ISP Network Design

Scalable Network Design

ISP Network Design

- PoP Topologies and Design
- Backbone Design
- Addressing
- Routing Protocols
- Security
- Out of Band Management
- Operational Considerations

Point of Presence Topologies

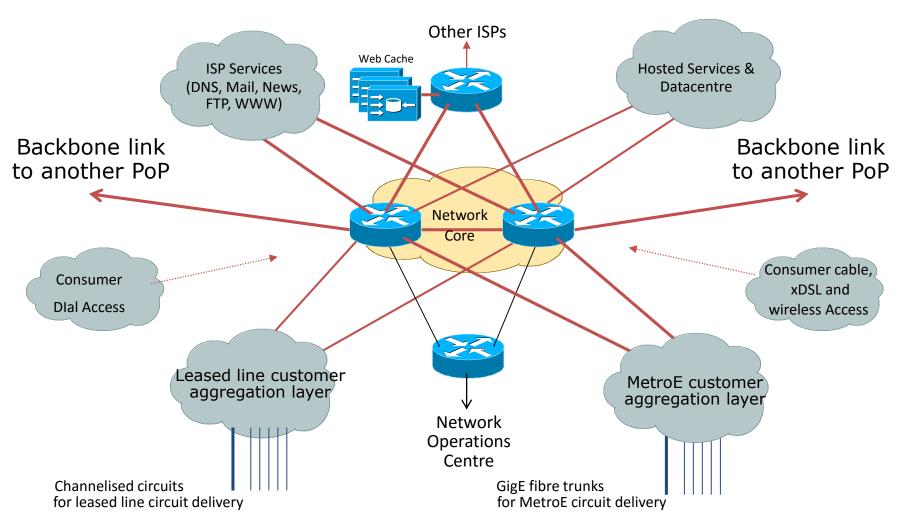

PoP Topologies

- Core routers high speed trunk connections
- Distribution routers and Access routers high port density
- Border routers connections to other providers
- Service routers hosting and servers
- Some functions might be handled by a single router

PoP Design

- Modular Design
- Aggregation Services separated according to
 - connection speed
 - customer service
 - contention ratio
 - security considerations

Modular PoP Design

Modular Routing Protocol Design Smaller ISPs

- Modular IGP implementation
 - IGP "area" per PoP
 - Core routers in backbone area (Area 0/L2)
 - Aggregation/summarisation where possible into the core
- Modular iBGP implementation
 - BGP route reflector cluster per module
 - Core routers are the route-reflectors
 - Remaining routers are clients & peer with routereflectors only

Modular Routing Protocol Design Larger ISPs

- Modular IGP implementation
 - IGP "area" per module (but avoid overloading core routers)
 - Core routers in backbone area (Area 0/L2)
 - Aggregation/summarisation where possible into the core
- Modular iBGP implementation
 - BGP route reflector cluster per module
 - Dedicated route-reflectors adjacent to core routers
 - Clients peer with route-reflectors only

Point of Presence Design

- Low Speed customer connections
 - PSTN/ISDN dialup
 - Low bandwidth needs
 - Low revenue, large numbers
- Leased line customer connections
 - E1/T1 speed range
 - Delivery over channelised media
 - Medium bandwidth needs
 - Medium revenue, medium numbers

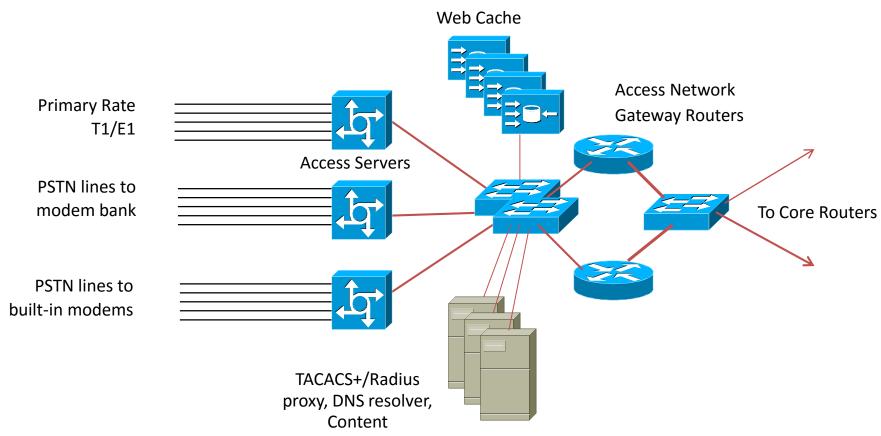

- Broad Band customer connections
 - xDSL, Cable and Wireless
 - High bandwidth needs
 - Low revenue, large numbers
- MetroE & Highband customer connections
 - Trunk onto GigE or 10GigE of 10Mbps and higher
 - Channelised OC3/12 delivery of E3/T3 and higher
 - High bandwidth needs
 - High revenue, low numbers

- PoP Core
 - Two dedicated routers
 - High Speed interconnect
 - Backbone Links ONLY
 - Do not touch them!
- Border Network
 - Dedicated border router to other ISPs
 - The ISP's "front" door
 - Transparent web caching?
 - Two in backbone is minimum guarantee for redundancy

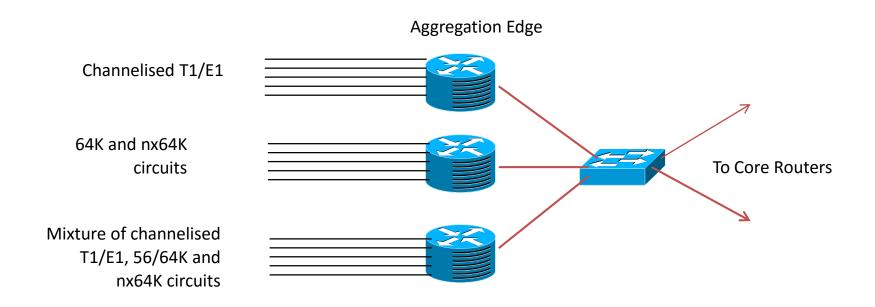

- ISP Services
 - DNS (cache, secondary)
 - News (still relevant?)
 - Mail (POP3, Relay, Anti-virus/anti-spam)
 - WWW (server, proxy, cache)
- Hosted Services/DataCentres
 - Virtual Web, WWW (server, proxy, cache)
 - Information/Content Services
 - Electronic Commerce

- Network Operations Centre
 - Consider primary and backup locations
 - Network monitoring
 - Statistics and log gathering
 - Direct but secure access
- Out of Band Management Network
 - The ISP Network "Safety Belt"

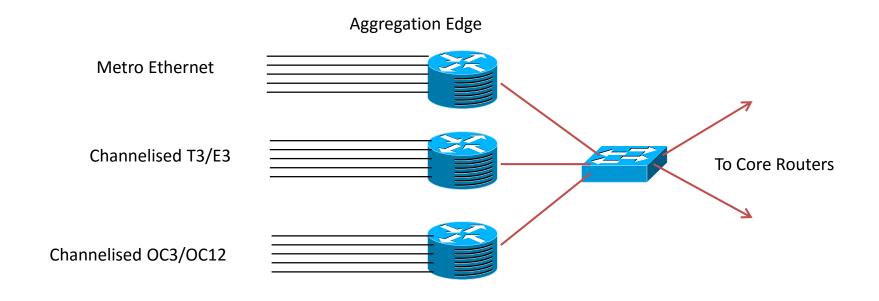

Low Speed Access Module

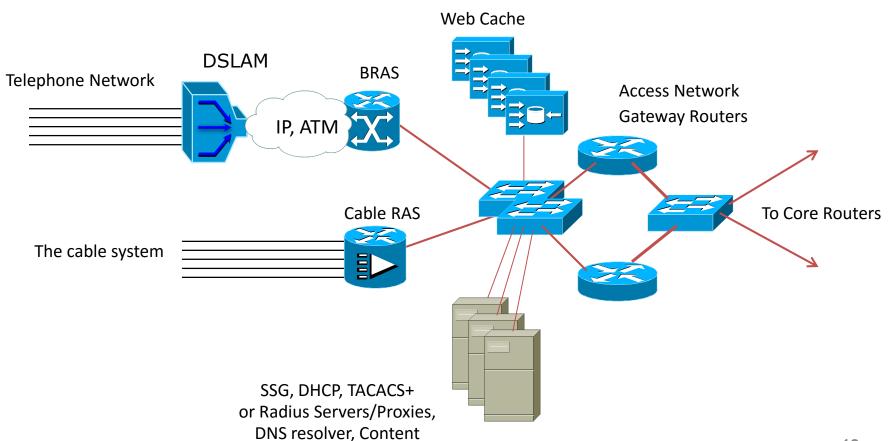

Medium Speed Access Module

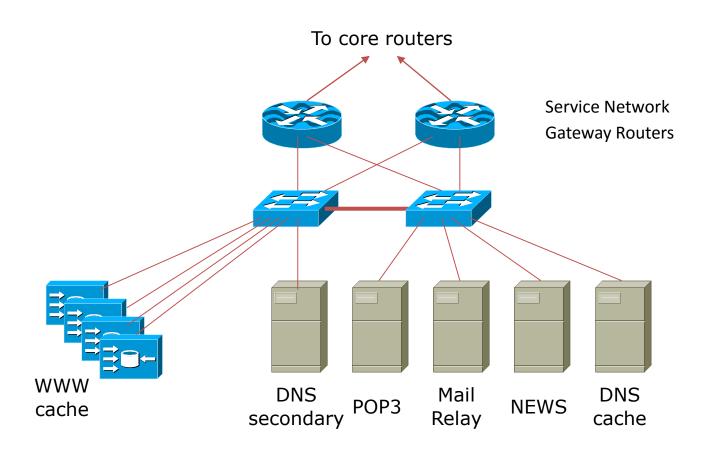

High Speed Access Module

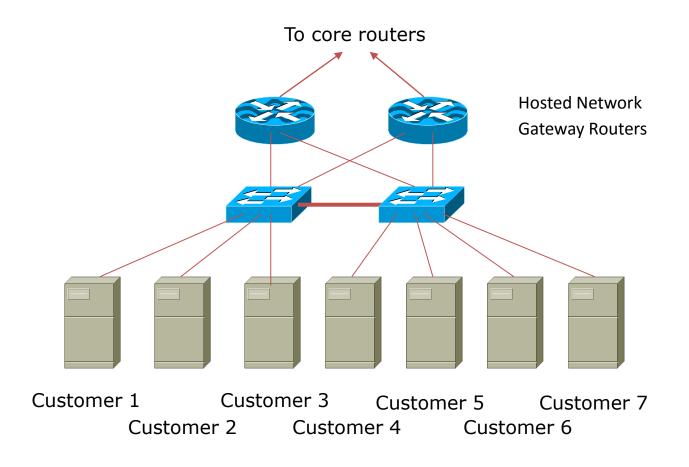

Broadband Access Module

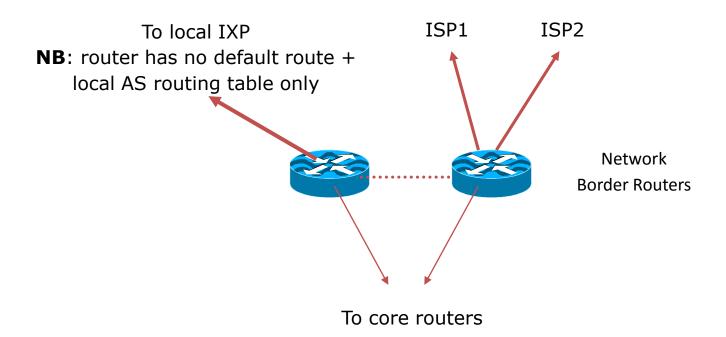

ISP Services Module

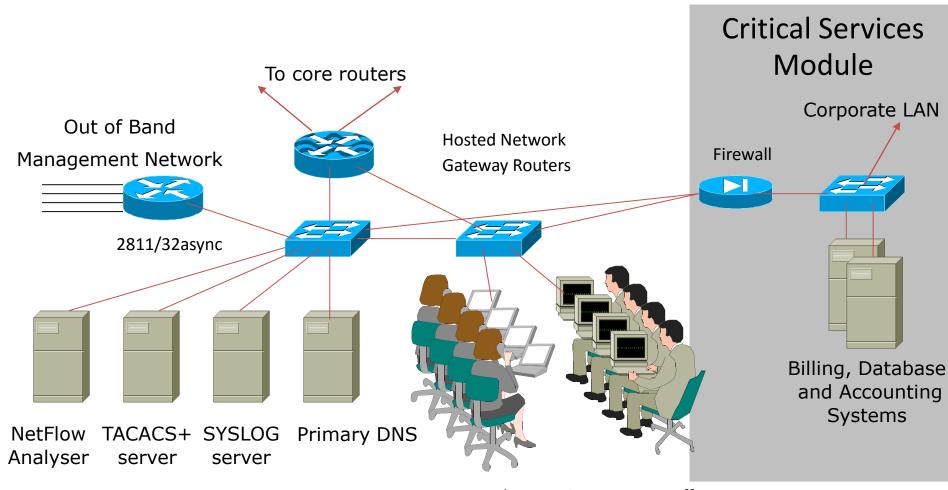

Hosted Services Module

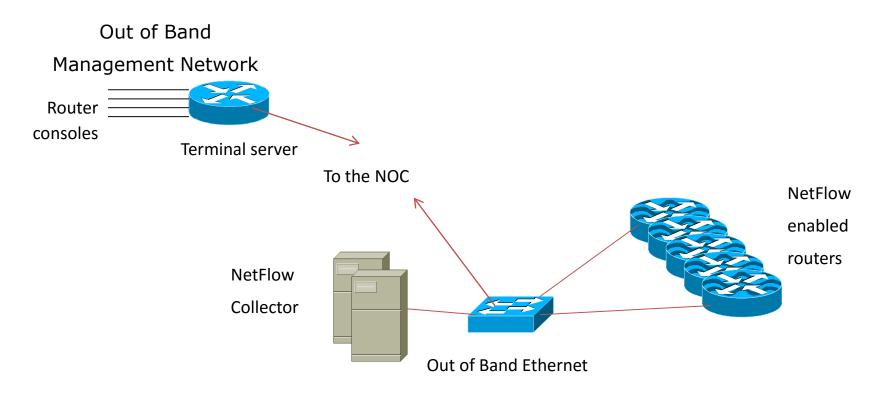

Border Module

NOC Module

Out of Band Network

Backbone Network Design

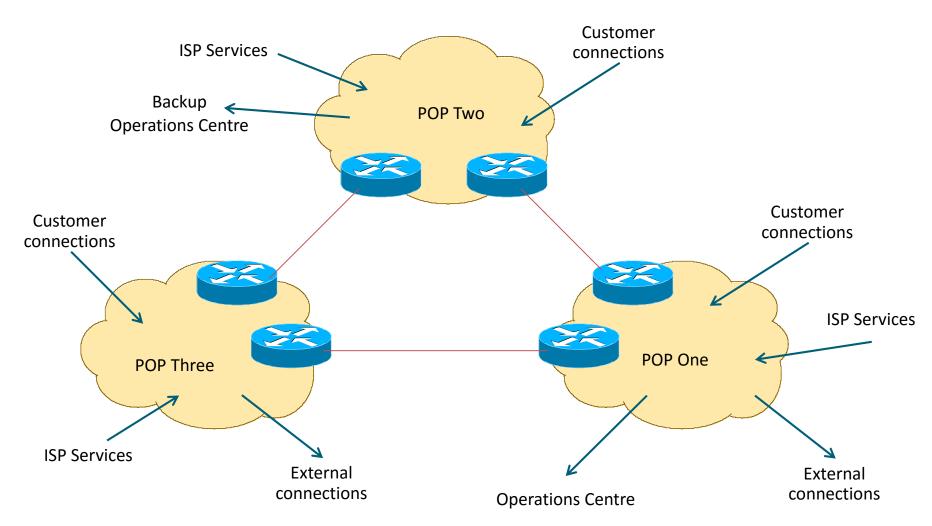

Backbone Design

- Routed Backbone
- Switched Backbone
 - Virtually obsolete
- Point-to-point circuits
 - nx64K, T1/E1, T3/E3, OC3, OC12, GigE, OC48,10GigE, OC192, OC768
- ATM/Frame Relay service from telco
 - T3, OC3, OC12,... delivery
 - Easily upgradeable bandwidth (CIR)
 - Almost vanished in availability now

Distributed Network Design

- PoP design "standardised"
 - operational scalability and simplicity
- ISP essential services distributed around backbone
- NOC and "backup" NOC
- Redundant backbone links

Distributed Network Design

Backbone Links

- ATM/Frame Relay
 - Virtually disappeared due to overhead, extra equipment, and shared with other customers of the telco
 - MPLS has replaced ATM & FR as the telco favourite
- Leased Line/Circuit
 - Most popular with backbone providers
 - IP over Optics and Metro Ethernet very common in many parts of the world

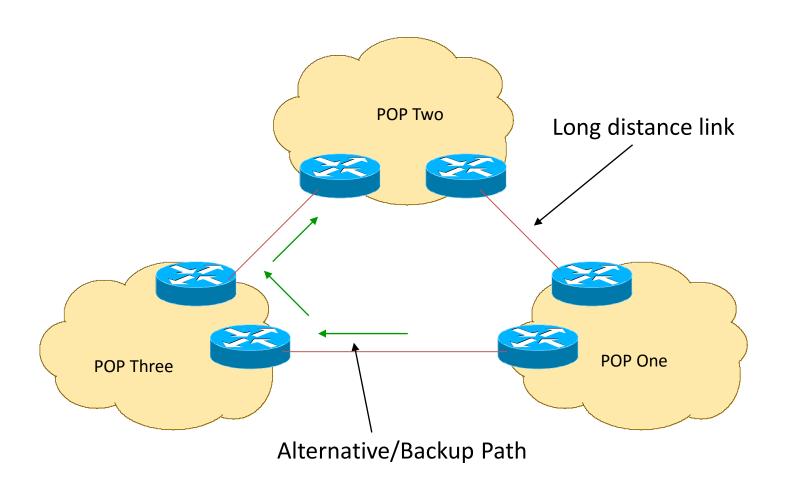

Long Distance Backbone Links

- These usually cost more
- Important to plan for the future
 - This means at least two years ahead
 - Stay in budget, stay realistic
 - Unplanned "emergency" upgrades will be disruptive without redundancy in the network infrastructure

Long Distance Backbone Links

- Allow sufficient capacity on alternative paths for failure situations
 - Sufficient can depend on the business strategy
 - Sufficient can be as little as 20%
 - Sufficient is usually over 50% as this offers "business continuity" for customers in the case of link failure
 - Some businesses choose 0%
 - Very short sighted, meaning they have no spare capacity at all!!

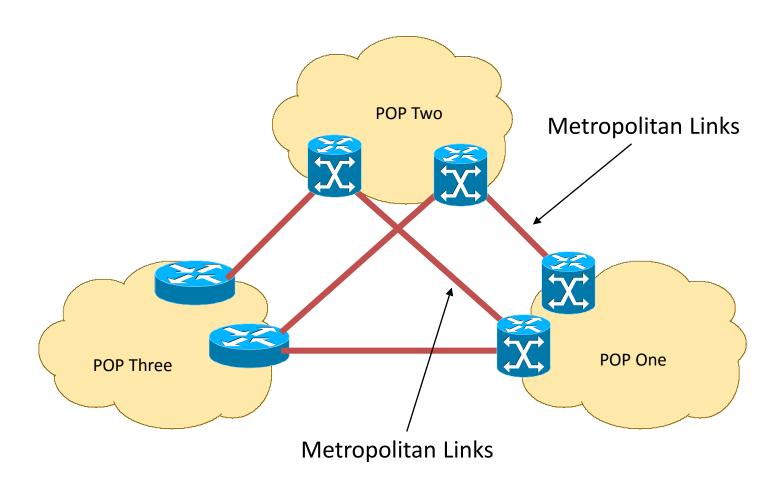

Long Distance Links

Metropolitan Area Backbone Links

- Tend to be cheaper
 - Circuit concentration
 - Choose from multiple suppliers
- Think big
 - More redundancy
 - Less impact of upgrades
 - Less impact of failures

Metropolitan Area Backbone Links

Traditional Point to Point Links

Upstream Connectivity and Peering

Transits

- Transit provider is another autonomous system which is used to provide the local network with access to other networks
 - Might be local or regional only
 - But more usually the whole Internet
- Transit providers need to be chosen wisely:
 - Only one
 - no redundancy
 - Too many
 - more difficult to load balance
 - no economy of scale (costs more per Mbps)
 - hard to provide service quality
- Recommendation: at least two, no more than three

Common Mistakes

- ISPs sign up with too many transit providers
 - Lots of small circuits (cost more per Mbps than larger ones)
 - Transit rates per Mbps reduce with increasing transit bandwidth purchased
 - Hard to implement reliable traffic engineering that doesn't need daily fine tuning depending on customer activities
- No diversity
 - Chosen transit providers all reached over same satellite or same submarine cable
 - Chosen transit providers have poor onward transit and peering

Peers

- A peer is another autonomous system with which the local network has agreed to exchange locally sourced routes and traffic
- Private peer
 - Private link between two providers for the purpose of interconnecting
- Public peer
 - Internet Exchange Point, where providers meet and freely decide who they will interconnect with
- Recommendation: peer as much as possible!

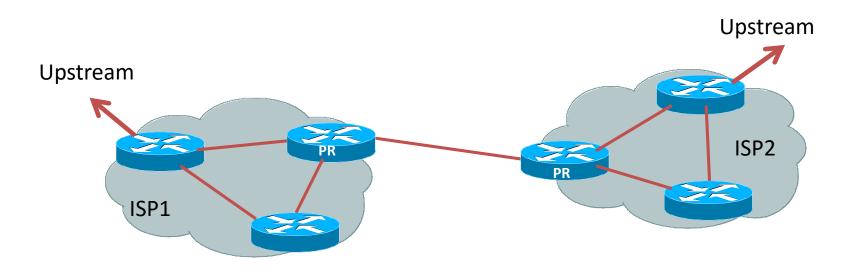

Common Mistakes

- Mistaking a transit provider's "Exchange" business for a no-cost public peering point
- Not working hard to get as much peering as possible
 - Physically near a peering point (IXP) but not present at it
 - (Transit sometimes is cheaper than peering!!)
- Ignoring/avoiding competitors because they are competition
 - Even though potentially valuable peering partner to give customers a better experience

Private Interconnection

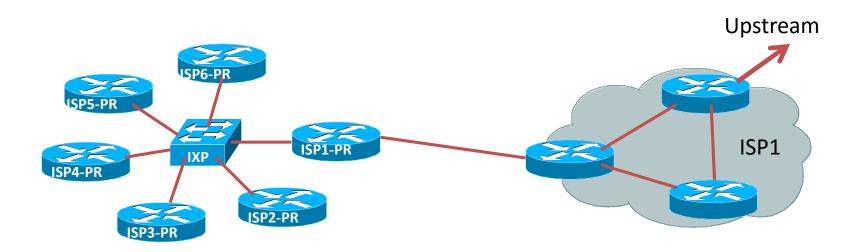

- Two service providers agree to interconnect their networks
 - They exchange prefixes they originate into the routing system (usually their aggregated address blocks)
 - They share the cost of the infrastructure to interconnect
 - Typically each paying half the cost of the link (be it circuit, satellite, microwave, fibre,...)
 - Connected to their respective peering routers
 - Peering routers only carry domestic prefixes

Private Interconnection

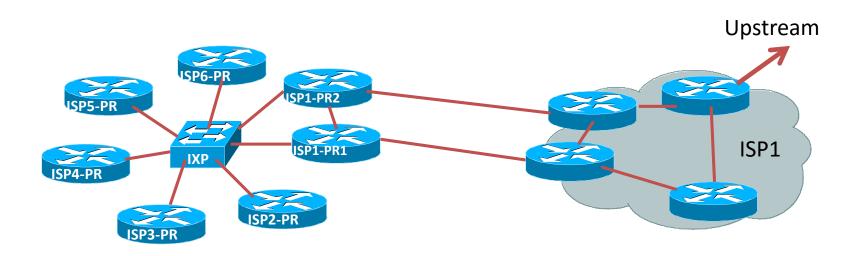

- PR = peering router
 - Runs iBGP (internal) and eBGP (with peer)
 - No default route
 - No "full BGP table"
 - Domestic prefixes only
- Peering router used for all private interconnects

- Service provider participates in an Internet Exchange Point
 - It exchanges prefixes it originates into the routing system with the participants of the IXP
 - It chooses who to peer with at the IXP
 - Bi-lateral peering (like private interconnect)
 - Multi-lateral peering (via IXP's route server)
 - It provides the router at the IXP and provides the connectivity from their PoP to the IXP
 - The IXP router carries only domestic prefixes

- ISP1-PR = peering router of our ISP
 - Runs iBGP (internal) and eBGP (with IXP peers)
 - No default route
 - No "full BGP table"
 - Domestic prefixes only
- Physically located at the IXP

- The ISP's router IXP peering router needs careful configuration:
 - It is remote from the domestic backbone
 - Should not originate any domestic prefixes
 - (As well as no default route, no full BGP table)
 - Filtering of BGP announcements from IXP peers (in and out)
- Provision of a second link to the IXP:
 - (for redundancy or extra capacity)
 - Usually means installing a second router
 - Connected to a second switch (if the IXP has two more more switches)
 - Interconnected with the original router (and part of iBGP mesh)

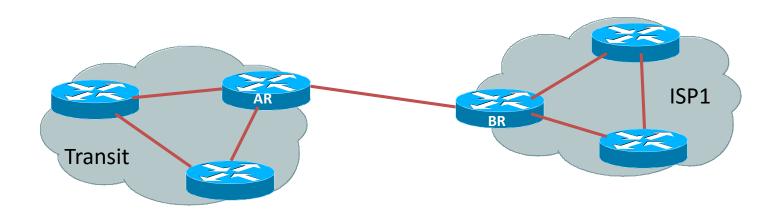

- Provision of a second link to the IXP means considering redundancy in the SP's backbone
 - Two routers
 - Two independent links
 - Separate switches (if IXP has two or more switches)

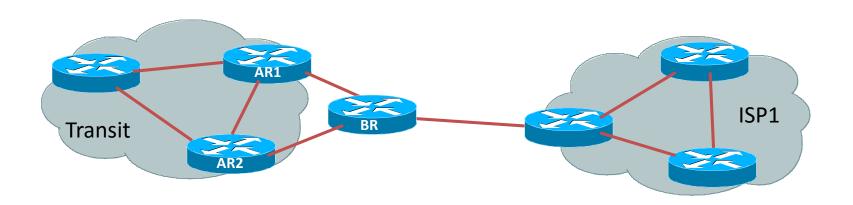

Upstream/Transit Connection

- Two scenarios:
 - Transit provider is in the locality
 - Which means bandwidth is cheap, plentiful, easy to provision, and easily upgraded
 - Transit provider is a long distance away
 - Over undersea cable, satellite, long-haul cross country fibre, etc
- Each scenario has different considerations which need to be accounted for

Local Transit Provider

- BR = ISP's Border Router
 - Runs iBGP (internal) and eBGP (with transit)
 - Either receives default route or the full BGP table from upstream
 - BGP policies are implemented here (depending on connectivity)
 - Packet filtering is implemented here (as required)

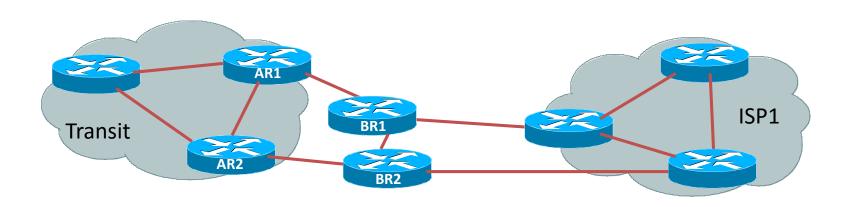

• BR = ISP's Border Router

- Co-located in a co-lo centre (typical) or in the upstream provider's premises
- Runs iBGP with rest of ISP1 backbone
- Runs eBGP with transit provider router(s)
- Implements BGP policies, packet filtering, etc
- Does not originate any domestic prefixes

- Positioning a router close to the Transit Provider's infrastructure is strongly encouraged:
 - Long haul circuits are expensive, so the router allows the ISP to implement appropriate filtering first
 - Moves the buffering problem away from the Transit provider
 - Remote co-lo allows the ISP to choose another transit provider and migrate connections with minimum downtime

- Other points to consider:
 - Does require remote hands support
 - (Remote hands would plug or unplug cables, power cycle equipment, replace equipment, etc as instructed)
 - Appropriate support contract from equipment vendor(s)
 - Sensible to consider two routers and two longhaul links for redundancy

Upgrade scenario:

- Provision two routers
- Two independent circuits
- Consider second transit provider and/or turning up at an IXP

Summary

- Design considerations for:
 - Private interconnects
 - Simple private peering
 - Public interconnects
 - Router co-lo at an IXP
 - Local transit provider
 - Simple upstream interconnect
 - Long distance transit provider
 - Router remote co-lo at datacentre or Transit premises

Addressing

Addressing Resources and Protocols

Getting IP address space

- Take part of upstream ISP's PA space or
- Become a member of your Regional Internet Registry and get your own allocation
 - Require a plan for a year ahead
 - General policies are outlined in RFC2050, more specific details are on the individual RIR website
- There is no more IPv4 address space at IANA
 - Most RIRs are now entering their "final /8" IPv4 delegation policies
 - Limited IPv4 available
 - IPv6 allocations are simple to get in most RIR regions

What about RFC1918 addressing?

- RFC1918 defines IP addresses reserved for private Internets
 - Not to be used on Internet backbones
 - http://www.ietf.org/rfc/rfc1918.txt
- Commonly used within end-user networks
 - NAT used to translate from private internal to public external addressing
 - Allows the end-user network to migrate ISPs without a major internal renumbering exercise
- Most ISPs filter RFC1918 addressing at their network edge
 - http://www.cymru.com/Documents/bogon-list.html

What about RFC1918 addressing?

- List of well known problems with this approach for an SP backbone:
 - Breaks Path MTU Discovery
 - Potential conflicts with usage of private addressing inside customer networks
 - Security through obscurity does not provide security
 - Troubleshooting outside the local network becomes very hard
 - Router interface addresses are only locally visible
 - Internet becomes invisible from the router
 - Troubleshooting of connectivity issues on an Internet scale becomes impossible
 - Traceroutes and pings provide no information
 - No distinction between "network invisible" and "network broken"
 - Increases operational complexity of the network infrastructure and routing configuration

Private versus Globally Routable IP Addressing

- Infrastructure Security: not improved by using private addressing
 - Still can be attacked from inside, or from customers, or by reflection techniques from the outside
- Troubleshooting: made an order of magnitude harder
 - No Internet view from routers
 - Other ISPs cannot distinguish between down and broken
- Performance: PMTUD breakage
- Summary:
 - ALWAYS use globally routable IP addressing for ISP Infrastructure

Addressing Plans – ISP Infrastructure

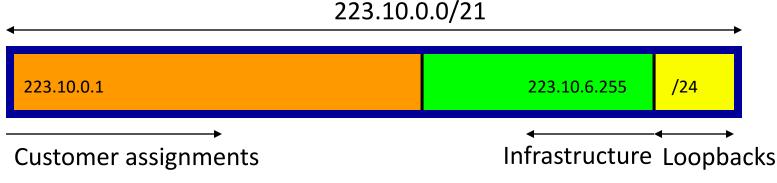

- Address block for router loop-back interfaces
- Address block for infrastructure
 - Per PoP or whole backbone
 - Summarise between sites if it makes sense
 - Allocate according to genuine requirements, not historic classful boundaries
- Similar allocation policies should be used for IPv6 as well
 - ISPs just get a substantially larger block (relatively) so assignments within the backbone are easier to make

Addressing Plans – Customer

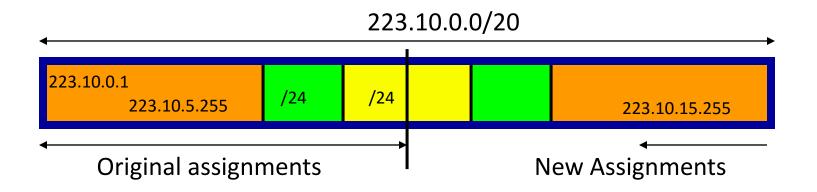

- Customers are assigned address space according to need
- Should not be reserved or assigned on a per PoP basis
 - ISP iBGP carries customer nets
 - Aggregation not required and usually not desirable

Addressing Plans – ISP Infrastructure

Phase One

Phase Two

Addressing Plans Planning

- Registries will usually allocate the next block to be contiguous with the first allocation
 - Minimum allocation could be /21
 - Very likely that subsequent allocation will make this up to a /20
 - So plan accordingly

Addressing Plans (contd)

- Document infrastructure allocation
 - Eases operation, debugging and management
- Document customer allocation
 - Contained in iBGP
 - Eases operation, debugging and management
 - Submit network object to RIR Database

Routing Protocols

Routing Protocols

- IGP Interior Gateway Protocol
 - carries infrastructure addresses, point-to-point links
 - examples are OSPF, ISIS,...
- EGP Exterior Gateway Protocol
 - carries customer prefixes and Internet routes
 - current EGP is BGP version 4
- No connection between IGP and EGP

Why Do We Need an IGP?

- ISP backbone scaling
 - Hierarchy
 - Modular infrastructure construction
 - Limiting scope of failure
 - Healing of infrastructure faults using dynamic routing with fast convergence

Why Do We Need an EGP?

- Scaling to large network
 - Hierarchy
 - Limit scope of failure
- Policy
 - Control reachability to prefixes
 - Merge separate organizations
 - Connect multiple IGPs

Interior versus Exterior Routing Protocols

Interior

- Automatic neighbour discovery
- Generally trust your IGP routers
- Prefixes go to all IGP routers
- Binds routers in one AS together

Exterior

- Specifically configured peers
- Connecting with outside networks
- Set administrative boundaries
- Binds AS's together

Interior versus Exterior Routing Protocols

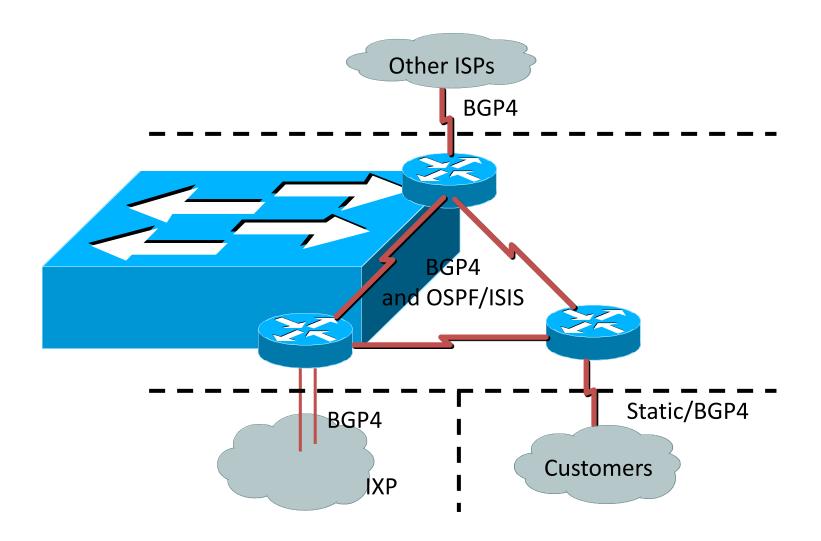

Interior

- Carries ISP infrastructure addresses only
- ISPs aim to keep the IGP small for efficiency and scalability

Exterior

- Carries customer prefixes
- Carries Internet prefixes
- EGPs are independent of ISP network topology

Hierarchy of Routing Protocols

Routing Protocols: Choosing an IGP

- Review the "OSPF vs ISIS" presentation:
 - OSPF and ISIS have very similar properties
- ISP usually chooses between OSPF and ISIS
 - Choose which is appropriate for your operators' experience
 - In most vendor releases, both OSPF and ISIS have sufficient "nerd knobs" to tweak the IGP's behaviour
 - OSPF runs on IP
 - ISIS runs on infrastructure, alongside IP

Routing Protocols: IGP Recommendations

- Keep the IGP routing table as small as possible
 - If you can count the routers and the point to point links in the backbone, that total is the number of IGP entries you should see

IGP details:

- Should only have router loopbacks, backbone WAN point-to-point link addresses, and network addresses of any LANs having an IGP running on them
- Strongly recommended to use inter-router authentication
- Use inter-area summarisation if possible

Routing Protocols: More IGP recommendations

- To fine tune IGP table size more, consider:
 - Using "ip unnumbered" on customer point-topoint links – saves carrying that /30 in IGP
 - (If customer point-to-point /30 is required for monitoring purposes, then put this in iBGP)
 - Use contiguous addresses for backbone WAN links in each area – then summarise into backbone area
 - Don't summarise router loopback addresses as iBGP needs those (for next-hop)
 - Use iBGP for carrying anything which does not contribute to the IGP Routing process

Routing Protocols: iBGP Recommendations

- iBGP should carry everything which doesn't contribute to the IGP routing process
 - Internet routing table
 - Customer assigned addresses
 - Customer point-to-point links
 - Dial network pools, passive LANs, etc

Routing Protocols: More iBGP Recommendations

- Scalable iBGP features:
 - Use neighbour authentication
 - Use peer-groups to speed update process and for configuration efficiency
 - Use communities for ease of filtering
 - Use route-reflector hierarchy
 - Route reflector pair per PoP (overlaid clusters)

Security

Security

- ISP Infrastructure security
- ISP Network security
- Security is not optional!
- ISPs need to:
 - Protect themselves
 - Help protect their customers from the Internet
 - Protect the Internet from their customers
- The following slides are general recommendations
 - Do more research on security before deploying any network

ISP Infrastructure Security

- Router security
 - Usernames, passwords, vty filters, TACACS+
 - Disable telnet on vtys, only use SSH
 - vty filters should only allow NOC access, no external access
 - See IOS Essentials for the recommended practices for ISPs

ISP Network Security

- Denial of Service Attacks
 - eg: "smurfing"
 - see http://www.denialinfo.com
- Effective filtering
 - Network borders see Cisco ISP Essentials
 - Static customer connections unicast RPF on ALL of them
 - Network operation centre
 - ISP corporate network behind firewall

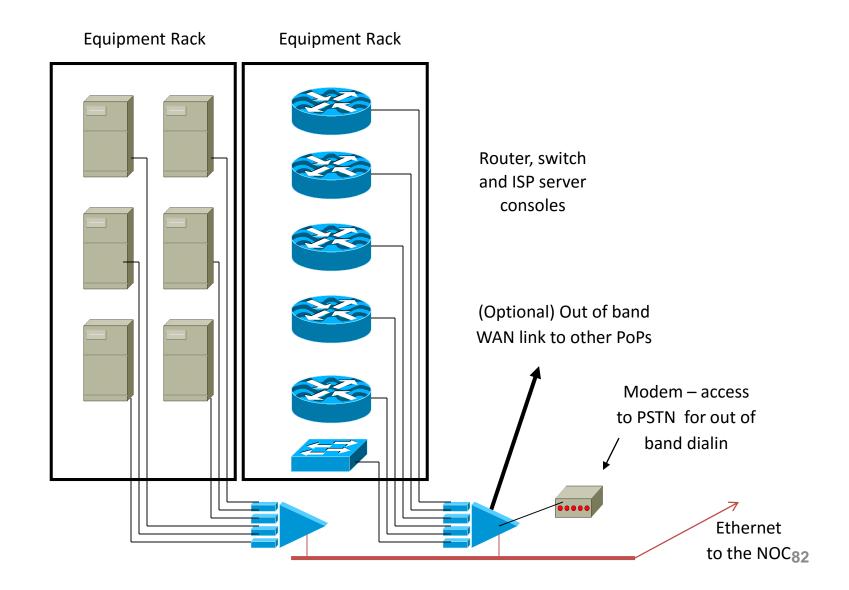

Ingress & Egress Route Filtering

Your customers should not be sending any IP packets out to the Internet with a source address other then the address you have allocated to them!

- Not optional!
- Allows access to network equipment in times of failure
- Ensures quality of service to customers
 - Minimises downtime
 - Minimises repair time
 - Eases diagnostics and debugging

- OoB Example Access server:
 - modem attached to allow NOC dial in
 - console ports of all network equipment connected to serial ports
 - LAN and/or WAN link connects to network core, or via separate management link to NOC
- Full remote control access under all circumstances

Out of Band Network

- OoB Example Statistics gathering:
 - Routers are NetFlow and syslog enabled
 - Management data is congestion/failure sensitive
 - Ensures management data integrity in case of failure
- Full remote information under all circumstances

- Designed to look like a typical PoP
 - Operated like a typical PoP
- Used to trial new services or new software under realistic conditions
- Allows discovery and fixing of potential problems before they are introduced to the network

- Some ISPs dedicate equipment to the lab
- Other ISPs "purchase ahead" so that today's lab equipment becomes tomorrow's PoP equipment
- Other ISPs use lab equipment for "hot spares" in the event of hardware failure

- Can't afford a test lab?
 - Set aside one spare router and server to trial new services
 - Never ever try out new hardware, software or services on the live network
- Every major ISP in the US and Europe has a test lab
 - It's a serious consideration

Operational Considerations

Operational Considerations

Why design the world's best network when you have not thought about what operational good practices should be implemented?

Operational Considerations Maintenance

- Never work on the live network, no matter how trivial the modification may seem
 - Establish maintenance periods which your customers are aware of
 - e.g. Tuesday 4-7am, Thursday 4-7am
- Never do maintenance on a Friday
 - Unless you want to work all weekend cleaning up
- Never do maintenance on a Monday
 - Unless you want to work all weekend preparing

Operational Considerations Support

- Differentiate between customer support and the Network Operations Centre
 - Customer support fixes customer problems
 - NOC deals with and fixes backbone and Internet related problems
- Network Engineering team is last resort
 - They design the next generation network, improve the routing design, implement new services, etc
 - They do not and should not be doing support!

Operational Considerations NOC Communications

- NOC should know contact details for equivalent NOCs in upstream providers and peers
- Or consider joining the INOC-DBA system
 - Voice over IP phone system using SIP
 - Runs over the Internet
 - www.pch.net/inoc-dba for more information

ISP Network Design

Summary

ISP Design Summary

- KEEP IT SIMPLE & STUPID! (KISS)
- Simple is elegant is scalable
- Use Redundancy, Security, and Technology to make life easier for <u>yourself</u>
- Above all, ensure quality of service for your customers
