View memory-card images on the 3.0-inch color viewer then select and print, or add a creative twist by transforming ordinary photos and HD movie stills into works of art with Full HD Movie Print. True intelligence is always a pleasure – with the PIXMA MG6270.

Before You Buy, Demand To Know The True Speed Of That Inkjet Printer

You cannot accurately compare the speed of inkjet printers when there are different test methods. Unless the universal ISO Print/Copy Speed Measurement standards are used, it's impossible to know which printer is faster: one that prints 10 images per minute (ipm) or one that prints 30 pages per minute (ppm). Canon has adopted the universal ISO standards for inkjet printers to ensure that you always get the performance you expect right out of the box. Demand the ISO standard – it's the only way to know the real speed of your inkjet printer.

- *"CHROMALIFE100" PROPER STORAGE CONDITIONS**
300-year life in an album:
<Criteria for estimations> The permanence presented above are made using an accelerated dark storage test designed for silver-halide photos (ISO/FDIS18909). Samples are printed with an optical density of 1.0 (each black, cyan, magenta, yellow) and kept in a controlled environment of high temperature and 50% relative humidity. The test environment is designed to accelerate color fading. The rate of the decrease in the optical density and the rate of yellow discoloration of the paper are measured. Finally, the results are extrapolated to the length of time that a printed image is kept in an environment of 23°C, 50% RH.

30-year lightfastness:
<Criteria for estimation> When displayed in a glass frame in a typical indoor space (estimating 500lux / 10 hours per day) without direct sunlight. Estimates for lightfastness are made under the following test conditions. Light source: White fluorescent light 70,000 lux; Temperature: 24°C; Humidity: 60% RH; A 2mm thick glass is placed on the sample with an air gap between the glass and the sample during accelerated testing.

20-year gas fastness:
<Criteria for estimation> Estimates for gas fastness are made under the following test conditions: Temperature (24°C) and humidity (60% RH) are controlled in an environment of mixed gases of O₂, NO_x and SO_x. The ratio of the gases is typical to indoor air composition (O₂: NO_x: SO_x = 3:19:1) with 100-times concentration in order to accelerate fading.

<Tips>
Making your printed images last longer: Light, environmental gases, high temperature and humidity can accelerate color fading. When displaying your photographs, avoid high-intensity lighting and use glass-filtered frames. Photos stored in the dark, using archival quality albums or storage materials, will tend to last longer than photos that are exposed to light. Avoid high temperatures and high humidity to promote the image permanence of your photos.

Note: The image permanence estimates presented above may vary depending on display / storage conditions. The expressed numbers of years estimates are the result of simulated, accelerated tests conducted by Canon Inc., and do not represent a product guarantee.
