of turbo routines*

## GFA BASIC BOOK

GFA BASIC is one of the most widely used languages for the ST, particularly by hobbyist programmers. This inexpensive (\$79.95) language is **Antic's** first-choice BASIC for ST program listings. It provides a full-featured, structured programming environment with excellent GEM support and execution speed. Several add-on programs have been released in the series including a compiler and support for vector graphics. The only real shortcoming has been a lack of information besides the terse users manual.

Now the **GFA BASIC Book** (\$39.95) goes a long way to fill this void, with a 306-page collection of tips and sample programs. It comes with a single-sided disk containing the samples described in the book. Author Frank Ostrowski certainly has the necessary credentials, since he wrote GFA BASIC in the first place.

The book is intended for mid-level programmers—those who know standard BASIC and want to learn how to use the advanced features of GFA BASIC. Although beginning programmers will find the book useful, particularly for graphics and sorting, the main thrust of the book is how to make use of system calls to GEM and GEMDOS functions. These discussions assume some preliminary knowledge on the reader's part and will need to be supplemented by more elementary ST reference books such as those in the Abacus series.

Topics include code optimization for speed, graphics and sound, accessing disk files, recursive programming and dealing with .RSC files. All are written clearly with numerous code examples. Missing from the book is a

discussion on effective use of blocks for structured programming—which can be a problem for those used to “spaghetti-code” BASIC implementations.

Sample programs on the disk include routines for using the sound chip, creating dialogue boxes, accessing disk directories, screen flipping and scrolling, loading screen fonts, sorting and including assembly code within a GFA BASIC program. Another set of programs deals with GEM and GEMDOS applications such as creating multiple windows, building slider boxes, making icons and dealing with the resource construction set.—JIM PIERSON-PERRY

## GFA VECTOR

If you've played games like STWars, Star Glider or R.P.V., you know how exciting 3-D graphics can be. However, 3-D graphics require powerful computer processors and large amounts of memory to display them. To create a 3-D application requires extensive knowledge in programming (usually a high-level compiled language or Assembly) and strong math skills. Until now, the only feasible hardware solution was a mainframe system. But with the introduction of the 16-bit personal computer, 3-D graphics are now possible. However, the software required to display and manipulate the 3-D objects is still complex.

GFA Systemtechnik, makers of GFA BASIC, the most powerful BASIC for

the Atari ST, have done it again. **GFA Vector** (\$49.95) is a utility package that creates and manipulates 3-D graphics.

The GFA Vector package comes with a 43-page manual and a disk containing the utilities. The manual takes users step-by-step from object creation to using the finished objects in their own GFA BASIC programs. The manual explains how to create 3-D objects in two ways, with numerical input or the graphics editor. Numerical input consists of entering the x, y and z locations of every point of the object and the connecting lines between those points. The graphics editor lets the user draw the top, side and front views of the objects, making sure that selected points match in at least two of the three windows. I found it easier to break out the pencil and graph paper, design my objects and enter them numerically.

After objects are created, they can be manipulated in the user's GFA BASIC programs. Four files make up a GFA Vector application. The module file contains the actual 3-D routines called in the program. The disk contains a series of module files not clearly explained by the manual.

Second file is your GFA BASIC program or GFA Runtime program. If you plan on giving your application to others, make sure you use the runtime program. The users file must be merged with the install.lst file on the GFA Vector disk. The install.lst file contains the major call routines that the user will be activating. The final program is the object file containing

**Antic Magazine/Disk—\$5 per issue, if you subscribe now!**

the created 3-D objects. Double-clicking on the module program will start the application.

Watching a 3-D application written in BASIC can be a painful experience. But the GFA Vector program updates complex 3-D objects in a smooth, real-time fashion. Only when the zoom factor is high and the object very large does the display slow down. I created a program that flew through the 3-D environment. By increasing the Zoom increment rate I achieved speeds close to Star Glider. Not bad for a BASIC program.

Manipulating objects is straightforward. The user only needs to call a particular array with the proper variables and the object or objects are updated. For example, `Scale%(1)=32` would set the size of object 1 to 32. A For/Next loop could be used to make the object move closer or farther away from the user's perspective. Some other possible calls are object selection, object color, object position and object rotation. In addition the user can draw the objects in or mode or xor mode, send picture data to alternate screen pages and then switch the data in those screen pages.

The GFA vector package is a great addition to any GFA BASIC programmer's library. It is also a must for anyone who is interested in 3-D graphics. My complaints are few, GFA Vector objects can be displayed in wire-frame mode only, I would have liked the ability to create solid objects, even if the refresh rate is slow.

An object can be rotated around an axis center. However, rotation around an arbitrary point is not available. The ability to create my own call functions would be nice. And finally, an additional utility should be included to convert the four support files into one file and/or compile the .bas file and remove the need for the runtime program altogether. All in all, GFA Vector is great. If you enjoy playing Flight Simulator, then pick up GFA BASIC and GFA Vector and make your own 3-D simulation.—SCOT TUMLIN ■

## HARD DISK BACKUPS

continued from page 55

### BACKUP!

Backup! is almost the opposite of the Hard Disk Toolkit in its advantages and drawbacks. Where Hard Disk Toolkit is super fast, Backup! is painfully slow. Toolkit backs up a partition with about 1Mb of storage in about 90 seconds. Backup! takes just over six minutes, but uses the most secure of the several backup approaches. Where Toolkit produces floppies that are unusable from the desktop, Backup! lets you choose between that kind of file or standard GEM-readable files. Backup! has a better manual than Toolkit plus online help screens. However, the Backup! manual could still be improved. It's skimpy on details in a couple of places that new users of hard drives would appreciate, such as setting the path for backups to begin, or skipping system files in the backup process.

Backup! is full of options. You can choose to only copy certain paths within a hard drive partition, or to back up only changed files either by

date or by actual file structure changes. Backup! helpfully creates a history file that keeps track of the files you have copied for use in subsequent incremental saves. But even this can be switched off if you want to maintain more than one set of backup floppies.

Accompanying this GEM program on the Backup! disk are SBackup and SRestore, which work under a shell environment. Their functions are identical to those under the GEM program, but they let you accomplish the same tasks in an auto-execute file using a shell program. These specialized programs may not be used by a large number of Backup! buyers, but Michtron's inclusion demonstrates the company's concern for ST users.

*(As we went to press, MichTron was planning to sell Backup! in a new combination package with two other utilities, M-Cache—reviewed February 1988—and Tuneup!—ANTIC ED)■*

\$59.95. MichTron Inc., 576 S. Telegraph, Pontiac, MI 48053. (314) 334-5700.

# ST TOOLBOX

## *dBMan 4.0, OmniRes*

### DBMAN 4.0

Application programs that let you build independent applications are among the most powerful software around. On IBM PC compatibles, a prime example is Ashton-Tate's dBase III Plus, which enables you to create highly powerful standalone databases that can run without dBase. On the Atari ST, **dBMan** software is command compatible with dBase III Plus and reads dBase files directly. In fact, dBMan applications can easily be migrated to just about any major operating system, from Macintosh to Unix.

When **Antic** reviewed the first version of dBMan in the August 1986 issue, we already called it "an important dBase III workalike." But two years later, dBMan 4.0 is much smoother and delivers even more power.

The main power of dBMan is in its application language, which has many characteristics of a programming language, such as decision words (IF, FOR, CASE), loop structures (LOOP, DO, WHILE), procedures and advanced mathematical functions. However, it also includes special keywords for working with data and databases. You can CREATE databases, create and use REPORT FORMS, specify FIELDS, FIELDSPECs, FIELD-TYPES and FILES, MODIFY STRUCTURES of files, etc.

The dBMan interactive mode is a mostly blank screen where you can type almost any command. Commands are executed immediately, not unlike the immediate mode in a language like ST BASIC. Of course, some commands don't work properly from this mode.

You can also operate dBMan from the menu-driven Assist shell, which lets you get at some of the program's power without actually program-

ming. You can create a database, enter data, sort and more in Assist mode—which is actually an application written in dBMan's application language.

The most powerful way to work with dBMan is to use the built-in text editor to create a script (program) using the commands and functions available in the application language. These scripts can be linked and even call one another to form a complete standalone application that's indistinguishable from a program written in C or assembly language. In fact, several standalone programs on the market today were written in dBMan's application language.

Commands include display or print data, change data from the keyboard, get data from the keyboard, manipulate a data file, sort the data, move the record pointer, plus the programming structure commands discussed above.

The specialized programming language provides tools and commands you don't see in a normal programming language, such as BROWSE, which provides all the records and fields in a table on the screen. Then you can scroll through the data and make changes that will be reflected in the data when you're done editing. You can also LOCATE or DELETE a record, SORT or INDEX a file, create a new file, APPEND records, and SET FILTER to look only at records which meet the given criteria. Other commands let you build a database interactively and design a report.

dBMan is a fully relational database. That is, by establishing the relationship between two files (a field which contains the same unique data in each file), you can get the contents of any fields in the other file by reference to the relation field in the first file. Let's say one of your files contains customer number, name, address and

phone number and the other contains customer number and amount owed. Because both files contain the customer number, you can create a report that lists customer names, addresses and amounts owed, even though this data is in two different files.

There are a number of interesting differences between dBMan and the PC's dBase III Plus. dBMan's Assist mode is more oriented toward using it as a standard database, while dBase's Assist is better for building relational database structures. Also, dBMan doesn't let you design custom screen layouts, and you can't use CATALOG or SET VIEW to establish a set of files to load automatically.

On the other hand, dBMan includes commands for specifying drop-down menus and reading which menu item was selected in order to design applications that look like standard GEM programs on the ST. Also, dBMan doesn't suffer from the dBase III Plus limitation of only having a single relation for any given file—dBMan files can be related to several other files through one or more relational fields. Unfortunately, dBMan duplicates dBase's lack of arrays, making some operations quite difficult.

The dBMan manual is quite good. It includes a tutorial and large sections detailing the commands and functions, as well as quick reference cards for commands and functions. It's not well-organized—some sections that are too technical would have been easy to understand had they appeared later. The built-in text editor does not use the mouse and can handle only a limited amount of text. For larger dBMan programs, you may need to use a word processor and save the text as an ASCII file.

Overall, dBMan is a powerful tool for building applications, and is virtually the only such program for the

## ST Resource

Atari ST. A runtime package is available, so users can run the final application without owning a copy of dBMan. Contact VersaSoft for information on licensing the runtime package. Now also shipping from the manufacturer is the Greased Lightning Compiler (\$249.95), which is claimed to make dBMan applications run four to 20 times faster.

Technical support by telephone costs \$25 for six calls, which seems a little steep for a product of this complexity. But if you want to build and sell standalone applications that manipulate data on the Atari ST, you must give serious consideration to dBMan.—DAVID PLOTKIN

\$249.95. VersaSoft, 4340 Almaden Expressway, Suite 250, San Jose, CA 95118. (408) 723-9044.

### OMNIRES

If you own only the SCI224 monochrome monitor for your ST, you've undoubtedly found yourself locked out of tons of color-only software. And it's almost as bad the other way around. Well, you've got two choices—buy the monitor you don't have (expensive), or buy **OmniRes** software (not expensive at all) which lets you run monochrome-only programs on color monitors and vice versa.

Of course you won't get color images on a monochrome screen and you won't get true high-resolution detail on a color screen. OmniRes is really eight separate programs, allowing four different options for going in either direction. The different conversion options yield varying results.

There are also a couple of side effects. First, mouse movements and response rates slow down. Second, various program elements also slow

down in different ways. For example, when I run SSI's President Elect on a real color monitor, a couple of bars of "Hail to the Chief" are played at the beginning, and the quick play option runs through the nine weeks of campaign screens faster than I can see. But with OmniRes and a monochrome monitor, "Hail to the Chief" sounds like a dirge and the flash through the campaign screens is slow enough for me to read.

With OmniRes installed, color-only software programs run with varying success. Heavily protected games may not run at all. Unless you copy the OmniRes program to Accolade's HardBall! program disk (which is *not* recommended), there's no way to run it in monochrome.

Putting monochrome-only software on a color screen works much better. There *isn't* much monochrome-only software around, but I tried the public domain JIL CAD program. When I ran it with Monochrome, another public domain program that displays mono-only software on a color screen, it left a fuzzy, muddied impression. The OmniRes display was significantly clearer.

Should you buy OmniRes? Yes, if you own a monochrome monitor and want to run color-only programs such as unprotected games or database files created using dBMaster or BasCtwo. However, if you want to run a color-only game which has a protection scheme that makes the guys at Fort Knox look careless, you'll get unpredictable results. However, the package comes with a list of successfully converted software. And you could phone E. Arthur Brown for updates before you buy.—MARTIN BROWN ■

# Tech Tips

## WINDOW OPENER

**T**his tip comes from *Antic* Technical and Online Editor Charles Jackson. **Window Opener** is a short, simple demonstration of a useful method for controlling text windows in BASIC. When RUN, the program draws an attractive moire pattern in Graphics 8. Afterwards, press [D] to bring up the text window *without* clearing your screen. Press [K] to remove the text window and restore the underlying graphic.

The trick is in the Graphics command. Add a 32 to the Graphics mode number to add a text window to your screen (see line 200). Add a 48 to the mode number to remove the window and restore your screen (see line 110).

Don't type the  
TYPO II Codes!

```
GC 10 REM TYPE A 'D' TO DISPLAY THE TEXT
    WINDOW
OO 20 REM TYPE A 'K' TO KILL IT
BT 30 GRAPHICS 8+16:POKE 710,0
YW 40 COLOR 1
OH 50 FOR X=0 TO 319 STEP 5:PLOT 0,0:DRAW
    TO X,191:NEXT X
IG 60 FOR X=191 TO 0 STEP -5:PLOT 0,0:DRA
    WTO 319,X:NEXT X

```

## FAST CURSOR XL/XE

**F**ast Cursor comes from Trevor Maingot of Ventura, California. Cursor speed is controlled in memory location 730, which normally has a value of 6. This program stores a 2 in location 730, thus greatly increasing cursor speed. NOTE: Fast Cursor doesn't work on the Atari 800 or 400 models.

When you see the onscreen message saying that the Fast Cursor routine is installed, press [RESET] to activate it. Now the only way to get rid of Fast Cursor is to turn the computer off.

```
10 FOR I=260 TO 277:READ A:POKE I,A:NEXT I
12 ? "FAST CURSOR INSTALLED, PRESS RESET, THEN TYPE'NEW'AND
    GO ABOUT YOUR BUSINESS"
15 X=USR(260)
16 END

```

*Antic* pays \$25 for every original and exclusive Tech Tip submission that we publish. Send your 8-bit or ST disk and printout to: *Antic Tech Tips*, 544 Second Street, San Francisco, CA 94107. Tech Tips welcomes very short programs that demonstrate the Atari's powers, simple hardware modifications, or useful macros for popular software.

## PARTIAL SCREEN CLEAR

Robby Chavers of Tampa, Florida, contributed this little program that lets you choose any point on a Graphics 0 screen and clear all the screen area below it, leaving the remainder intact.

This program fools BASIC into thinking that the screen position was moved down by changing the values in memory locations 88 and 89. To change the number of screen lines you *don't* want to clear, change the value of LINE in line 120 to any number up to 23.

```
100 POKE 82,0:? CHR$(125);
110 FOR P=0 TO 340:? P;:NEXT P

# OBLITERATOR

## OBLITERATOR

Obliterator is a new and very exciting product from Psygnosis, which takes full advantage of the features of the Commodore Amiga and Atari ST, whilst supporting the full range of 68000, 68010 and 68020 processors.

When compared to Psygnosis's previously released animated graphic adventure - Barbarian, the player will find over 100 separate locations within the product's three-dimensional playfield. The effect of the detail and complexity of the graphics must be seen to be fully appreciated.

Two other features which Psygnosis have added to this product are a "Save Game" facility and stunning music and amazing sound effects.

All this should combine to make for yet another award winning product from Psygnosis.

**OBLITERATOR — \$39.95**

### Other Psygnosis Titles

Terrorpods — \$39.95  
Barbarian — \$39.95  
Deep Space — \$39.95  
Arena — \$39.95

*All available for 512K  
Colour, Atari ST,  
Commodore Amiga.*
