Alternative Intersection Analysis Using SIDRA INTERSECTION

Contents of this presentation:

1. **Resources** on Alternative Intersections
2. SIDRA INTERSECTION **Network Model**
(Introduction)
3. **Interchanges** and **Alternative Intersections**
Using SIDRA INTERSECTION
4. An **Interchange Comparison** Example

Alternative Intersection Analysis Using SIDRA INTERSECTION

1. Resources on Alternative Intersections

Useful Sources on Alternative Intersections

- FHWA (2010). **Alternative Intersections/Interchanges: Informational Report**. US Department of Transportation, Federal Highway Administration, McLean, Virginia, USA. [\[324 page document\]](#)
- HIGHWAY CAPACITY MANUAL (2015 / 2016), Chapter 23 (**Ramp Terminals and Alternative Intersections**). [\[Forthcoming major edition of HCM\]](#)
- TONDER et al (2013). **Diverging diamond interchange – an innovative way of managing traffic at a standard diamond interchange**. AITPM National Conference, Perth, Australia. [\[An application in South Africa\]](#)
- WIKIPEDIA: **Continuous-Flow Intersection** and **Diverging Diamond Interchange** topics. [\[Useful references\]](#)

FHWA (2010). Alternative Intersections/Interchanges: Informational Report

Selected alternative intersection and interchange treatments
in the United States and other countries:

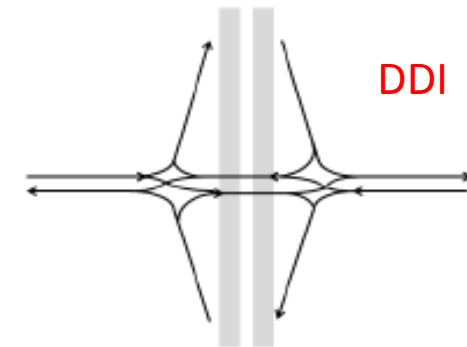

- Displaced left-turn (**DLT**) intersection
- Median U-turn (**MUT**) intersection
- Restricted crossing U-turn (**RCUT**) intersection
- Quadrant roadway (**QR**) intersection
- Double crossover diamond (**DCD**) interchange
[Diverging Diamond Interchange (**DDI**)]
- **DLT** interchange

Highway Capacity Manual (2015 / 2016), Chapter 23 (Ramp Terminals and Alternative Intersections)

Alternative intersection types:

- Diverging Diamond Interchanges (**DDI**)
- Median U-turn (**MUT**) intersections
- Displaced left-turn (**DLT**) intersections
- Restricted crossing U-turn (**RCUT**) intersections

Converted to left side driving

TONDER et al (2013). Diverging diamond interchange – an innovative way of managing traffic at a standard diamond interchange.

“The design of the conversion of the **KwaMashu interchange** (on National Route 2 north of Durban) from a standard diamond to a diverging diamond layout is complete and construction of the conversion commenced in June 2012 and is due for completion in May 2013. This will be the very first diverging diamond interchange to be implemented in the Southern Hemisphere.”

Alternative Intersection Analysis Using SIDRA INTERSECTION

2. SIDRA INTERSECTION **Network Model**

SIDRA NETWORK Model

Unique lane-based
NETWORK model

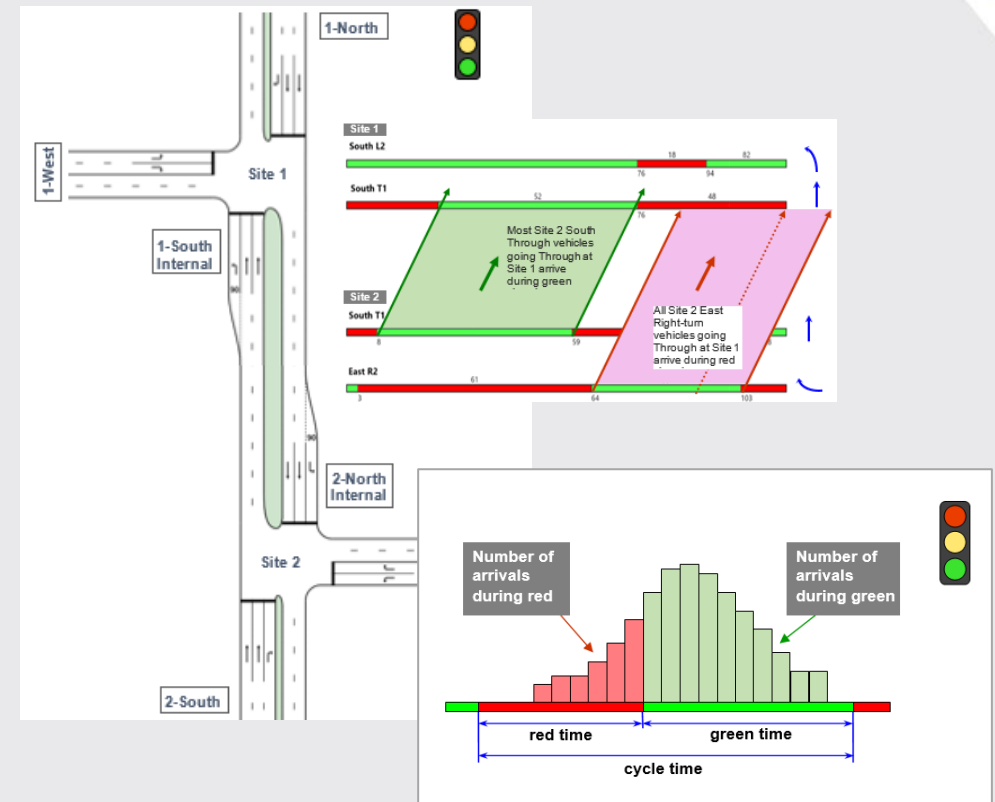

All intersection types
(signals, roundabouts,
sign control)

PAIRED INTERSECTIONS
(detailed lane-based
analysis)

SIDRA INTERSECTION features enabling analysis of Alternative Intersections

- ❖ **LANE-BASED** network model
- ❖ **QUEUE SPILLBACK** and **Capacity Constraint**
- ❖ **Movement Classes** (special use for downstream turning movements)
- ❖ **Second-by-second lane-based platoon model**
- ❖ **Lane Movements** at intersections
- ❖ **Implied midblock lane changes**
- ❖ **Common Control Group** for signal phasing and timing with one signal controller unit (Version 7)

Lane Utilisation at Alternative Intersections

HCM 2015 / 2016, page 23-7 :

Lane Utilization Effects

Lane utilization is the extent to which lanes are used equally (or unequally) by drivers. The presence of multiple intersections operating as a single unit can strongly influence drivers' choice of lanes when approaching an upstream intersection. At interchanges, this can mean through-lane utilization at the upstream intersection reflects desired turn movements at the downstream intersection. Likewise, at MUT and RCUT intersections, this can mean dual right-turn lane utilizations reflect downstream movements; with drivers headed for the U-turn crossover using the leftmost of the side-street, right-turn lanes.

This applies to all
“paired intersections”

Exhibit 23-2
Impact of Interchange Type
on Lane Utilization

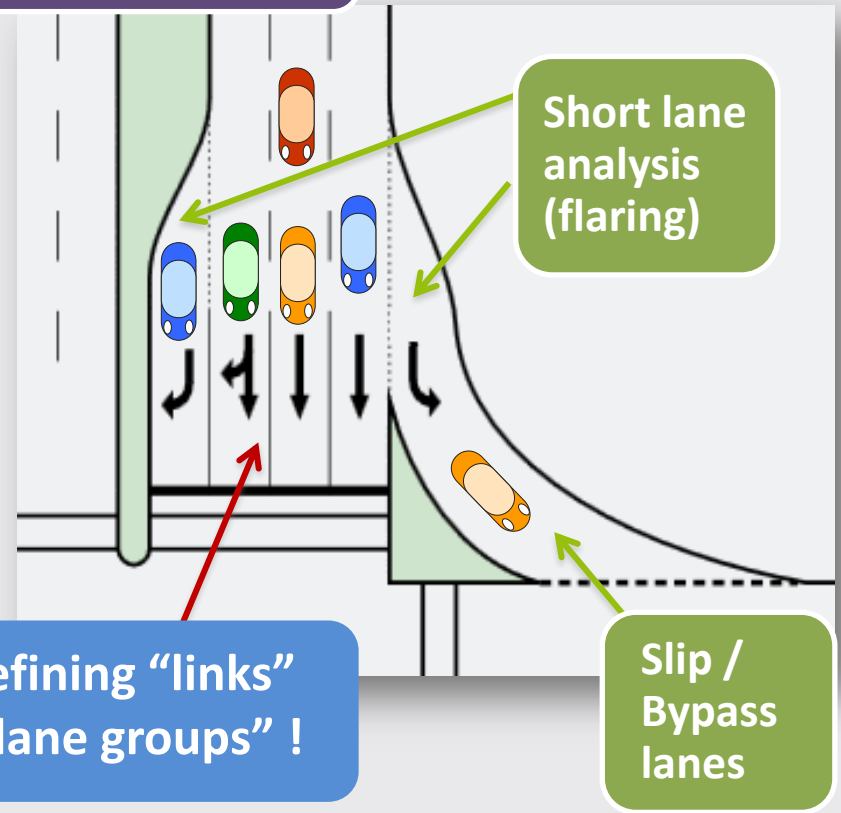

SIDRA Lane-based model for intersections since 1984

LANE-BASED MODEL

More realistic and reliable analysis compared with **approach-based** and **lane group (link) - based** methods (various UK models and US HCM).

- **General:** Unequal lane flows, de facto exclusive lanes, short lanes, slip/bypass lanes (give-way/yield, continuous, signals).
- **Roundabouts:** Circulating lane use; Dominant and subdominant lanes.
- **NETWORK Model** (lane queues, lane blockage, signal platoon arrival and departure patterns).

Individual lanes have different characteristics

Iterative method for LANE BLOCKAGE and CAPACITY CONSTRAINT

Backward spread of congestion (reduced upstream capacity)

Capacity constraint (reduced downstream arrival flows)

- ❖ The two basic elements of the model are **highly interactive with opposing effects**.
- ❖ SIDRA INTERSECTION 6 uses a **network-wide iterative process** to find a solution that balances these opposing effects.
- ❖ Backward spread of congestion and capacity constraint are common to **all intersection types**.

Importance of Back of Queue Model and Lane-Based Probability of Blockage

LANE BLOCKAGE PROBABILITY

Probability of blockage of upstream Site lanes (worst full-length or two-segment lane for the approach)

Network: Two-Intersection Network

Back of Queue Percentile and Probability of Blockage values are based on back of queue estimates for individual lanes

Blocked
(capacity reduction)

CAPACITY REDUCTION DUE TO LANE BLOCKAGE

Upstream capacity reduction due to blockage by downstream lanes (worst lane for the approach)

Network: Two-Intersection Network

Movement Classes

- Light Vehicles
- Heavy Vehicles
- Buses
- Bicycles
- Large Trucks
- Light Rail / Trams
- Two User Classes for special treatment

Combined with the lane-based method, new Movement Classes allow modelling of **Bus Priority Lanes, Bicycle Lanes**, and so on ...

Site Origin-Destination Movements by **Movement Class** as a basis of all data and modelling
