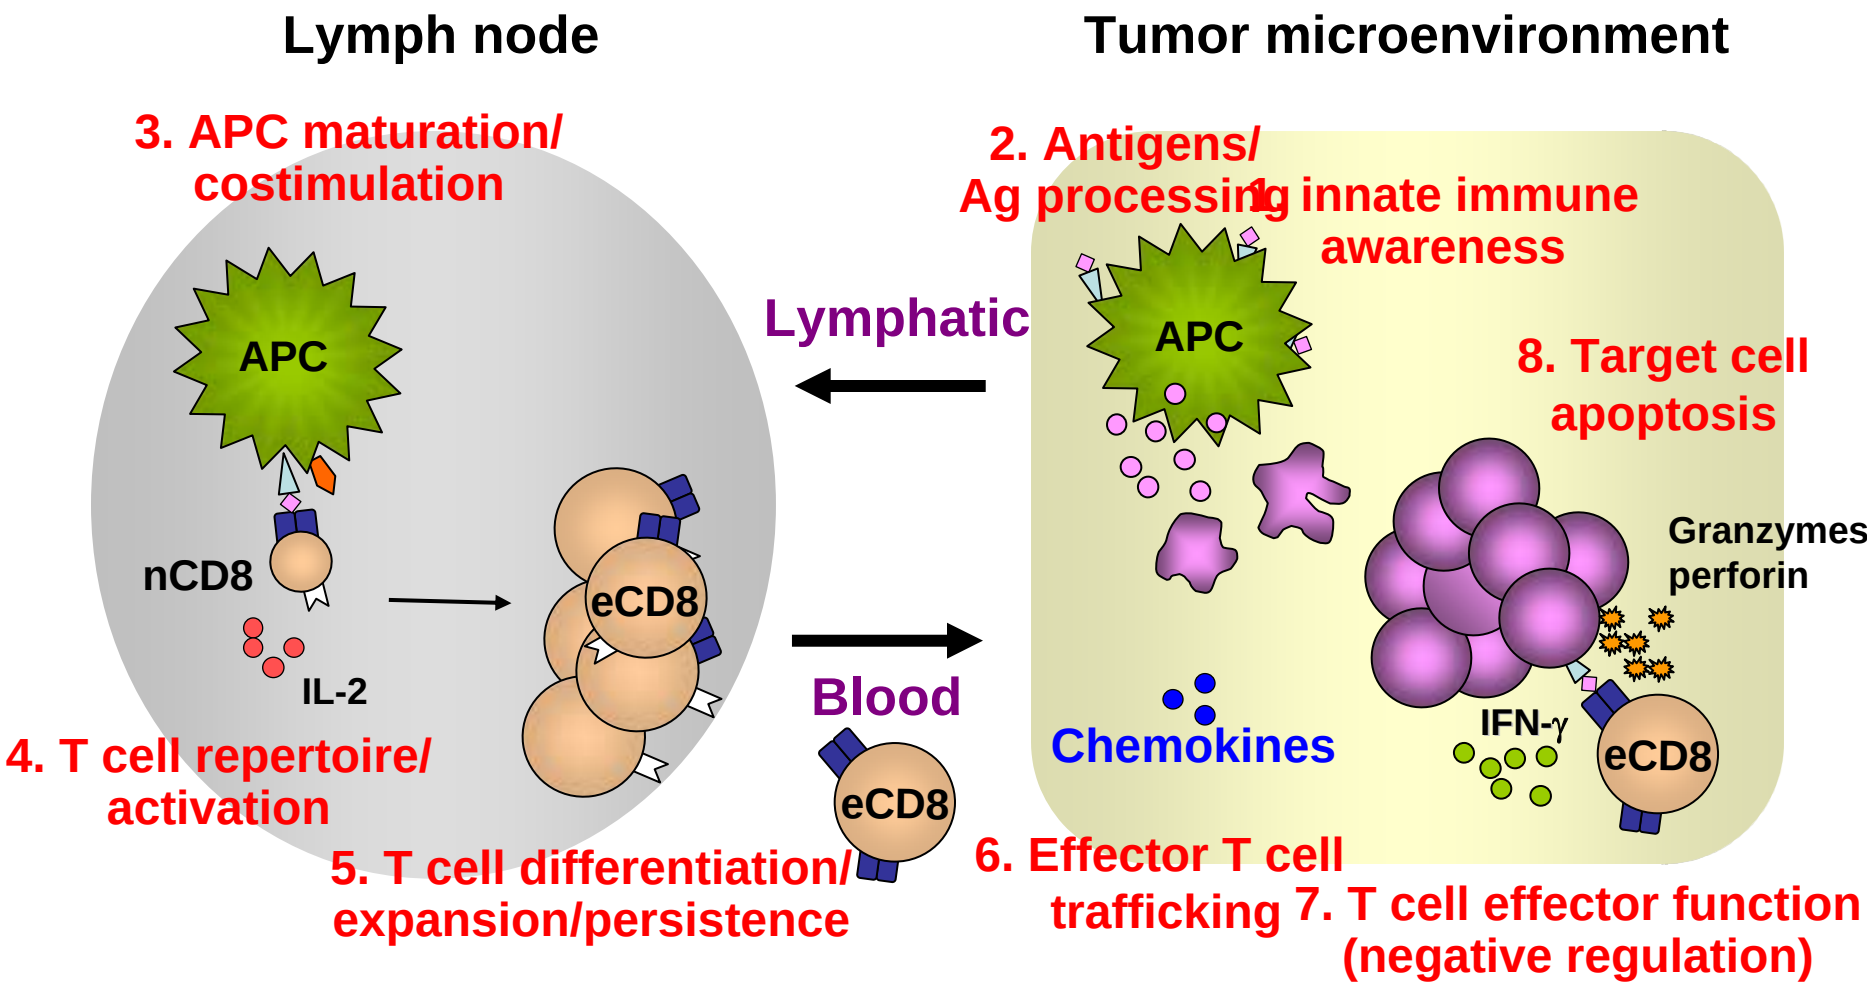
Immunotherapy/Immunotherapy combinations

Thomas F. Gajewski
Jon Wiggington
Lieping Chen
Glenn Dranoff

Rationale and foundation for discussion

- Important disclaimer: we are not suggesting that “vaccines don’t work” and therefore combinations of vaccines plus other therapies will automatically be required
- Rather, our view is that an anti-tumor immune response is a complex and multi-stage process that can become dysregulated at several levels in the context of a growing tumor
- Overcoming each of these defects may require a distinct intervention, and therefore combination therapies may be important in order to translate immune responses into tumor regression
- Another way to look at it: with T cell-based immunotherapy, the “drug” is not necessarily the product administered (e.g. vaccine)—rather, the therapeutic entity is the properly generated tumor **antigen-specific effector T cell population** that has **penetrated the tumor microenvironment** and **maintained effector function there**

At what levels can a spontaneous anti-tumor T cell response fail?



Hypothetical barriers point towards strategies for intervention

Vaccines →

1. Innate immune awareness/Ag presentation/APC maturation
   - Are there “danger” signals to ensure productive antigen display?
2. T cell repertoire/initial activation
   - Repertoire may be restricted or of low avidity
   - Immune suppression may carry over to DLN compartment

Adoptive Tx →

3. T cell differentiation/expansion/persistence
   - Proper T cell phenotype might not be induced (Th1/CTL/memory)
   - Magnitude or duration of T cell response may be inadequate
4. T cell trafficking into tumor sites
   - Lack of proper chemokine receptors on T cells, or chemokines at tumor site
   - Signals for penetrating extracellular matrix?
5. Executing effector function in tumor microenvironment
   - Dominant negative regulatory pathways
   - Poor maintenance of effector function (e.g. regeneration of cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Loss of antigens, processing machinery, MHC
   - Anti-apoptotic mechanisms: tumor cells can be resistant
   - Interface with tumor cell-intrinsic biology: oncogenic pathways orchestrating resistance

Candidate approaches to overcome these barriers

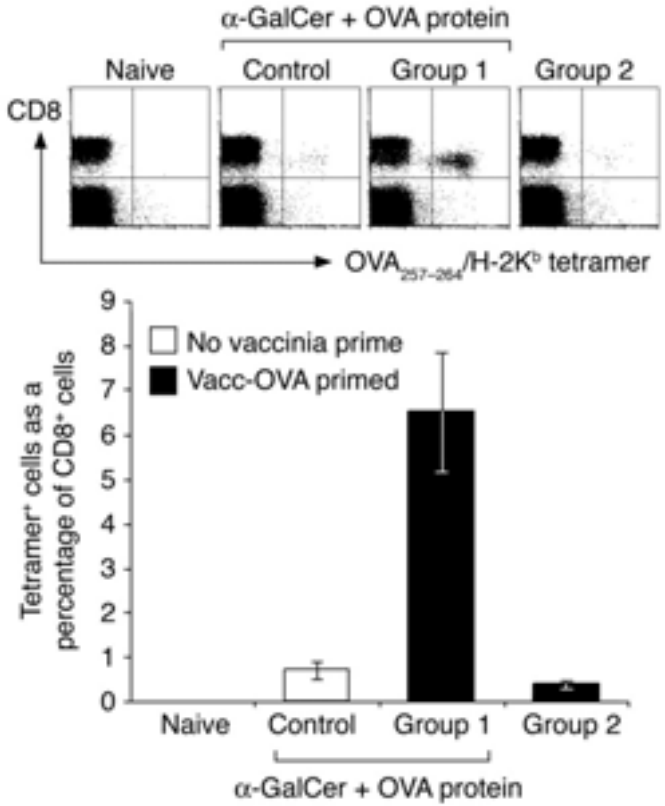
1. Innate immune awareness/Ag presentation/APC maturation
   - Innate immune cells and cytokines, TLR agonists, CD40 ligands, vaccination—novel Ag sources
2. T cell repertoire/initial activation
   - B7 and other costimulatory ligands
   - Interference with lymph node-based or systemic negative regulators (CTLA4, IDO, arginase, anergy, Tregs)
3. T cell differentiation/expansion/persistence
   - Differentiation cytokines (IL-12, IL-18)
   - Expansion, survival factors (IL-2, IL-7, IL-15, anti-41BB; homeostatic proliferation)
4. T cell trafficking into tumor sites
   - Intratumoral chemokines, LIGHT
   - Pro-inflammatory treatments (XRT, TLR agonists, innate cytokines)
5. Executing effector function in tumor microenvironment
   - Blockade of tumor microenvironment-based negative regulators (IDO, PD-1/PD-L1, Tregs, anergy, TGF-β, IL-10, iNOS)
   - Promote effector cell proliferation (regenerate cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Blockade of key anti-apoptotic molecules (Bcl2 and Spi inhibitors)
   - Inhibit oncogenic pathways that create resistant phenotype and/or resistant microenvironment (Stat3; MEK? Notch? Wnt?)

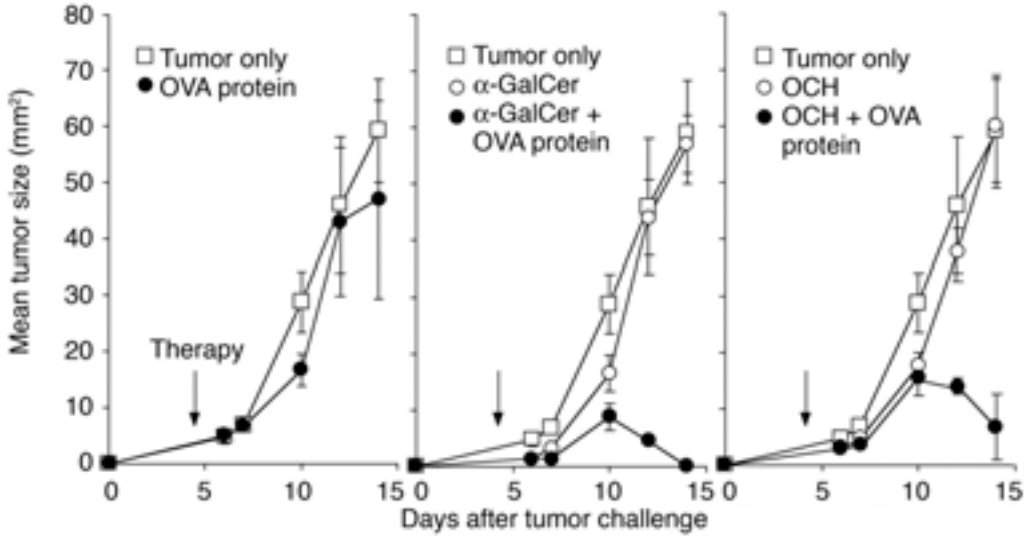
Candidate approaches to overcome these barriers

1. Innate immune awareness/Ag presentation/APC maturation
   - Innate immune cells and cytokines, TLR agonists, CD40 ligands, vaccination—novel Ag sources
2. T cell repertoire/initial activation
   - B7 and other costimulatory ligands
   - Interference with lymph node-based or systemic negative regulators (CTLA4, IDO, arginase, anergy, Tregs)
3. T cell differentiation/expansion/persistence
   - Differentiation cytokines (IL-12, IL-18)
   - Expansion, survival factors (IL-2, IL-7, IL-15, anti-41BB; homeostatic proliferation)
4. T cell trafficking into tumor sites
   - Intratumoral chemokines, LIGHT
   - Pro-inflammatory treatments (XRT, TLR agonists, innate cytokines)
5. Executing effector function in tumor microenvironment
   - Blockade of tumor microenvironment-based negative regulators (IDO, PD-1/PD-L1, Tregs, anergy, TGF-β, IL-10, iNOS)
   - Promote effector cell proliferation (regenerate cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Blockade of key anti-apoptotic molecules (Bcl2 and Spi inhibitors)
   - Inhibit oncogenic pathways that create resistant phenotype and/or resistant microenvironment (Stat3; MEK? Notch? Wnt?)

Example 1: α-GalCer

Administration of protein and α-GalCer can synergistically expand CD8+ T cells





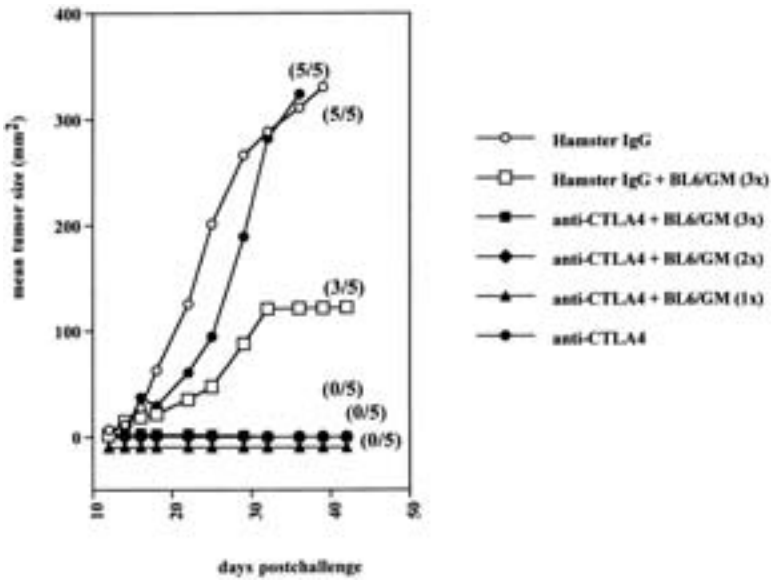
Silk, Cerundolo et al. J. Clin. Invest. 2004

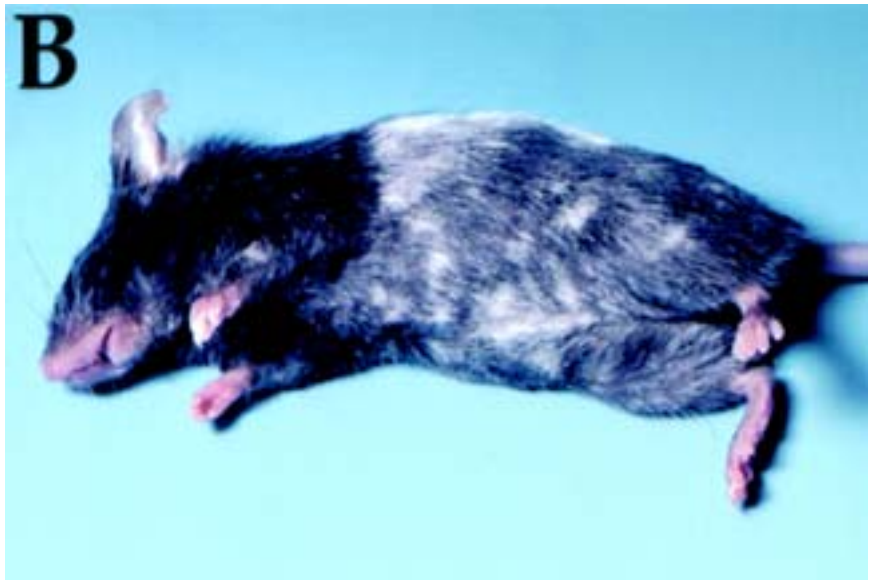
Candidate approaches to overcome these barriers

1. Innate immune awareness/Ag presentation/APC maturation
   - Innate immune cells and cytokines, TLR agonists, CD40 ligands, vaccination—novel Ag sources
2. T cell repertoire/initial activation
   - B7 and other costimulatory ligands
   - Interference with lymph node-based or systemic negative regulators (CTLA4, IDO, arginase, anergy, Tregs)
3. T cell differentiation/expansion/persistence
   - Differentiation cytokines (IL-12, IL-18)
   - Expansion, survival factors (IL-2, IL-7, IL-15, anti-41BB; homeostatic proliferation)
4. T cell trafficking into tumor sites
   - Intratumoral chemokines, LIGHT
   - Pro-inflammatory treatments (XRT, TLR agonists, innate cytokines)
5. Executing effector function in tumor microenvironment
   - Blockade of tumor microenvironment-based negative regulators (IDO, PD-1/PD-L1, Tregs, anergy, TGF-β, IL-10, iNOS)
   - Promote effector cell proliferation (regenerate cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Blockade of key anti-apoptotic molecules (Bcl2 and Spi inhibitors)
   - Inhibit oncogenic pathways that create resistant phenotype and/or resistant microenvironment (Stat3; MEK? Notch? Wnt?)

Example 2: CTLA-4

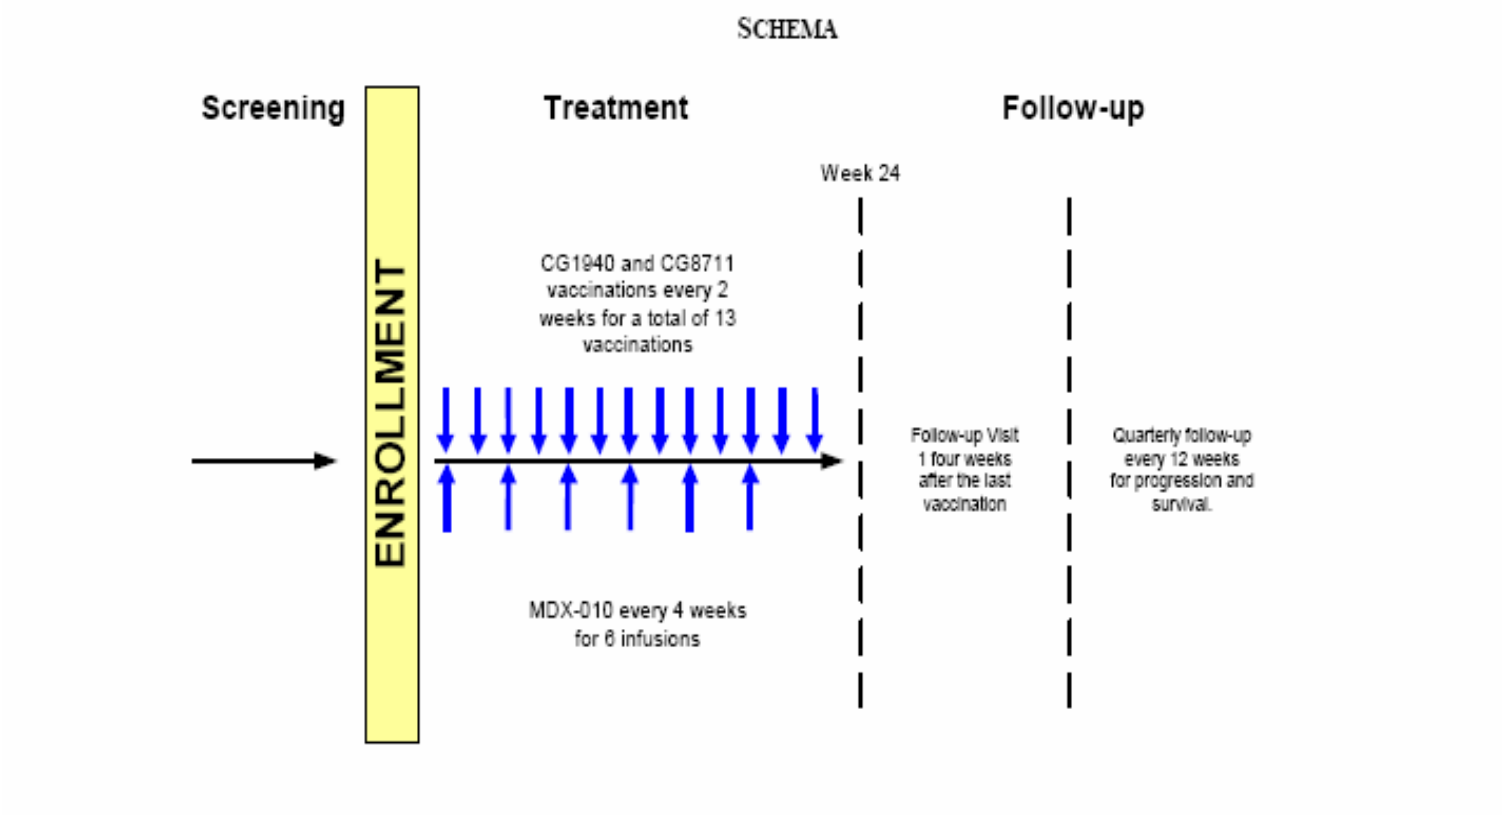
Anti-CTLA-4 mAb + GM-CSF-transduced B16 vaccine induces tumor rejection and leads to vitiligo





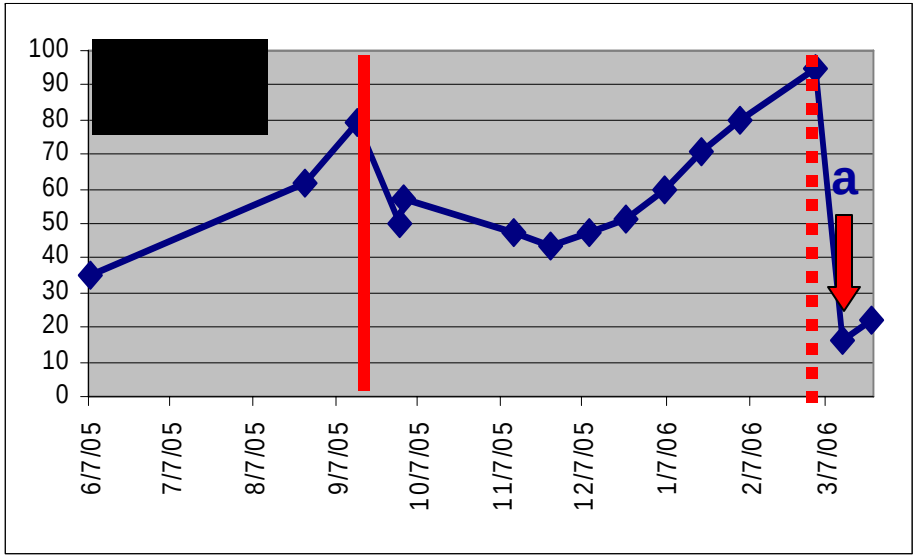
van Elsas, Allison et al. JEM 1999

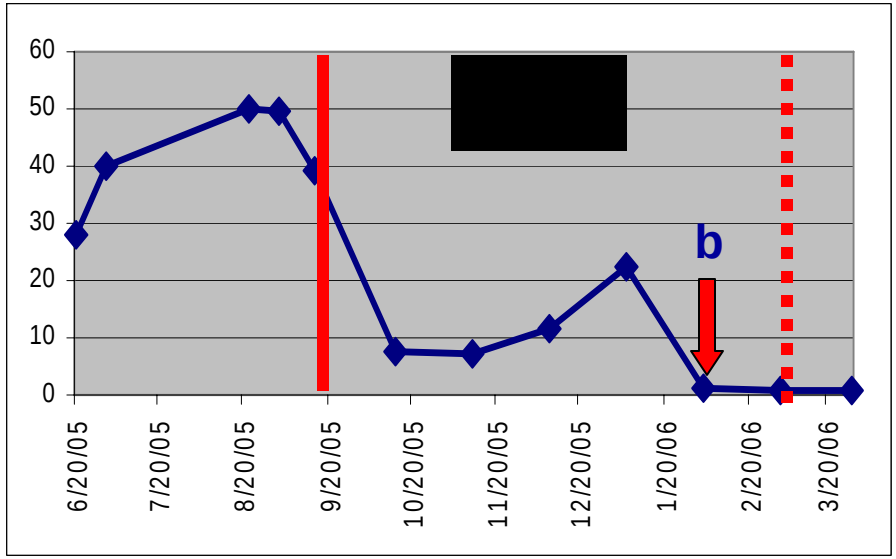
GVAX Immunotherapy (CG1940/CG8711) + Ipilimumab (MDX-010: anti-CTLA-4) for HRPC

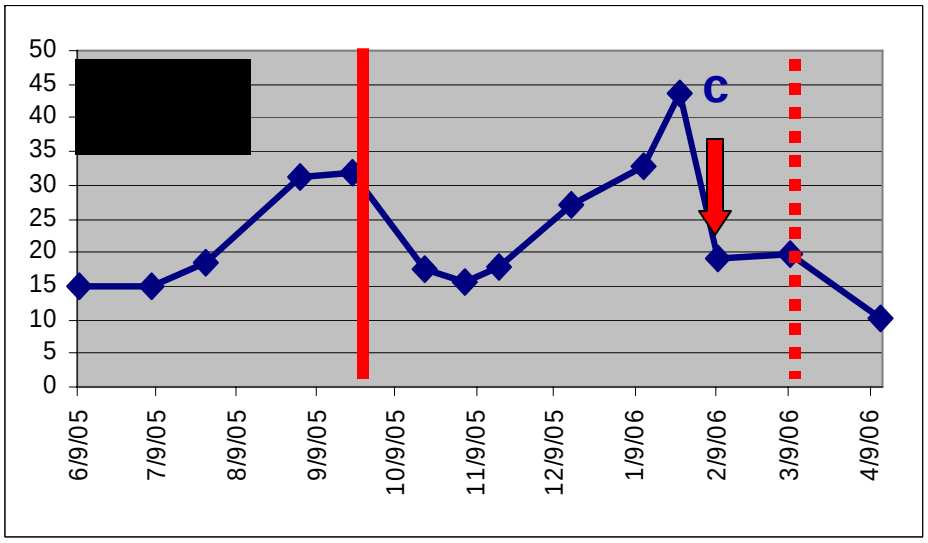


VUmc Cancer Center Amsterdam

GVAX + anti-CTLA-4 in prostate cancer: PSA curves – Dose Level 3 (3 mg/kg)







a : 13Mar06: SAE -Hypophysitis (7 mo)

b: 03Feb06: Hypophysitis (5 mo)

c: 09Feb06: SAE – Hypophysitis (5 mo)

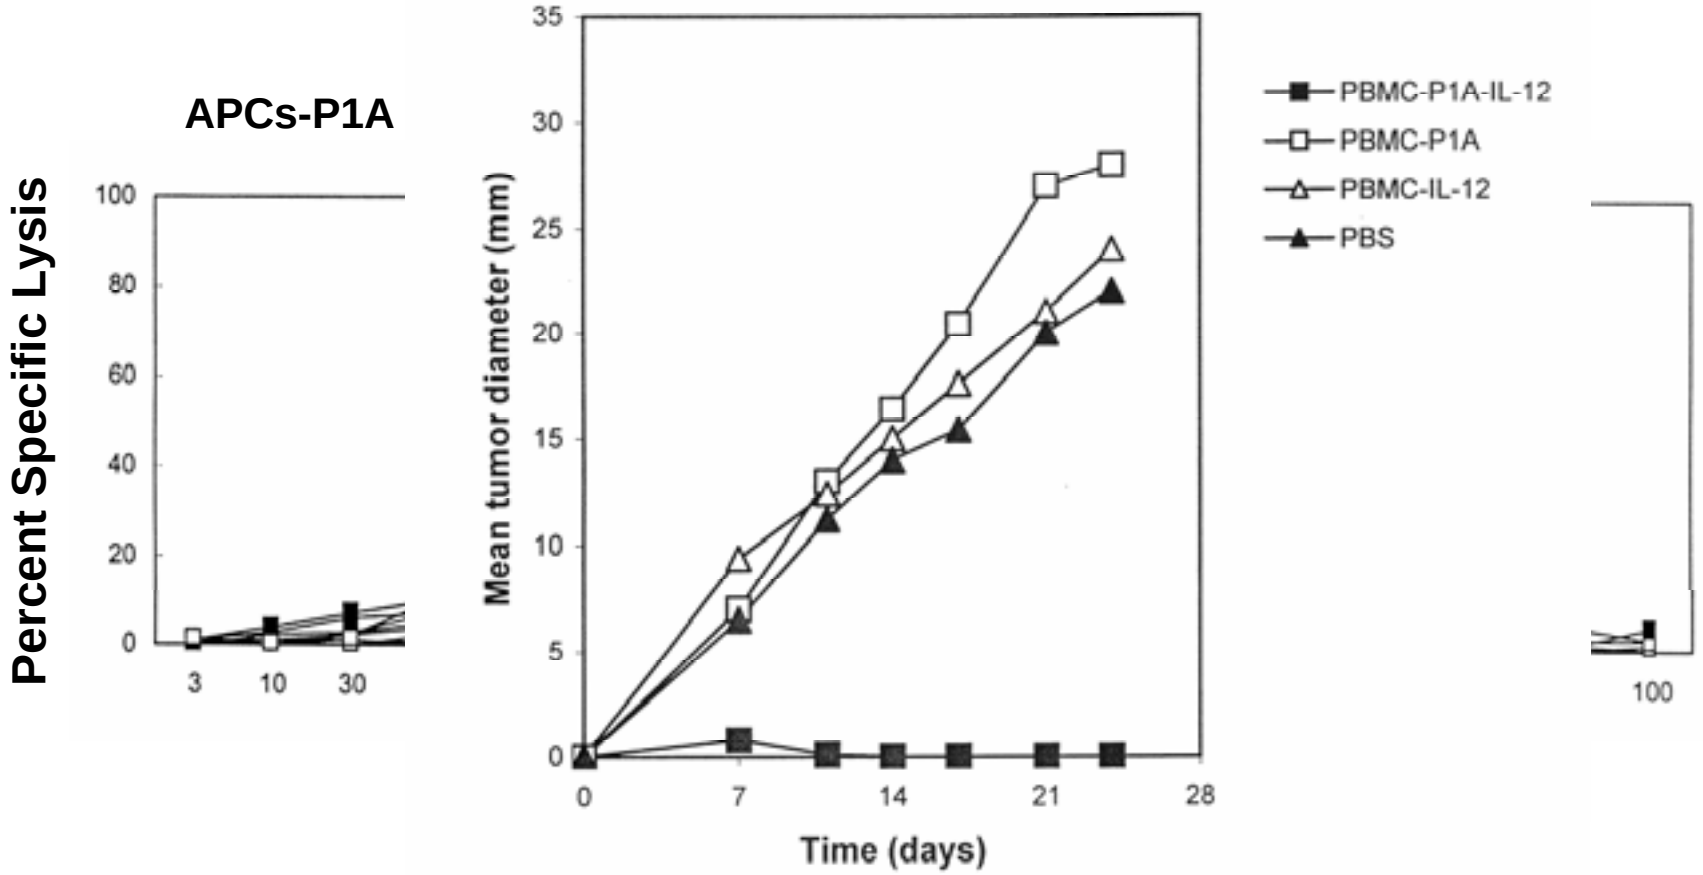
Gerritsen et al. ASCO 2006

Candidate approaches to overcome these barriers

1. Innate immune awareness/Ag presentation/APC maturation
   - Innate immune cells and cytokines, TLR agonists, CD40 ligands, vaccination—novel Ag sources
2. T cell repertoire/initial activation
   - B7 and other costimulatory ligands
   - Interference with lymph node-based or systemic negative regulators (CTLA4, IDO, arginase, anergy, Tregs)
3. T cell differentiation/expansion/persistence
   - Differentiation cytokines (IL-12, IL-18)
   - Expansion, survival factors (IL-2, IL-7, IL-15, anti-41BB; homeostatic proliferation)
4. T cell trafficking into tumor sites
   - Intratumoral chemokines, LIGHT
   - Pro-inflammatory treatments (XRT, TLR agonists, innate cytokines)
5. Executing effector function in tumor microenvironment
   - Blockade of tumor microenvironment-based negative regulators (IDO, PD-1/PD-L1, Tregs, anergy, TGF-β, IL-10, iNOS)
   - Promote effector cell proliferation (regenerate cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Blockade of key anti-apoptotic molecules (Bcl2 and Spi inhibitors)
   - Inhibit oncogenic pathways that create resistant phenotype and/or resistant microenvironment (Stat3; MEK? Notch? Wnt?)

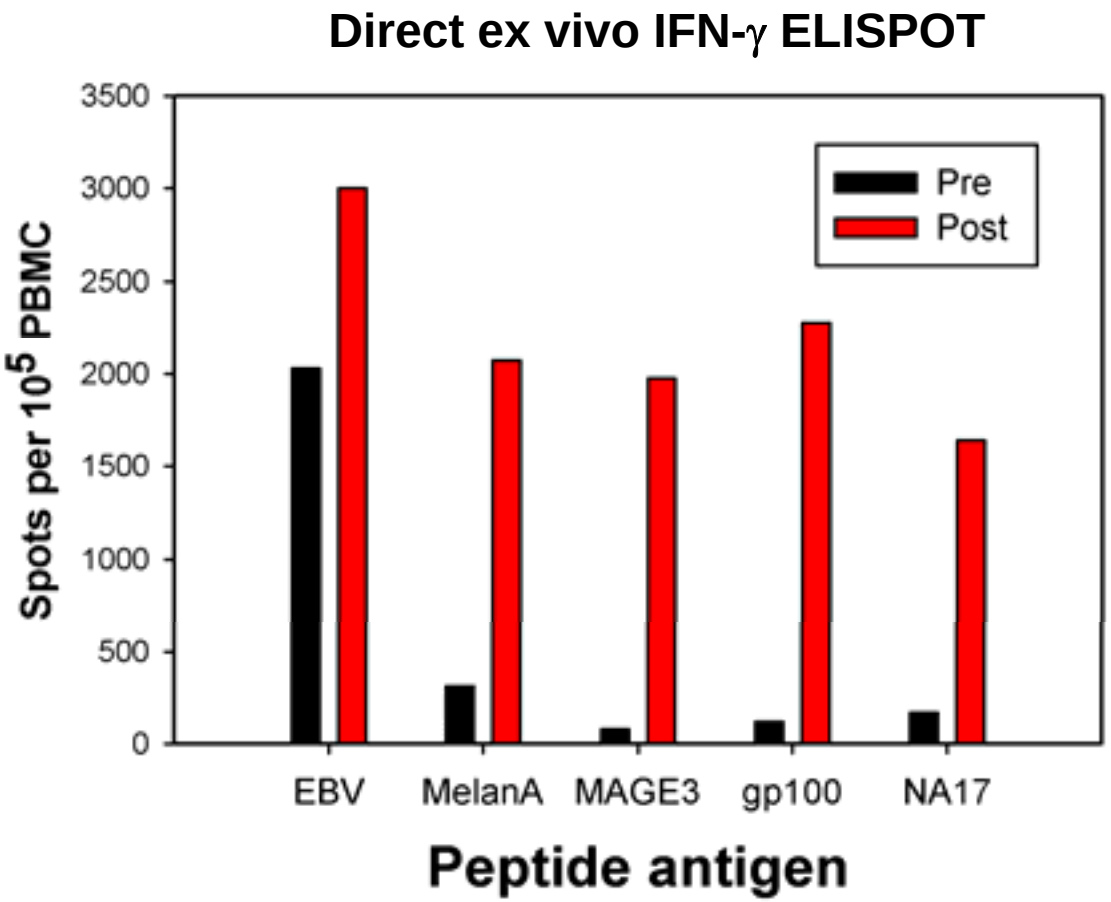
Example 3A: IL-12

Superior induction of specific CTL responses in mice using peptide-loaded APCs + IL-12



Fallarino et al. Int. J. Cancer 1999

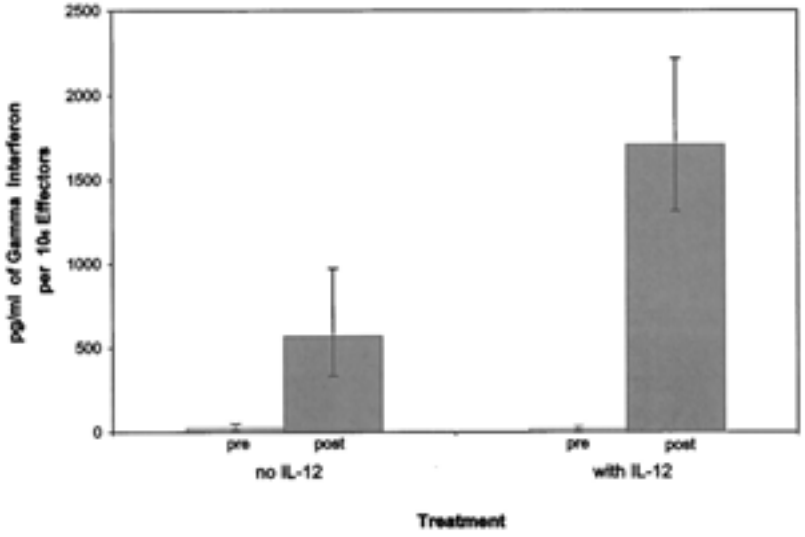
Potent T cell response against multiple antigens post-immunization of melanoma patients with peptide-pulsed PBMC + IL-12



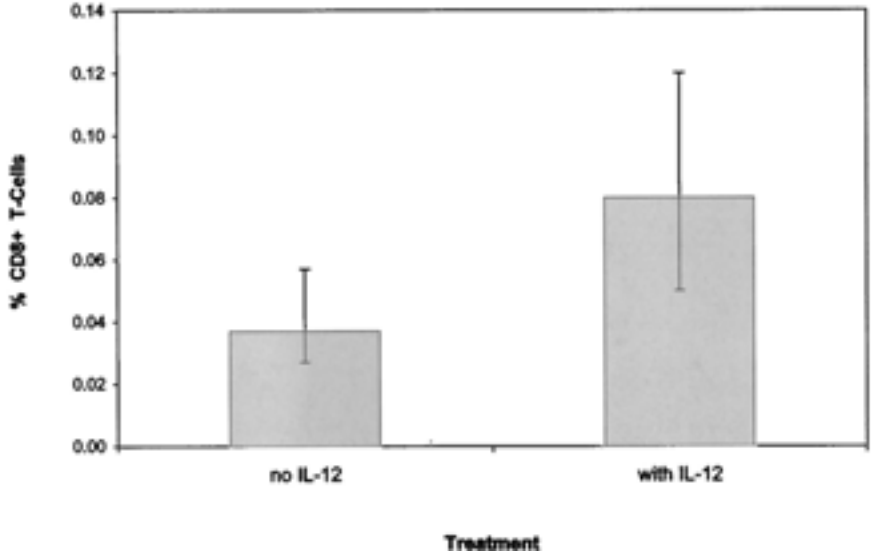
3 patients with CR post-vaccination

Superior immune responses with IL-12 + peptides in Montanide in patients with melanoma

IFN-γ production



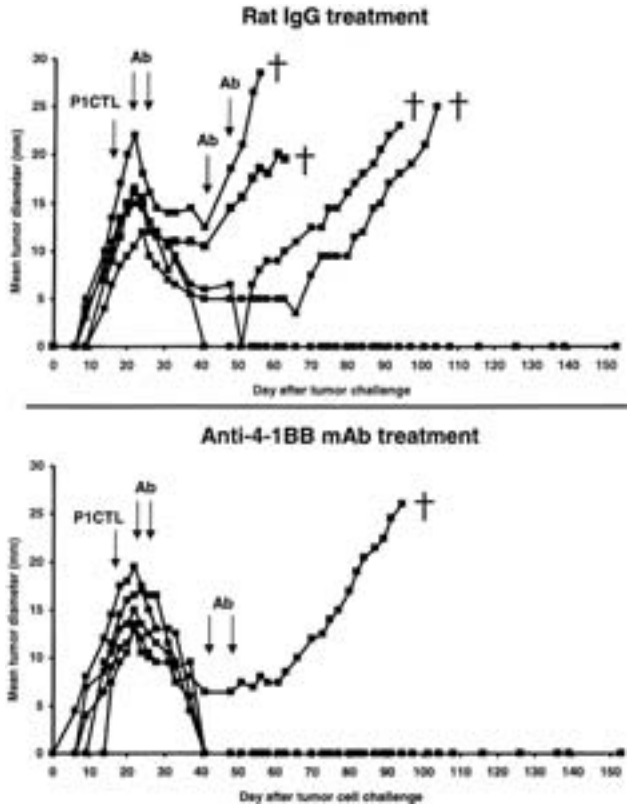
Tetramer staining

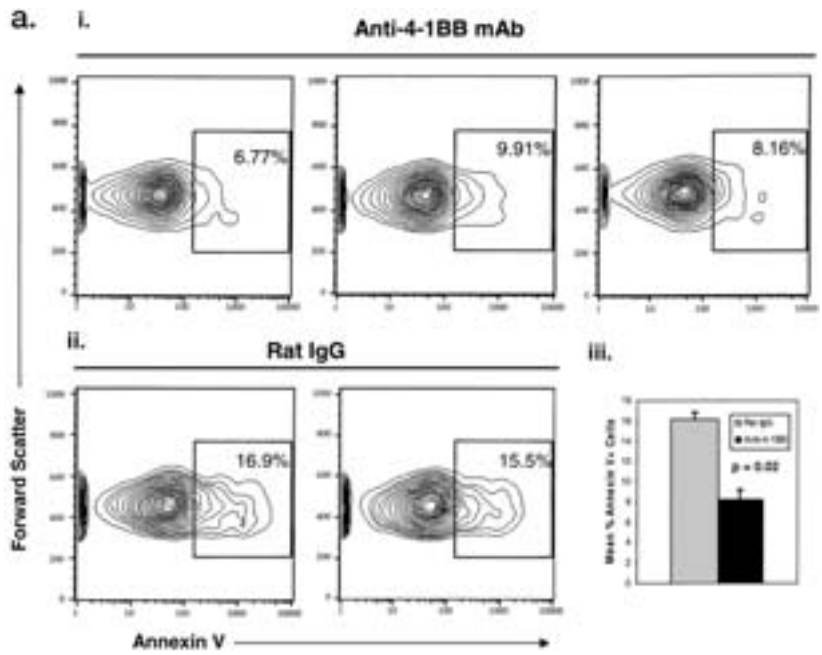


Lee, Weber et al. JCO 2001

Example 3B: Anti-4-1BB

Co-administration of anti-4-1BB mAb with adoptively transferred T cells induces superior tumor rejection and T cell survival in mice

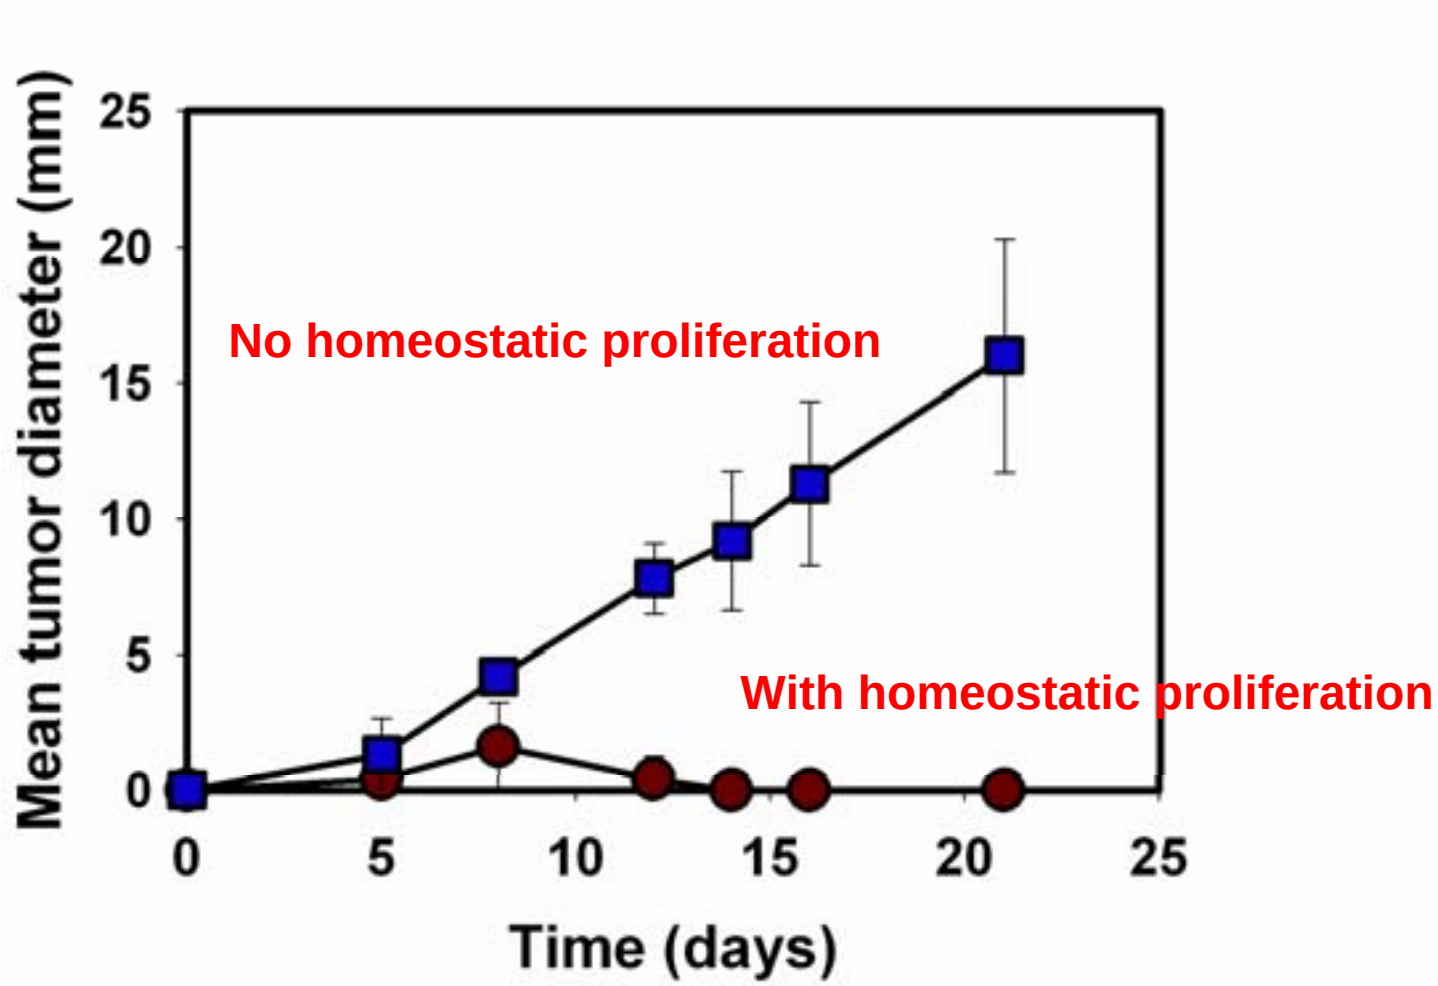




May, Liu et al. Cancer Res. 2002.

Example 3C: Homeostatic proliferation

Anergic 2C T cells reject tumors after homeostatic proliferation in RAG2$^{-/-}$ hosts

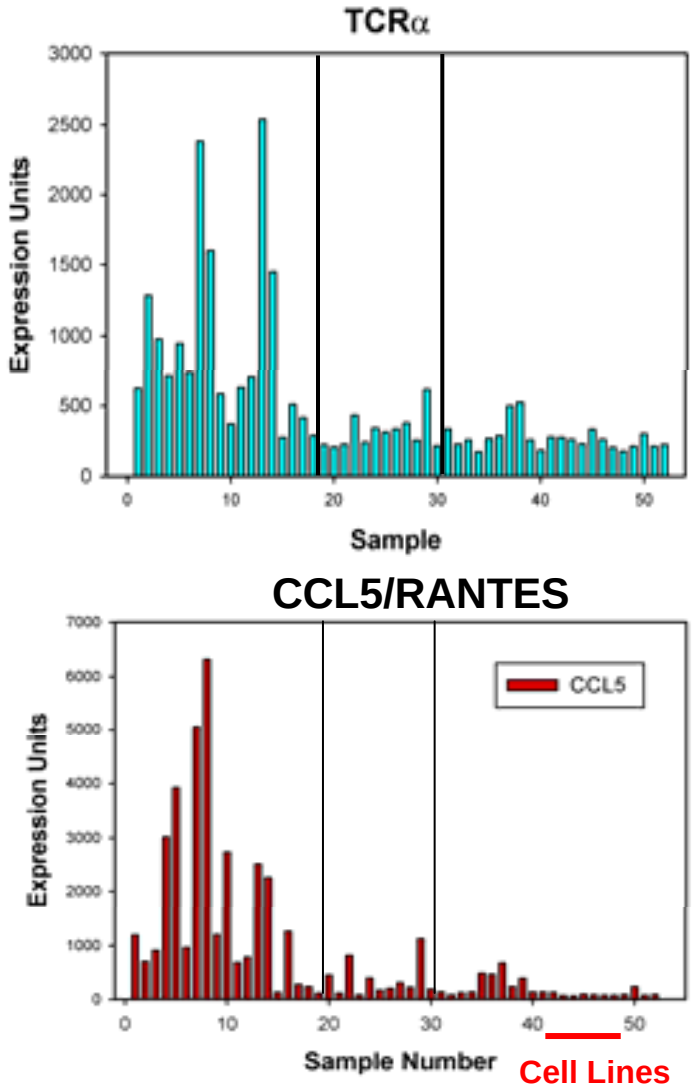


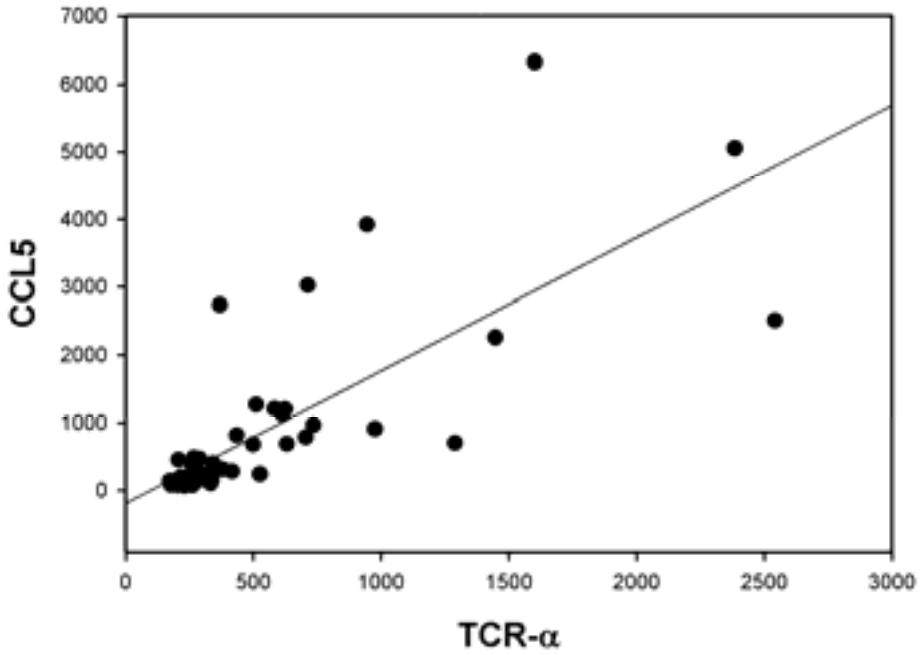
Brown et al., J. Immunol., 2006

Candidate approaches to overcome these barriers

1. Innate immune awareness/Ag presentation/APC maturation
   - Innate immune cells and cytokines, TLR agonists, CD40 ligands, vaccination—novel Ag sources
2. T cell repertoire/initial activation
   - B7 and other costimulatory ligands
   - Interference with lymph node-based or systemic negative regulators (CTLA4, IDO, arginase, anergy, Tregs)
3. T cell differentiation/expansion/persistence
   - Differentiation cytokines (IL-12, IL-18)
   - Expansion, survival factors (IL-2, IL-7, IL-15, anti-41BB; homeostatic proliferation)
4. T cell trafficking into tumor sites
   - Intratumoral chemokines, LIGHT
   - Pro-inflammatory treatments (XRT, TLR agonists, innate cytokines)
5. Executing effector function in tumor microenvironment
   - Blockade of tumor microenvironment-based negative regulators (IDO, PD-1/PD-L1, Tregs, anergy, TGF-β, IL-10, iNOS)
   - Promote effector cell proliferation (regenerate cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Blockade of key anti-apoptotic molecules (Bcl2 and Spi inhibitors)
   - Inhibit oncogenic pathways that create resistant phenotype and/or resistant microenvironment (Stat3; MEK? Notch? Wnt?)

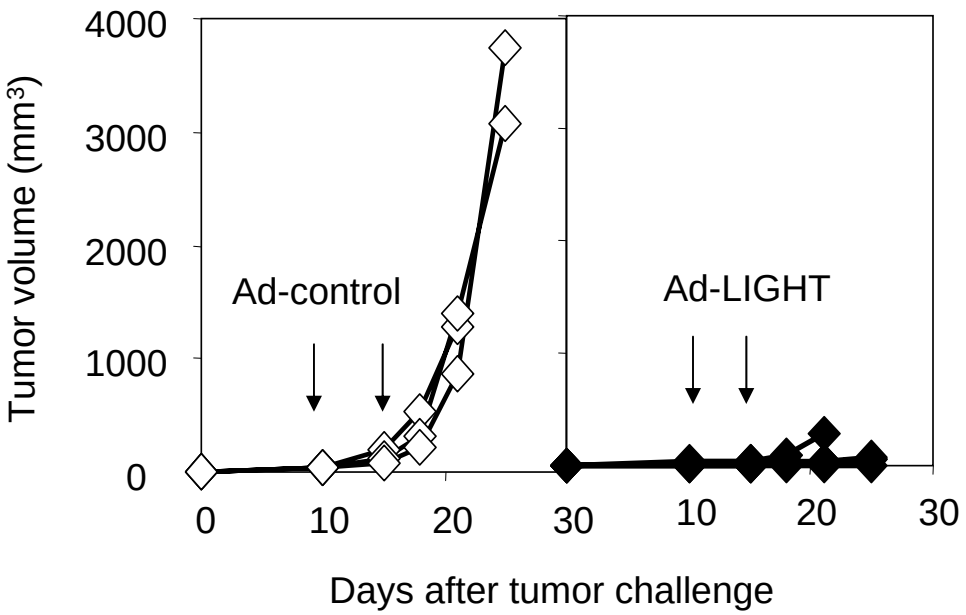
T cell transcripts in melanoma metastases are associated with expression of specific chemokine genes



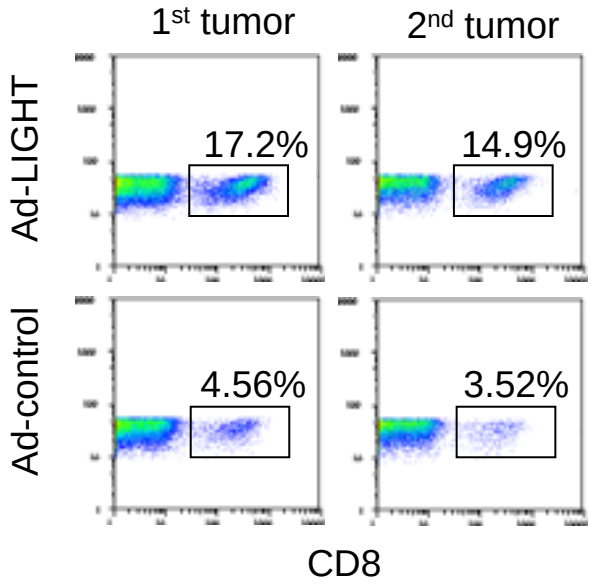


Example 4: Intratumoral LIGHT adenovirus in B16 melanoma promotes greater recruitment of CD8$^+$ T cells in primary tumor and leads to rejection of non-injected distant metastases

Tumor rejection



CD8$^+$ T cell infiltrate

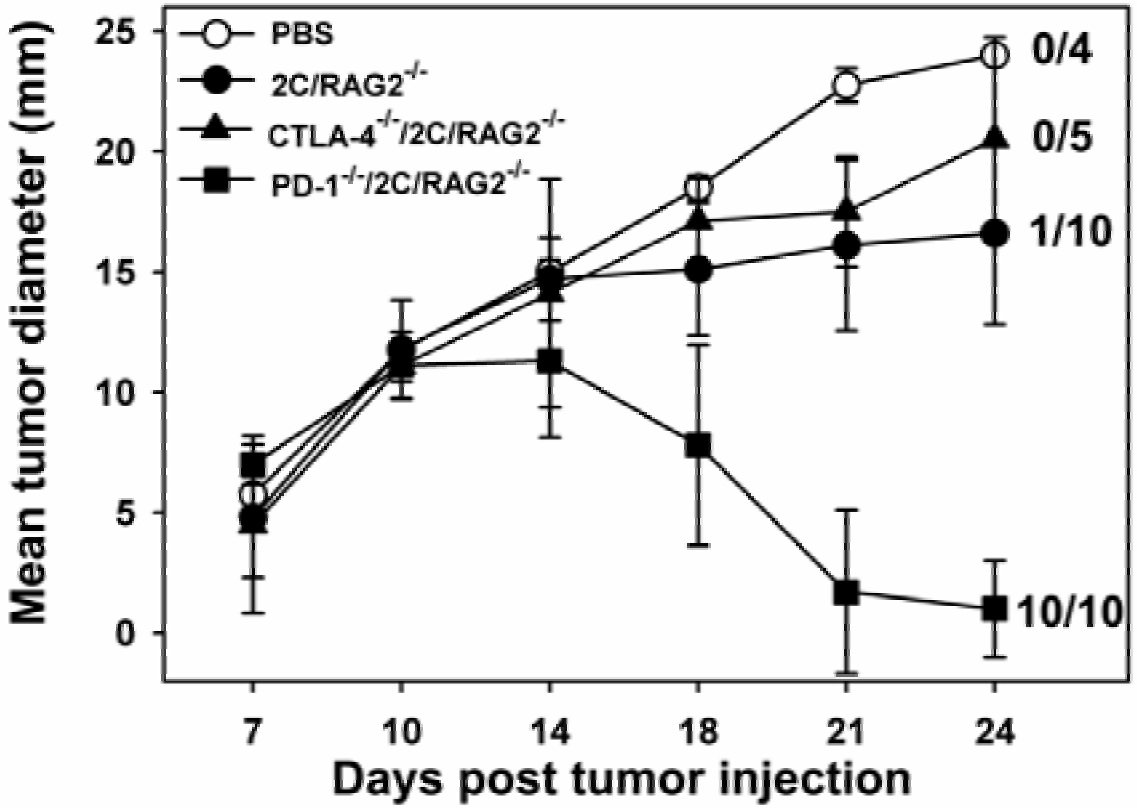


Yu et al, J. Immunol. 2007

Candidate approaches to overcome these barriers

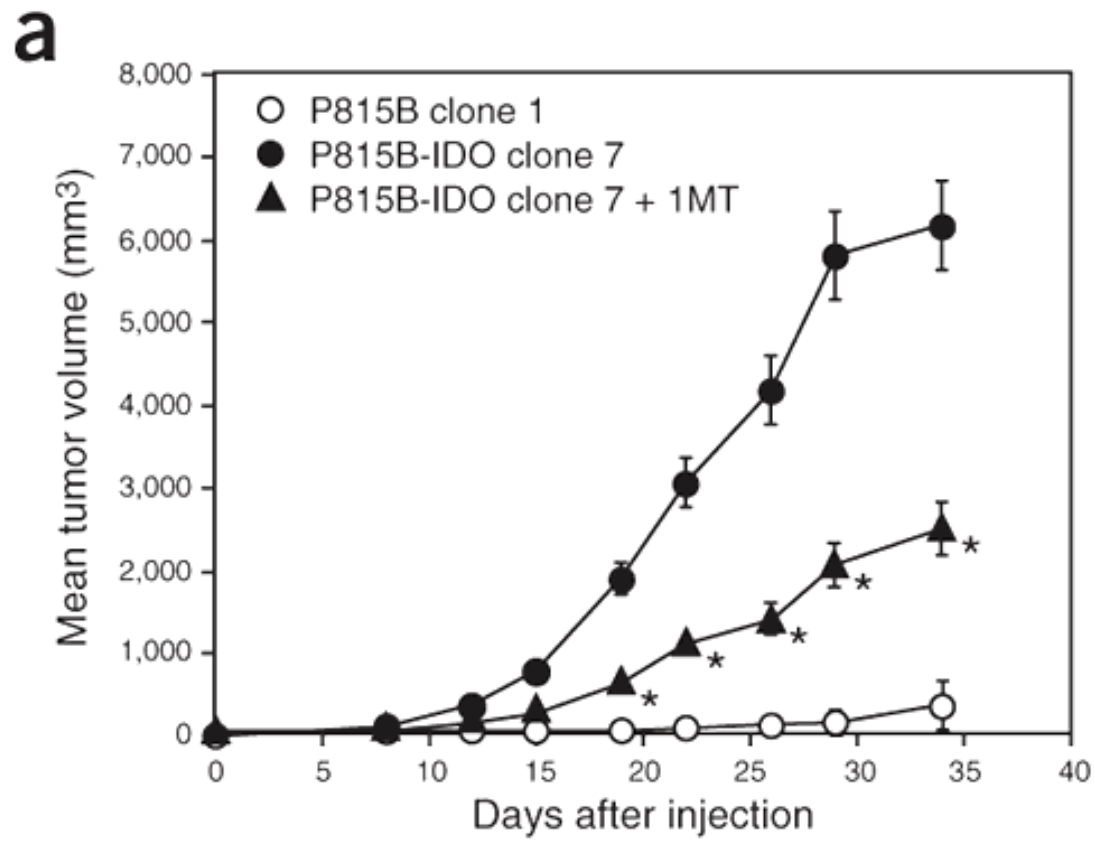
1. Innate immune awareness/Ag presentation/APC maturation
   - Innate immune cells and cytokines, TLR agonists, CD40 ligands, vaccination—novel Ag sources
2. T cell repertoire/initial activation
   - B7 and other costimulatory ligands
   - Interference with lymph node-based or systemic negative regulators (CTLA4, IDO, arginase, anergy, Tregs)
3. T cell differentiation/expansion/persistence
   - Differentiation cytokines (IL-12, IL-18)
   - Expansion, survival factors (IL-2, IL-7, IL-15, anti-41BB; homeostatic proliferation)
4. T cell trafficking into tumor sites
   - Intratumoral chemokines, LIGHT
   - Pro-inflammatory treatments (XRT, TLR agonists, innate cytokines)
5. Executing effector function in tumor microenvironment
   - Blockade of tumor microenvironment-based negative regulators (IDO, PD-1/PD-L1, Tregs, anergy, TGF-β, IL-10, iNOS)
   - Promote effector cell proliferation (regenerate cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Blockade of key anti-apoptotic molecules (Bcl2 and Spi inhibitors)
   - Inhibit oncogenic pathways that create resistant phenotype and/or resistant microenvironment (Stat3; MEK? Notch? Wnt?)

Example 5A: PD-1$^{-/-}$ 2C TCR Tg T cells are superior at tumor rejection in vivo



Blank et al, Cancer Research, 2004

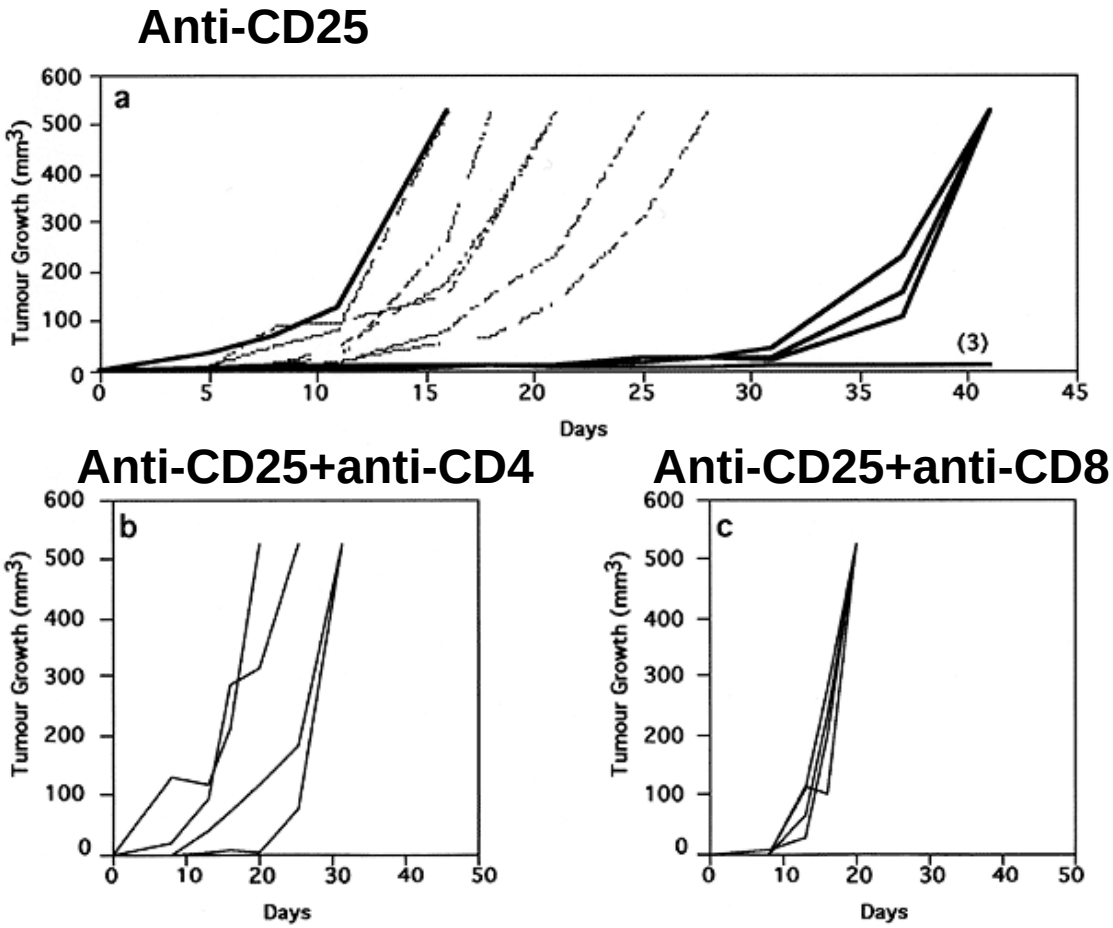
Example 5B: 1-methyltryptophan reverses immunosuppression by IDO and improves tumor control in vivo



Uyttenhove et al Nature Med. 9:1269, 2003

Example 5C: CD25^{+} Tregs

CD25 depletion can partially control B16 melanoma growth in vivo



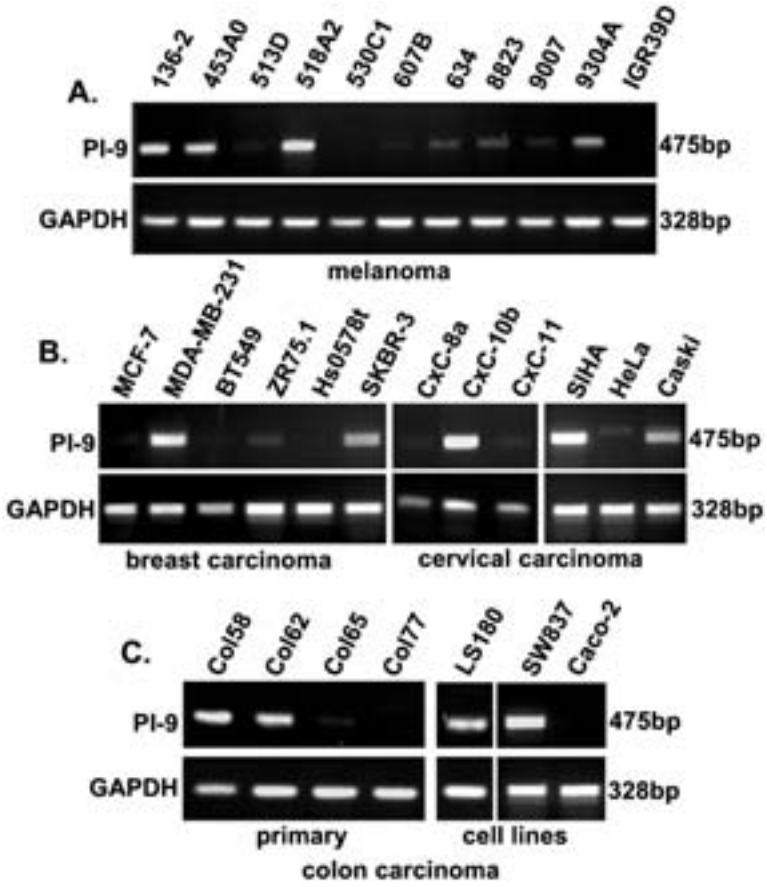
Jones, Gallimore et al. Cancer Immunity 2002

Candidate approaches to overcome these barriers

1. Innate immune awareness/Ag presentation/APC maturation
   - Innate immune cells and cytokines, TLR agonists, CD40 ligands, vaccination—novel Ag sources
2. T cell repertoire/initial activation
   - B7 and other costimulatory ligands
   - Interference with lymph node-based or systemic negative regulators (CTLA4, IDO, arginase, anergy, Tregs)
3. T cell differentiation/expansion/persistence
   - Differentiation cytokines (IL-12, IL-18)
   - Expansion, survival factors (IL-2, IL-7, IL-15, anti-41BB; homeostatic proliferation)
4. T cell trafficking into tumor sites
   - Intratumoral chemokines, LIGHT
   - Pro-inflammatory treatments (XRT, TLR agonists, innate cytokines)
5. Executing effector function in tumor microenvironment
   - Blockade of tumor microenvironment-based negative regulators (IDO, PD-1/PD-L1, Tregs, anergy, TGF-β, IL-10, iNOS)
   - Promote effector cell proliferation (regenerate cytotoxic granules)
6. Tumor cell susceptibility to recognition and killing
   - Blockade of key anti-apoptotic molecules (Bcl2 and Spi inhibitors)
   - Inhibit oncogenic pathways that create resistant phenotype and/or resistant microenvironment (Stat3; MEK? Notch? Wnt?)

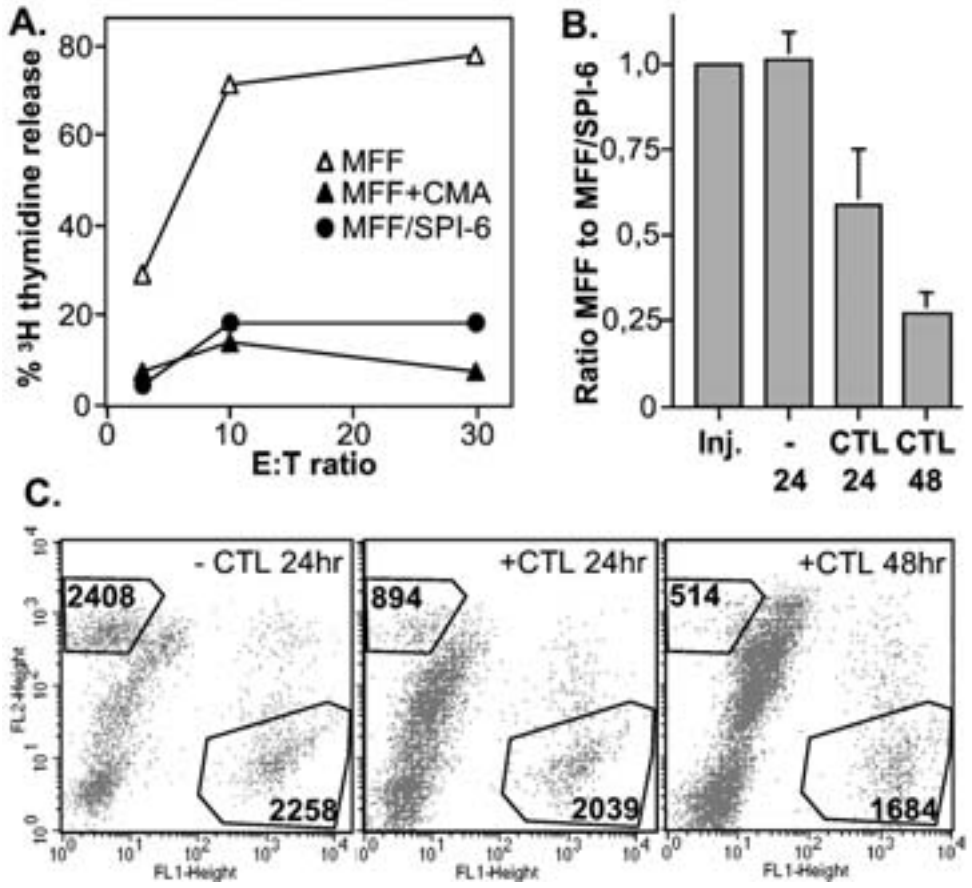
Example 6: PI-9/Spi6

Serine protease inhibitor PI-9 is frequently expressed in human cancers



Medema, J. P. et al. Proc. Natl. Acad. Sci. USA 2001

Introduction of the murine equivalent Spi6 into tumor cells decreases susceptibility to T cell-mediated lysis in vitro

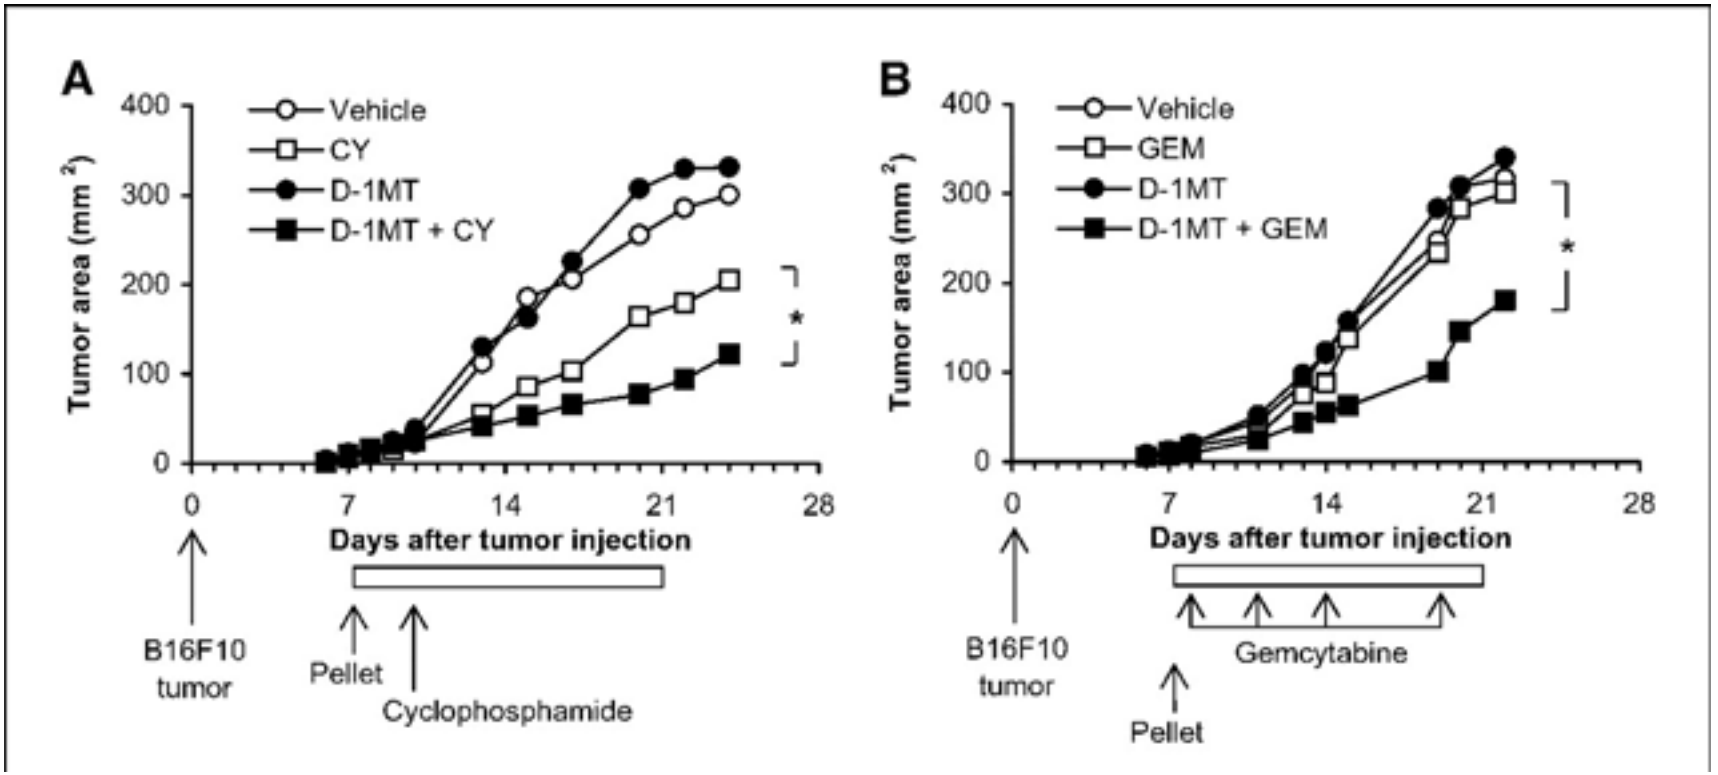


Multiple combinations:

Another layer of complexity and excitement through combined manipulation of regulatory checkpoints

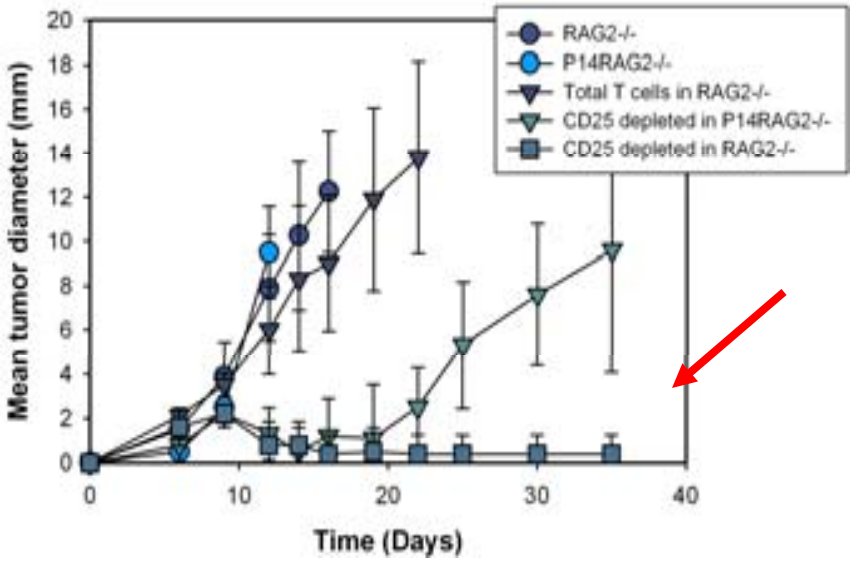
- 1-MT + lymphodepletion
- Anergy reversal + Treg-depletion
- Anti-4-1BB + anti-CTLA-4
- Anti-4-1BB + anti-PD-L1
- Anti-CTLA-4 + Treg depletion
- TLR agonist + Treg-depletion

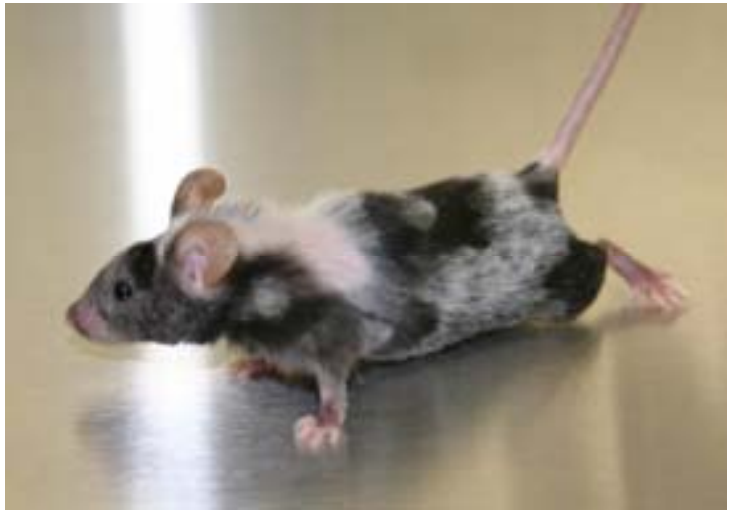
1-MT + lymphodepleting chemotherapy:
Partial control of B16 melanoma



Hou, Munn et al. Cancer Res. 2007

Treg depletion + anergy reversal CD25-depleted T cells transferred into lymphopenic hosts gives long-lived rejection of B16 melanoma and vitiligo

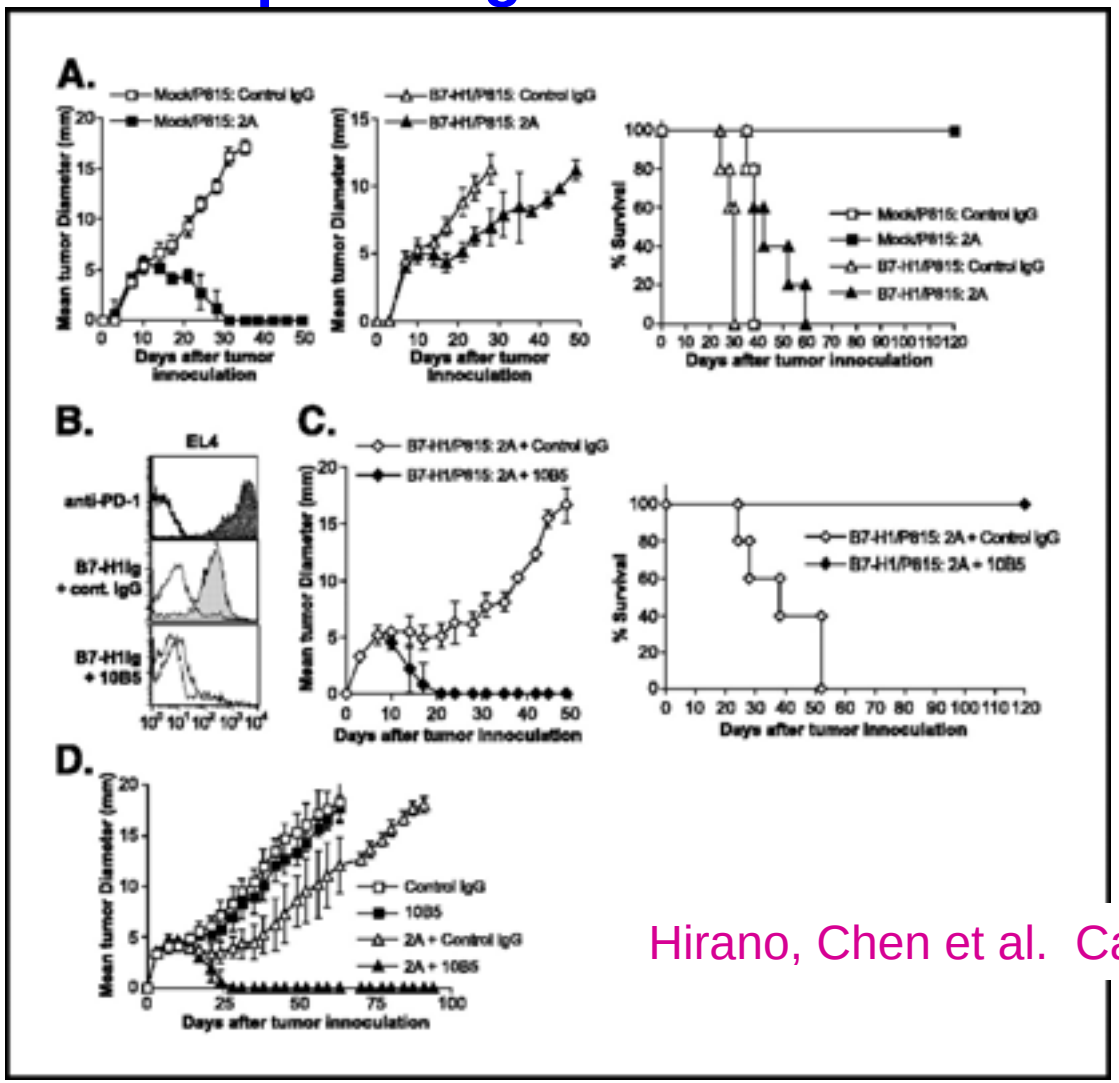




Kline et al. Submitted.

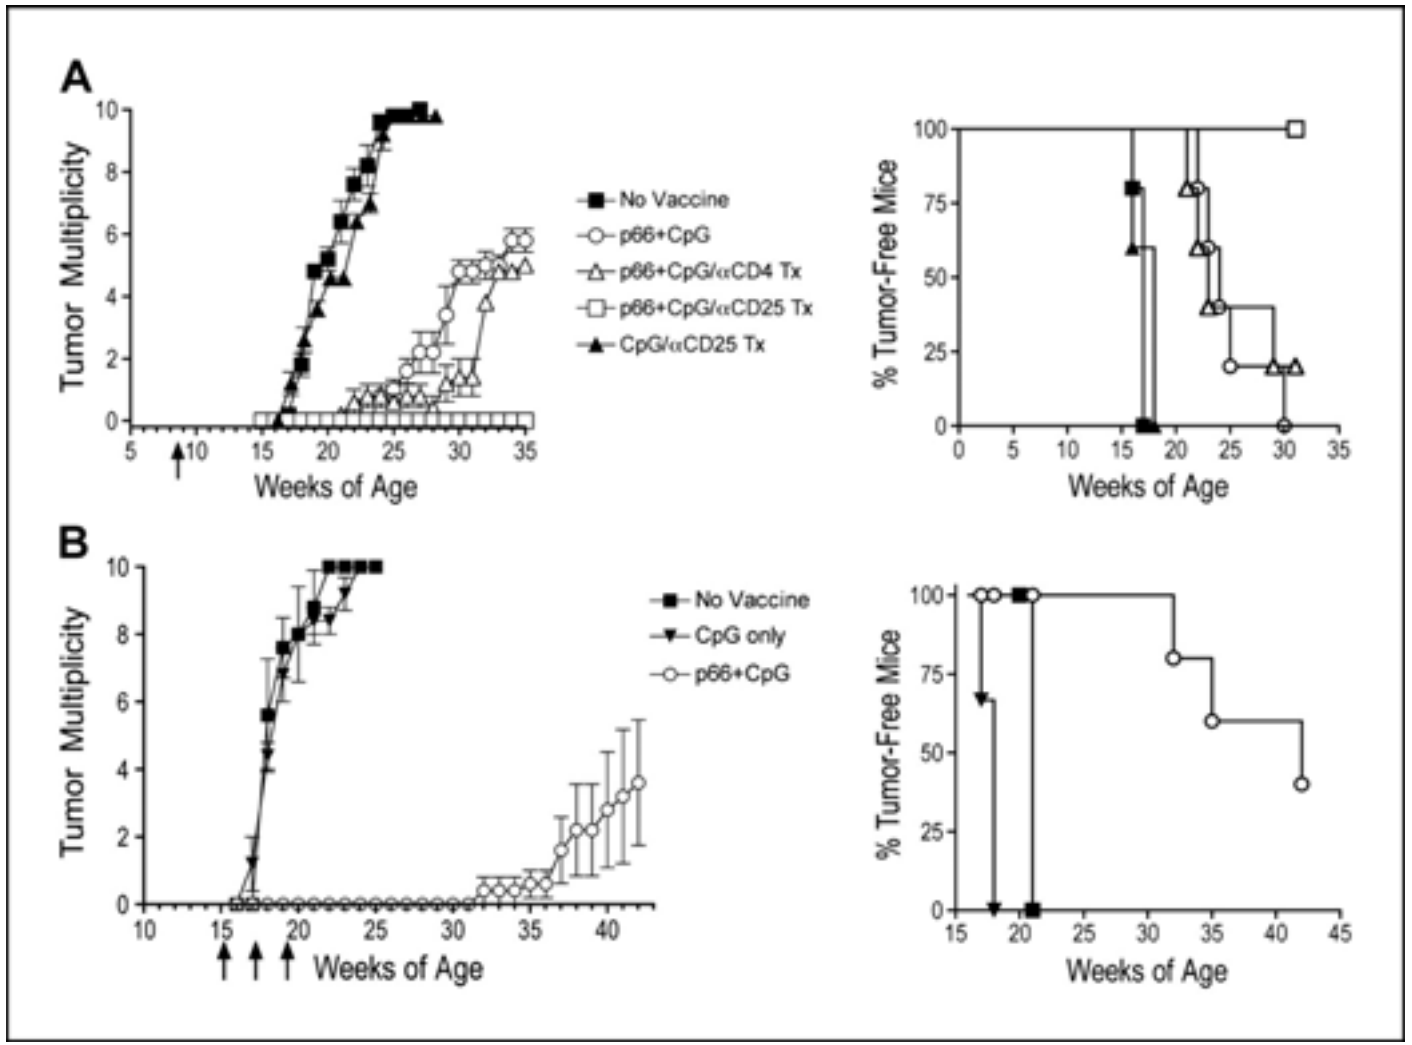
Anti-4-1BB + anti-PD-L1

Combination induces induces rejection of PD-L1-expressing tumors in vivo



Hirano, Chen et al. Cancer Res. 2005

Vaccine + CpG + Treg depletion:
Control of mammary tumors in Neu Tg mice



Nava-Parada, Celis et al. Cancer Res. 2007

Conclusions

- Spontaneous anti-tumor T cell responses may fail at one of several levels
- Specific mechanisms of failure have identified new targets and strategies for intervention
- There is a strong scientific basis for combination therapies with the aim of overcoming specific barriers and immunologic checkpoints to increase the therapeutic efficacy of T cell-based immunotherapy of cancer
- Some agents are becoming available for clinical translation, but others need broad-based community support to be made available for clinical studies based on a sound rationale and preclinical data

Agents prioritized by scientific community for clinical development

Table 1. Final Rankings of Agents with High Potential for Use in Treating Cancer

Rank*	Agent	Agent Category
1	IL-15	T-Cell Growth Factor
2	Anti-Programmed Death-1 (PD1)and/or anti–B7-H1 (PD1 Ligand)	**T-Cell Checkpoint Blockade Inhibitor
3	IL-12	Vaccine Adjuvant
4	Anti-CD40 and/or CD40L	Antigen Presenting Cell Stimulator
5	IL-7	T-Cell Growth Factor
6	CpG	Vaccine Adjuvant
7	1-Methyl Tryptophan	Enzyme Inhibitor
8	Anti-CD137 (anti–4-1BB)	T-Cell Stimulator
9	Anti–TGF-beta	Signaling Inhibitor
10	Anti–IL-10 Receptor or Anti–IL-10	Suppression Inhibitor
11	Flt3L	Dendritic Cell Growth Factor/ Vaccine Adjuvant
12	Anti-Glucocorticoid-Induced TNF Receptor (GITR)	T-cell Stimulator
13	CCL21 Adenovirus	T-Cell Attracting Chemokine
14	Monophosphoryl Lipid A (MPL)	Vaccine Adjuvant
15	Poly I:C and/or Poly ICLC	Vaccine Adjuvant
16	Anti-OX40	T-Cell Stimulator
17	Anti–B7-H4	T-Cell Checkpoint Blockade Inhibitor
18	Resiquimod and/or 852A	Vaccine Adjuvant
19	LIGHT and/or LIGHT vector	T-Cell Stimulator
20	Anti–Lymphocyte Activation Gene-3 (LAG-3)	T-Cell Checkpoint Blockade Inhibitor

Clinical development of anti-CTLA-4 mAb: Example of MDX-010 (Ipilumumab)

- Fully human IgG1 monoclonal antibody to human CTLA-4 created by Medarex
- Blocks binding of CTLA-4 to CD80 and CD86
- Augments immune responses in primate models
- Co-developed by Medarex and Bristol-Myers Squibb in multiple cancer indications
  - Phase III study in metastatic melanoma ongoing
  - Phase II studies in renal cell carcinoma, prostate cancer, ovarian cancer, and others

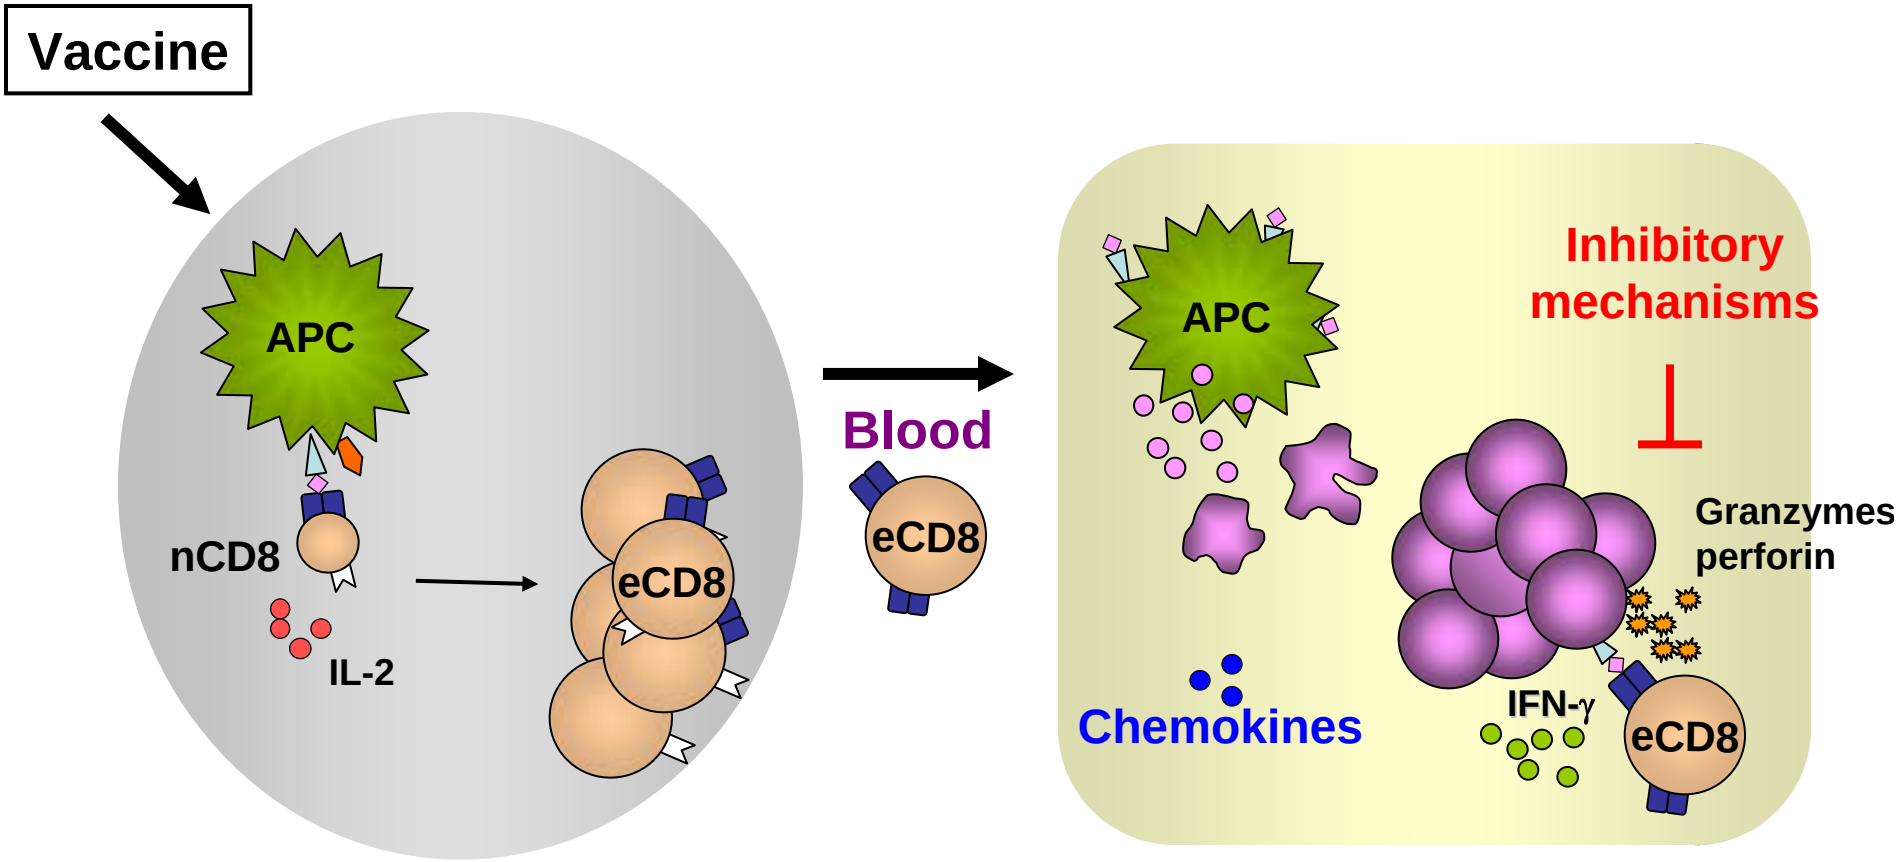
Complexities of anti-tumor immune responses: Taking into account the effector phase



Lymph node
(Priming phase)

Tumor microenvironment
(Effector phase)

I. Priming phase/vaccine: considerations for combinations

- Antigen choice(s)
  - Peptides, protein, DNA, RNA, bulk tumor cells
  - Type of antigen (e.g. necessary for malignant phenotype)
  - Class I MHC, class II MHC, non-classical (glycolipids)
- Adjuvant components
  - Emulsions in oil-based formulations
  - TLR agonists (LPS/MPL + CpG)
  - Cytokine additions—differentiation promoters
  - Microbial vectors
  - Dendritic cell-oriented
- Dose, schedule, route of administration
  - Issue of tissue-specific homing of T cells

IV. Negative regulatory pathways: considerations for combinations

- Inhibitory receptors on T cells
  - CTLA-4
  - PD-1
  - KIRs
- Inhibitory cytokines
  - TGF-β
  - IL-10
- Inhibitory cell populations
  - CD4+CD25+FoxP3+ Tregs
  - Other Tregs
  - Myeloid suppressor cells
  - B cells
- Metabolic regulation
  - IDO
  - Arginase
  - Nutrient deprivation (glucose)

V. Tumor cell susceptibility : considerations for combinations

- Expression of “signal 1”
  - Antigens
  - Antigen processing machinery
  - MHC, β2M
- Overcoming anti-apoptotic mechanisms
  - Survivin
  - Bcl2-family members
  - Serine protease inhibitors
- Interface with tumor cell-intrinsic oncogenes
  - Ras/MAP kinase pathway & DC activation
  - Stat3 pathway and chemokines
  - Notch pathway and survival, immune gene expression

III. T cell trafficking: considerations for combinations

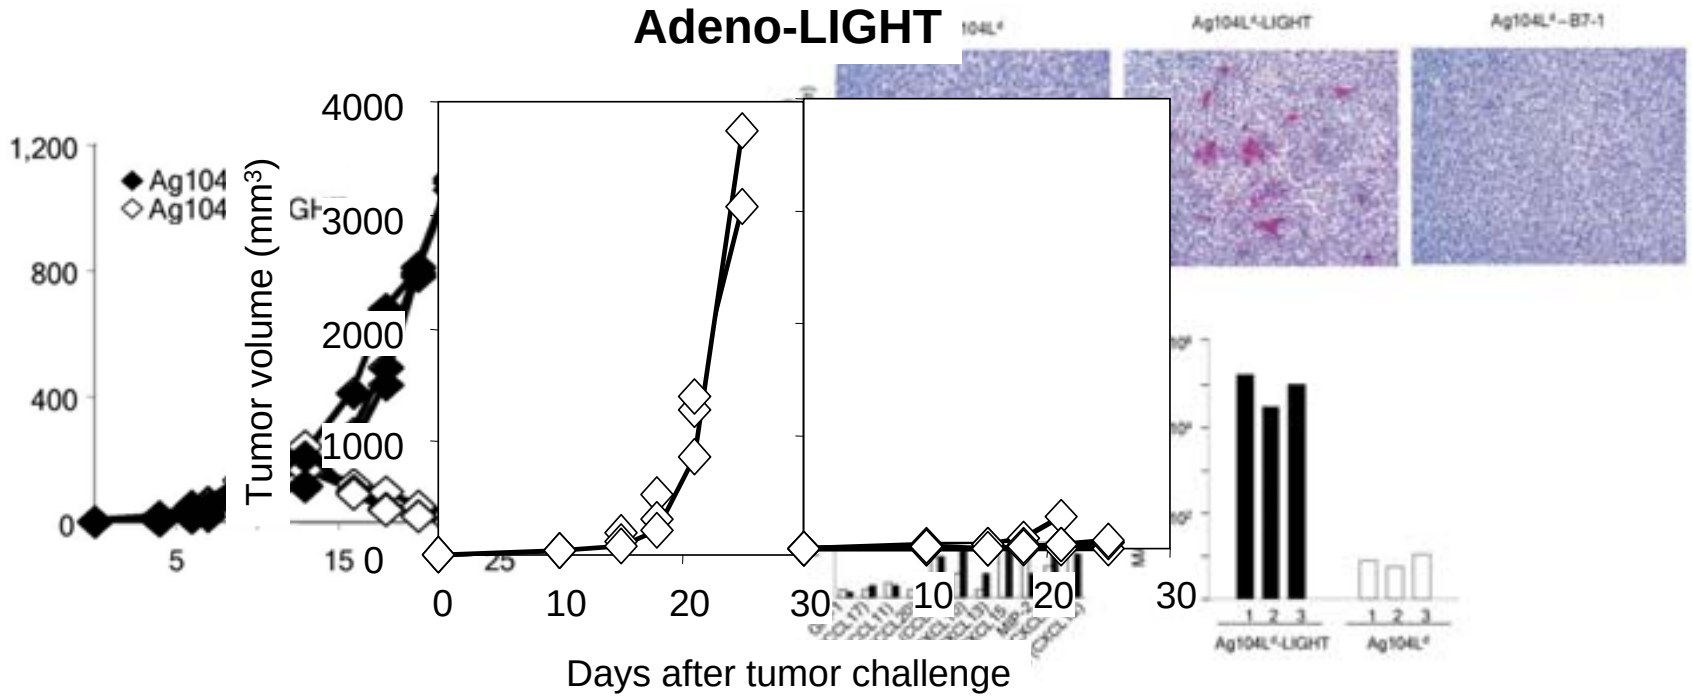
- Intratumoral chemokines
  - Mig, IP-10, MIP-1α
  - CCL21
  - (Blockade of TARC/MDC?)
- Intratumoral LIGHT
  - Promotes secondary generation of chemokines
- Homing receptors/adhesion molecules
  - Intratumoral ICAM-1 (component of TRICOM)
  - Immunizing via optimal route (tissue specific homing)
- Angiogenesis targeting

II. T cell expansion and persistence: considerations for combinations

- Survival/homeostatic cytokines
  - IL-7
  - IL-15
  - IL-21
- Costimulatory receptors
  - B7 family members
  - 4-1BB
  - Other TNFR family members

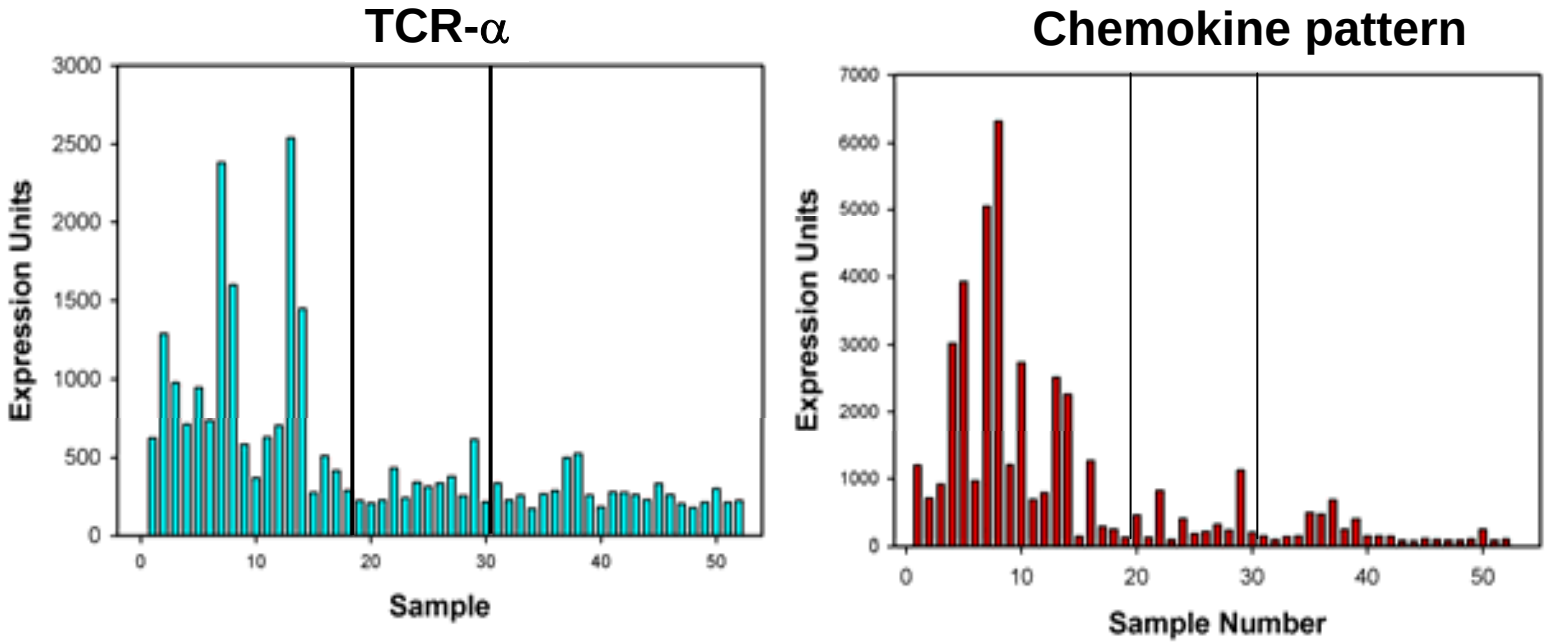
Example 4: LIGHT

Intratumoral LIGHT can induce T cell recruitment and tumor rejection in multiple tumor models



Fu et al, submitted

Only a subset of melanoma metastases appear to have the appropriate signature for T cell recruitment



Harlin, Gajewski et al. Manuscript in preparation.
