Large Deviation Background

Rate function The function $I : \mathcal{X} \mapsto [0, \infty]$ is called rate function if

- I is lower semicontinuous
- I has compact level set.

Large Deviation Background

Rate function The function $I : \mathcal{X} \mapsto [0, \infty]$ is called rate function if

- I is lower semicontinuous
- I has compact level set.

Large deviation Principle

A sequence of random variables X_1, X_2, \dots is said to satisfy a LDP with speed a_n and rate function I if for all Borel sets $A \subset M$,

- $\limsup_{n \rightarrow \infty} \frac{1}{a_n} \log \mathbb{P}\{X_n \in A\} \leq - \inf_{X \in cl(A)} I(x)$
- $\liminf_{n \rightarrow \infty} \frac{1}{a_n} \log \mathbb{P}\{X_n \in A\} \geq - \inf_{X \in int(A)} I(x)$

Large Deviation Background

Rate function The function $I : \mathcal{X} \mapsto [0, \infty]$ is called rate function if

- I is lower semicontinuous
- I has compact level set.

Large deviation Principle

A sequence of random variables X_1, X_2, \dots is said to satisfy a LDP with speed a_n and rate function I if for all Borel sets $A \subset M$,

- $\limsup_{n \rightarrow \infty} \frac{1}{a_n} \log \mathbb{P}\{X_n \in A\} \leq - \inf_{x \in cl(A)} I(x)$
- $\liminf_{n \rightarrow \infty} \frac{1}{a_n} \log \mathbb{P}\{X_n \in A\} \geq - \inf_{x \in int(A)} I(x)$

In easy word, $\lim_{n \rightarrow \infty} \frac{1}{a_n} \log \mathbb{P}\{X_n \in A\} \approx -I(x)$.

Expected size of Range

Expected size of Range

Theorem (Dvoretzky and Erdős, 1950)

$$\mathbb{E}R_n = \begin{cases} \kappa n + O(n^{1/2}), & \text{if } d = 3; \\ \kappa n + O(\log n), & \text{if } d = 4; \\ \kappa n + c_d + O(n^{2-d/2}), & \text{if } d \geq 5 \end{cases}$$

where

- $\kappa = \mathbb{P}(S_i \neq 0 \text{ for } i > 0)$ is the exit probability from the origin.
- $c_d (d = 5, 6, \dots)$ are positive constants.

Expected size of Range

Theorem (Dvoretzky and Erdős, 1950)

$$\mathbb{E}R_n = \begin{cases} \kappa n + O(n^{1/2}), & \text{if } d = 3; \\ \kappa n + O(\log n), & \text{if } d = 4; \\ \kappa n + c_d + O(n^{2-d/2}), & \text{if } d \geq 5 \end{cases}$$

where

- $\kappa = \mathbb{P}(S_i \neq 0 \text{ for } i > 0)$ is the exit probability from the origin.
- $c_d (d = 5, 6, \dots)$ are positive constants.

Further, the strong law of large numbers holds

$$\lim_{n \rightarrow \infty} \frac{R_n}{\mathbb{E}R_n} = 1 \quad a.s. \text{ if } d \geq 2.$$

The Kesten-Hamana theorem describes the probability of unusually large range ($\{R_n \geq \theta n\}$ for $\theta > \kappa$).

Question: What can we say about the probability of unusually small range ($\{R_n \leq \theta n\}$ for $\theta < \kappa$)?

Theorem 1

Let $d \geq 3$. For every $b > 0$,

$$\lim_{n \rightarrow \infty} \frac{1}{n^{\frac{d-2}{d}}} \log \mathbb{P}(R_n \leq bn) = -\frac{1}{d} I^\kappa(b),$$

where

$$I^\kappa(b) = \inf_{\phi \in \Phi^\kappa(b)} \left[\frac{1}{2} \int_{\mathbb{R}^d} |\nabla \phi|^2(x) dx \right]$$

with

$$\Phi^\kappa(b) = \{ \phi \in H^1(\mathbb{R}^d) :$$

$$\int_{\mathbb{R}^d} \phi^2(x) dx = 1, \int_{\mathbb{R}^d} (1 - e^{-\kappa \phi^2(x)}) dx \leq b \}.$$

Performing the limit

This step is to derive appropriate limit result for rate function, via functional analysis. The result of this step is that we obtain the required rate function in Proposition 2.

Increasing the size of torus

Proposition 6

$\lim_{N \rightarrow \infty} I_N^\kappa(b) = I^\kappa(b)$ for all $b > 0$. where I^κ is the rate function defined in Theorem 1.

Increasing the size of torus

Proposition 6

$\lim_{N \rightarrow \infty} I_N^\kappa(b) = I^\kappa(b)$ for all $b > 0$. where I^κ is the rate function defined in Theorem 1.

Combine this proposition with the previous result, we will get the upper bound.

Current Work

Let J_n be the number of intersecting points of two independent random walks start at the origin.

CONJECTURE

Let $d \geq 3$. For every $c > 0$,

$$\lim_{n \rightarrow \infty} \frac{1}{n^{\frac{d-2}{d}}} \log \mathbb{P}(J_n \geq cn) = -\frac{1}{d} \hat{I}_d^\kappa(c),$$

where

$$\hat{I}_d^\kappa(c) = \inf_{\phi \in \Phi_d^\kappa(c)} \left[\int_{\mathbb{R}^d} |\nabla \phi|^2(x) dx \right]$$

with

$$\Phi_d^\kappa(c) = \{ \phi \in H^1(\mathbb{R}^d) : \int_{\mathbb{R}^d} \phi^2(x) dx = 1, \int_{\mathbb{R}^d} (1 - e^{-(\kappa/c)\phi^2(x)})^2 dx \geq 1 \}.$$
