

Introduction to Python: NumPy, Pandas and Plotting

Bioinformatics and Research Computing (BaRC)

http://barc.wi.mit.edu/hot_topics/

WHITEHEAD INSTITUTE

NumPy

- Numerical Python
- Efficient multidimensional array processing and operations
 - Linear algebra (matrix operations)
 - Mathematical functions
- Array (objects) must be of the **same** type

NumPy: Slicing

	Expression	Shape
	<code>arr[:2, 1:]</code>	<code>(2, 2)</code>
	<code>arr[2]</code> <code>arr[2, :]</code> <code>arr[2:, :]</code>	<code>(3,)</code> <code>(3,)</code> <code>(1, 3)</code>
	<code>arr[:, :2]</code>	<code>(3, 2)</code>
	<code>arr[1, :2]</code> <code>arr[1:2, :2]</code>	<code>(2,)</code> <code>(1, 2)</code>

Pandas

- Efficient for processing tabular, or panel, data
- Built on top of NumPy
- Data structures: Series and DataFrame (DF)
 - Series: one-dimensional , same data type
 - DataFrame: two-dimensional, columns of different data types
 - index can be integer (0,1,...) or non-integer ('GeneA','GeneB',...)

index
↓

Series

Gene	Expression
GeneA	3.51
GeneB	0.44
GeneC	5.21
GeneD	4.55
GeneE	6.78

index
↓

DataFrame

	Gene	GTEX-1117F	GTEX-111CU	GTEX-111FC
0	DDX11L1	0.1082	0.1158	0.02104
1	WASH7P	21.4	11.03	16.75
2	MIR1302-11	0.1602	0.06433	0.04674
3	FAM138A	0.05045	0	0.02945
4	OR4G4P	0	0	0
5	OR4F5	0	0	0

axis = 0

axis = 1

4

What can you do with a Pandas DataFrame?

- Filter
 - Select rows/columns
- Sort
- Numerical or Mathematical operations (e.g. mean)
- Group by column(s)
- Many others!

<https://pandas.pydata.org/pandas-docs/stable/>

DataFrame Slicing: Selecting Data

Ensembl ID	Gene	GTEX-1117F	GTEX-111CU	GTEX-111FC
ENSG00000223972	DDX11L1	0.1082	0.1158	0.02104
ENSG00000227232	WASH7P	21.4	11.03	16.75
ENSG00000243485	MIR1302-11	0.1602	0.06433	0.04674
ENSG00000237613	FAM138A	0.05045	0	0.02945
ENSG00000268020	OR4G4P	0	0	0
ENSG00000186092	OR4F5	0	0	0

- loc by row or column names
e.g. "Gene", "GTEX-117F"
- iloc by integer location,
i.e. column or row number
e.g. 1,2,3

"Tidy" Data

Each **variable** is saved
in its own **column**

Each **observation** is
saved in its own **row**

"Tidy" Data Example

Gene	Adipose	Adipose	Blood	Blood	Heart	Heart
DDX11L1	0.1082	0.1158	0.05103	0.03214	0.04833	0.144
WASH7P	21.4	11.03	10.7	11.62	9.953	10.35
FAM138A	0.05045	0	0	0	0.09018	0.144

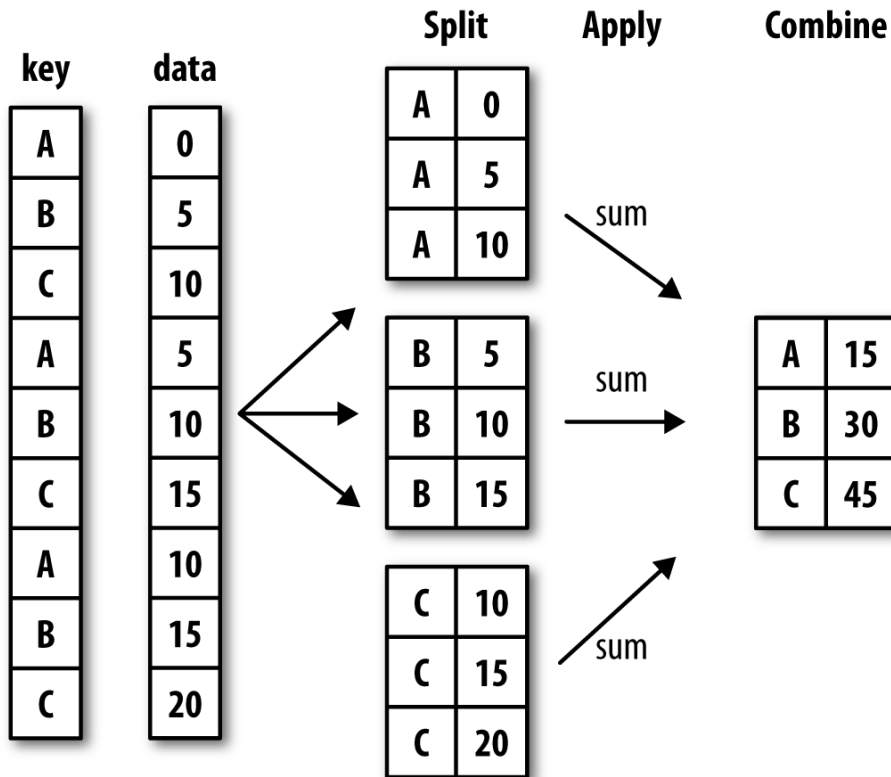

Gene	Tissue	Expression
DDX11L1	Adipose	0.1082
WASH7P	Adipose	21.4
FAM138A	Adipose	0.05045
DDX11L1	Adipose	0.1158
WASH7P	Adipose	11.03
FAM138A	Adipose	0
DDX11L1	Blood	0.05103
WASH7P	Blood	10.7
FAM138A	Blood	0
DDX11L1	Blood	0.03214
WASH7P	Blood	11.62
FAM138A	Blood	0
DDX11L1	Heart	0.04833
WASH7P	Heart	9.953
FAM138A	Heart	0.09018
DDX11L1	Heart	0.144
WASH7P	Heart	10.35
FAM138A	Heart	0.144

Pandas - groupby

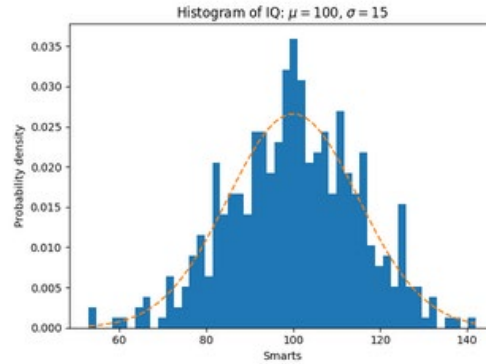

- Split, Apply and Combine

Plotting

- Matplotlib

- Seaborn

- Plotly
