Goulds Pumps

ITT Industries
Engineered for life

Goulds 3996 process pump line is specifically designed to provide superior performance for in-line services of the Chemical Process Industries.

Goulds Model 3996

In-Line Process Pumps Designed for Total Range of Industry Services

- Capacities to 1400 GPM (318 m³/h)
- Heads to 700 feet (213 m)
- Temperatures to 500° F (260° C)
- Pressures to 375 PSIG (2586 kPa)

Performance Features for In-Line Services

Extended Pump Life

- Integral pump bearings
- TaperBore™ Plus/BigBore™ seal chambers
- Precision fits for accurate alignment
- Flexibly coupled

Ease of Maintenance

- In-line mounting
- Field alignment not required
- Back pull-out design
- External impeller adjustment

Safety

- ANSI B15.1 coupling guard
- Ductile iron frame and motor support
- Fully serrated flanges

Services

Caustic transfer
Acid unloading
Monomer/Polymer transfer
Liquid nitrogen
Liquid ammonia
Reflux and light tower bottoms
Waste acid recovery
Pickle liquor circulation
Chilled water
Filter feed
Condensate return

Model 3996 In-Line Process Pumps

Heavy Duty Design Features for a Wide Range of Process Services

FIELD ALIGNMENT NOT REQUIRED

Precision rabbet locks provide positive, built-in alignment between pump and motor.

FLEXIBLY COUPLED

Conventional flexible spacer coupling.

CONTINUOUS HIGH PERFORMANCE

Original high efficiency, maintained by simple external adjustment resulting in long-term energy savings.

MAXIMUM INTERCHANGEABILITY

All parts (shaft, sleeve, mechanical seals, etc.) except casing are fully interchangeable with Goulds Model 3196 *STX* and *MTX*.

HEAVY DUTY SHAFT

Shaft designed for minimum deflection—less than .002 in. (.05 mm)—at seal faces.

STREAMLINED SUCTION

With contoured suction baffle reduces turbulence assuring low NPSH requirements.

STANDARD NEMA C-FACE NORMAL THRUST MOTOR

HIGH STRENGTH DUCTILE IRON MOTOR SUPPORT

Open on two sides for easy access to back pull-out assembly.

INTEGRAL PUMP BEARINGS

All hydraulic loads carried by pump—not by motor. Bearings sized for 2-year minimum and 10-year average life under tough operating conditions. Regreaseable bearings standard. . .available with greased-for-life or oil mist lubrication.

ANSI B73.1M SHAFT SEALING

Choice of large or standard bore seal chambers for maximum sealing flexibility to meet service conditions.

POSITIVE SEALING

Fully confined gasket at casing joint protects alignment fit from liquid.

HEAVY WALLED CASING

With ribbed suction and discharge nozzles support pump and driver and resist pipe strain without distortion. ANSI class 150 flanges standard, class 300 flanges optional.

FULLY OPEN IMPELLER

Acknowledged best design for C.P.I. services—solids handling, stringy material, corrosives, abrasives. Back pump-out vanes minimize stuffing box/seal chamber pressure and reduce thrust for longer bearing and seal life.

In-Line Design For Cost Savings

In-line pumps have become increasingly popular with users due to minimal floor space required and reduced installation costs. Installation is simple since the unit is mounted directly in the line like a valve. Field alignment is not required and the unit is not subject to misalignment due to pipe strain or temperature changes.

Setting The Standards For Reliability

The 3996 is designed for optimum reliable service ...shaft size and overhang are optimized to provide maximum seal and bearing life...precision fits provide built-in alignment between pump and motor (field alignment not required). Hydraulic and mechanical loads are carried by the pump, not by special motors (the 3996 uses standard C-face motors).

Service*

Goulds 3996...The Preferred In-Line Design

A variety of in-line pumps are available including close-coupled, rigid-coupled, and flexibly-coupled/integral bearing designs. Only the flexibly-coupled design such as the 3996 is built without compromise.

Dynamic Seal

For Elimination of Sealing Problems—Reduced Maintenance Costs

On tough pumping services, especially corrosives and slurries, mechanical seals require outside flush and constant, costly attention. Even then, seal failures are common, resulting in downtime.

Goulds offers the ANSI PLUS™ Dynamic Seal which, simply by fitting a repeller between the stuffing box and impeller, eliminates the need for a mechanical seal.

Benefits of Goulds Dynamic Seal:

- External seal water not required
- Elimination of pumpage contamination and product dilution
- Reduces utility cost
- No need to treat seal water
- Eliminates problems associated with piping from a remote source

At start-up, the repeller functions like an impeller, and pumps liquid and solids from the stuffing box. When pump is shut down, packing (illustrated) or other type of secondary seal prevents pumpage from leaking.

Besides being available as a complete unit, any Goulds 3996 can be easily field-converted to Dynamic Seal. Retrofit kits are readily available.

Hydraulic Coverage Model 3996

Sealing Solutions

Goulds engineered seal chambers are designed to accept a wide range of sealing arrangements to meet specific user requirements. Your Goulds representative will gladly recommend the best sealing solution for your service...some of which are illustrated here.

SINGLE INSIDE SEAL (with BigBore™ Seal Chamber)

- Non-corrosive to moderate corrosive liquids
- Moderate abrasives
- Liquids that have good lubrication qualities

CONVENTIONAL DOUBLE SEAL (with BigBore™ Seal Chamber)

- Liquids not compatible with single seal
- Toxic, hazardous, abrasive, corrosive
- When pump is operating under cavitation or low flows
- Meet environmental regulations

SINGLE CARTRIDGE SEAL (with TaperBore™ PLUS Seal Chamber)

- Same application as conventional single seal
- Ease of maintenance
- No seal setting problems

DOUBLE CARTRIDGE SEAL (with BigBore™ Seal Chamber)

- Same applications as conventional double seal
- Reduced maintenance costs
- No seal setting errors

DOUBLE GAS BARRIER SEAL (with BigBore™ Seal Chamber for Gas Seals)

- Toxic or hazardous liquids
- Meet environmental regulations
- When use of seal pot or external flush is not desirable
- When compatible seal flush liquid not available

Goulds Patented TaperBore™ PLUS

How It Works

The unique flow path created by the patented Vane Particle Ejector directs solids away from the mechanical seal, not towards the seal as with other tapered bore designs. And, the amount of solids entering the bore is minimized. Air and vapors are also efficiently removed.

On services with or without solids, air or vapors, Goulds TaperBore™ PLUS is the effective solution for extended seal and pump life and lower maintenance costs.

- 1 Solids/liquid mixture flows toward mechanical seal/seal chamber.
- 2 Turbulent zone. Some solids continue to flow toward shaft. Other solids are forced back out by centrifugal force (generated by back pump-out vanes).
- 3 Clear liquid continues to move toward mechanical seal faces. Solids, air, vapors flow away from seal.
- 4 Low pressure zone created by Vane Particle Ejector. Solids, air, vapor liquid mixture exit seal chamber bore.
- 5 Flow in TaperBore™ PLUS seal chamber assures efficient heat removal (cooling) and lubrication. Seal face heat is dissipated. Seal faces are continuously flushed with clean liquid.

Engineered Seal Chamber Selection Guide

	A	B	C	TYPE 1 Standard Bore	TYPE 2 BigBore™	TYPE 3 TaperBore™ PLUS	TYPE 4 Jacketed TaperBore™ PLUS	TYPE 5 Jacketed BigBore™
	Ideally Suited	Acceptable	Not Recommended	Designed for packing. Also accommodates mechanical seals.	Enlarged chamber for increased seal life through improved lubrication and cooling.	Lower seal face temperatures, self-venting and draining. Solids and vapors circulated away from seal faces.	Maintains proper temperature control (heating or cooling) of seal environment.	Maintains proper temperature control (heating or cooling) of seal environment.
